<td></td>
<td></td>
<td>• To indicate a wild-card character, use an asterisk (*).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For example, if you do not want to sign any .drv files, specify the following: *.drv</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Using wild-card characters is especially helpful if you include dynamically linked files in your project and you want to avoid signing all files that match a certain pattern.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Note that the files and file patterns that should not be signed override any files and file patterns that should be signed. For example, if you specify *.exe in an Include setting and in an Exclude setting, InstallShield does not sign any .exe files.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>To delete the file or file pattern, click the Delete button in this setting.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>To add another file or file pattern, use the Exclude Patterns and Files setting.</td>
</tr>

Internet Tab for a Release

InstallShield 2020 » Releases View » Release

**Project** • The Internet tab is available in the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
The Internet tab is where you specify Web-related information.

### Table 13-207 • Settings on the Internet Tab

<table>
<thead>
<tr>
<th>Setting</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Web Type</strong></td>
<td>Basic MSI, InstallScript MSI</td>
<td>Select the configuration of your Web installation package. Available options are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>One Executable</strong>—Build this release as a single self-extracting Setup.exe file. This Web type is ideal for a package that is to be downloaded from many Web or FTP sites, since the installation package is self-contained. Note, however, that the entire installation package is downloaded, so the download time is longer than with the Install from the Web type that is described below.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>Downloader</strong>—Build this release as a combination of Setup.exe and your .msi package, where the end user downloads and launches Setup.exe, which in turn downloads and runs the .msi database, which contains all of your files.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>Install from the Web</strong>—Build this release as a combination of Setup.exe, your .msi database, and external cabinet files (.cab). The end user downloads and runs Setup.exe, which in turn downloads and runs the .msi database; based on the end user’s setup type and feature selections, only the requested .cab files are downloaded and installed, which minimizes download time.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For the Downloader and Install from the Web types, application maintenance and repair uses the URL that you specify in the URL for Your Files setting as the installation source.</td>
</tr>
<tr>
<td><strong>URL for Your Files</strong></td>
<td>Basic MSI, InstallScript MSI</td>
<td>Specify the directory that contains the data cabinet files that will be downloaded. This setting accepts a URL in the form <a href="http://www.yourcompany.com/download">http://www.yourcompany.com/download</a>. This setting is used only if the Web Type setting for the current release is set to Install from the Web or Downloader.</td>
</tr>
<tr>
<td><strong>IFTW .cab Size (KB)</strong></td>
<td>Basic MSI, InstallScript MSI</td>
<td>Specify the size, in kilobytes, of the cabinet files (.cab) for the Web media type. Specify the value 0 (zero) to build a separate .cab file for each component. This setting is used only if the value of the Web Type setting for the current release is Install from the Web.</td>
</tr>
</tbody>
</table>
Generate One-Click Install

Specify whether to create a One-Click Install, which is an installation program whose initial user interface is an HTML page. When an end user visits your Web page and clicks an Install button on it, the installation files are downloaded to the target system and then launched.

**Project** • For Basic MSI and InstallScript MSI projects: What files are downloaded to the end user’s system depends on the option that is selected for the Web Type setting for the current release. If you select Yes for the Generate One-Click Install setting, you must specify file names in the One-Click HTML Base Name setting and the One-Click .cab Base Name setting for this release. This setting is used only if you select Web for the release’s Media Format setting.

For InstallScript projects: If you select Yes for this setting, InstallShield includes with your installation an external setup player (Setup.ocx file) that downloads and then launches the Setup.exe file with the appropriate command line. For details, see One-Click Install Installations in InstallScript Projects.

### Table 13-207 • Settings on the Internet Tab (cont.)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate One-Click Install</td>
<td>Basic MSI, InstallScript, InstallScript MSI</td>
<td>Specify whether to create a One-Click Install, which is an installation program whose initial user interface is an HTML page. When an end user visits your Web page and clicks an Install button on it, the installation files are downloaded to the target system and then launched.</td>
</tr>
<tr>
<td>One-Click HTML Base Name</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Specify the base file name of the HTML file that InstallShield should generate at build time. The .htm file name extension is appended to the base name that you specify, and the generated file is created in the Disk1 folder of the current release location. This setting is used only if the value of the Generate One-Click Install setting is Yes.</td>
</tr>
<tr>
<td>One-Click .cab Base Name</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Specify the base file name for the cabinet file (.cab) that is generated by the build process for a One-Click Install installation. The .cab file name extension is appended to the name that you specify here. The generated files are created in the Disk1 folder for the current release. The name that you specify for this setting is displayed at run time in the Digital Certificate when you digitally sign your installation. This setting is used only if the value of the Generate One-Click Install setting is Yes.</td>
</tr>
<tr>
<td>Create Default Web Page</td>
<td>InstallScript</td>
<td>Specify whether you want InstallShield to create a default Web page (.htm file) and place it in the Disk1 folder.</td>
</tr>
</tbody>
</table>
The Events tab lets you configure settings for various tasks that you want InstallShield to perform before, during, or after builds.

The Events tab settings are organized into the following main categories:

- **Commands**
- **Publishing**

### Table 13-207 • Settings on the Internet Tab (cont.)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Web Page URL | InstallScript| Do one of the following to indicate what URL should be launched if you click the Run From Web command on the Build menu:
- To launch the Setup.htm file that InstallShield creates at build time and places in the Disk1 folder, leave this box blank.
- To launch a different Web page, type the URL in this box or click the browse button to select the Web file.

**Tip** • If you enter a URL, do not include the name of the page, and do not include an ending forward slash. For example, if the full URL for the Setup.htm file is `http://www.mypages.com/setup/Setup.htm`, enter the following as the Web page URL: `http://www.mypages.com/setup` When you click the Run from Web command on the Build menu, InstallShield launches the appropriate URL (`http://www.mypages.com/setup/Setup.htm`, in the aforementioned example).

**Project** • The Events tab is available in the following project types:
- Advanced UI
- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- Suite/Advanced UI

*Additional project-specific differences are noted where applicable.*

The Events tab lets you configure settings for various tasks that you want InstallShield to perform before, during, or after builds.

The Events tab settings are organized into the following main categories:

- Commands
- Publishing
• Distribution

• Virtual Machine (This area is available in the Premier edition of InstallShield.)

Commands Settings

Use the Commands area on the Events tab to specify commands that you want to be run at various stages of the build process.

Table 13-208 • Commands Settings on the Events Tab

| Setting         | Project Type                                      | Description                                                                                                                                                                                                 
|-----------------|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------
| Prebuild Event  | Basic MSI, InstallScript, InstallScript MSI, Merge Module, Suite/Advanced UI | **Edition** • This setting is available in the Premier edition of InstallShield. Specify the command that you want to be run before InstallShield starts building the release. This event runs after InstallShield creates the release folder and log file, but before InstallShield starts building the release. To specify more than one command, click the ellipsis button (…) in this setting, which opens the Prebuild Event dialog box. Enter each command on a separate line in this dialog box. At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one. When you are entering a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see Specifying Commands that Run Before, During, and After Builds. |
| Precompression Event | Basic MSI, InstallScript MSI | **Edition** • This setting is available in the Premier edition of InstallShield. Specify the command that you want to be run after InstallShield has built the .msi package and the .cab files (if your product’s data files are to be stored in .cab files). Note that this event occurs after .cab files are streamed into the .msi package, but before the .msi package has been digitally signed and streamed into the Setup.exe file. To specify more than one command, click the ellipsis button (…) in this setting, which opens the Precompression Event dialog box. Enter each command on a separate line in this dialog box. At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one. When you are entering a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see Specifying Commands that Run Before, During, and After Builds. |
Publishing Settings

The Publishing settings that are displayed depend on what project type you are using; they also depend on whether you are using the version of InstallShield that ships by itself, or the one that is included in AdminStudio.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Execute Batch File</td>
<td>InstallScript, InstallScript Object</td>
<td>To launch a batch file (.bat) or executable file (.exe) after the release has been built, enter the path to the file, or click the ellipsis button (...) to browse to the file. You can use path variables, enclosed within angle brackets (&lt;&gt;), as part of the path. If you specify a file for this, InstallShield sets environment variables with the same names (including the angle brackets) and values as the project's build variables. InstallShield also sets the environment variable &lt;SMEDIADIR&gt;, whose value is the path to the folder in which the release's Disk Images, Log Files, and Report Files folders are created. You can refer to the value of an environment variable in a batch file by surrounding the variable name with percent signs (%); for example: set PATH = %&lt;ISPROJECTDIR&gt;%;%PATH% When the file is finished, InstallShield deletes the environment variables that it set.</td>
</tr>
<tr>
<td>Postbuild Event</td>
<td>Basic MSI, InstallScript, InstallScript MSI, Merge Module, Suite/Advanced UI</td>
<td></td>
</tr>
</tbody>
</table>
Publishing Settings in the Version of InstallShield that Ships By Itself (Without AdminStudio)

For the version of InstallShield that ships by itself (without AdminStudio), the settings in the Publishing area on the Events tab are available in merge module projects. Use these settings to specify information such as whether you want the merge module to be available in the Merge Modules folder or a repository after each successful build of the release.

Table 13-209 • Publishing Settings on the Events Tab—for InstallShield Without AdminStudio

<table>
<thead>
<tr>
<th>Setting</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Publish Merge Module</td>
<td>Merge Module</td>
<td>Specify whether you want the merge module to be available in the Merge Modules folder or a repository after each successful build of the selected release. Available options are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>Publish to repository</strong>—InstallShield publishes the merge module to the repository that is specified in the Repository Name setting whenever you successfully build the release. Note that this option is available only if one or more repositories have been configured. (To configure a repository, on the Tools menu, click Options, and then click the Repository tab. Use this tab to configure a repository.)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>Copy to Merge Modules folder</strong>—InstallShield updates the Merge Modules folder with this new merge module whenever you successfully build the release.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>Do not publish</strong>—InstallShield does not publish the merge module to a repository or copy it to the Merge Modules folder when you build the release.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>To learn more, see Using a Repository to Share Project Elements.</td>
</tr>
<tr>
<td>Repository Name</td>
<td>Merge Module</td>
<td>Select the repository where the merge module that you are building should be published when the release is successfully built. Note that this option is available only if one or more repositories have been configured. (To configure a repository, on the Tools menu, click Options, and then click the Repository tab. Use this tab to configure a repository.)</td>
</tr>
<tr>
<td>Display Name</td>
<td>Merge Module</td>
<td>Specify a display name for the merge module that you are publishing to the repository. When you select this merge module in the Redistributables view after it has been published to the repository, the display name is available in the details pane.</td>
</tr>
<tr>
<td>Publisher</td>
<td>Merge Module</td>
<td>Type the name of the person publishing this merge module to the repository. This name will be displayed in the description pane when you select this merge module in the Redistributables view. When you select this merge module in the Redistributables view after it has been published to the repository, the publisher name is available in the details pane.</td>
</tr>
</tbody>
</table>
For the version of InstallShield that ships as part of AdminStudio, the settings in the Publishing area on the Events tab are available in Basic MSI projects. Use these settings to specify information such as whether you want the Windows Installer package that you are building to be published to the software repository.

### Description

Type the description that should be displayed for this merge module. When you select this merge module in the Redistributables view after it has been published to the repository, the description is available in the details pane.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Merge Module</td>
<td>Type the description that should be displayed for this merge module. When you select this merge module in the Redistributables view after it has been published to the repository, the description is available in the details pane.</td>
</tr>
</tbody>
</table>

### Publishing Settings in the Version of InstallShield that Ships as Part of AdminStudio

For the version of InstallShield that ships as part of AdminStudio, the settings in the Publishing area on the Events tab are available in Basic MSI projects. Use these settings to specify information such as whether you want the Windows Installer package that you are building to be published to the software repository.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Publish to AdminStudio Repository</td>
<td>Basic MSI</td>
<td>Specify whether you want the Windows Installer package that you are building to be published to the software repository. If you use the software repository to manage a Windows Installer package, the .msi file and all of its other associated files and subfolders are stored in a subfolder of the software repository location that is identified for the package's Application Catalog.</td>
</tr>
<tr>
<td>Group</td>
<td>Basic MSI</td>
<td>If you select Yes for the Publish to AdminStudio Repository setting and you want to associate the Windows Installer package with one or more groups in the Application Catalog, click the ellipsis button (...) in this setting. The Select Application Manager Groups dialog box opens. Select the check box for each group that you want to contain the Windows Installer package.</td>
</tr>
<tr>
<td>Update Option</td>
<td>Basic MSI</td>
<td>Specify how you want to handle the importing of the Windows Installer package that is built for the selected release into the Application Catalog. Available options are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>New Package Version</strong>—A new build is treated as a new package in the Application Catalog.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>Overwrite Existing Version</strong>—A new build overwrites the existing version in the Application Catalog.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>New Package History Version</strong>—A new build is treated as a new version of the package that exists in the Application Catalog.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>Ignore if Exists</strong>—A new build is imported only if it does not already exist in the Application Catalog.</td>
</tr>
</tbody>
</table>
Distribution

Use the Distribution area on the Events tab to configure settings for distributing releases to a folder or FTP site automatically at build time.

Table 13-211 • Distribution Settings on the Events Tab

<table>
<thead>
<tr>
<th>Setting</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy to Folder</td>
<td>Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>If you want to be able to automatically distribute your release to a folder, specify location. Existing folders with the same names as copied folders are overwritten, but no folders are deleted. Specify the folder path by entering the path in this setting, or click the ellipsis button (...) to browse to the location. If the media format of the selected release is a network image, which creates only one disk image folder, the contents of the disk image folder, rather than the folder itself, are copied. If you chose to create a self-extracting executable file, the executable file, rather than the disk image folders, is copied.</td>
</tr>
</tbody>
</table>

*Project* • For InstallScript and InstallScript Object projects, InstallShield automatically copies the release to the folder that you specify on the Events tab every time that you build the release.

For any of the following project types, InstallShield copies all of the relevant files for your release to the specified folder whenever you right-click the release in the Releases view and then click Distribute:

- Basic MSI
- InstallScript MSI
- Merge Module

If you want the build engine to copy your release to the specified folder after every build in a Basic MSI, InstallScript MSI, or Merge Module project, select Yes for the Distribute After Build setting.

*Note* • If you specify a folder for this setting and you also specify an FTP location on the Events tab, InstallShield copies the release to only the FTP location.
FTP Location

If you want to be able to automatically distribute your release to an FTP server, specify the FTP URL for the location. Each release in your project can have a different FTP location.

**Note** • If you need to distribute your release to a path outside the FTP default folder, use a double slash (//). For example, to distribute your release to a root-level folder called *myproduct*, where the URL of the FTP server is `ftp://ftp.mydomain.com`, enter `ftp://ftp.mydomain.com//myproduct` for the FTP location.

**Project** • For InstallScript and InstallScript Object projects, InstallShield automatically copies the release to the FTP location that you specify on the Events tab every time that you build the release.

For any of the following project types, InstallShield copies all of the relevant files for your release to the specified FTP location whenever you right-click the release in the Releases view and then click Distribute:

- Basic MSI
- InstallScript MSI
- Merge Module

If you want the build engine to copy your release to the specified location after every build in a Basic MSI, InstallScript MSI, or Merge Module project, select Yes for the Distribute After Build setting.

**FTP Site User Name**

If a user name is required to upload to the FTP location that you are specifying, enter the user name.

**Project** • If you enter a user name for one of the releases in a Basic MSI, InstallScript MSI, or Merge Module project, that same user name is used for other releases in the same project and in other Basic MSI, InstallScript MSI, and Merge Module projects.

**FTP Site Password**

If a password is required to upload to the FTP location that you are specifying, enter the password.

**Project** • If you enter a password for one of the releases in a Basic MSI, InstallScript MSI, or Merge Module project, that same password is used for other releases in the same project and in other Basic MSI, InstallScript MSI, and Merge Module projects.

<table>

Virtual Machine Settings

Edition • The Virtual Machine area is available in the Premier edition of InstallShield.

Use the Virtual Machine area on the Events tab to configure settings for distributing the selected release to a virtual machine (VM) at build time or on demand. To learn more, see Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand.

Table 13-212 • Virtual Machine Settings on the Events Tab

<table>
<thead>
<tr>
<th>Setting</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Configuration    | Basic MSI, InstallScript, InstallScript MSI, Suite/Advanced UI | This setting shows the name of the group of VM configuration settings that you want to use when distributing the selected release to a VM.  
To specify an existing VM configuration, select it in this setting.  
To create a new VM configuration, click the ellipsis button (...) in this setting.  
To edit an existing VM configuration, select it in this setting and then click the ellipsis button (...).  
To override the selected VM configuration’s details (such as the destination on the VM where you want the installation to be distributed) for the selected release, configure the subsettings under this setting.  
To learn more about VM distribution, see Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand.  
For information on how to share VM configurations with other machines, see Sharing Virtual Machine Settings for Distribution of Releases. |

Tip • To quickly distribute your release on demand, instead of after each build, right-click the release and click Distribute. Note that the Distribute command is available only if the release has been built at least once.

Release Settings
Releases View

Appx/MSIX Tab for a Release

InstallShield 2020 » Releases View » Release

Project • The Appx/MSIX tab is available in Basic MSI projects.

Windows app package (.appx/.msix) creation is enabled in the per-release tab titled Appx/MSIX tab. Here, some core settings can be specified that impact the Windows app package build process.

The Appx/MSIX tab settings are organized into the following main categories:

- General
- Package Identity Overrides
- Display Properties
General Settings

Use the General area on the Appx/MSIX tab to specify whether a Windows app package (.appx) will be built as part of building the release and to specify other core settings that impact the build process such as choosing whether to include desktop extensions or server extensions.

Table 13-213 • General Settings on the Appx/MSIX Tab

</tbody>
</table>

Package Type

Choose a package type. This setting converts your Windows desktop application to the modern Windows app packaging format. The available drop-down options are:

- **APPX** - Build the Windows App Package
- **MSIX** - MSIX is the next generation software deployment model for Windows platform, bringing in the best of MSI, AppX and App-V together in a single package. MSIX has the capability to run a traditional Win32 app in a native container, achieving application isolation, ease of deployment, fully clean uninstallation and seamless software updates all at the same time.
- **Both** - Builds both .appx and .msix packages.
### Distribution Method

Choose a distribution method for your Windows app package. This setting directs which set of warnings are issued for potential problems related to Windows Store policies or requirements related to sideloading. Available drop-down options are:

- **Direct Distribution (Sideload)**—Distribute a Windows app package without having it downloaded from the Windows Store. Sideloaded apps have not been certified by the Windows Store. A common example of a sideloaded app is one that is distributed to an enterprise environment and is internal to a company only. If a package will be sideloaded, you will typically need to sign it, unless your customer wishes to sign it themselves.

- **Windows Store**—Distribute a Windows app package through the Windows Store. When this option is selected, additional warnings will be issued for items that are known to be rejected by Windows Store policy despite the build being valid in a sideloading scenario. If a package will be distributed through the Windows Store, it is subject to additional policies that limit its contents. This type of app doesn’t need to be signed before it is uploaded to Microsoft because Microsoft signs the package.

### Include Desktop Extensions

Choose whether to include “full trust” apps and other Desktop Bridge extensions as part of the core Windows App package (.appx/.msixWindows App) format. If you want to enable your desktop apps to start leveraging Universal Windows Platform (UWP) APIs, you should enable desktop extensions.

If you select **No**, warnings are issued for any such items that cannot be represented.

If you select **Yes**, additional subsettings can be configured as needed to specify a minimum Windows version and maximum tested Windows version supported by the included apps and desktop extensions.

---

**Tip** • When using InstallShield to create a Windows App package, choose to include either desktop extensions or server extensions, but not both. Although a Windows App package can contain both desktop and server extensions, targeting one set over the other is a more likely scenario.

<tr>
<td><strong>Include Server Extensions</strong></td>
<td>Basic MSI</td>
<td>Choose whether to include Windows Server extensions as part of the core Windows App package (.appx/.msixWindows App) format, thus creating a Windows Server App. If you want to target Windows Server Nano’s native installation package format and deploy a service, WMI provider, event source, or performance counter, you should enable server extensions. If you select <strong>No</strong>, warnings are issued for any items that cannot be represented. If you select <strong>Yes</strong>, additional subsettings can be configured as needed to specify the minimum Windows Server operating system and maximum tested Windows Server operating system supported by the included apps.</td>
</tr>
</tbody>
</table>

**Tip** • **When using InstallShield to create a Windows App package, choose to include either desktop extensions or server extensions, but not both. Although a Windows App package can contain both desktop and server extensions, targeting one set over the other is a more likely scenario.**
Include MSIX Core Extensions

The MSIX Core enables the installation of MSIX apps on previous versions of Windows, provided the apps are already built to work on those versions of Windows.

The MSIX Core is built for the following Windows versions that do not currently natively support MSIX:

- Windows 7 SP1- 6.1.7601.0
- Windows 8.1 Update 1- 6.3.9600.0
- Windows 10 2015 LTSC (1507)- 10.0.10240.0
- Windows 10 2016 LTSC (1607)- 10.0.14393.0
- Windows Server 2008 R2 - 6.1.7601.0
- Windows Server 2012- 6.2.9200.0
- Windows Server 2012 R2 - 6.3.9600.0
- Windows Server 2016 - 10.0.14393.0

By default, the **No** option is selected. The possible options are:

- **No** - When you select this option, the MSIX Core entry will not be added to the manifest file.
- **Yes** - When you select this option, the MSIX Core entry will be added to the manifest file along with the specified minimum Windows version and maximum tested Windows version.

**Tip** • *The MSIX Core package needs MSIX pre-requisite to be installed on the older package.*

Minimum Version

(under Include Server Extensions)

Optionally, specify the app's minimum supported Windows version number. If you leave this blank, the minimum version number of Windows 7 SP1 Update (6.1.7601.0) is assumed.

The version must contain only numbers and it requires four parts using the format of `majorversion.minorversion.buildnumber.revisionnumber` (with values in each part ranging from 0 to 6553).

Tested Version

(under Include Server Extensions)

Optionally, specify the app's maximum supported tested Windows version number. If you leave this blank, this setting defaults to match the maximum MSIX core supported version number 10.0.14393.0 (Windows 10 2016 LTSC - 1607).

The version must contain only numbers and it requires four parts using the format of `majorversion.minorversion.buildnumber.revisionnumber` (with values in each part ranging from 0 to 65535).
Package Identity Overrides Settings

Use the Package Identity Overrides area on the Appx/MSIX tab to uniquely identify a package to Windows. These fields are typically not shown to an end user. Also, because the settings are overridden, the fields are not expanded by default.

Note • Architecture is also part of a Windows App package’s identity. Use the Template Summary setting in the Product Configuration, or in General Information, to specify the architecture of your Windows App package.

Table 13-214 • Package Identity Overrides Settings on the Appx/MSIX Tab

<table>
<thead>
<tr>
<th>Setting</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
</table>
To override the actual value of the certificate if one is specified on the Signing tab, specify the Subject name (name of the owner) of the certificate that will be used to sign the package. For example:

CN=Revenera, O=Revenera, L=Itasca, S=Illinois, C=US

If a package will be distributed through the Windows Store, it doesn’t need to be signed before it’s uploaded to Microsoft, in which case a signing certificate may be skipped. If a package will be sideloaded, it may or may not need to be signed, depending on how your customers expect to handle the package:

- If the customer prefers to sign the package themselves, they may need a specific publisher defined in the **Publisher** override setting that matches their certificate.
- If the customer merely wants to deploy the package, they may expect it to be signed with a trusted Authenticode Certificate. The requirements on this are equivalent to those for a trusted UAC prompt.
- Sideload requires that the Sideload setting in Windows is enabled. Sideload is enabled by default in the Windows 10 Anniversary Update.

**Tip** • *The following settings on the Signing tab of the Releases view also influence the built package by controlling whether and how the Windows App package is signed: **Digital Certificate Information**, **Certificate Password**, and **Sign Output Files**.*

<table>
<thead>
<tr>
<th>Setting</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Publisher** | Basic MSI    | To override the actual value of the certificate if one is specified on the Signing tab, specify the Subject name (name of the owner) of the certificate that will be used to sign the package. For example: CN=Revenera, O=Revenera, L=Itasca, S=Illinois, C=US. Note that if a package will be distributed through the Windows Store, it doesn’t need to be signed before it’s uploaded to Microsoft, in which case a signing certificate may be skipped. If a package will be sideloaded, it may or may not need to be signed, depending on how your customers expect to handle the package:
  - If the customer prefers to sign the package themselves, they may need a specific publisher defined in the **Publisher** override setting that matches their certificate.
  - If the customer merely wants to deploy the package, they may expect it to be signed with a trusted Authenticode Certificate. The requirements on this are equivalent to those for a trusted UAC prompt.
  - Sideload requires that the Sideload setting in Windows is enabled. Sideload is enabled by default in the Windows 10 Anniversary Update.

| **Version** | Basic MSI | Enter a version number for the Windows App package to which the certificate conforms. If nothing is specified, the version number is copied from the **Product Version** setting in General Information or Product Configuration. The version must contain only numbers and requires four parts using the following format (with values in each part ranging from 0 to 65535): `majorversion.minorversion.buildnumber.revisionnumber`, such as: `1.0.0.60325`. Use as few characters as possible. For example, do not use unnecessary leading zeros; instead of entering `14.00.25.1`, enter the following: `14.0.25.1` |
Display Properties

Use the four fields in the Display Properties area on the Appx/MSIX tab to identify a package to an end user.

Table 13-215 • Display Properties Settings on the Appx/MSIX Tab

<table>
<thead>
<tr>
<th>Setting</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Basic MSI</td>
<td>Specify the string that users will recognize as the name of the package. This is typically the name of the application. If nothing is specified, the Display Name is copied from the Product Name setting in General Information or Product Configuration. When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see Using String Entries in InstallShield.</td>
</tr>
</tbody>
</table>

**Note** • Localization of Windows App packages requires the Windows 10 SDK be installed on the same machine as InstallShield. If it is not present, InstallShield will build a Windows App package containing only the default language.

<table>

<td></td>
</tr>
</tbody>
</table>

**Note** • Localization of Windows App packages requires the Windows 10 SDK be installed on the same machine as InstallShield. If it is not present, InstallShield will build a Windows App package containing only the default language.
### Updates Tab for a Release

**InstallShield 2020 » Releases View » Release**

*Project* • The Update tab is available in the following project type:

- Suite/Advanced UI

Additional project-specific differences are noted where applicable.

The Updates tab lets you configure settings for various tasks that you want InstallShield to perform before, during, or after builds.

The Updates tab settings are organized into the following main categories:

- **Enabling Downloadable Update Support**
- **Configuring a Newer Version of Downloadable Updates**
- **Configuring a Prompt Message**
- **Adding Downloadable Update Support**

<table>

- Neutral

## Distribution Method

Choose a distribution method for your MSIX package. This setting directs which set of warnings are issued for potential problems related to Windows Store policies or requirements related to sideloading. Available drop-down options are:

- **Direct Distribution (Sideload)** — Distribute a MSIX package without having it downloaded from the Windows Store. Sideloaded apps have not been certified by the Windows Store. A common example of a sideloaded app is one that is distributed to an enterprise environment and is internal to a company only. If a package will be sideloaded, you will typically need to sign it, unless your customer wishes to sign it themselves.

- **Windows Store** — Distribute a MSIX package through the Windows Store. When this option is selected, additional warnings will be issued for items that are known to be rejected by Windows Store policy despite the build being valid in a sideloading scenario. If a package will be distributed through the Windows Store, it is subject to additional policies that limit its contents. This type of app doesn’t need to be signed before it is uploaded to Microsoft because Microsoft signs the package.

Include Universal Extensions

Include whether to include Universal device extensions as part of the core UWP app package format. If you want to enable your apps to start leveraging Universal Windows Platform (UWP) APIs, you should enable Universal extensions.

If you select,

- No— The warnings are issued for any such items that cannot be represented.
- Yes— The additional subsettings can be configured as needed to specify a minimum Windows version and maximum tested Windows version supported by the included apps and Universal extensions.

Include Desktop Extensions

Choose whether to include “full trust” apps and other Desktop Bridge extensions as part of the core UWP app package format. If you want to enable your desktop apps to start leveraging Universal Windows Platform (UWP) APIs, you should enable desktop extensions.

If you select,

- No— The warnings are issued for any such items that cannot be represented.
- Yes— The additional subsettings can be configured as needed to specify a minimum Windows version and maximum tested Windows version supported by the included apps and desktop extensions.

Important • When using InstallShield to create a UWP app package, choose to include either desktop extensions or server extensions, but not both. Although a UWP app package can contain both desktop and server extensions, targeting one set over the other is a more likely scenario.

The MSIX Core enables the installation of MSIX apps on previous versions of Windows, provided the apps are already built to work on those versions of Windows.

The MSIX Core is built for the following Windows versions that do not currently natively support MSIX:

- Windows 7 SP1- 6.1.7601.0
- Windows 8.1 Update 1- 6.3.9600.0
- Windows 10 2015 LTSC (1507)- 10.0.10240.0
- Windows 10 2016 LTSC (1607)- 10.0.14393.0
- Windows Server 2008 R2 - 6.1.7601.0
- Windows Server 2012- 6.2.9200.0
- Windows Server 2012 R2 - 6.3.9600.0
- Windows Server 2016 - 10.0.14393.0

By default, the No option is selected. The possible options are:

- No - When you select this option, the MSIX Core entry will not be added to the manifest file.
- Yes - When you select this option, the MSIX Core entry will be added to the manifest file along with the specified minimum Windows version and maximum tested Windows version.

Tip • The MSIX Core package needs MSIX pre-requisite to be installed on the older package.

The description that you specify is displayed on the User Account Control (UAC) box to the right of the “Program Name:” label. The UAC dialog box opens when an end user launches the signed file and elevated privileges are required. If you leave this setting blank, InstallShield uses the name of the file without its extension as the description to the right of the “Program Name:” label on the UAC dialog box. Note that if you use the Sign Files in Package setting and its subsettings to sign the files in your package, InstallShield does not use this signature description for the UAC dialog box of the files in your package that are signed at build time.</td>
</tr>
<tr>
<td><strong>Package Identity Overrides</strong></td>
<td>MSIX, MSIX</td>
<td>Use the Package Identity Overrides area on the General tab to uniquely identify a package to Windows. These fields are typically not shown to an end user.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>MSIX, MSIX</td>
<td>Specify a unique alphanumeric string that identifies your UWP app package to Windows. If this is left blank, InstallShield generates a name based on the Package Name setting in the General Information.</td>
</tr>
</tbody>
</table>
To override the actual value of the certificate if one is specified on the General tab, specify the Subject name (name of the owner) of the certificate that will be used to sign the package. For example:

CN=Revenera, O=Revenera, L=Itasca, S=Illinois, C=US

If a package will be distributed through the Windows Store, it doesn’t need to be signed before it’s uploaded to Microsoft, in which case a signing certificate may be skipped. If a package will be sideloaded, it may or may not need to be signed, depending on how your customers expect to handle the package:

- If your customer prefers to sign the package themselves, they may need a specific publisher defined in the Publisher override setting that matches their certificate.
- If your customer merely wants to deploy the package, they may expect it to be signed with a trusted Authenticode Certificate. The requirements on this are equivalent to those for a trusted UAC prompt.
- Sideloading requires that the Sideloading setting in Windows is enabled. Sideloading is enabled by default in the Windows 10 Anniversary Update.

The following settings on the General tab of the Releases view also influence the built package by controlling whether and how the UWP app package is signed:

- Digital Certificate Information
- Certificate Password
- Sign Output Files

### Publisher Display Name

Specify the string that users will recognize as the publisher’s name. For example:

- Revenera

If your customer prefers to sign the package themselves and if nothing is specified, the Display Name is copied from the Publisher setting in General tab.

<table>

Chained .msi Package Settings

Windows Installer 4.5 includes support for installing multiple packages using transaction processing. The packages are chained together and processed as a single transaction. If one or more of the packages in the transaction cannot be installed successfully or if the end user cancels the installation, the Windows Installer initiates rollback for all packages to restore the system to its earlier state.

The Chained .msi Packages area in the Releases view is where you identify .msi packages that you want InstallShield to include in your installation as chained packages. This area is also where you configure settings such as the properties that should be passed to the chained packages.

The Windows Installer chaining functionality supports any packages that can be installed through `MsiInstallProduct`; it does not support the chaining of InstallScript MSI packages.

Windows Installer 4.0 and earlier versions do not install any chained .msi packages.

Tip • To learn how to add Windows Installer 4.5 redistributables, see Adding Windows Installer Redistributables to Projects.

Table 13-216 • General Tab for MSIX Release

<table>
<thead>
<tr>
<th>Setting</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Version     | MSIX, MSIX   | Enter a version number for the UWP app package to which the certificate conforms. If nothing is specified, the version number is copied from the `Product Version` setting in General Information. The version must contain only numbers and it requires four parts using the following format (with values in each part ranging from 0 to 65535): `majorversion.minorversion.buildnumber.revisionnumber`, such as:

- 1.0.0.60325

Use as few characters as possible. For example, do not use unnecessary leading zeros; instead of entering 14.00.25.1, enter the following:

- 14.0.25.1

<table>
<thead>
<tr>
<th>Modification</th>
<th>Package</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSIX, MSIX</td>

</tr>
</tbody>
</table>
The following table describes the settings for chained .msi packages.

Table 13-217 • Chained .msi Package Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Installation (run-time path)</strong></td>
<td>Specify the name of the Windows Installer package (.msi file), or click the Browse button to browse to it.</td>
</tr>
<tr>
<td></td>
<td>If you click the Browse button, InstallShield automatically enters the product code for you. InstallShield also prompts you to specify whether you want to stream the .msi package—and its uncompressed files, if the .msi package is not compressed—into your product's main .msi package:</td>
</tr>
<tr>
<td></td>
<td>• If you specify that you want InstallShield to stream the files, InstallShield adds the name of the .msi package to the <strong>Installation (run-time path)</strong> setting. InstallShield also automatically adds either the file name (if it is a compressed .msi package) or the entry <em>.</em> (if it is an uncompressed .msi package) to the <strong>Streamed files</strong> box. For the <em>.</em> entry, InstallShield streams in the .msi package, all of the files in the same folder as the .msi package, and all of the subfolders and their files.</td>
</tr>
<tr>
<td></td>
<td>• If you specify that you do not want InstallShield to stream the files, InstallShield adds the following path to the <strong>Installation (run-time path)</strong> setting:</td>
</tr>
<tr>
<td></td>
<td>[SourceDir]FileName.msi</td>
</tr>
<tr>
<td></td>
<td>You can change this path if appropriate. For example, you may want to use a path such as the following one, and also clear the <strong>Delete streamed files after installation</strong> check box:</td>
</tr>
<tr>
<td></td>
<td>[LocalAppDataFolder]{ProductCodeGUID}\FileName.msi</td>
</tr>
<tr>
<td></td>
<td>In this example, the .msi package is cached on the local system, and it is available for maintenance.</td>
</tr>
<tr>
<td>Tip • You may not want to stream many or large files in the .msi package, since the Windows Installer has limitations for the file size of .msi packages.</td>
<td></td>
</tr>
<tr>
<td><strong>Product code</strong></td>
<td>This setting indicates the product code of the .msi package that is being chained to your main installation. The product code is used for uninstalling the chained package when appropriate.</td>
</tr>
<tr>
<td></td>
<td>InstallShield automatically adds the product code for this setting if you use the Browse button for the <strong>Installation (run-time path)</strong> setting to select the .msi package.</td>
</tr>
</tbody>
</table>
Table 13-217 • Chained .msi Package Settings (cont.)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI level</td>
<td>Specify the user interface (UI) level that you want to be used for the chained .msi package. Valid options are:</td>
</tr>
<tr>
<td></td>
<td>• Basic UI (/qb)—Display the built-in small progress dialog.</td>
</tr>
<tr>
<td></td>
<td>• Full UI (/qf)—Display the modal and modeless dialogs that are available in the .msi package.</td>
</tr>
<tr>
<td></td>
<td>• No UI (/qn)—Run the installation silently.</td>
</tr>
<tr>
<td></td>
<td>• Reduced UI (/qr)—Display only modeless dialogs, such as the full-size progress dialog.</td>
</tr>
<tr>
<td>Install condition</td>
<td>Enter any installation condition that you want to use for the chained .msi package. If the condition evaluates to True at run time, the Windows Installer launches the chained .msi package if the chained package’s product has not already been installed.</td>
</tr>
<tr>
<td></td>
<td>The default condition is:</td>
</tr>
<tr>
<td></td>
<td><strong>Not Installed</strong></td>
</tr>
<tr>
<td></td>
<td>You can modify this if necessary. For example, if you are adding the chained .msi package to a minor upgrade and you want the Windows Installer to launch the chained .msi package during a first-time installation and during an upgrade, consider adding a condition such as the following one:</td>
</tr>
<tr>
<td></td>
<td><strong>Not Installed OR REINSTALL&gt;&lt;&quot;FeatureName&quot;</strong></td>
</tr>
<tr>
<td></td>
<td>In this example, FeatureName is the name of a feature that will be updated if the main installation is running in upgrade mode. It will also be updated during a repair.</td>
</tr>
</tbody>
</table>

**Note** • At run time, the installation evaluates the install condition; if it evaluates to False, the installation evaluates the removal condition. If the install condition always evaluates to True (even during uninstallation of the main product), the removal condition is never evaluated, and the chained .msi package is never uninstalled. Therefore, you may want to avoid specifying an install condition that will always evaluate to True.

For information on condition syntax, see Conditional Statement Syntax in the Windows Installer Help Library.
### Table 13-217 • Chained .msi Package Settings (cont.)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Install properties</strong></td>
<td>To pass one or more properties from the main installation to this chained .msi package during the installation, enter the properties and their corresponding values. For example, to install a specific feature of a chained package to a subfolder of the main installation’s INSTALLDIR location, you could enter the following string for this setting:  \n\n<code>INSTALLDIR=&quot;[INSTALLDIR]Subfolder&quot; ADDLOCAL=Feature1</code></td>
</tr>
</tbody>
</table>
| **Removal condition** | Enter any uninstallation condition that you want to use for the chained .msi package. If the Install condition evaluates to False and the Removal condition evaluates to True, Windows Installer removes the chained package’s product if it is present. The default condition is: \n\n`REMOVE="ALL"`

For information on condition syntax, see Conditional Statement Syntax in the Windows Installer Help Library. |
| **Removal properties**| To pass one or more properties from the main installation to this chained .msi package during the uninstallation, enter the properties and their corresponding values. This setting is often left blank. |
| **Release flags**     | You can assign one or more release flags to a chained .msi package that you want to include in only certain builds. For example, if you have a chained .msi package that should be included only in a special edition of your product that contains a special add-on that requires the chained .msi package, you can flag that chained package and include it only when it is needed. If you want to assign a release flag to this chained .msi package, enter it for this setting. The string that you enter can be any combination of letters or numbers. To have more than one flag on a chained package, use a comma to separate the flags. |
| **Streamed files**    | This box indicates the files for the chained .msi package that are being streamed into the main installation’s package. Use the Add File and Add Folder buttons to add more files or entire folders to the list of streamed files. To specify an alternate extraction location, edit the entry’s **Run-time path** value by selecting and then clicking it again. InstallShield highlights the entry’s text, enabling you to edit it. The files are extracted to a temporary folder by default. To remove an entry in this box, select it and then click the Remove button. |
Once you have added an upgrade item in the Upgrades view, you can use the Patch Design view to create a patch configuration for that upgrade so that you can deliver it as a patch. The patch can be applied to target systems that have an earlier version of the product.

You can create multiple patch configurations in the Patch Design view. Each patch configuration contains the settings and data required to build a patch. Each patch configuration must contain at least one latest setup and one previous setup. With these minimal settings, you can create a patch.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete streamed files after</td>
<td>If you want the installation to delete the streamed files after installation, select this check box. If the streamed files should remain on the target system, clear this check box.</td>
</tr>
<tr>
<td>installation</td>
<td>It is generally most useful to let the files remain on the system only if you have extracted them to a non-temporary location, such as [LocalAppDataFolder]{PackageCode}.*. to cache an extracted package locally.</td>
</tr>
<tr>
<td></td>
<td>This check box is selected by default for chained .msi packages that included one or more streamed files. This check box is disabled for chained .msi packages that do not include any streamed files.</td>
</tr>
</tbody>
</table>

**Patch Configuration**

**Project** • This information applies to the following project types:
- Basic MSI
To create a patch, you begin by right-clicking the Patch Design explorer in the Patch Design view and then clicking Add New Patch Configuration. A patch configuration consists of one latest setup and one or more previous setups. Before you specify the latest and previous setups, you can specify overall patch properties on the following tabs for your patch configuration:

- Common
- Identification
- Digital Signature
- Sequence
- Advanced

See Also
Creating and Applying Patches

Common Tab

InstallShield 2020 » Patch Design View » Patch Configuration

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

When you click a patch configuration in the Patch Design view, InstallShield displays several tabs. The Common tab for a patch configuration exposes frequently used patch settings.

Patch Output Location

Specify where you want your patch file built or browse for an existing folder. InstallShield appends the following subdirectories to your output location:

\PatchConfig\Name\Patch

Note • InstallShield also adds a folder called Interim to your output directory. The Interim folder contains the following files after you build a patch:

- .log—contains output from the patch creation process; this usually contains information that is useful for troubleshooting
- .pcp—patch creation properties file; this contains all of the settings necessary to generate a patch package
Launcher Settings

In this area, you can configure the following launcher settings:

**Table 13-218 • Configurable Launcher Settings**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Update.exe</td>
<td>If you want to create an Update.exe update launcher for the current patch, select this check box. To learn when an Update.exe update launcher is required, see Patching Considerations.</td>
</tr>
<tr>
<td>Include Windows Installer 3.1 Engine</td>
<td>Select this check box to include the Windows Installer 3.1 engine with your patch package.</td>
</tr>
<tr>
<td>Include .NET Framework</td>
<td>Select this check box to include the .NET Framework with your patch package.</td>
</tr>
</tbody>
</table>

Patch Creation Cache

In this area, you can set the following:

**Table 13-219 • Patch Creation Cache Settings**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable</td>
<td>When you select this check box, InstallShield creates intermediate files that are used in subsequent builds to improve performance speed. These intermediate files are left indefinitely on your system. Do not select this check box if you have limited disk space.</td>
</tr>
</tbody>
</table>

Optimize Patch for Large Files

Select this check box to create small bit-level patches for all application files larger than 4 MB in your installation project.

Allow Patch to be Uninstalled (Requires Windows Installer 3.0)

Select this check box if you would like the patch to be uninstallable without having to uninstall and reinstall the entire application and other patches. Note that uninstallation of patches works only under certain conditions. For example, versions of Windows Installer earlier than version 3.0 cannot remove just the patch from an application. For more information, see Removing Patches in the Windows Installer help.

Project • The uninstallable patch functionality is not available for InstallScript MSI projects if the InstallScript user interface (UI) style is the traditional style (which uses the InstallScript engine as an external UI handler).

This functionality is applicable to InstallScript MSI projects in which the InstallScript UI style is the new style (which uses the InstallScript engine as an embedded UI handler). To learn more, see Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations.
**Build Patch**

Click this button to build your patch after you have configured all of the appropriate settings.

---

*Note* • You can also build your patch from the Patch Design explorer. Right-click the appropriate patch configuration, and then click Build Patch.

**See Also**
- Patch Design View
- Creating and Applying Patches
- Patch Uninstallation
- Enabling the Uninstallation of a Patch

**Identification Tab**

*Project* • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

When you click a patch configuration in the Patch Design view, InstallShield displays several tabs. The Identification tab exposes settings for display strings. The display strings are used to populate information about the patch in Add or Remove Programs. It is also used by the Windows Installer 3.0 (and later) APIs that interrogate and catalog patches applied to a target machine.

*Tip* • Every time that you change the latest setup for a patch configuration in the Patch Design view, InstallShield uses the Add or Remove Programs information from the latest setup as the values for the Identification tab settings. You can override the values on the Identification tab as needed.

**Table 13-220 • Identification Tab Settings**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>Specify the name of your patch.</td>
</tr>
<tr>
<td>Support URL</td>
<td>Specify the uniform resource locator (URL) that you would like your customers to visit for technical support.</td>
</tr>
<tr>
<td>Description</td>
<td>Specify a brief description of your patch.</td>
</tr>
<tr>
<td>Manufacturer name</td>
<td>Specify the name of the application’s manufacturer.</td>
</tr>
<tr>
<td>Target product name</td>
<td>Specify the name of the application or the target application suite.</td>
</tr>
</tbody>
</table>

Digital Signature Tab

InstallShield 2020 » Patch Design View » Patch Configuration

When you click a patch configuration in the Patch Design view, InstallShield displays several tabs. The Digital Signature tab is where you specify settings if you want to digitally sign your patch.

Note • If you want to digitally sign the files—such as your application’s executable files—in your patch, you can specify which files should be signed through the Signing tab in the Releases view.

Table 13-221 • Digital Signature Tab Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sign the Patch Package</td>
<td>To digitally sign your patch package, select this check box.</td>
</tr>
<tr>
<td>Sign Update.exe</td>
<td>To digitally sign the Update.exe file, select this check box.</td>
</tr>
<tr>
<td>Certificate URL</td>
<td>Type a fully qualified URL—for example, <a href="http://www.mydomain.com">http://www.mydomain.com</a>. This URL is used in your digital signature to link to a site that you would like end users to visit to learn more about your product, organization, or company.</td>
</tr>
<tr>
<td>Digital Certificate Information</td>
<td>To specify the digital certificate that you want to use to sign your release, click the Browse button next to this setting. The Certificate Selection dialog box opens, enabling you to specify either the location of the .pfx file or information about the certificate store that contains the certificate. To learn more, see Certificate Selection Dialog Box.</td>
</tr>
</tbody>
</table>
### Table 13-221 • Digital Signature Tab Settings (cont.)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Password</strong></td>
<td>If the .pfx file that you are using has a password, enter it. InstallShield encrypts the password and stores it in your project file (.ism).</td>
</tr>
<tr>
<td></td>
<td>At build time, InstallShield uses the password to sign files with a .pfx file. If your certificate is protected by a password but you do not enter it in this setting, signing with a .pfx file fails.</td>
</tr>
<tr>
<td></td>
<td>Note that if you configure your project to use a certificate that was imported with password protection into a store, Windows prompts for the password at build time when InstallShield is attempting to sign your project’s files. The strong key protection that Windows uses does not permit InstallShield to provide the password to the cryptographic provider.</td>
</tr>
<tr>
<td><strong>Signature Description</strong></td>
<td>Specify the signature description that you want to use for the patch package and Update .exe file, if applicable. The description that you specify is displayed on the User Account Control (UAC) box to the right of the “Program Name:” label. The UAC dialog box opens when an end user launches the signed file and elevated privileges are required.</td>
</tr>
<tr>
<td></td>
<td>If you leave this setting blank, InstallShield uses the name of the file without its extension as the description to the right of the “Program Name:” label on the UAC dialog box.</td>
</tr>
</tbody>
</table>

### See Also
- Patch Design View
- Non-Administrator Patches
- Preparing Installations for Non-Administrator Patches
- Signing a Patch Package

### Sequence Tab

When you click a patch configuration in the Patch Design view, InstallShield displays several tabs. The Sequence tab is where you specify the order that Windows Installer version 3.0 and later should apply patches to an installed product, regardless of the order in which they are provided to the target machine. For versions of Windows Installer earlier than version 3.0, the patch sequence is ignored, and any patches are applied to the product in the order that they are provided to the target machine.
Use default patch sequencing

Select this check box if you want to use the default sequencing for the patches of your product. This default sequence accounts for obsolete patches, superseded patches, and patches that have already been applied to the product.

If you clear this check box, you can add your own custom sequence. If you clear this check box but do not add a sequence, no sequencing information is built into your patch.

Patch Sequencing

Advanced Tab

InstallShield 2020 » Patch Design View » Patch Configuration

Project • This information applies to the following project types:

• Basic MSI
• InstallScript MSI

When you click a patch configuration in the Patch Design view, InstallShield displays several tabs. The Advanced tab for a patch configuration exposes a comprehensive set of build settings that you can configure for a patch.

Patch Settings

In this area, you can configure the following settings for your patch:

Table 13-222 • Patch Configuration Settings

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Patch Output Location</td>
<td>Specify where you want your patch file built or browse for an existing folder. InstallShield appends the following subdirectories to your output location: \PatchConfigName\Patch. Note • InstallShield also adds a folder called Interim to your output directory. The Interim folder contains the following files after you build a patch: • .log—contains output from the patch creation process; this usually contains information that is useful for troubleshooting • .pcp—patch creation properties file; this contains all of the settings necessary to generate a patch package</td>
</tr>
<tr>
<td>Generate Patch GUID</td>
<td>Specify whether you want a new GUID generated each time that you build your patch. If you select No, the GUID listed for the Patch GUID property is used. The default setting is Yes.</td>
</tr>
</tbody>
</table>
### Build Settings

In this area, you can configure the following build settings for your patch:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include Whole Files</td>
<td>Specify whether to include whole files for every file included in the patch package.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: You can override this setting on a file-by-file basis in the Latest Setup settings.</td>
</tr>
<tr>
<td>Validate at Build</td>
<td>Specify whether you want to use the upgrading and patching validation every time you build a patch.</td>
</tr>
<tr>
<td>Leave Patch Components Decompressed</td>
<td>Select Yes to leave all .msp file information in a temporary folder. This information can be useful when troubleshooting. If you do not want this information stored, select No.</td>
</tr>
<tr>
<td>Enable Patch Creation Caching</td>
<td>Select Yes if you want InstallShield to create intermediate files that are used in subsequent builds to improve performance speed. These intermediate files are left indefinitely on your system. Select No if you have limited disk space. The Patch Cache Folder is where you specify where the intermediate files should be created.</td>
</tr>
<tr>
<td>Patch Cache Folder</td>
<td>Specify a directory where the temporary files from patch caching should be stored. These intermediate files are left indefinitely on your system.</td>
</tr>
</tbody>
</table>
Run-time Settings

In this area, you can configure the following run-time settings for your patch:

Table 13-224 • Run-time Settings for a Patch

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow Product Codes to Differ</td>
<td>Specify whether you want the patch creation executable to suppress build-time prompts if product codes differ between the original and latest installations. For a major upgrade, be sure to select.</td>
</tr>
<tr>
<td>Allow Product Versions to Differ</td>
<td>Specify whether you want the patch creation executable to suppress build-time prompts if product versions differ between the original and latest installations.</td>
</tr>
<tr>
<td>List of Patch GUIDs to Replace</td>
<td>To replace one or more earlier installed patches with the current patch, set this property to the patch GUIDs of those patches, and separate each with a comma. For example:</td>
</tr>
<tr>
<td></td>
<td><code>{C86838C9-DEDC-4451-B96F-94AFB9460F15}, {C8633E5B-AC44-45d8-B487-C68B381F60D6}</code></td>
</tr>
<tr>
<td></td>
<td>Setting this property is typically not required, even if you have several patch configurations in the Patch Design view. However, if your patch does not overwrite files added in an earlier patch, it may be necessary to set this property.</td>
</tr>
</tbody>
</table>

**Note** • This property affects only the installation portion of the patch. It does not revert files back to their original versions.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List of Target Product Codes</td>
<td>Specify the product codes that you want to target with this patch, and separate each with a comma. If you enter an asterisk (*) for this setting, InstallShield replaces it at build time by the product codes of the installations that are listed as previous images in this patch configuration.</td>
</tr>
<tr>
<td>Create Update.exe</td>
<td>Specify whether you want to create an Update.exe update launcher for the current patch.</td>
</tr>
<tr>
<td></td>
<td>To learn when an Update.exe update launcher is required, see Patching Considerations.</td>
</tr>
</tbody>
</table>

<td>If you select this option, it may be necessary for your patch to contain the information</td>
</tr>
<tr>
<td></td>
<td>needed to target each of the earlier minor upgrades that were created</td>
</tr>
<tr>
<td></td>
<td>after the RTM (or the most recent major upgrade of the product, if one was created).</td>
</tr>
<tr>
<td></td>
<td>For example, if you are creating a minor-upgrade patch for service pack 2 and you select No for</td>
</tr>
<tr>
<td></td>
<td>this property, your patch needs to target the minor-upgrade patch for service pack 1. You could</td>
</tr>
<tr>
<td></td>
<td>also optionally target other baselines (such as RTM); doing so would increase the patch</td>
</tr>
<tr>
<td></td>
<td>payload. Note that if you do not target the RTM version, any end user who has the RTM version</td>
</tr>
<tr>
<td></td>
<td>but not the service pack 1 minor-upgrade patch would need to install service pack 1 before</td>
</tr>
<tr>
<td></td>
<td>service pack 2.</td>
</tr>
<tr>
<td></td>
<td>Versions of Windows Installer earlier than 3.1 ignore this setting.</td>
</tr>
</tbody>
</table>
In this area, you can configure the following settings for the Windows Installer engine:

### Table 13-225 • Windows Installer Settings for a Patch

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include MSI 3.1 Engine</td>
<td>Specify whether the Windows Installer engine should be included with your patch package.</td>
</tr>
<tr>
<td>Engine Location</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Download Engine From The Web</strong>—If the Windows Installer engine needs to be installed, it is downloaded at run time.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Extract Engine From Update.exe</strong>—The build streams the Windows Installer engine into the Update.exe file, giving you a single file to distribute to your customers. At run time, the engine is extracted from the Update.exe file and installed if required.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Copy From Source Media</strong>—The build copies the Windows Installer engine into the same directory as the Update.exe file.</td>
</tr>
</tbody>
</table>

### Windows Installer Engine

In this area, you can configure the following settings for the Windows Installer engine:

**Optimized Install Mode (MSI 3.1 Required)**

If you want Windows Installer 3.1 to optimize the patching process so that it reduces the time that is required to apply the current patch, select Yes. If the patch only modifies a select list of tables, Windows Installer 3.1 ignores the actions that are associated with all other tables. For more information, including the list of tables, see "Patch Optimization" in the Windows Installer Help Library.

If you select Yes for this property, Microsoft Corporation recommends that you test your patch extensively to ensure that it behaves as expected.

If you do not want Windows Installer 3.1 to optimize the patching process for the current patch, select No. Windows Installer will run a complete repair of the application when the patch is applied to the target machine.

Versions of Windows Installer earlier than 3.1 ignore this property. Windows Installer 3.0 optimizes patches if the patch only modifies the select list of tables. To avoid patch optimization by Windows Installer 3.0, you must use the DisableFlyWeightPatching policy. For more information, see DisableFlyWeightPatching in the Windows Installer Help Library.

Versions of Windows Installer earlier than 3.0 run a complete repair of the installation when a patch is applied.
Microsoft .NET Framework

In this area, you can configure the following settings for the Microsoft .NET Framework:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows Installer 3.1 engine URL</td>
<td>Specify the URL for the location of the engine. This is the location that the Update.exe file uses at run time to download the engine. The default URL location is a live site maintained by Revenera for your convenience.</td>
</tr>
</tbody>
</table>

*Note* • The 3.1 engine is available for download from the default URL (http://www.installengine.com/Msiengine30).

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include in Build</td>
<td>Specify whether to include the Microsoft .NET Framework in your patch. If you select Yes, the same version of the .NET Framework that was included in the latest release is included in this new patch.</td>
</tr>
</tbody>
</table>

**Engine Location**

Select one of the following options:

- **Download Engine From The Web** — If the .NET Framework needs to be installed, it is downloaded at run time.

- **Extract Engine From Update.exe** — The build streams the .NET Framework into the Update.exe file, giving you a single file to distribute to your customers. At run time, the engine is extracted from the Update.exe file and installed if required.

- **Copy From Source Media** — The build copies the .NET Framework into the same directory as the Update.exe file.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Engine URL</td>
<td>Specify the URL for the location of the .NET Framework. This is the location that the Update.exe file uses at run time to download the .NET Framework. The default URL location is a live site maintained by Revenera for your convenience.</td>
</tr>
</tbody>
</table>
**Update Launcher Settings**

In this area, you can configure the following settings for the `Update.exe` launcher:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Company Name</strong></td>
<td>If you want to override the default company name for <code>Update.exe</code> with your company name, enter your company name. The company name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the <code>Update.exe</code> file and then click Properties. To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</td>
</tr>
<tr>
<td><strong>Product Name</strong></td>
<td>If you want to override the default product name for <code>Update.exe</code> with your product name, enter your product name. The product name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the <code>Update.exe</code> file and then click Properties. To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</td>
</tr>
<tr>
<td><strong>Product Version</strong></td>
<td>If you want to override the default product version for <code>Update.exe</code> with your product version, enter your product version. The product version is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the <code>Update.exe</code> file and then click Properties. To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>If you want to override the default description for <code>Update.exe</code> with your own description, enter the appropriate description. The description is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the <code>Update.exe</code> file and then click Properties. To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</td>
</tr>
<tr>
<td><strong>Copyright</strong></td>
<td>If you want to override the default copyright notice for <code>Update.exe</code> with your product’s copyright notice, enter your product’s copyright notice. The copyright notice is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the <code>Update.exe</code> file and then click Properties. To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</td>
</tr>
</tbody>
</table>
Table 13-227 • Update Launcher Settings for a Patch (cont.)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required Execution Level</strong></td>
<td>Use the Required Execution Level setting to specify the minimum level that is required by your project’s Update.exe file for running on Windows Vista and later platforms. The available options are:</td>
</tr>
<tr>
<td></td>
<td>• Administrator—Update.exe requires administrative privileges to run. Administrators must authorize it; non-administrators must authenticate as an administrator.</td>
</tr>
<tr>
<td></td>
<td>• Highest available—Update.exe prefers administrative privileges. Administrators must authorize it; non-administrators run it without administrative privileges.</td>
</tr>
<tr>
<td></td>
<td>• Invoker—Update.exe does not require administrative privileges, and all users can run it without administrative privileges. Update.exe does not display any UAC messages prompting for credentials or for consent.</td>
</tr>
<tr>
<td></td>
<td>• Use Previous Setup Manifest—The Update.exe manifest uses the same required execution level that was specified for the previous setup. This is the default option.</td>
</tr>
</tbody>
</table>

For InstallScript MSI projects, and for Basic MSI projects if the Create Update.exe check box is selected, InstallShield embeds an application manifest in the Update.exe launcher. This manifest specifies the selected execution level. Operating systems earlier than Windows Vista ignore the required execution level.

If the Create Update.exe check box is cleared for a Basic MSI project, InstallShield does not embed the Windows application manifest in an Update.exe launcher.

For more information, see Minimizing the Number of User Account Control Prompts During Installation.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Icon</strong></td>
<td>To use your own icon for the Update.exe file, specify the fully qualified name of the file that contains the icon. To specify a file, type an absolute path or a path that is relative to a path variable, or click the ellipsis button (...) to browse to the file from within the Change Icon dialog box. By default, the icon with index 0 is used; to specify a different icon, either select an icon in the Change Icon dialog box or append the icon’s index or resource ID (preceded by a minus sign) to the file name. For example, C:\Temp\MyLibrary.dll,2 indicates the icon with an index of 2, and C:\Temp\MyLibrary.dll,-100 indicates the icon with a resource ID of 100. If you leave this setting blank, InstallShield uses a default icon for your Update.exe file.</td>
</tr>
</tbody>
</table>

Patch Design View
Creating and Applying Patches
Latest Setup

InstallShield 2020 » Patch Design View » Patch Configuration

**Project** • This information applies to the following project types:
- Basic MSI
- InstallScript MSI

The Latest Setup item for a patch configuration is where you specify settings for the latest version of your installation.

**Latest Setup Path**

The latest setup should be the latest version of your installation for which you want to create a patch. The default setting, `<ISLatestRelease>`, resolves to the last full release that you build.

The release that you specify in this box should be an uncompressed release, ideally created with an administrative installation if the previous product versions were compressed.

**Include Whole Files**

Select the files that you want to include as whole files in your patch rather than have the build perform a bit-level difference of the files.

*Note* • To include all of your files as whole files, set the Include Whole Files property for the patch configuration to Yes.

**See Also**
- Patch Design View
- Adding a New Latest Setup Item

Previous Setups

InstallShield 2020 » Patch Design View » Patch Configuration » Latest Setup

**Project** • This information applies to the following project types:
- Basic MSI
- InstallScript MSI

Each patch configuration in the Patch Design view must contain at least one latest setup and one previous setup in order for you to create a patch. If your patch will target multiple earlier versions of your product, ensure that each target image has its own previous setup item.

For example, if your company supports versions 1.0 and 1.1 of an application, you may want to create a patch that will upgrade both of these applications to version 2.0. To create a single patch to update both versions, you would add V1.0 and V1.1 as previous setups to the latest setup. Your latest setup would contain V2.0.

When you click a previous setup item in the Patch Design view, the following tabs are available:
- Common
Chapter 13
View Reference

- Advanced

Adding a New Previous Setup Item

Common Tab

InstallShield 2020 » Patch Design View » Patch Configuration » Latest Setup » Previous Setups

Project • This information applies to the following project types:
- Basic MSI
- InstallScript MSI

When you click a previous setup item in the Patch Design view, InstallShield displays different tabs. The Common tab exposes the basic previous setup configuration settings.

Table 13-228 • Common Settings for Previous Setup Configuration

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Previous Setup</td>
<td>Specify the installation (.msi file or Setup.exe file) that needs to be patched to update it to the latest version of your setup. Because the patch-creation process requires an uncompressed release, you will be prompted for a location to decompress the previous version, if necessary.</td>
</tr>
</tbody>
</table>

Caution • Keep the following in mind when specifying paths. You cannot decompress setups that span multiple disks from a local or network drive. You will need to find an alternate method of decompressing the setup.

| Ignore Missing Files | If any files that are included in two separate versions cannot be found in a more recent version, then the files will be excluded from the patch package unless they have changed in the later version. The advantage of ignoring the files is that only the modified files need to be added to the package. A complete setup image is not required if you choose to ignore missing source files. |

Advanced Tab

InstallShield 2020 » Patch Design View » Patch Configuration » Latest Setup » Previous Setups

Project • This information applies to the following project types:
- Basic MSI
- InstallScript MSI
When you click a previous setup item in the Patch Design view, InstallShield displays different tabs. The Advanced tab contains the settings that are accessible on the Common tab, in addition to the following transform filter settings:

**Table 13-229 • Advanced Settings for Previous Setup Configuration**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Version Relationship</strong></td>
<td>Select the condition that describes the required relationship between the latest version of your product and the previous version whose settings you are specifying for the patch. InstallShield will create a transform between the selected previous setup and the latest setup only if the selected condition is met.</td>
</tr>
<tr>
<td><strong>Version to Check</strong></td>
<td>Select what part or parts of the three-part version number should be used to determine whether a transform between the selected previous setup and the latest setup should be created, based on the option selected for the Version Relationship. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Check Major, Minor, and Upgrade Versions</strong>—If InstallShield should check all three parts of the previous setup’s version number with all three parts of the latest setup’s version number, select this option.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Check Major and Minor Versions</strong>—If InstallShield should check the first two parts of the previous setup’s version number with first two parts of the latest setup’s version number, select this option. The third part of the version number is ignored.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Check Major Version Only</strong>—If InstallShield should check the first part of the previous setup’s version number with first part of the latest setup’s version number, select this option. The second and third parts of the version number are ignored.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Do Not Check Versions</strong>—If InstallShield should create the transform regardless of the relationship between the previous setup version number and the latest setup version number, select this option.</td>
</tr>
<tr>
<td><strong>Match Product Code</strong></td>
<td>To create a transform only if the previous setup and the latest setup have the same product code, select Yes. If you select No, InstallShield will create a transform between the previous setup and the latest setup, regardless of the product code.</td>
</tr>
<tr>
<td><strong>Match Upgrade Code</strong></td>
<td>To create a transform only if the previous setup and the latest setup have the same upgrade code, select Yes. If you select No, InstallShield will create a transform between the previous setup and the latest setup, regardless of the upgrade code.</td>
</tr>
<tr>
<td><strong>Match Language</strong></td>
<td>To create a transform only if the previous setup and the latest setup have the same language, select Yes. If you select No, InstallShield will create a transform between the previous setup and the latest setup, regardless of the language.</td>
</tr>
</tbody>
</table>
Additional External Files

InstallShield 2020 » Patch Design View » Patch Configuration » Latest Setup

**Project** • This information applies to the following project types:
- Basic MSI
- InstallScript MSI

Patching an additional external file provides the ability to create a binary file patch against versions of an application file that have not been shipped as part of the previous installation.

For example, if one of your application files was potentially updated by another installation, you should reference that file version so that the file-level patch can be applied successfully at run time.

Additional Tools View

InstallShield 2020

**Project** • The Additional Tools view is available in the following project types:
- Basic MSI
- DIM
- InstallScript
The additional tools provide added functionality for your project. Not all of the items in this view apply to every project type. Click the following links to see the project types for which the items are available.

**Dependency Scanners**

*Project* • The Dependency Scanners view is available in the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

The Dependency Scanners view includes three different scanning tools that you can use to identify possible dependencies that you may need to add to your project. These scanners include a Visual Basic project scanner, a static scanner that scans files that are in your project, and a dynamic scanner that scans a running application for any dependencies.

**MSI Debugger**

*Project* • The MSI Debugger view is available in the following project types:

- Basic MSI
- MSI Database
- Transform

Debug your setup by setting breakpoints at any action or dialog in the User Interface sequence and watching and changing the Windows Installer properties at each step.

**Direct Editor**

*Project* • The Direct Editor is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
Chapter 13
View Reference

- **MSM Database**
- **QuickPatch**
- **Transform**

The Direct Editor is a view in InstallShield that lets you review all of the tables in your project file (.ism) or database file (.msi, .msm, or .mst). In some project types, this view also offers functionality for advanced users who are very familiar with the Windows Installer database format. The Direct Editor also includes a Reference Tracking pane that lets you easily visualize relationships between table records.

### Dependency Scanners

**InstallShield 2020**

*A cube icon is present here.*

**Project** • The Dependency Scanners view is available in the following project types:

- **Basic MSI**
- **InstallScript**
- **InstallScript MSI**
- **InstallScript Object**

A file often relies on functions in other files to perform a task. However, you may not be aware of all these other files—known as dependencies—when you include your application’s files in your installation project. InstallShield offers the following scanning wizards to assist you in identifying and working with these files. You can access these scanners in the Dependency Scanners view.

**Table 13-230 • Dependency Scanners**

<table>
<thead>
<tr>
<th>Scanning Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Perform Static Scanning</strong></td>
<td>The Static Scanning Wizard looks at portable executable files (for example, .exe, .ocx, .com, .tlb, .hlp, and .chm) in your project and checks for dependencies that they may require.</td>
</tr>
<tr>
<td><strong>Perform Dynamic Scanning</strong></td>
<td>The Dynamic Scanning Wizard monitors your system while an executable file is running and checks for .dll or .ocx files that may be required by the executable file.</td>
</tr>
</tbody>
</table>

Any files that are added to a Basic MSI or InstallScript MSI project through one of these scanners are added in accordance with Setup Best Practices.

If you use the Static and Dynamic scanning wizards, you can specify files that you want to be included or excluded automatically any time that you perform a static or dynamic scan through InstallShield. For more information, see Filtering Files in Dependency Scanners.
MSI Debugger

InstallShield 2020

Project • The MSI Debugger view is available in the following project types:

- Basic MSI
- MSI Database
- Transform

When you debug a release in the MSI Debugger, you can view and set Windows Installer properties as you step through the package’s User Interface and Execute sequences.

Task • Follow the steps below to begin going through a setup in the MSI Debugger:

1. Build your release. However, there is one important restriction when you intend on debugging the release: You cannot debug a package that is compressed inside Setup.exe.

2. Go to the MSI Debugger view. The debugger lists every standard action and custom action in the User Interface and Execute sequences as well as every dialog in your project. You can also click the Debug button on the toolbar or choose Debug from the Build menu to launch the MSI Debugger.

3. Set a breakpoint on an action or dialog.

4. Start the debugger.

The MSI Debugger runs through each action and dialog until it reaches your breakpoint, at which point it halts execution. Now, you can view and set properties in the Watch window and the Variable window. Finally, you can step through each of the remaining actions, or you can stop the debugger.

Note • The MSI Debugger supports deferred custom actions that delay the execution of a system change to the time when the installation script is executed.

Do not confuse the MSI Debugger with the InstallScript Debugger, since they have completely separate purposes. You cannot debug a setup package with the InstallScript Debugger, and you cannot debug an InstallScript custom action with the MSI Debugger.

Tip • When InstallShield steps into one of the following types of custom actions (You can step into a custom action by pressing the F11 key.), it will give you the option to launch a registered debugger installed on a client machine. A dialog will appear allowing you to choose one of two options. Select Yes to launch a registered debugger. Select No to step over to the next action. The supported custom actions are as follows:

- MSI DLL
- Standard DLL
Direct Editor

InstallShield 2020

Project • The Direct Editor is available in the following project types:

• Basic MSI
• DIM
• InstallScript
• InstallScript MSI
• InstallScript Object
• Merge Module
• MSI Database
• MSM Database
• QuickPatch
• Transform

Note that the following information includes additional project-specific details.

The Direct Editor is a view in InstallShield that lets you review all of the tables in your project file (.ism) or database file (.msi, .msm, or .mst). In some project types, this view also offers functionality for advanced users who are very familiar with the Windows Installer database format.

For Windows Installer–based projects, the Direct Editor can run in two different modes:

• **Project edit mode**—This mode lets you edit tables in the project file. The changes that are made in the Direct Editor are incorporated into the Windows Installer package that InstallShield creates at build time.

  Any changes that you make in the other views within InstallShield are reflected in the Direct Editor; in addition, any changes that you make in the Direct Editor are also reflected in the other corresponding views (if available). For example, if you use the Features view to add a new feature to your project, InstallShield automatically adds that feature to the Feature table in the Direct Editor. If you use the Direct Editor view to add the feature, InstallShield automatically updates the Features view accordingly.

  When you are working in any of the following Windows Installer–based project types, you are working in project edit mode: Basic MSI, DIM, InstallScript MSI, Merge Module, and QuickPatch.

• **Direct edit mode**—This mode lets you edit tables in the Windows Installer database (.msi, .msm, or .mst file). When you save the changes that you have made in the Direct Editor, InstallShield updates the Windows Installer database.

  Many of the other standard InstallShield views are not available in direct edit mode, since they require build-time functionality that is not available when you are directly editing the Windows Installer database.

  When you are working in any of the following Windows Installer–based project types, you are working in direct edit mode: MSI Database, MSM Database, and Transform.

Starting the MSI Debugger
Using the Direct Editor in Any Project Type

The Direct Editor has a Tables explorer that lists each table in your project or database. When you select a table in this explorer, the right pane shows the following elements:

- A row of buttons and other controls
- A spreadsheetlike table

Each row in a table represents a record in your project or database. The parenthetical note in each column heading indicates the type and size of data that you enter in the column. For example, S255 indicates a string with up to 255 characters; I2 indicates a 2-byte integer.

The following table describes all of the buttons and other controls that are displayed when you select a table in the Direct Editor.

Table 13-231 • Controls in the Direct Editor View

<table>
<thead>
<tr>
<th>Name of Control</th>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Record</td>
<td>![New Icon]</td>
<td>Displays the Add Record to Table dialog box, which lets you add a new row to the selected table.</td>
</tr>
<tr>

<td>![Edit Icon]</td>
<td>Displays the Edit Record in Table dialog box, which lets you edit the data in the selected row.</td>
</tr>
<tr>
<td>Delete Selected Records</td>
<td>![Delete Icon]</td>
<td>Deletes the selected row or rows.</td>
</tr>
<tr>
<td>Cut Selected Records</td>
<td>![Cut Icon]</td>
<td>Removes the currently selected rows and places them on the Clipboard.</td>
</tr>
<tr>
<td>Copy Selected Records</td>
<td>![Copy Icon]</td>
<td>Copies the currently selected rows to the Clipboard.</td>
</tr>
<tr>
<td>Paste Records</td>
<td>![Paste Icon]</td>
<td>Inserts the rows that are saved to the Clipboard.</td>
</tr>
<tr>
<td>Find String</td>
<td>![Find Icon]</td>
<td>Displays the Find dialog box, which lets you search for instances of a string. This dialog box lets you specify criteria such as whether you want to search in the selected table, or all tables.</td>
</tr>
<tr>
<td>Find Next</td>
<td>![Find Next Icon]</td>
<td>Searches for the next occurrence of the specified string.</td>
</tr>
<tr>
<td>Find and Replace</td>
<td>![Find and Replace Icon]</td>
<td>Displays the Replace dialog box, which lets you search for instances of a string and replace them with a new string. This dialog box lets you specify criteria such as whether you want to search in the selected table, or all tables.</td>
</tr>
</tbody>
</table>
Using the Direct Editor with Project Edit Mode in Windows Installer–Based Projects

In Basic MSI, DIM, InstallScript MSI, Merge Module, and QuickPatch projects, advanced users can use the Direct Editor to perform tasks such as the following:

- View all of the tables in the project file (.ism).
- Add and remove records from tables.
- Cut, copy, and paste records or fields.
- Edit individual fields in the tables.
- Add custom tables.
- Filter the table records that are shown to hide ones that do not contain a specific string.
- Search one table or all tables for a specific string and replace it if necessary.
- Resize and reorder the columns in a table.

**Tip** • If you press F1 while a standard Windows Installer table is selected, the Windows Installer Help Library opens to provide information about that specific table.

Note the following details when using the Direct Editor with project edit mode in Windows Installer–based projects:

- The File table displays only static data. InstallShield may add additional information, such as dynamically linked files, to the File table in the Windows Installer database that it creates at build time.
- Unlike the corresponding tables in the Windows Installer database, tables such as the Binary, Icon, and Patch tables in the .ism file do not store binary data. Rather, they store links to build-source paths.
- Column attributes for both standard tables and InstallShield tables cannot be altered while in project edit mode. They can, however, be edited for custom tables. Note that column attributes can be edited in standard, InstallShield, and custom tables in direct edit mode.
- You cannot use localizable properties in the Directory table.

---

**Table 13-231 • Controls in the Direct Editor View (cont.)**

<td></td>
<td>Dynamically filters the records that are displayed in the Direct Editor view according to the string that you specify in this search box. As you type a string in this box, InstallShield hides all of the rows that do not contain it.</td>
</tr>
<tr>
<td>Direct Editor Help</td>
<td><img src="image" alt="Icon" /></td>
<td>Displays the help for the Direct Editor view.</td>
</tr>
</tbody>
</table>
Using the Direct Editor with Direct Edit Mode in Windows Installer–Based Projects

In MSI Database, MSM Database, and Transform projects, you can use the Direct Editor to essentially perform all of the tasks that are available in this view with direct edit mode. However, instead of working with tables in the .ism file, you are working directly with the Windows Installer database (.msi, .msm, or .mst).

Using the Direct Editor in InstallScript and InstallScript Object Projects

The Direct Editor in InstallScript and InstallScript Object projects lets you see all of the tables in your .ism file; however, it is recommended that you use the other views in InstallShield to modify these types of projects.

Note that although InstallScript and InstallScript Object projects use many of the same tables that are available in Windows Installer–based projects, many of the common tables have different meanings. In addition, InstallShield ignores custom tables in InstallScript and InstallScript Object projects; custom tables are not available at run time.

Direct Editor Table Insights

The Direct Editor in InstallShield includes several features that provide visual insights into tables, schema information, and validation errors designed to boost the productivity of setup authors or packagers who use the Direct Editor for troubleshooting to identify and resolve advanced problems. These features are described following:

- Directory Table Psuedocolumn Displays Resolved Target Directory Path
- Column Header Schema Information Tooltips
- Table Record Reference Tracking
- Broken References Indicator

Directory Table Psuedocolumn Displays Resolved Target Directory Path

InstallShield includes a read-only, grayed out pseudocolumn to the Directory table that displays the resolved path of each row’s directory location. A pseudocolumn behaves like a table column, but is not actually stored in the table. You can sort by the pseudocolumn’s visible text, but you cannot insert, update, or delete its values.

Column Header Schema Information Tooltips

InstallShield provides tooltips on column headers that display the column’s schema information.

Examples

The Directory table receives the following schema tooltips:

<table>
<thead>
<tr>
<th>Column Header</th>
<th>Tooltip</th>
</tr>
</thead>
<tbody>
<tr>
<td>Directory (s72)</td>
<td>Directory: char(72), required</td>
</tr>
<tr>
<td>Directory_Parent (S72)</td>
<td>Directory_Parent: char(72), nullable</td>
</tr>
<tr>
<td>DefaultDir (l255)</td>
<td>DefaultDir: char(72), localizable, required</td>
</tr>
<tr>
<td>ISDescription (S255)</td>
<td>ISDescription: char(255), nullable</td>
</tr>
</tbody>
</table>
Table 13-232 *

<table>
<thead>
<tr>
<th>Column Header</th>
<th>Tooltip</th>
</tr>

<td>Extended Type: long integer, nullable</td>
</tr>
<tr>
<td>ISComments (S255)</td>
<td>ISComments: char(255), nullable</td>
</tr>
</tbody>
</table>

Table Record Reference Tracking

The Direct Editor includes a Reference Tracking pane that lets you easily visualize relationships between table records. A Show Reference Tracking button at the top of the Direct Editor provides a show/hide toggle of the pane.

Each record may reference one or more other records or be referenced by one or more other records. When a record is highlighted that refers to other records or is referred from other records, the Reference Tracking pane is populated with a Reference Tables section showing the tables in which the references reside and an additional section that displays the actual record references. The record references section includes arrow icons that indicate the direction of the reference, where:

- A green arrow pointing to the right indicates that the record that is selected in the Direct Editor table references the record displayed in the Reference Tracking pane.
• A blue arrow pointing to the left indicates that the record selected in the Direct Editor table is referenced by the record displayed in the Reference Tracking pane.

• Two arrows in both directions (a green arrow pointing right and a blue arrow pointing left) indicate that the record selected in the Direct Editor table references and is referenced by the record displayed in the Reference Tracking pane.

**Note** • When multiple Direct Editor records are selected, only the “focused” record’s references are shown. In addition, if multiple tables appear in the Reference Tables section, this indicates that the record selected in the Direct Editor table references or is referenced by records in multiple tables. You can click any table in the Reference Tables section to view the associated records references.

**Tip** • In the Reference Tracking pane, you can quickly jump between record references by double-clicking within a cell.

**Broken References Indicator**

There are instances where a Direct Editor table record might reference a foreign key record that no longer exists. InstallShield displays the cells of such broken references with a red fill color to call attention to the broken reference.

For example, if the Directory column in the Component table references a directory name that is not found in the Directory table, then the Directory column is filled in red.

**Note** • The Direct Editor broken reference indicator is unrelated to the Maintain referential integrity check box on the Preferences tab of the Options dialog box. While the Maintain referential integrity setting is designed to update the foreign keys when you modify a primary key, the purpose of the broken reference indicator is to display broken references to help you easily identify orphaned records. Therefore, broken references are displayed regardless of the selection of the Maintain referential integrity setting.

InstallShield 2020

The following table lists some InstallShield tables that add specific functionality to your application. Click a link for more information about a specific table.

Table 13-235 • InstallShield Table Names and Descriptions

<table>
<thead>
<tr>
<th>Table Name</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISAlias</td>
<td>Basic MSI, InstallScript,</td>
<td>This table contains alias information used when an InstallShield Professional project is converted to a Windows Installer–based project.</td>
</tr>
<tr>
<td></td>
<td>InstallScript MSI, InstallScript Object</td>
<td></td>
</tr>
<tr>
<td>ISComCatalogAttribute</td>
<td>Basic MSI, DIM, InstallScript MSI, Merge Module</td>
<td>This table contains information about COM+ catalog attributes. Each entry has a foreign key to a ISComCatalogObject table entry to which the attribute belongs.</td>
</tr>
<tr>
<td>ISComCatalogCollection</td>
<td>Basic MSI, DIM, InstallScript MSI, Merge Module</td>
<td>This table contains information about COM+ catalog collections. A COM+ catalog collection is a folder of a same type of COM+ catalog objects. For example, the COM+ applications item, the Components item, and the Legacy Components item in the Component Services view are the COM+ catalog collections. Each entry has a foreign key to a ISComCatalogObject table entry to which the collection belongs.</td>
</tr>
<tr>
<td>ISComCatalogCollectionObject</td>
<td>Basic MSI, DIM, InstallScript MSI, Merge Module</td>
<td>This table contains information about COM+ catalog collections where COM+ catalog objects belong.</td>
</tr>
<tr>
<td>ISComCatalogObject</td>
<td>Basic MSI, DIM, InstallScript MSI, Merge Module</td>
<td>This table contains information about COM+ catalog objects. A COM+ catalog object is an item that is contained within a COM+ catalog collection. Each entry has the display name.</td>
</tr>
<tr>
<td>ISComPlusApplication</td>
<td>Basic MSI, DIM, InstallScript MSI, Merge Module</td>
<td>This table contains information about a COM+ application. A COM+ application is a COM+ catalog object with extra information. This table has application specific information and a foreign key to a ISComCatalogObject table entry which has the basic information.</td>
</tr>
<tr>
<td>ICustomActionReference</td>
<td>Basic MSI, DIM, InstallScript MSI, Merge Module</td>
<td>This table contains information about the behavior of each of the custom actions that are included in the installation.</td>
</tr>
</tbody>
</table>
If you upgrade a project that was created with InstallShield Professional to InstallShield 2020, InstallShield might add data to the ISAlias table.

In Windows Installer, identifiers cannot contain spaces and must contain only specified characters. Because of this, some of your component names, feature names, or script-defined folder names that you used in InstallShield Professional might not be valid in a project that you upgraded to a Windows Installer-based project. To address this issue, InstallShield uses aliasing to match the old name with a new identifier. (InstallShield does not perform a lexicon change for these names because they might be used as strings within your script.)
Note: If you upgrade to an InstallScript project, the only invalid characters in feature names or script-defined folder names are the following:

\/:*?"<>|

In component names, the preceding characters and the single quotation mark (’) are invalid.

The ISAlias table contains the following information.

### Table 13-236 • ISAlias Table Information

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alias</td>
<td>Name string used in InstallShield Professional.</td>
</tr>
<tr>
<td>Identifier</td>
<td>String that is used by InstallShield to reference the alias.</td>
</tr>
<tr>
<td>Table</td>
<td>Name of the table that uses the alias (for example, Feature). This table is available in the Direct Editor.</td>
</tr>
</tbody>
</table>

Upgrading Projects Created with InstallShield Professional

**ISCOMCatalogAttribute Table**

InstallShield 2020

**Project** • This information applies to the following project types:
- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISCOMCatalogAttribute table contains the information about COM+ catalog attributes. Each entry has a foreign key to a ISComCatalogObject table entry to which the attribute belongs.

**Columns**

**ISCatalogObject_(primary key)**
A foreign key into the ISCatalogObject table

**ItemName (primary key)**
The named attribute for a catalog object

**ItemValue**
A value associated with the attribute defined in ItemName
**ISCOMCatalogCollection Table**

*InstallShield 2020*

❗️ *Project* • *This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The **ISCOMCatalogCollection** table contains information about COM+ catalog collections. A COM+ catalog collection is a folder of a same type of COM+ catalog objects. For example, COM+ application, Component and Legacy Component nodes in the Component Services view are the COM+ catalog collections. Each entry has a foreign key to a **ISComCatalogObject** table entry to which the collection belongs.

**Columns**

**ISCatalogCollection** *(primary key)*

A unique key for the **ISCatalogCollection** table.

**ISCatalogObject**

A foreign key into the **ISCatalogObject** table. This is the catalog object that a catalog collection belongs to.

**Name**

A catalog collection name.

**ISCOMCatalogCollectionObject Table**

*InstallShield 2020*

❗️ *Project* • *This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The **ISCOMCatalogCollectionObject** table contains information about COM+ catalog collections where COM+ catalog objects belong.

**Columns**

**ISCatalogCollection** *(primary key)*

A unique key for the **ISCatalogCollection** table
**ISCatalogObject_(primary key)**

A foreign key into the ISCatalogObject table; This is the catalog object that a catalog collection contains.

**ISCOMCatalogObject Table**

InstallShield 2020

*Project* • *This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISCOMCatalogObject table contains information about COM+ catalog objects. A COM+ catalog object is an item that is contained within a COM+ catalog collection. Each entry has the display name.

**Columns**

**ISCatalogObject (primary key)**

A unique key for the ISCatalogObject table

**DisplayName**

The display name of a catalog object

**ISCOMPlusApplication Table**

InstallShield 2020

*Project* • *This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISCOMPlusApplication table contains information about a COM+ application. A COM+ application is a COM+ catalog object with extra information. This table has application specific information and a foreign key to an ISComCatalogObject table entry that has the basic information.

**Columns**

**ISCatalogObject_(primary key)**

A foreign key into the ISComCatalogObject table. This is the root level application object. All other data associated with this application can be derived through the ISComCatalogObject table.
ComputerName

If the ComponentService object was loaded from a remote machine, store the computer name here. This can be NULL for the local computer.

Component_

A foreign key to the component table.

ISCcustomActionReference Table

InstallShield 2020

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISCustomActionReference table contains information about the intended behavior of each custom action that is included in the project.

Table 13-237 • ISCustomActionReference Table Information

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Key</th>
<th>Nullable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action_ Identifier</td>
<td>Identifier</td>
<td>Yes</td>
<td>No</td>
<td>Identifier that references an entry in the CustomAction table.</td>
</tr>
<tr>
<td>Description</td>
<td>Text</td>
<td>No</td>
<td>No</td>
<td>Text that describes the behavior of the custom action.</td>
</tr>
<tr>
<td>FileType</td>
<td>Text</td>
<td>No</td>
<td>No</td>
<td>The file type of the help file.</td>
</tr>
<tr>
<td>ISCAReferenceFilePath</td>
<td>Text</td>
<td>No</td>
<td>No</td>
<td>The full path, including the file name, for the file that describes the behavior of the custom action. This column is included in the InstallShield project file (.ism), but not in the .msi file.</td>
</tr>
</tbody>
</table>

Guidelines for Creating Custom Actions that Meet Requirements of the Windows Logo Program
InstallShield Custom Action Reference

ISIIISItem Table

InstallShield 2020

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

The ISIIISItem table contains information about IIS settings that are configured in the Internet Information Services view.

**Table 13-238 • ISIIISItem Table Information**

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Key</th>
<th>Nullable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISIIISItem</td>
<td>String</td>
<td>Yes</td>
<td>No</td>
<td>Primary key for table. This item identifies the Web site or other IIS item that is being created.</td>
</tr>
<tr>
<td>ISIIISItem_Parent</td>
<td>String</td>
<td>No</td>
<td>Yes</td>
<td>Foreign key into the ISIIISItem column. This item identifies the Web site or other IIS item that contains the current item.</td>
</tr>
<tr>
<td>DisplayName</td>
<td>Localizable string</td>
<td>No</td>
<td>Yes</td>
<td>An optional localized name for the Web site or other IIS item.</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
<td>No</td>
<td>No</td>
<td>Identifies the type of IIS item. Available options are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• 1—Web site</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• 2—Application</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• 3—Virtual directory</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• 4—Application pool</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• 5—Web service extension</td>
</tr>
<tr>
<td>Component_</td>
<td>String</td>
<td>No</td>
<td>Yes</td>
<td>Name of the component that contains the IIS item.</td>
</tr>
</tbody>
</table>

Managing Internet Information Services
ISIISProperty Table

InstallShield 2020

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

The ISIISProperty table contains information about IIS settings that are configured in the Internet Information Services view.

**Note** • When you configure advanced settings for a Web site, application, or virtual directory in the Internet Information Services view, InstallShield configures the MetaData* fields in the ISIISProperty table automatically. For help on specific settings, see IIS Metabase Properties in the MSDN Help Library.

Table 13-239 • ISIISProperty Table Information

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Key</th>
<th>Nullable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISIISProperty</td>
<td>String</td>
<td>Yes</td>
<td>No</td>
<td>Primary key for table.</td>
</tr>
<tr>
<td>ISIISItem</td>
<td>String</td>
<td>Yes</td>
<td>No</td>
<td>Primary key for table; foreign key into the ISIISItem table. This item identifies the Web site or other IIS item that this property is for.</td>
</tr>
<tr>
<td>Schema</td>
<td>String</td>
<td>No</td>
<td>Yes</td>
<td>This column is reserved for future use.</td>
</tr>
<tr>
<td>FriendlyName</td>
<td>String</td>
<td>No</td>
<td>Yes</td>
<td>This column is reserved for future use.</td>
</tr>
<tr>
<td>MetaDataProp</td>
<td>Integer</td>
<td>No</td>
<td>Yes</td>
<td>Equates to the dwMDIdentifier field of the METADATA_RECORD structure.</td>
</tr>
<tr>
<td>MetaDataType</td>
<td>Integer</td>
<td>No</td>
<td>Yes</td>
<td>Equates to the dwMDDataType field of the METADATA_RECORD structure.</td>
</tr>
</tbody>
</table>

**Note** • InstallShield supports the following values:

- 1 (DWORD_METADATA)
- 2 (STRING_METADATA)
- 5 (MULTISZ_METADATA)
Table 13-239 • ISISProperty Table Information (cont.)

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Key</th>
<th>Nullable</th>
<th>Description</th>
</tr>
</thead>
</table>
| MetaDataUserType    | Integer | No  | Yes      | Equates to the dwMDUserType field of the METADATA_RECORD structure. Available options, which are defined in the Windows SDK header IISCnfg.h, are:  
|                     |         |     |          | • 1 (IIS_MD_UT_SERVER)  
|                     |         |     |          | • 2 (IIS_MD_UT_FILE)  
|                     |         |     |          | • 100 (IIS_MD_UT_WAM)  
|                     |         |     |          | • 101 (ASP_MD_UT_APP) |
| MetaDataAttributes  | Integer | No  | Yes      | Equates to the pbMDAttributes field of the METADATA_RECORD structure. |
| MetaDataValue       | String  | No  | Yes      | Equates to the pbMDData field of the METADATA_RECORD structure. |
| Order               | Integer | No  | Yes      | The order that you would like the property to be applied to the IIS item. |
| ISAttributes        | Integer | No  | Yes      | Indicates whether the IIS property is a standard property or an advanced property. Advanced properties are configurable through the Other IIS Properties setting in the Internet Information Services view. Available options are:  
|                     |         |     |          | • 0 (Standard property)  
|                     |         |     |          | • 1 (Advanced property)  
|                     |         |     |          | All other options are reserved for future use. |

ISProductConfigurationInstance Table

InstallShield 2020

Project • This information applies to the following project types:

• Basic MSI
The ISProductConfigurationInstance table provides support for installing multiple instances of a product in the same context on the same machine. This table defines each of the property values for each instance that an installation supports. For more information, see Setting Properties for an Instance.

**Caution** • Creating an installation that lets end users install multiple instances of a product on the same machine and in the same context requires sophisticated authoring and serious commitment on the part of the installation developer. This functionality is recommended for only advanced installation developers.

Table 13-240 • ISProductConfigurationInstance Table Information

<table>
<thead>
<tr>
<th>Column</th>
<th>Type</th>
<th>Key</th>
<th>Nullable</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISProductConfiguration</td>
<td>Text</td>
<td>Yes</td>
<td>No</td>
<td>Identifies the product configuration to which this instance applies.</td>
</tr>
<tr>
<td>InstanceId</td>
<td>Integer</td>
<td>Yes</td>
<td>No</td>
<td>Identifies the instance number of this instance. This value is stored in the property InstanceId.</td>
</tr>
<tr>
<td>Property</td>
<td>Identifier</td>
<td>Yes</td>
<td>No</td>
<td>Identifies the property to create for this instance.</td>
</tr>
<tr>
<td>Value</td>
<td>Text</td>
<td>Yes</td>
<td>No</td>
<td>Specifies the value for this property for this instance.</td>
</tr>
</tbody>
</table>

ISSelfReg Table

InstallShield 2020

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
If you have selected ISSelfReg as the self-registration method for COM servers, and if your project contains any files (or dynamic links) marked as self-registered, InstallShield adds information about those files to the ISSelfReg table of your .msi database.

**Table 13-241 • ISSelfReg Table Information**

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileKey</td>
<td>Foreign key into the File table, identifying the file (.dll, .ocx, .exe, .tlb, .olb) to be self-registered.</td>
</tr>
<tr>
<td>Cost</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>Order</td>
<td>A nonnegative number identifying the order in which self-registration will occur. Any files with an Order value of 1 will be registered first, followed by files with an Order value of 2, and so forth. Finally, all files with an Order value of 0 will be registered.</td>
</tr>
<tr>
<td>CmdLine</td>
<td>For self-registering .exe files, stores a command line to be passed to the executable when it is self-registered. By default the field is empty, and the InstallShield run-time engine registers the .exe file with the /regserver argument and unregisters it with the /unregserver argument. To specify different arguments to pass during registration and unregistration, separate the arguments with a vertical bar (</td>

<td>Icon</td>
<td>ISIconIndex</td>
<td>Optional icon index to be extracted.</td>
</tr>
</tbody>
</table>
A QuickPatch project is a specific type of Windows Installer–based project recommended for installation authors who want to ship small, single upgrades to their end users. Each QuickPatch project has its own set of views.

**Patch Settings View**

The Patch Settings view contains links to several views:

- **General Information View**—Enter information about your upgrade and the original installation. Specify which releases should be patched by the current project, and select which custom actions should be included.
- **Files View**—Add files to your patch, and specify file-patching options.
- **Registry View**—Specify which registry values should be changed or removed.
- **Path Variables View**—Make your patch easily portable between development systems with variable-based file linking.

**Additional Tools View**

The Additional Tools view contains a link to the Direct Editor. Use the Direct Editor to edit the database tables directly.

**See Also**

Product Properties

InstallShield 2020 » QuickPatch Project » General Information View

Project • This information applies to QuickPatch projects.
When you click Product Properties in the General Information view, InstallShield displays the following:

Table 13-243 • Settings for Product Properties

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Original Setup Path</td>
<td>This area shows the product name and the path to the original installation image. The path box is read-only.</td>
</tr>
<tr>
<td>Product Version</td>
<td>The Original setup version box shows the product version of the original installation. This box is read-only. In the QuickPatch Version box, you can change the product version for your QuickPatch project. Entry in this box is optional.</td>
</tr>
<tr>
<td>FlexNet Connect Integration</td>
<td>If FlexNet Connect was enabled in your original installation and if you designate custom version numbers that FlexNet Connect should use to identify your product (as opposed to using the standard version scheme that Windows Installer uses), type the new custom version number for your QuickPatch in this box.</td>
</tr>
</tbody>
</table>

Notifying End Users about Upgrades Using FlexNet Connect

Build Settings

InstallShield 2020 » QuickPatch Project » General Information View

Project • This information applies to QuickPatch projects.

When you click Build Settings in the General Information view, InstallShield displays the following tabs:

- Common
- Identification
- Digital Signature
- Advanced

Common Tab

InstallShield 2020 » QuickPatch Project » General Information View » Build Settings

Project • This information applies to QuickPatch projects.

When you click Build Settings in the General Information view, InstallShield displays several tabs. The Common tab exposes frequently used build settings for a QuickPatch:

**Build Location**

Specify where you want your patch file built or browse for an existing folder.
**Launcher Settings**

In this area, you can configure the following launcher settings:

Table 13-244 • Configurable Launcher Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Update.exe</td>
<td>If you want to create an Update.exe update launcher for the current QuickPatch package, select this check box. To learn when an Update.exe update launcher is required, see Patching Considerations.</td>
</tr>
<tr>
<td>Include Windows Installer 3.1 engine</td>
<td>Select this check box to include the Windows Installer 3.1 engine with your patch package.</td>
</tr>
<tr>
<td>Include .NET Framework</td>
<td>Select this check box to include the .NET Framework with your patch package.</td>
</tr>
</tbody>
</table>

**Patch Uninstallation**

Select the Allow Patch to be Uninstalled (Requires Windows Installer 3.0) check box if you would like the QuickPatch to be uninstallable without having to uninstall and reinstall the entire application and other QuickPatch packages. Note that uninstallation of QuickPatch packages works only under certain conditions. For example, versions of Windows Installer earlier than version 3.0 cannot remove just the QuickPatch from an application. For more information, see Removing Patches in the Windows Installer help.

**See Also**

**Identification Tab**

When you click Build Settings in the General Information view of a QuickPatch project, InstallShield displays several tabs. The Identification tab exposes settings for display strings. The display strings are used to populate information about the patch in Add or Remove Programs. It is also used by the Windows Installer 3.0 (and later) APIs that interrogate and catalog patches applied to a target machine.
**Note** • Patch metadata is stored directly in the patch (.msp) file and not in any of the .msi packages. The .msp file contents are not localizable. Therefore, string entries are not available for any of the metadata settings below.

**Table 13-245 • Identification Tab Settings**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>Specify the name of your patch.</td>
</tr>
<tr>
<td>Support URL</td>
<td>Specify the uniform resource locator (URL) that you would like your customers to visit for technical support.</td>
</tr>
<tr>
<td>Description</td>
<td>Specify a brief description of your patch.</td>
</tr>
<tr>
<td>Manufacturer name</td>
<td>Specify the name of the application's manufacturer.</td>
</tr>
<tr>
<td>Target product name</td>
<td>Specify the name of the application or the target application suite.</td>
</tr>
<tr>
<td>Classification</td>
<td>Specify the category of upgrade. Examples include Critical Update, Hotfix, and Service Pack.</td>
</tr>
</tbody>
</table>

Specifying Identification Information for a QuickPatch

**Digital Signature Tab**

InstallShield 2020 » QuickPatch Project » General Information View » Build Settings

**Project** • This information applies to QuickPatch projects.

When you click Build Settings in the General Information view of a QuickPatch project, InstallShield displays several tabs. The Digital Signature tab is where you specify settings if you want to digitally sign your patch.

**Note** • With QuickPatch projects, you can digitally sign the patch package and the Update.exe file. If you want to digitally sign individual files—such as your application’s executable files—in your QuickPatch package, you must manually sign them and then add them to your project. You can use `SignTool.exe`, which is included with the Windows SDK, to manually sign your files.

**Table 13-246 • Settings in the Digital Signature Tab**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sign the Patch Package</td>
<td>To digitally sign your QuickPatch package, select this check box.</td>
</tr>
<tr>
<td>Sign Update.exe</td>
<td>To digitally sign the Update.exe file, select this check box.</td>
</tr>
</tbody>
</table>
Project • This information applies to QuickPatch projects.

When you click Build Settings in the General Information view, InstallShield displays several tabs. The Advanced tab exposes a comprehensive set of build settings that you can configure for a QuickPatch.

### Table 13-246 • Settings in the Digital Signature Tab (cont.)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certificate URL</td>
<td>Type a fully qualified URL—for example, <a href="http://www.mydomain.com">http://www.mydomain.com</a>. This URL is used in your digital signature to link to a site that you would like end users to visit to learn more about your product, organization, or company.</td>
</tr>
<tr>
<td>Digital Certificate Information</td>
<td>To specify the digital certificate that you want to use to sign your release, click the Browse button next to this setting. The Certificate Selection dialog box opens, enabling you to specify either the location of the .pfx file or information about the certificate store that contains the certificate. To learn more, see Certificate Selection Dialog Box.</td>
</tr>
<tr>
<td>Password</td>
<td>If the .pfx file that you are using has a password, enter it. InstallShield encrypts the password and stores it in your project file (.ism). At build time, InstallShield uses the password to sign files with a .pfx file. If your certificate is protected by a password but you do not enter it in this setting, signing with a .pfx file fails. Note that if you configure your project to use a certificate that was imported with password protection into a store, Windows prompts for the password at build time when InstallShield is attempting to sign your project’s files. The strong key protection that Windows uses does not permit InstallShield to provide the password to the cryptographic provider.</td>
</tr>
<tr>
<td>Signature Description</td>
<td>Specify the signature description that you want to use for the patch package and Update.exe file, if applicable. The description that you specify is displayed on the User Account Control (UAC) box to the right of the “Program Name:” label. The UAC dialog box opens when an end user launches the signed file and elevated privileges are required. If you leave this setting blank, InstallShield uses the name of the file without its extension as the description to the right of the “Program Name:” label on the UAC dialog box.</td>
</tr>
</tbody>
</table>

Build Location

In the Build Location area, you can configure the following settings.

Table 13-247 • Build Location Settings

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build Location</td>
<td>Specify where you want your patch file built or browse for an existing folder.</td>
</tr>
<tr>
<td>Project File Format</td>
<td>Select the file format that you want to use for your project file (.ism). Available options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Binary</strong>—To save the .ism file as a database file, select this option. This format is best for the speed of opening and saving the project file. This is the default format for the current project type. If you select this project file format for the current project, you can modify the .ism file in a Windows Installer database editor. You can also modify the .ism file by using the Windows Installer API or its automation interface.</td>
</tr>
<tr>
<td></td>
<td>• <strong>XML</strong>—To save the .ism file as a hierarchical text-based format, select this option. This project file format is best for use with source code control systems. It enables you to modify the project file using XML tools.</td>
</tr>
</tbody>
</table>

*Note* • Both project file formats let you build releases from the command line.

| Create Update.exe         | Specify whether you want to create an Update.exe update launcher for the current QuickPatch package.                                                                                                         |
|                          | To learn when an Update.exe update launcher is required, see Patching Considerations.                                                                                                                       |

| List of Patch GUIDs to replace | To replace one or more earlier installed patches with the current QuickPatch, set this property to the patch GUIDs of those patches, and separate each with a comma. For example: |
|                              | {C86838C9-DED9-4451-B99F-94AFB9460F15}, {C8633E58-ACE4-45d8-B487-C683B1F60D6}                                                                                                                                 |
|                              | Setting this property is typically not required, even if you have several QuickPatch projects in the History. However, if your QuickPatch project does not overwrite files added in an earlier QuickPatch project, it may be necessary to set this property. |
|                              | If you do not know the GUID of a patch that you want to replace, click this property and then click the ellipsis button (...). Select the patch (.msp or .exe file), and InstallShield will add the corresponding GUID to this property. |

### Table 13-247 • Build Location Settings (cont.)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create new &quot;UpdatedImage&quot; folder</td>
<td>This setting enables you to build your QuickPatch package with an existing UpdatedImage folder. To use this option, you must have built this package at least once (so that an UpdatedImage folder exists). Setting this option to No builds the package from the existing UpdatedImage folder. This lets you tweak the .msi package in the UpdatedImage folder and use that .msi data in a QuickPatch project. Setting this option to Yes (the default setting) regenerates the .msi file in the UpdatedImage folder every time that the package is built.</td>
</tr>
<tr>
<td>Generate MsiPatchOldAssembly tables</td>
<td>Specify whether to automatically generate entries for the MsiPatchOldAssemblyFile and MsiPatchOldAssemblyName tables, which allow a patch package that is running under Windows Installer 3.0 and later to patch an assembly in the global assembly cache (GAC) without making a run-time request for the original installation source. For more information, see Patching Assemblies in the Global Assembly Cache.</td>
</tr>
<tr>
<td>Create patch sequencing entry</td>
<td>Specify whether you want to use patch sequencing for your QuickPatch. A patch sequence accounts for obsolete patches, superseded patches, and patches that have already been applied to the product. The sequence specifies the order that Windows Installer version 3.0 and later should apply patches to an installed product, regardless of the order in which they are provided to the target machine. For versions of Windows Installer earlier than version 3.0, the patch sequence is ignored, and any patches are applied to the product in the order that they are provided to the target machine.</td>
</tr>
</tbody>
</table>
Streamline QuickPatch

Specify whether you want InstallShield to streamline the creation of your QuickPatch package to build as simple a package as possible. The default value is Yes.

The goal of QuickPatch streamlining is to generate a QuickPatch package that has fewer new subfeatures and custom actions than a non-streamlined QuickPatch package.

For example, if your QuickPatch project includes a new file or registry entry and InstallShield does not use QuickPatch streamlining, InstallShield creates a new subfeature for that file or registry entry. InstallShield also adds one or more prebuilt InstallShield custom actions to work around certain Windows Installer patch requirements. However, if InstallShield does use QuickPatch streamlining, the file or registry entry is added to an existing feature, and no special prebuilt InstallShield custom actions are required.

Note • InstallShield cannot streamline the creation of a QuickPatch package in the following scenarios:

- The QuickPatch package removes an installed file.
- The QuickPatch package removes or renames a registry key.
- The QuickPatch package targets a non-streamlined QuickPatch image. That is, you cannot use QuickPatch streamlining if you select the check box in the History area of the General Information view for a QuickPatch that did not use QuickPatch streamlining. If you try to build a streamlined QuickPatch that targets one or more non-streamlined QuickPatch images, InstallShield displays a build warning, and it does not use streamlining.

Password Protect Launcher

To password-protect your QuickPatch package, select Yes, and then type a password for the Launcher Password setting. When you password-protect your QuickPatch package, any end user who wants to apply your QuickPatch must enter a case-sensitive password to launch your update.

This setting is applicable only to QuickPatch packages that use an Update.exe file.

Launcher Password

Type a password to protect your application. You must select Yes for the Password Protect Launcher setting to activate password protection.

When you password-protect your patch, any end user who wants to apply your patch must enter a case-sensitive password to launch your update.

This setting is applicable only to patches that use an Update.exe file.
Windows Installer Engine

In this area, you can configure the following settings for the Windows Installer engine:

Table 13-248 • Windows Installer Engine Settings

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include Windows Installer 3.1 engine</td>
<td>Specify whether the Windows Installer engine should be included with your patch package.</td>
</tr>
<tr>
<td>Engine Location</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td>• Download Engine From The Web—If the Windows Installer engine needs to be installed, it is downloaded at run time.</td>
</tr>
<tr>
<td></td>
<td>• Extract Engine From Update.exe—The build streams the Windows Installer engine into the Update.exe file, giving you a single file to distribute to your customers. At run time, the engine is extracted from the Update.exe file and installed if required.</td>
</tr>
<tr>
<td></td>
<td>• Copy From Source Media—The build copies the Windows Installer engine into the same directory as the Update.exe file.</td>
</tr>
<tr>
<td>Windows Installer 3.1 engine URL</td>
<td>Specify the URL for the location of the engine. This is the location that the Update.exe file uses at run time to download the engine. The default URL location is a live site maintained by Revenera for your convenience.</td>
</tr>
</tbody>
</table>

Microsoft .NET Framework

In this area, you can configure the following settings for the Microsoft .NET Framework:

Table 13-249 • Microsoft .NET Framework Settings

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include In Build</td>
<td>Specify whether to include the Microsoft .NET Framework in your patch.</td>
</tr>
<tr>
<td>Engine Location</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td>• Download Engine From The Web—If the .NET Framework needs to be installed, it is downloaded at run time.</td>
</tr>
<tr>
<td></td>
<td>• Extract Engine From Update.exe—The build streams the .NET Framework into the Update.exe file, giving you a single file to distribute to your customers. At run time, the engine is extracted from the Update.exe file and installed if required.</td>
</tr>
<tr>
<td></td>
<td>• Copy From Source Media—The build copies the .NET Framework into the same directory as the Update.exe file.</td>
</tr>
<tr>
<td>Engine URL</td>
<td>Specify the URL for the location of the .NET Framework. This is the location that the Update.exe file uses at run time to download the .NET Framework. The default URL location is a live site maintained by Revenera for your convenience.</td>
</tr>
</tbody>
</table>
## Update Launcher Settings

In this area, you can configure the following settings for the `Update.exe` launcher:

### Table 13-250 • Update Launcher Settings for a Patch

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Company Name</strong></td>
<td>If you want to override the default company name for <code>Update.exe</code> with your company name, enter your company name. The company name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the <code>Update.exe</code> file and then click Properties. To learn more, see Customizing File Properties for the Update Launcher.</td>
</tr>
<tr>
<td><strong>Product Name</strong></td>
<td>If you want to override the default product name for <code>Update.exe</code> with your product name, enter your product name. The product name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the <code>Update.exe</code> file and then click Properties. To learn more, see Customizing File Properties for the Update Launcher.</td>
</tr>
<tr>
<td><strong>Product Version</strong></td>
<td>If you want to override the default product version for <code>Update.exe</code> with your product version, enter your product version. The product version is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the <code>Update.exe</code> file and then click Properties. To learn more, see Customizing File Properties for the Update Launcher.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>If you want to override the default description for <code>Update.exe</code> with your own description, enter the appropriate description. The description is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the <code>Update.exe</code> file and then click Properties. To learn more, see Customizing File Properties for the Update Launcher.</td>
</tr>
<tr>
<td><strong>Copyright</strong></td>
<td>If you want to override the default copyright notice for <code>Update.exe</code> with your product’s copyright notice, enter your product’s copyright notice. The copyright notice is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the <code>Update.exe</code> file and then click Properties. To learn more, see Customizing File Properties for the Update Launcher.</td>
</tr>

InstallShield 2020 » QuickPatch Project » Files View

This information applies to QuickPatch projects.

When you click a new file in the Files To Patch explorer within the Files view, you can configure the following settings:

File Settings

Table 13-251 • Settings in the File Settings Area

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specify the file that you want to add to the patch setup</td>
<td>If you are modifying a file in the original installation, specify the latest version of the file that you want to be installed on the target system when the patch is applied.</td>
</tr>
<tr>
<td>Self-Registering</td>
<td>If the file that you are adding is a self-registering DLL or .ocx file, select this check box.</td>
</tr>
<tr>
<td>Extract COM Information</td>
<td>If the file is a COM server and you want InstallShield to extract COM information from the file when the patch is built, select this check box.</td>
</tr>
</tbody>
</table>

Integration Settings

Select the file destination and the features that you want to associate with this file.

Note • This install state binding requires feature association. When you add new data to your QuickPatch project, you must associate it with a feature. New data is installed only if the corresponding feature is installed.

Modified/Deleted File Settings

InstallShield 2020 » QuickPatch Project » Files View

This information applies to QuickPatch projects.

When you click a file that you have added from your original installation to the Files To Patch explorer within the Files view, you can configure the following settings:
### Updated File

**Table 13-252 • Settings in the Updated File Area**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Specify the latest version of your file</strong></td>
<td>If you are modifying a file in the original installation, specify the latest version of the file that you want to be installed on the target system when the patch is applied.</td>
</tr>
<tr>
<td><strong>Include Whole File</strong></td>
<td>If you want to include the selected file in your patch as a whole file, rather than only the byte-level file differences of the file, you may want to consider selecting this check box. If you do so, InstallShield configures your patch so that Windows Installer ignores any actual version number of the selected file, and instead considers it be version 1.0.0.0 when it is determining whether to update the target system’s file with the version in your QuickPatch package, or to leave the file as is. Selecting this check box for an unversioned file may be helpful to ensure that the file on the target system is always overwritten with the newer equivalent unversioned file in your QuickPatch package. According to Windows Installer file overwrite rules, a file of any version is maintained over an unversioned file. Therefore, if you select this check box, Windows Installer updates the unversioned file with the one in the QuickPatch package because it considers the file in the QuickPatch to be a versioned file. Important • According to Windows Installer file overwrite rules, the file with the highest version is maintained, even if the file already on the target system has a higher version than the one being installed. Therefore, if the file on the target system is a versioned file, you may want to avoid selecting this check box, since in some scenarios it could lead to the file on the target system not being updated. For example, if the file on the target system is version 1.1.0.0, the file in your QuickPatch project is version 2.0.0.0, and you select this check box, the file on the target system is not updated at run time. This occurs because even though the actual version number of the file in the QuickPatch package is newer than the one on the target system, Windows Installer considers the file in the QuickPatch to be 1.0.0.0, which would make it older than the file on the target system.</td>
</tr>
<tr>
<td><strong>Extract COM Information</strong></td>
<td>If the file is a COM server and you want InstallShield to extract COM information from the file when the patch is built, select this check box. This check box is selected by default for patch files that contain COM information in the Class or TypeLib tables in the base .msi package. When you specify an existing file that you want to patch, InstallShield automatically detects if the file is self-registering. If the original file was self-registering, the file in the patch is also set to self-register.</td>
</tr>
</tbody>
</table>
Original File Information

The Original File Information area provides information about the original file in the original installation.

Component Information

The Component Information area provides file component information such as the component name and key file.

Check this box to have the patch delete this file from the setup

Select this check box to remove the file from the target machine when the patch is applied.

Registry View

InstallShield 2020 » QuickPatch Project

Project • This information applies to QuickPatch projects.

The Registry view in a QuickPatch project provides a visual representation of what currently exists on a source machine and what you will patch on a destination/target system once your patch project is built and applied to the target system. The Destination computer’s Registry view pane and the Destination computer’s registry data pane are prepopulated with registry entries in the original installation.

Each item in the Destination computer’s registry data pane appears next to an icon specific to the value type and the data’s current condition. Icons for data values that have been modified have a turquoise pencil. Icons for new data values have a red star in the upper-right corner. Icons for registry values that will be deleted from the target system have a red X. See the following sample icons and descriptions below.

Table 13-253 • Icons in the Registry View of a QuickPatch Project

### InstallShield Prerequisite Editor Reference

**Project** • The following project types include support for InstallShield prerequisites:

- Basic MSI
- InstallScript
- InstallScript MSI

All of these project types include support for the setup prerequisite type of InstallShield prerequisite. Basic MSI projects include support for the feature prerequisite type.

InstallShield also includes support for including InstallShield prerequisites as packages in Advanced UI and Suite/Advanced UI projects. For more information, see Including InstallShield Prerequisites (.prq) in an Advanced UI or Suite/Advanced UI Project.

An InstallShield prerequisite is an installation for a product or technology framework that is required by your product. Some examples of InstallShield prerequisites that are included with InstallShield are Java Runtime Environment (JRE) and SQL Server Express Edition. You can add any of the existing InstallShield prerequisites to your installation projects and configure many of their settings. You can also create your own InstallShield prerequisites, and add them to your projects.

---

**Task**

To open the InstallShield Prerequisite Editor:

On the **Tools** menu, click **Prerequisite Editor**.

---

**Task**

To open an existing prerequisite in the InstallShield Prerequisite Editor, do one of the following:

1. On the **File** menu, click **Open**. The **Open** dialog box opens.
2. Select the file by browsing and click **Open**.

The following tabs are associated with the InstallShield Prerequisite Editor:

- **Properties**
- **Conditions**
- **Files to Include**
- **Application to Run**
- **Behavior**
- **Dependencies**

---

**See Also**

Properties Tab

The Properties tab of the InstallShield Prerequisite Editor is where you specify general information about an InstallShield prerequisite.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| Unique identifier for InstallShield prerequisite | Type a unique file identifier for the InstallShield prerequisite or leave the default value as is. This could be the name of the prerequisite application or component, or a GUID.  

*Note* • Every time you open the InstallShield Prerequisite Editor to create a new InstallShield prerequisite, a new GUID is generated and listed in this box. |
| Alternate location to download .prq from if prerequisite files are being downloaded | If appropriate, type the alternate URL for your .prq file. For example:  
http://www.mywebsite.com/MyPrq.prq  
For more information, see Specifying an Alternate URL for a .prq File.  

*Note* • InstallShield prerequisites do not have support for FTP URLs. |
| Description | Type an overview of the prerequisite. This description is displayed under the Overview heading when you select a prerequisite in the Redistributables view. |

Defining InstallShield Prerequisites  
InstallShield Prerequisite Editor Reference

Conditions Tab

The Conditions tab of the InstallShield Prerequisite Editor lets you define installation conditions that determine whether an InstallShield prerequisite already is installed on the target machine. Failure to do so causes problems because the target system behaves as if the InstallShield prerequisite was not properly installed. You can also create installation conditions that specify operating system, registry, or file requirements.

If a condition evaluates as true at run time, that condition is met. The InstallShield prerequisite is installed on the target machine if the following are true:

- The target machine meets any of the operating system conditions and all of the other conditions that are listed on the Conditions tab.
- For feature prerequisites only (that is, an InstallShield prerequisite that is associated with one or more features in the main installation)—The feature that contains the feature prerequisite must be installed. Thus, if the feature has a condition that is not met on the target system, or if the end user chooses not to install the feature, the feature is not
installed. As a result, none of its associated feature prerequisites are installed, unless the feature prerequisites are also associated with other features that are installed.

**Note** • *Because installation of prerequisites such as Windows service packs is not supported, the operating system version information is not expected to change. Therefore, the operating system conditions are not considered in verifying whether a prerequisite was installed correctly.*

When you click the Add button on this tab, the Prerequisite Condition dialog box opens. This dialog box also opens when you select an existing condition on the Conditions tab and then click the Modify button.

InstallShield Prerequisite Editor Reference

**Files to Include Tab**

*InstallShield 2020 » InstallShield Prerequisite Editor*

When you are creating a new InstallShield prerequisite, you must specify the installation files that should be included with the InstallShield prerequisite. You can also modify the list of files for an existing InstallShield prerequisite. The Files to Include tab of the InstallShield Prerequisite Editor is where you specify the files.

When you click the Add button or the Add Multiple Files button on this tab to specify an InstallShield prerequisite file or the Modify button to change the file, the New File dialog box opens.

When you click the **Set File(s) URL** button, the **Set File(s) URL** dialog box opens.

**Note** • *InstallShield prerequisites do not have support for FTP URLs.*

Application to Run Tab

InstallShield 2020 » InstallShield Prerequisite Editor

The Application to Run tab of the InstallShield Prerequisite Editor is where you specify how an InstallShield prerequisite should be installed on the target machine.

**Table 13-2 • Settings on the Application to Run Tab**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specify the application you wish to launch</td>
<td>Select the file—typically a Setup.exe setup launcher or an .msi package—that should be launched on the target machine if the InstallShield prerequisite is installed. Only files that have been specified on the Files to Include tab are included in this list.</td>
</tr>
<tr>
<td></td>
<td><strong>Project</strong> • If you specify an .msi file and you indicate on the Behavior tab that the progress should be shown, the Setup.exe setup launcher captures progress messages and uses Windows Installer APIs instead of MsiExec.exe to launch the .msi package at run time. If you specify any other file type, or if you specify an .msi file for which progress should not be shown, the Setup.exe setup launcher runs the file with either the open verb (for .msi and .exe files) or the default verb (for all other file types) at run time.</td>
</tr>
<tr>
<td>Requires Windows Installer engine and/or .NET Framework to be installed first</td>
<td>If the Windows Installer engine, the .NET Framework (Dotnetfx.exe), or both must be installed before this InstallShield prerequisite is installed, select this check box.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> • Selecting this check box does not add the Windows Installer engine or the .NET Framework to your installation. It only specifies that if they are included in the installation, they should be installed before this InstallShield prerequisite is installed. To include the Windows Installer engine or the .NET Framework with your installation, you must add them to your project. To learn how, see Adding Windows Installer Redistributables to Projects or Adding .NET Framework Redistributables to Projects.</td>
</tr>
</tbody>
</table>
Table 13-2 • Settings on the Application to Run Tab (cont.)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specify the command line for the application</td>
<td>If applicable, type the command line for the file selected in the Specify the application you wish to launch list. Do not include the name of the file in this box. For information on command-line parameters that you can specify, see Specifying Command-Line Parameters for an InstallShield Prerequisite.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> • If a setup prerequisite is configured to be hidden (that is, it is not included in the setup prerequisite run-time dialog as one of the prerequisites that need to be installed), it is launched with its silent command-line parameters—not its standard command-line parameters. Therefore, if it is possible that the <strong>The prerequisite should be hidden from the installation list</strong> check box on the Behavior tab will be selected, specify command-line parameters in the Specify the command line for the application when the setup is running in silent mode box.</td>
</tr>
<tr>
<td>Specify the command line for the application when the setup</td>
<td>If applicable, type the appropriate command line. Do not include the name of the file in this box. For information on command-line parameters that you can specify, see Specifying Command-Line Parameters for an InstallShield Prerequisite.</td>
</tr>
<tr>
<td>is running in silent mode</td>
<td><strong>Note</strong> • Using the /s command-line parameter to launch an installation that includes an InstallShield prerequisite does not automatically run the prerequisite installation silently. You may also need to specify a valid silent command-line parameter for the InstallShield prerequisite in this Specify the command line for the application when the setup is running in silent mode setting on the Application to Run tab.</td>
</tr>
<tr>
<td>Specify the return code (in decimal) the application returns</td>
<td>If the selected InstallShield prerequisite application requires that the target machine be restarted after the application is installed, type the return code in this box.</td>
</tr>
<tr>
<td>if a reboot is required</td>
<td><strong>Tip</strong> • If multiple return codes exist, list each one separated by a comma.</td>
</tr>
<tr>
<td></td>
<td>If you do not know the return codes for the file that you are launching as the InstallShield prerequisite, contact the author of the file. For more information on InstallShield prerequisites that require a restart, see Restarting a Target Machine for InstallShield Prerequisite Installations.</td>
</tr>
</tbody>
</table>

Behavior Tab

The Behavior tab of the InstallShield Prerequisite Editor is where you specify what should occur in certain scenarios.

Table 13-3 • Settings on the Behavior Tab

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>The prerequisite requires administrative privileges</strong></td>
<td>Select this check box if administrative privileges are required to install the InstallShield prerequisite or if the InstallShield prerequisite must be installed per machine. This check box is selected by default.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>InstallShield prerequisites that require administrative privileges may require that end users provide credentials or consent before installation can occur on Windows Vista and later systems. For more information, see Minimizing the Number of User Account Control Prompts During Installation.</td>
</tr>
<tr>
<td><strong>The prerequisite may be optionally skipped by the user</strong></td>
<td>If the installation should display a message box that enables end users to choose whether to install the InstallShield prerequisite, select this check box. If end users should not be able to choose whether to install the InstallShield prerequisite, clear this check box.</td>
</tr>
<tr>
<td><strong>The prerequisite should be hidden from the installation list</strong></td>
<td>If a target system needs one or more setup prerequisites to be installed, the setup prerequisite dialog is displayed at run time before the main installation runs. When an end user clicks the Install button on this dialog, the setup prerequisites are installed. If you want to include the current setup prerequisite in the list of setup prerequisites that are displayed in that dialog, clear this check box. If you do not want to include the current setup prerequisite in the list, select this check box. The setup prerequisite is hidden from the list of setup prerequisites, but it is still installed on the target system if needed.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Feature prerequisites are never listed in the setup prerequisite dialog at run time, regardless of whether the The prerequisite should be hidden from the installation list check box is selected or cleared. That is, if you add an InstallShield prerequisite to your project and associate it with a feature, that feature prerequisite is not listed in the setup prerequisite dialog that is displayed at run time before the main installation runs. Note that if a setup prerequisite or a feature prerequisite is marked as hidden, it is launched with its silent command-line parameters—not its standard command-line parameters. To learn more, see Specifying Command-Line Parameters for an InstallShield Prerequisite.</td>
</tr>
</tbody>
</table>
Table 13-3 • Settings on the Behavior Tab (cont.)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Progress should be shown in the prerequisites window (raw MSI file only)</td>
<td>If you want the progress of the installation for the current InstallShield prerequisite to be displayed at run time, select this check box. The progress can be shown only if the InstallShield prerequisite installation is an .msi file; it cannot be shown if the file that the InstallShield prerequisite installation launches is a Setup.exe file. In addition, the installation that contains the prerequisite must be a Basic MSI or InstallScript MSI installation. If your InstallShield prerequisite installation is a Setup.exe file, this setting is ignored. In addition if the installation that contains the InstallShield prerequisite is an InstallScript installation, this setting is ignored. Note • If you select this check box so that progress can be shown, only some command-line parameters are supported. Command-line parameters are specified on the Application to Run tab of the InstallShield Prerequisite Editor. For more information, see Specifying Command-Line Parameters for an InstallShield Prerequisite. Also note that if you specify that the progress should be shown for a prerequisite that is an .msi package, the user interface of the prerequisite’s .msi package is not displayed by default. If you want to override this behavior, you can specify /qf as a command-line parameter on the Application to Run tab.</td>
</tr>
</tbody>
</table>
If, after installing the prerequisite, the conditions still indicate it is required

If the conditions still indicate that the InstallShield prerequisite needs to be installed after the InstallShield prerequisite installation has been run, either of the following may be true:

- The InstallShield prerequisite was not successfully installed.
- The conditions that were specified for the InstallShield prerequisite were not accurate.

For example, a condition may indicate that the InstallShield prerequisite needs to be installed if a particular file does not exist on the target machine. If the file is still missing even after the InstallShield prerequisite is installed, it is possible that the condition should not have been created.

Specify the behavior that should occur if the conditions still indicate that the InstallShield prerequisite needs to be installed. The available options are:

- **Abort the setup**—If your application should not be installed, select this option.
- **Ask whether to continue the setup**—If the installation should display a message box that prompts the end user to specify whether the main installation should continue, select this option.
- **Continue the setup**—If the installation should essentially ignore the InstallShield prerequisite's unmet condition and proceed to the next InstallShield prerequisite installation (if one is required) or the main installation, select this option.

**Table 13-3 • Settings on the Behavior Tab (cont.)**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If, after installing the prerequisite, the conditions still indicate it is required</td>
<td>If the conditions still indicate that the InstallShield prerequisite needs to be installed after the InstallShield prerequisite installation has been run, either of the following may be true:</td>
</tr>
<tr>
<td></td>
<td>- The InstallShield prerequisite was not successfully installed.</td>
</tr>
<tr>

</tr>
</tbody>
</table>
If the prerequisite requires a reboot

Installing an InstallShield prerequisite may require that the target machine be restarted, as described in Restarting a Target Machine for InstallShield Prerequisite Installations.

Specify the behavior that should occur if the InstallShield prerequisite requires that a target machine be restarted.

- **Exit and resume on reboot**—To end the InstallShield prerequisite installation, allow the InstallShield prerequisite to restart the target machine, and then continue the installation, select this option.

- **Note it, fail to resume if the machine is rebooted, and reboot after the installation**—To note that the target machine should be restarted if it is required, to schedule the restart for the end of the main installation, but to exit if the target machine restarts after the InstallShield prerequisite installation, select this option. Thus, if it appears that a restart is required but you want to postpone it until the end of the main installation (or until a subsequent InstallShield prerequisite triggers a restart), select this option.

  At run time, the value of the Windows Installer property **ISSCHEDULEREBOOT** is set to 1 in the main installation when a restart is still pending.

- **Ignore it, and fail to resume if machine is rebooted**—To continue the installation but end it if the target machine is restarted, select this option. Thus, if it appears that a restart is required but you want to try to skip it, select this option.

- **Prompt the user only if no reboot is detected, but always reboot the machine and resume on reboot**—To prompt the end user to restart the target machine only if it appears that the target machine does not need to be restarted, select this option. The target machine is restarted if the end user agrees to allow it, and then the installation continues.

- **Prompt the user to reboot the machine even if nothing is detected, and resume on reboot**—To prompt the end user to restart the target machine even if it appears that the target machine does not need to be restarted, select this option. The target machine is restarted if the end user agrees to allow it, and then the installation continues.

- **Reboot the machine and resume on reboot**—To restart the target machine and then continue the installation, select this option.

### Error 0x%08x saving file %s

In this error message, %s refers to the path and file name of a file that needs to be saved at build time for an Advanced UI or Suite/Advanced UI project. To resolve this error, ensure that the file is available and is not read-only or locked.

### InstallShield does not support signing with .spc and .pvk files.

Replace the digital certificate information in your project with a .pfx certificate, or with a reference to a certificate in a certificate store.

This error occurs if you added .spc and .pvk files to your project in an earlier version of InstallShield that included support for digitally signing with those files, and then you open your project in InstallShield 2020 and attempt to build a release or a patch.

To resolve this error, remove the .spc reference from the release or patch configuration. You can replace it with a .pfx certificate, or with a reference to a certificate in a certificate store. To learn more, see:

- Digital Signing and Security
- Digitally Signing a Release and Its Files at Build Time
- Signing a Patch Package
- Signing a QuickPatch Package

### The files in this release are being signed with a SHA-1 certificate.

Windows will not trust files that were signed with SHA-1 certificates if they were signed after January 1, 2016.

This warning occurs if your project is configured to use a SHA-1 certificate to digitally sign your release at build time.

SHA-256 is favored over SHA-1, which is being deprecated because of the potential for security vulnerabilities. Thus, it is recommended that you replace any SHA-1 certificates in your InstallShield projects with SHA-256 certificates.

In InstallShield, to replace a SHA-1 certificate with a SHA-256 certificate for signing your releases, use the Signing tab in the Releases view to replace the reference to the current certificate with one for a SHA-256 certificate.

To learn more, see Digital Signing and Security.

</table>
Including IA64 %1 %2 in an x64 package.

This build warning occurs if the following conditions are true:

- x64 is specified for the Template Summary setting.
- The project includes an Itanium 64-bit file that the installation may transfer to target systems at run time.

An x64 target system cannot run an Itanium 64-bit file.

Depending on your requirements, you may want to replace the IA64 file with an x64 file. In other scenarios, you may want to ignore this build warning. For example, if the file’s component has a condition that prevents the component from being installed on x64 systems, you may want to ignore this build warning.

Including x64 %1 %2 in an IA64 package.

This build warning occurs if the following conditions are true:

- IA64 is specified for the Template Summary setting.
- The project includes an x64 file that the installation may transfer to target systems at run time.

An Itanium 64-bit target system cannot run an x64 file.

Depending on your requirements, you may want to replace the x64 file with an IA64 file. In other scenarios, you may want to ignore this build warning. For example, if the file’s component has a condition that prevents the component from being installed on IA64 systems, you may want to ignore this build warning.
Errors and Warnings

This build warning occurs if the following conditions are true:

• Intel is specified for the Template Summary setting.
• Strict is selected for the Platform Validation setting.
• The project includes an x64 file that the installation may transfer to target systems at run time.

An x86 target system cannot run an x64 file.

Depending on your requirements, you may want to replace the x64 file with an x86 file. In other scenarios, you may want to ignore this build warning. For example, if the file’s component has a condition that prevents the component from being installed on x86 systems, you may want to ignore this build warning.

For more information, see Selecting the Appropriate Type of Architecture Validation for Builds.

This build error occurs if InstallShield cannot determine whether a file in the project is 32 bit or 64 bit when performing architecture validation.

For more information, see Selecting the Appropriate Type of Architecture Validation for Builds.

| -7234                   | InstallShield could not create the software identification tag because the template file Swidtag.xml could not be opened. | InstallShield uses the Swidtag.xml file, which is installed to one of the following locations, to build tag files:  
  
  *InstallShield Program Files folder*  
  *InstallShield Program Files folder*  
  
  To resolve this issue, ensure that the Swidtag.xml file is present and not locked.  
  
  For more information, see Including a Software Identification Tag for Your Product. |
| -7233                   | An invalid URL (%2) is specified in the Packages view for package %1.     | This build error occurs if you selected Download From The Web for a package in the Packages view of an Advanced UI or Suite/Advanced UI project, but the URL setting under the Location setting is blank, or it contains an invalid URL. To resolve this error, enter a URL that starts with one of the following strings:  
  
  • http://  
  • https://  
  • ftp:// |
| -7225                   | The project does not contain any packages.                               | This build error occurs if try to build an Advanced UI or Suite/Advanced UI project that does not contain any packages.  
  
  To resolve this error, use the Packages view to add a package to your project. For more information, see Guidelines for Adding Packages to an Advanced UI or Suite/Advanced UI Project. |
| -7223                   | A Mode condition or a Detection condition is required for the Setup.exe to run correctly. | This build error occurs if your Advanced UI or Suite/Advanced UI project includes an .exe package but you have not configured the appropriate conditions for it yet.  
  
  For information on adding detection conditions to a package in a project, see the following:  
  
  • Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects  
  • Guidelines for Defining Conditions in an Advanced UI or Suite/Advanced UI Project  
  
  For information on how mode conditions are created, see Triggering Install Mode or Maintenance Mode of an Advanced UI or Suite/Advanced UI Installation. |

<tbody>
<tr>
<td>-7222</td>
<td>No supported languages included in the media. You must select at least one supported language for the media.</td>
<td>This error occurs only when no supported language is selected in the media. To resolve this issue, ensure that at least one language is selected for the Language(s) setting in the Releases view.</td>
</tr>
<tr>
<td>-7220</td>
<td>InstallShield encountered an error while including a DIM reference.</td>
<td>This error occurs if your project includes a DIM reference, as shown in the DIM References view, but InstallShield cannot find the DIM project file (.dim). This might occur if the .dim file was moved to a different location or it was renamed, but the path or file name in the installation project that contains the DIM references has not been updated.</td>
</tr>
</tbody>
</table>
| -7218                   | Conflicts were detected building DIMs. In Table %1 Row %2, data files differ in the following columns: %3. | This warning occurs if InstallShield encounters a data conflict between the installation project that is open and one of its DIM references. In this warning message, %1 indicates the name of the table that contains the conflict, and %2 indicates the applicable row; %3 is in the following format:

`ColumnName ("InstallationUnitValue" <> "InstallationProjectValue")`

The table data for the DIM reference is available in the Direct Editor view of the DIM project. The table data for the installation is available in the Direct Editor view of the installation project.

If a data conflict occurs, InstallShield uses either the installation project data or the DIM data; it depends on which value is selected in the Conflict Resolution setting on the Build Options tab in the DIM References view:

- **Use Base Project Value** — If this value is selected, InstallShield uses the value that is in the installation project instead of the value that is in the DIM project.

- **Use DIM Project Value** — If this value is selected, InstallShield uses the value that is in the DIM project instead of the value that is in the installation project.

If the appropriate value is being used, you can ignore this warning message. If you want to use the value that is being overridden, you can either revise the value in that project, or change the value of the Conflict Resolution setting. Note, however, that if other conflicts occur for this DIM reference, changing the value of the Conflict Resolution setting may also change the resulting built values for those other conflicts.

For more information, see Resolving Build-Time Conflicts Between a Basic MSI Project and a DIM Reference.
This project includes InstallScript objects that are deprecated. These objects should be removed from the project. A prerequisite should be used instead where possible.

InstallScript objects have been deprecated in favor of InstallShield prerequisites. The recommended alternative for InstallScript objects is InstallShield prerequisites. You can use the InstallShield Prerequisite Editor to create your own InstallShield prerequisites. You can share these InstallShield prerequisites among InstallScript, InstallScript MSI, and Basic MSI projects. To learn more, see:

- Defining InstallShield Prerequisites
- Adding InstallShield Prerequisites, Merge Modules, and Objects to InstallScript Projects

Skipping build events. Build events are supported only in the Premier edition of InstallShield.

InstallShield lets you specify commands that you want to be run at various stages of the build process. This build event functionality is available in the Premier edition of InstallShield. For more information, see Specifying Commands that Run Before, During, and After Builds.

If you try to use the Professional edition of InstallShield to build a release that includes build events, InstallShield ignores the build event settings and generates this warning.

To resolve this warning, use the Premier edition of InstallShield to build the release.

Error loading table %1. This error occurs if the table that is mentioned in the error message is missing from your project, or it is missing columns.

To resolve this error, open the Direct Editor view, and look for the table that is mentioned in the error message. If it exists, compare the columns in the table with those in a new project, and add any missing tables. If the table does not exist, you can export it from a new project as an .idt file, and then import the .idt file into your existing project. For more information, see:

- Exporting Tables from the Direct Editor
- Importing Tables with the Direct Editor

<td>Building a compressed Network Image Setup.exe. All other build types are not allowed in the evaluation mode of InstallShield.</td>
<td>If you are using InstallShield in evaluation mode (that is, you have not activated it), you can build compressed Setup.exe files, but no other release types. If you are creating a Windows Installer–based release, the .msi database is always embedded in the Setup.exe file. If you try to build an uncompressed release in evaluation mode, the uncompressed option is ignored, and InstallShield displays this build warning. Once you have activated InstallShield, the evaluation-mode limitations are removed.</td>
</tr>
</tbody>
</table>
| -7209                   | The current Windows Installer package name includes Unicode characters that may cause a run-time error if a compressed Network Image Setup.exe is built. | This build warning occurs if the following conditions are true:  
  - For the name of the .msi package, you include Unicode characters that are not supported by your build machine’s ANSI code page.  
  - You include a setup launcher (Setup.exe file) with your release.  
This warning occurs to inform you that when the Windows Installer package is extracted from Setup.exe to a temporary location on the target system, run-time error 1152 may occur. To resolve this warning, change the name of the .msi package so that it does not contain Unicode characters that are not supported by your machine’s ANSI code page. To do so, you can use the MSI Package File Name setting on the General tab for a product configuration in the Releases view. |

</table>
| -7208                   | The current location for this package includes Unicode characters that may cause a run-time error when Windows Installer tries to extract its .cab files. | This warning occurs if the following conditions are true:  
  - The path for the release that InstallShield is building contains Unicode characters that are not supported by your build machine’s ANSI code page.  
  - You configure the release so that your product’s program files are compressed into .cab files.  
  
  You can ignore this warning if end users will launch your release from a location whose path does not contain Unicode characters that are not supported by your build machine’s ANSI code page.  
  
  If end users try to launch your installation from a path that contains Unicode characters that are not supported by the target system’s ANSI code page, run-time error 1311 occurs when Windows Installer tries to extract the .cab files. |
| -7207                   | A package cannot contain both the MsiLockPermissionsEx and LockPermissions tables. | An installation should not contain both the MsiLockPermissionsEx table and the LockPermissions table. If you use the Permissions setting for a service, and the settings under it, you are configuring the MsiLockPermissionsEx table of the package. If Traditional Windows Installer handling is selected for the Locked-Down Permissions setting in the General Information view and you have set permissions for one or more files, folders, or registry keys in your project, you are configuring the LockPermissions table of the package.  
  
  For more information, see Securing Files, Folders, Registry Keys, and Windows Services in a Locked-Down Environment. |
| -7201                   | The language '%1' is missing from this project but included in this release. | This build warning occurs if a language is selected in the UI Languages setting on the Build tab in the Releases view, but it is not also selected in the Setup Languages setting in the General Information view.  
  
  This build warning is alerting you that the release will not include the specified run-time language. If you do not want to include the specified run-time language in your release, you can ignore this warning.  
  
  If you do want to include the specified run-time language in your release, add the language to the Setup Languages setting. |
The Find What setting for the %1 text change is not configured. This text change will not be performed.

You have added a change item to a change set in the Text File Changes view; however, the value for the Find What setting is blank. This setting must have a value; otherwise, the text file changes are not made at run time.

For more information, see Specifying a Change for a Text File.

The Include Files setting for the %1 text change set is not configured. None of the text changes associated with this text change set will be performed.

You have added a change set in the Text File Changes view; however, the value for the Include Files setting is blank. This setting must have a value; otherwise, the text file changes are not made at run time.

For more information, see Creating a Text Change Set.

The %1 translation for string identifier %2 includes characters that are not available on code page %3.

This error occurs if both of the following conditions are true:

- The string identifier value that you entered for the specified language contains characters that are not available in that language's code page.
- You are building a language-specific (ANSI) database.

To resolve this error, consider using the String Editor view to edit the value of the string identifier so that it uses characters from the appropriate code page.

If you must use characters that are not available in the target language’s code page, consider selecting Yes for the Build UTF-8 Database setting. Note, however, that this may result in user interface issues in some scenarios because the Windows Installer does not fully support UTF-8 databases. For more information, see the description of the Build UTF-8 Database setting.

</table>
| -7185                   | The %1 translation for string identifier %2 includes characters that are not available on code page %3. | This error occurs if both of the following conditions are true:  
  - The string identifier value that you entered for the specified language contains characters that are not available in that language’s code page.
  - You are building a language-specific (ANSI) database.

To resolve this error, consider using the String Editor view to edit the value of the string identifier so that it uses characters from the appropriate code page.

If you must use characters that are not available in the target language’s code page, consider selecting Yes for the Build UTF-8 Database setting. Note, however, that this may result in user interface issues in some scenarios because the Windows Installer does not fully support UTF-8 databases. For more information, see the description of the Build UTF-8 Database setting. |
The %1 column of the %2 table includes characters that are not available on code page %3: "%4"

This error occurs if both of the following conditions are true:

- A table in the source project database contains characters that are not available in the code page for one or more target languages.
- You are building a language-specific (ANSI) database.

To resolve this error, consider changing the data that is described in the error message so that it uses characters from the appropriate code page. For example, if the error message mentions the Shortcut table, consider changing the string in the Shortcuts view.

If you must use characters that are not available in the target language’s code page, consider selecting Yes for the Build UTF-8 Database setting. Note, however, that this may result in user interface issues in some scenarios because the Windows Installer does not fully support UTF-8 databases. For more information, see the description of the Build UTF-8 Database setting.

"%1" contains a reference to a string table entry '%2' that is not included in the project’s string table.

In this warning message, %1 indicates the fully qualified path to an InstallScript file (.rul) in the project, and %2 indicates the string ID that is used in that .rul file but is not listed as one of the project’s string entries.

InstallShield displays this warning at build time for each string identifier that is found in the project’s InstallScript file but not in the String Editor view.

To see the line in the InstallScript code that has the string identifier, double-click the warning message that is displayed on the Tasks tab of the Output window at build time. The string identifier is preceded by the string constant operator (@).

To resolve this build issue, ensure that the string identifier is defined in the String Editor view. In addition, ensure that the spelling of the string identifier in the InstallScript code matches that in the String Editor view.

</table>
| -7117                   | Custom Action %1 called from Standard dll and stored in Binary table cannot have deferred/rollback/commit execution. | This error occurs if you try to call a deferred-, rollback-, or commit-execution custom action using a standard .dll. When you call a non-Windows Installer .dll (that is, one that does not have the MyFunc(MSIHANDLE) entry point), InstallShield does the following:  
  - InstallShield creates a wrapper .dll with the standard Windows Installer entry point.  
  - InstallShield stores your .dll plus the InstallShield wrapper .dll in the Binary table.  
  When the custom action is called, Windows Installer calls the InstallShield wrapper .dll. This, in turn, extracts your .dll from the Binary table and calls the function that you specified. However, the InstallShield wrapper .dll does not have access to the Binary table during deferred, rollback, or commit custom actions, and thus it cannot extract and call into your .dll.  
  To resolve this error, try one of the following options:  
    - Create a new .dll that has a standard Windows Installer entry point and call it directly.  
    - Use InstallScript code to do perform the same functionality if you do not want to write your own .dll.  
    - Schedule your custom action to run in immediate mode instead of deferred, rollback, or commit mode. |
<p>| -7116                   | Custom Action DLL %1 not found in release.                             | Check the Knowledge Base for information about this error, or request technical support.       |

An error occurred while scanning a device driver package. Check the Knowledge Base for information about this error, or request technical support.

The MSI 3.1 Engine could not be found. You can download this using the Redistributable Downloader under the Tools menu, if it has been made available by Microsoft. We have included the 3.0 Engine in your built installation.

This message is displayed as a build error if version 3.1 of the Windows Installer engine was selected to be included but it was not found on the build machine.

This message is displayed as a build warning if the version 3.1 or 2.0 best-fit option was selected but version 3.1 of the Windows Installer engine was not found on the build machine.

Internal build error. Check the Knowledge Base for information about this error, or request technical support.

The File %1 in Component %2 is being installed to the Windows Fonts folder, but there is no corresponding record in the Font table. The Font will not be registered properly on the target system.

To resolve this warning, open the Files and Folders view and remove the font mentioned in the message. Then re-add the font to the Fonts folder; InstallShield adds the corresponding record to the Font table automatically.

Refreshing the COM+ settings from the client machine. An error occurred while refreshing the COM+ settings from the client machine.

This build error occurs when an exception error has occurred with a COM+ application that is selected in the Component Services view. An option is provided to refresh the COM+ settings during the build process, and build error -7062 occurs when this option is selected and the refreshing process has failed. To resolve this error, you can open the Component Services view, select the COM+ application, and clear the Refresh the COM+ settings from the client machine at build check box on the Installation tab.

Internal build error. Check the Knowledge Base for information about this error, or request technical support.

Due to licensing requirements, InstallShield requires that you provide the MSI 3.0 engine redistributable from the MSI 3.0 Beta. Please copy instmsi.exe from the MSI 3.0 Beta folder to \redist\Language Independent\i386\MSI3.0\instmsiw.exe.

Check the Knowledge Base for information about this error, or request technical support.

<td>-7024</td>
<td>To include J# in the build you must also include .NET.</td>
<td>J# requires the .NET Framework Redistributable Package, but it is not included in the installation. If you are sure that your end users already have the .NET Framework on their systems, you can ignore this warning message. However, if there is a chance that they will not have the .NET Framework, add it to your installation. If the .NET Framework is not on their systems, they might have trouble installing J# as part of your installation. For more information, see Adding .NET Framework Redistributables to Projects.</td>
</tr>
<tr>
<td>-7023</td>
<td>Internal build error.</td>
<td>This error occurs if a merge module such as MFC 7.1 is not configured correctly or it is corrupted. If you have more than one merge module in your project but you do not know which one is causing the error, you need to first identify the problematic merge module. You can do this by removing a merge module from your project and then building your release. If the error recurs, you have identified the problematic merge module. If not, remove a different merge module and then build. Once you have identified the merge module causing the error, try reinstalling it. If that does not resolve the error, contact the author to obtain the latest version.</td>

</tbody>
</table>
The Custom Action %1 in the InstallExecuteSequence table is run from an installed file. To run the custom action successfully, you may need to have a condition that checks if the source file is installed locally.

To successfully run a custom action that is run from an installed file, you must ensure that the file is installed locally using a conditional statement:

- If the custom action is sequenced before RemoveFiles—Run the action only if the component was installed locally. (?ComponentName=3)
- If the custom action is sequenced between RemoveFiles and InstallFiles—Run the action only if the component was installed locally. Do not run the action on an uninstallation. (?ComponentName=3) AND NOT($ComponentName=2)
- If the custom action is sequenced after InstallFiles—Run the action only if the component will be installed locally. ($ComponentName=3)

**Note** • The ComponentName is the component that is associated with the source file.

Unable to find the .NET Compact Framework for the given platform/processor combination from the InstallShield Program File Folder\Support\NetCF.ini file.

Ensure that the .NET Compact Framework is in the correct location.

Error in including .NET Compact Framework .cab files in setup.

This error might occur for the following reasons:

- The .NET Compact Framework files cannot be found in the locations specified in the InstallShield Program Files Folder\Support\NetCR.ini file.
- The CEDefault.ico file is not in the InstallShield Program File Folder\Program\04xx folder.
- There is an error writing to the ISCEInstall table.

Unable to copy InstallShield Program File Folder\Support\CFAppMgr.ini file to a temporary location.

Make sure that CFAppMgr.ini file exists at the InstallShield Program Files Folder\Support folder. If this file does not exist, launch the InstallShield setup in repair mode. Remove any temporary files to create more disk space on the system.

Unable to find the .NET Compact Framework .cab file for the processor.

Open the InstallShield Program Files Folder\Support\NetCF.ini file and configure the .NET CF selection for this processor to resolve the issue.

<tr>
<td>-4352</td>
<td>There is no key file for the specified component. A key file is required for dynamic COM extraction.</td>
<td>Specify the key file for the specified component from the Components view.</td>
</tr>
</tbody>
</table>
This warning occurs when you add a COM server .dll file using the Component Wizard, which does static COM extraction, and then later change the component’s COM Extract at Build setting to Yes. The dynamically extracted data conflicts with the static data in the .ism file. Ensure that the COM extraction setting is accurate.

-4349: Failed to build %1 information for dynamically extracted COM components.

Check the Knowledge Base for information about this error, or request technical support.

-4348: Failed to build %1 information for dynamically extracted COM components.

Check the Knowledge Base for information about this error, or request technical support.

-4347: Failed to build information for dynamically extracted COM components.

Check the Knowledge Base for information about this error, or request technical support.

-4346: Failed to build information for dynamically extracted COM components.

Check the Knowledge Base for information about this error, or request technical support.

-4345: Failed to build information for dynamically extracted COM components.

Check the Knowledge Base for information about this error, or request technical support.

-4344: Failed to build information for dynamically extracted COM components.

Check the Knowledge Base for information about this error, or request technical support.

-4343: Failed to build information for dynamically extracted COM components.

Check the Knowledge Base for information about this error, or request technical support.

-4340: Failed to initialize COM extraction module.

Check the Knowledge Base for information about this error, or request technical support.
## Table 13-2 - Build Errors and Warnings (cont.)

<table>
<thead>
<tr>
<th>Error or Warning Number</th>
<th>Message</th>
<th>Troubleshooting Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>-4327</td>
<td>Could not write string ID &quot;%1&quot; to the InstallScript strings file.</td>
<td>This error pertains to projects containing InstallScript (either an InstallScript MSI project or a Basic MSI project with InstallScript custom actions). At build time, InstallShield creates an .ini file that contains all of the string entries in the project. In the error message, &quot;%1&quot; represents the line number in this .ini file that fails to get written. If the line number is 0, a general failure to create or write to the .ini file occurred. This might indicate that you are out of disk space.</td>
</tr>
<tr>
<td>-4303</td>
<td>An unexpected error occurred while synchronizing the file key in the specified component.</td>
<td>Check the Knowledge Base for information about this error, or request technical support.</td>
</tr>
<tr>
<td>-4302</td>
<td>A conflict was encountered while synchronizing file key %1 in component %2.</td>
<td>Check the Knowledge Base for information about this error, or request technical support.</td>
</tr>
<tr>
<td>-4301</td>
<td>Could not find the .msi file for key synchronization.</td>
<td>Check to ensure the specified MSI file exists.</td>
</tr>
<tr>
<td>-4093</td>
<td>Cannot copy source %1 to target %2.</td>
<td>Ensure that the file exists, that there is enough disk space on the target location, and that you are able to copy to the location.</td>
</tr>
<tr>
<td>-4092</td>
<td>Error opening MSI database %1.</td>
<td>Check the Knowledge Base for information about this error, or request technical support.</td>
</tr>
<tr>
<td>-4075</td>
<td>File not found. An error occurred merging module '%1' for feature '%2'.</td>
<td>Verify that the merge module exists in the merge module search path. This error may occur if an installation project that contained an InstallScript MSI object was upgrade to InstallShield 2020, which no longer supports InstallScript MSI objects. If this is the case, remove that objects from your project through the Redistributables view. You can upgrade the InstallScript MSI object to InstallShield 2020, which will convert it to a merge module project. Then you can add that merge module to your installation project.</td>
</tr>
<tr>
<td>-4072</td>
<td>Error retrieving the dependencies for %1.</td>
<td>Check the Knowledge Base for information about this error, or request technical support.</td>
</tr>
<tr>
<td>-4006</td>
<td>Cannot delete file.</td>
<td>Ensure the specified file exists and is not set to read-only.</td>
</tr>
</tbody>
</table>

<tr>
<td>-1013</td>
<td>The specified file is being used by another program.</td>
<td>Close the application that is currently using the file and re-run the build process.</td>
</tr>
<tr>
<td>-1009</td>
<td>Insufficient disk space or the target drive cannot be located.</td>
<td>Increase disk space on the build target, or select a new target for the build. If the target drive cannot be located, select a new target, or ensure permissions are set correctly for the target drive.</td>
</tr>
<tr>
<td>-1007</td>
<td>Cannot copy source %1 to target %2</td>
<td>Ensure that the file exists, that there is enough disk space on the target location, and that you are able to copy to the location.</td>
</tr>
</tbody>
</table>
Media Build Errors and Warnings

InstallShield 2020

Media build errors that occur before the build is generated are displayed in an error message dialog box; those that occur while the build is generated are displayed in the Output window and are recorded in the log file.

Table 13-3 • Media Build Errors and Warnings

<table>

</tbody>
</table>

**Error 118**

**InstallShield 2020**

**Message**

Could not find CAB file with file `number`. The system cannot find the path specified.

**Troubleshooting Information**

This error occurs when you build an already built media and one of the cabinet files that was previously created no longer exists.

If you encounter this error, rebuild the media.
Error 129

InstallShield 2020

Message

Media too small. Could not fit filename on disk number.

Troubleshooting Information

This error can occur for any of the following reasons:

- Total size of files required to be on one disk is greater than selected disk size.
- An installation requires that certain files reside on the first disk, including the files placed in the Support Files view (such as Setup.bmp and License.txt) and Data1.cab. Also, an installation requires that certain files be compressed in Data1.cab, including the following:
  - files needed by the objects you have included in your setup
  - resource files for each language your installation supports
  - the file for the dialog box skin you selected

If your installation includes a large skin, setup files, or objects—or a large number of support files, objects, or languages—the total size of files required to be on the first disk can be greater than the disk size you selected in the Release Wizard's Media Type panel.

To avoid this error and complete the build successfully, you must either remove the skin or some support files or objects from your project, reduce the size of some support files or choose a skin with a smaller file, or select a larger disk size.

If the error message specifies a disk other than disk 1, some of the files in your components may be too large to fit on the disk even when they have been compressed. In this case, you must either remove the large files, reduce their size, or select a larger disk size.

- There is not enough space on your drives.

To create the installation's cabinet files, the release builder requires space in the system's temporary folder and in the build location. To avoid this error, make sure you have enough free space on the drive on which the system's temporary folder resides and the drive on which you have specified the build location.

You can find the system's temporary folder by typing in the word "set" at a DOS prompt. The temporary folder is identified by the value of the environment variable TEMP. You can find the build location by looking at the Release Wizard's General Options panel's Advanced dialog box or the Release view's Release Location property.

- There is not enough virtual memory.

On Windows NT, this error can be caused by a lack of free virtual memory rather than a lack of free hard disk space. For information, visit Knowledge Base article Q102757.

Warning -5000

InstallShield 2020

Message

Component 'component name' contains a link to a non-existent file - 'filename'
Troubleshooting Information

The indicated component contains a link to the indicated file, which cannot be found. Remove the file from the component, or if you have renamed or moved the file, restore it to the indicated name and location.

Warning -5006

InstallShield 2020

Message

'EnterPassword' dialog resource not found in resource library filename.

Troubleshooting Information

You have selected the Show Password dialog during setup initialization option in the Release Wizard’s Password panel or the Show Password Dialog property in the Releases view, but one or more copies of _Isres.dll do not contain a resource template for this dialog box. (A separate instance of this warning is displayed for each copy of _Isres.dll that does not contain the resource template.) To fix this problem, you must use the Premier edition of InstallShield.

Warning -5020

InstallShield 2020

Message

The built media files could not be uploaded to the site URL. The URL could not be parsed.

Troubleshooting Information

Verify that the URL you specified in the Release view’s FTP Host Address property exists.

Warning -5021

InstallShield 2020

Message

The built media files could not be copied to the folder 'path'.

Troubleshooting Information

You have selected the Copy the built media files to the folder option in the Release Wizard’s Postbuild Options panel or the Copy to Folder property in the Release view; the built media files could not be copied to the folder that you specified with that option. Make sure that the path you specified exists and is writable.
Warning -5032
InstallShield 2020

**Message**
Failed to sign the self-extracting executable file.

**Troubleshooting Information**
The build failed to sign the self-extracting executable file as specified in the Release Wizard’s Digital Signature panel or the Release view’s Sign Media property. Among the possible causes of this error are an invalid or missing private key file.

Warning -5050
InstallShield 2020

**Message**
The font data could not be read from the project file. The 'Font' table may be missing from the project.

**Troubleshooting Information**
Check the Direct Editor to see if a Font table is included in your project. If it is not, and you cannot use source control software to roll back to a version of your project that did include that table, try deleting the font files from your project and then re-including them.

Warning -5051
InstallShield 2020

**Message**
Unable to create font data file: 'data file path and name'

**Troubleshooting Information**
Make sure that the specified path exists and is writable, and that a read-only file of the same name does not already exist at the same location.

Error -7040
InstallShield 2020

**Message**
No features included in the media.

**Description**
Your specified media does not contain any features. All media builds must include at least one feature.
Troubleshooting Information
Make sure that you have created at least one feature in the Features view.

Error -7041
InstallShield 2020

Message
Could not create instance of CABEngine. CABEngine component might not be installed or registered properly. You may need to reinstall InstallShield.

Troubleshooting Information
To resolve the problem, manually register the file MediaBuild40.dll (in the InstallShield\MediaBuild folder of your build machine's common files folder) using Regsvr32.exe (in the Windows system folder), using a DOS command line like the following:

Regsvr32.exe "C:\Program Files\Common Files\InstallShield\MediaBuild\MediaBuild40.dll"

Error -7043
InstallShield 2020

Message
Could not open the following media for the differential build - "path to media header file"

Troubleshooting Information
The message refers to a media header file that you specified in the Differential Media list box in the Release Wizard's Update panel. This error can be caused by any of the following conditions:

- The file does not exist.
- The file is corrupted.
- The file is an incompatible media, for example, a media built by InstallShield Professional 5.x.

Error -7044
InstallShield 2020

Message
Product Version is not specified in the Product Properties view.

Troubleshooting Information
You must specify a non-null value in the Product Version setting in the General Information view.
Error -7045

InstallShield 2020

Message
File could not be found - "path\Corecomp.ini"

Troubleshooting Information
Corecomp.ini could not be found in the indicated location. If you have renamed or moved Corecomp.ini, place a copy in the indicated location with the file name Corecomp.ini. If you cannot restore Corecomp.ini in this way, run a repair of InstallShield.

Error -7126

InstallShield 2020

Message
Unable to build the setup.

Description
There is not enough free disk space to build the setup.

Troubleshooting Information
The Media Wizard requires space in the system's temporary folder. Make sure you have enough free space on this drive, as well as in the build location.

Error -7127

InstallShield 2020

Message
The Disk Images directory is use by another program.

Troubleshooting Information
This error can occur for any of the following reasons:

- The Disk Images or Disk1 folder that you are trying to build to may be open in Windows Explorer or DOS. Open a different folder in the Windows Explorer or DOS window, or close the window, and then rerun the media builder.

- The Disk Images or Disk1 folder is read-only. Right-click the folder in Windows Explorer and click Properties. If the folder is marked as read-only, uncheck the read-only check box and then rerun the media builder.

- A folder named bldback exists under the folder where the media is being built to. If such a folder exists, delete it, and then rerun the media builder.
Error -7275

Message
Certificate invalid.

Troubleshooting Information
The digital certificate that is specified for your project is invalid. Specify a valid certificate and build again.

Error -7276

Message
Certificate expired.

Troubleshooting Information
Your digital certificate has expired. Specify a current certificate and build again.

Error -7380

Message
Build canceled by the user.

Description
The build has been canceled by the user.

Troubleshooting Information
The user canceled the build process by clicking the Cancel button.

Error -9008

Message
Failed saving object property.

Troubleshooting Information
This error can occur if an object in the project is corrupted (for example, is missing Isrt.dll).
MSI/MSM Conversion Errors

The table below provides troubleshooting tips for each error that could be encountered while converting an installation package (.msi file) or merge module (.msm file) in the Open MSI/MSM Wizard.

The wizard also returns errors from accessing Windows Installer databases. For more information on those errors, see Build Errors and Warnings. You might receive undocumented, internal errors if the source .msi or .msm package is invalid.

Tip • Before launching the Open MSI/MSM Wizard, validate the package with Orca or Msival2.exe, both part of the Microsoft Windows Installer Platform SDK.

Table 13-4 • MSI and MSM Conversion Errors

<table>
<thead>
<tr>
<th>Error Number</th>
<th>Message</th>
<th>Troubleshooting Tips</th>
</tr>
</thead>
<tbody>
<tr>
<td>-6000</td>
<td>Unable to open file</td>
<td>The path to the .msi or .msm file might be invalid.</td>
</tr>
<tr>
<td></td>

<tr>
<td>100001</td>
<td>Unexpected error</td>
<td>The error message lists the function and table name associated with the error.</td>
</tr>
<tr>
<td>100002</td>
<td>Unable to extract file from the cabinet</td>
<td>Verify that the source is a valid .msi or .msm database.</td>
</tr>
<tr>
<td>200001</td>
<td>No output path was specified</td>
<td>This warning appears if the converter needs to extract binary files from the database tables or cabinet files, but an invalid output path was specified in the Data File Location box on the <strong>File Locations</strong> panel of the Open MSI/MSI Wizard.</td>
</tr>
</tbody>
</table>
Internal Errors

The following are internal errors. They should not be encountered when importing a valid .msi or .msm database. Before launching the Open MSI/MSM Wizard, validate the package with Orca or Msival2.exe, both part of the Microsoft Windows Installer Platform SDK.

The error message will display the database table, field, and value for which the conversion failed.

Table 13-5 • Internal Errors

</tbody>
</table>
Errors and Warnings

This information applies to the following project types:
- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- QuickPatch
- Transform

The following table contains a listing of Windows Installer errors that may occur during run time of an installation. The errors are related to the built-in InstallShield custom actions that are added automatically to InstallShield projects to support different functionality. For a list of the custom actions, see InstallShield Custom Action Reference.

### Chapter 13

Errors and Warnings

**Table 13-6 • Windows Installer Run-time Errors (cont.)**

<table>
<thead>
<tr>
<th>Error Number</th>
<th>Message</th>
<th>Troubleshooting Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>27510</td>
<td>Error installing COM+ application [2]. Could not load Microsoft(R) .NET class libraries. Registering .NET serviced components requires that Microsoft(R) .NET Framework be installed.</td>
<td>This error may occur if your project contains a COM+ application that you configured in the Component Services view. To prevent this error from occurring, consider adding the .NET Framework to your project. To learn how, see Adding .NET Framework Redistributables to Projects. As an alternative, you can use the Installation Requirements page in the Project Assistant to add a .NET Framework requirement to your project. If a target system does not have the appropriate version of the .NET Framework, the installation displays an error message, and the product is not installed.</td>
</tr>
<tr>
<td>27511</td>
<td>Could not execute SQL script file [2]. Connection not open: [3]</td>
<td>This error may occur if your project contains a SQL script that you configured in the SQL Scripts view. This error occurs if the connection is disconnected before the installation runs the SQL script.</td>
</tr>
</tbody>
</table>
| 27514        | This installation requires a Microsoft SQL Server. The specified server [3] is a Microsoft SQL Server Desktop Engine or SQL Server Express. | This error may occur if your project contains a SQL connection that you configured in the SQL Scripts view. This error occurs if the target system has Microsoft SQL Server Desktop Engine or Microsoft SQL Server Express, and if the following check boxes are cleared on the Requirements tab for a SQL connection in the SQL Scripts view:  
  •  Allow installation to Microsoft SQL Server Desktop Engine/SQL Server Express  
  •  Allow installation to continue when minimum requirements are not met |
| 27515        | Error retrieving schema version from [2] [3]. Database: [4] [5]           | This error may occur if your project contains a SQL script that you configured in the SQL Scripts view, and if a version is specified in the Schema Version setting on the General tab for that SQL script. This error occurs if the target database server encounters a SQL script error when the run time attempts to retrieve the current schema version from the InstallShield table. |
Table 13-6 • Windows Installer Run-time Errors (cont.)

<table>
<thead>
<tr>
<th>Error Number</th>
<th>Message</th>
<th>Troubleshooting Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>27516</td>
<td>Error writing schema version to [2] [3]. Database: [4]. [5]</td>
<td>This error may occur if your project contains a SQL script that you configured in the SQL Scripts view, and if a version is specified in the Schema Version setting on the General tab for that SQL script. This error occurs if the target database server encounters a SQL script error when the run time attempts to write a schema version to the InstallShield table.</td>
</tr>
<tr>
<td>27517</td>
<td>This installation requires Administrator privileges for installing COM+ applications. Log on as an administrator and then retry this installation.</td>
<td>This error may occur if your project contains a COM+ application that you configured in the Component Services view. This error occurs if you do not have administrator privileges for installing COM+ applications, but you are running an installation that includes COM+ applications.</td>
</tr>
<tr>
<td>27519</td>
<td>Error updating XML file [2]. [3]</td>
<td>This error may occur if your project contains XML references that you configured in the XML File Changes view. This error occurs if MSXML fails to save the target XML file. The [3] parameter refers to the error code that MSXML returned. Possible error codes are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• XML_BAD_ENCODING—The XML file contains a character that is not part of the specified encoding, which is defined on the Advanced tab for an XML file in the XML File Changes view.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• E_INVALIDARG—The XML file does not have a valid file name.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• E_ACCESSDENIED—A file system error occurred.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• E_OUTOFMEMORY—The XML file could not be saved. Other values that can occur indicate that a file system error occurred.</td>
</tr>
<tr>
<td>27520</td>
<td>Error opening XML file [2]. [3]</td>
<td>This error may occur if your project contains XML references that you configured in the XML File Changes view. This error occurs if MSXML fails to load the target XML file. The [3] parameter refers to the error code that MSXML returned. A possible error codes is:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• S_FALSE—The XML file load failed.</td>
</tr>
</tbody>
</table>

<td>27552</td>
<td>Error creating database [4]. Server: [2] [3]. [5]</td>
<td>This error may occur if your project contains a SQL connection that you configured in the SQL Scripts view, and if the Create Catalog If Absent check box on the General tab for the connection is selected. This error occurs if the target database server encounters a SQL scripting error when creating the database catalog that is specified in the Catalog Name setting on the General tab for a SQL connection in the SQL Scripts view.</td>
</tr>
<tr>
<td>27553</td>
<td>Error connecting to database [4]. Server: [2] [3]. [5]</td>
<td>This error may occur if your project contains a SQL connection that you configured in the SQL Scripts view. This error occurs if the target database server encounters a SQL scripting error when connecting to the database catalog that is specified in the Catalog Name setting on the General tab for a SQL connection in the SQL Scripts view.</td>
</tr>
</tbody>
</table>
Setup.exe Return Values and Run-Time Errors (InstallScript Projects)

InstallShield 2020

Project • This information applies to InstallScript projects.

Setup.exe may produce error messages if it cannot start properly. In most cases, you will encounter these messages when a severe error occurs. Rarely will your end users see these messages.

You can capture these return values when you call the CreateProcess API to launch Setup.exe, or use a batch file to launch Setup.exe.

When you get an error message, it appears in a message box. Every error message has a number. These are InstallScript system error messages, and there is no way to suppress them in your script. The following table describes each of these error messages:

<table>
<thead>
<tr>
<th>Error/Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3010</td>
<td>The installation required a restart but the installation is not initiating the restart. In this case, the installation completed with BATCH_INSTALL set to a non-zero value, but the System function was not called. Note that Setup.exe returns this value only if the installation was successful and was not cancelled (that is, the installation did not end via the abort keyword). Otherwise, the appropriate error value or ISERR_SETUP_CANCELED is returned. The constant for this return value is ERROR_SUCCESS_REBOOT_REQUIRED.</td>
</tr>
</tbody>
</table>
This return value occurs if the installation itself is restarting the machine because the `System` function was called—typically as a result of the `SdFinishReboot` function calling `System` internally.

Note that Setup.exe returns this value only if the installation was successful and was not cancelled (that is, the installation did not end via the abort keyword). Otherwise, the appropriate error value or ISERR_SETUP_CANCELED is returned.

The constant for this return value is ERROR_SUCCESS_REBOOT_INITIATED.

<table>

Setup.exe Return Values and Run-Time Errors (Basic MSI and InstallScript MSI Projects)

InstallShield 2020

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Note that project-specific differences are explained where applicable.

The table below lists the errors that might occur when Setup.exe from a Basic MSI or InstallScript MSI project is run. For Setup.exe errors that might occur for an InstallScript project, see Setup.exe Return Values and Run-Time Errors (InstallScript Projects).

You can capture these return values when you call the **CreateProcess** API to launch Setup.exe, or use a batch file to launch Setup.exe.

<td><strong>Project</strong> • This is applicable to InstallScript MSI projects.</td>
<td>If the Windows Installer engine returns ERROR_SUCCESS (0), the Setup.exe file may return ERROR_SUCCESS_REBOOT_INITIATED (1641). This return value occurs if the installation itself is restarting the machine because the <strong>System</strong> function was called—typically as a result of the <strong>SdFinishReboot</strong> function calling <strong>System</strong> internally.</td>
</tr>
</tbody>
</table>
Unable to load module [1], Error Code: [2]

[1] is the full path to the .dll file that the installation is attempting to load (ISSetup.dll in all cases).

[2] is the Windows error returned from LoadLibrary().

This error occurs if ISSetup.dll is not in the Disk1 folder. It also may occur if ISSetup.dll is compressed in Setup.exe if a compressed media is being built.

To resolve this error, try rebuilding the release.

An error occurred initializing the InstallScript engine.

Project • This is applicable to InstallScript MSI projects.

This error indicates that a problem occurred when the InstallScript engine was being loaded.

Unable to extract InstallScript engine support files to temp location.

Project • This is applicable to InstallScript MSI projects.

This error occurs if one or more files could not be extracted from the ISSetup.dll file to a temporary directory.

To troubleshoot this error, create a Windows Installer log file to obtain more information. The log file has the corresponding Windows error number and other diagnostic information that may help troubleshoot this issue.

Error configuring ODBC data source. Verify that the file exists and that you can access it.

Machines running Windows 95 do not have the ODBC core. You need to install MDAC before installing any package with an ODBC driver.

The installation was successful and a restart is required to complete the installation.

Project • This is applicable to InstallScript MSI projects.

If the Windows Installer engine returns ERROR_SUCCESS (0), the Setup.exe file may return ERROR_SUCCESS_REBOOT_REQUIRED (3010). This indicates that installation required a restart but the installation is not initiating the restart. In this case, the installation completed with BATCH_INSTALL set to a non-zero value, but the System function was not called.

Setup.exe Return Values and Run-Time Errors (InstallScript Projects)
Setup.exe Return Values and Run-Time Errors (Advanced UI and Suite/Advanced UI Projects)

InstallShield 2020

Project • This information applies to the following project types:
  • Advanced UI
  • Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The table below lists the errors that might occur when an end user runs an Advanced UI or Suite/Advanced UI Setup.exe installation. The Type of Code column in this table indicates the following information:
  • Exit code only—The installation status is returned by the Advanced UI or Suite/Advanced UI Setup.exe file.
  • Error code/exit code—The installation status is processed for evaluated error conditions, and the status is returned by the Advanced UI or Suite/Advanced UI Setup.exe file.
  • Logged only—The installation status is logged when debug logging is enabled. (Debug logging is enabled when the /debuglog command-line parameter is passed to the Advanced UI or Suite/Advanced UI Setup.exe file to launch the Advanced UI or Suite/Advanced UI installation. For more information on command-line parameters, see Advanced UI and Suite/Advanced UI Setup.exe Command-Line Parameters.)

Note • Some of the error messages may be displayed before any string entries are available to the running Advanced UI or Suite/Advanced UI Setup.exe file. Therefore, in such cases (for example, Setup.xml is missing, another instance of the Advanced UI or Suite/Advanced UI installation is already running, or condition validation failed), those particular resulting error messages are displayed in English. Other errors that occur before language selection are typically displayed in the default setup language.

Visual Studio Project Import Errors and Warnings

InstallShield 2020

This table lists the errors and warnings that might occur when you do any of the following:
- Convert a Visual Studio setup project (.vdproj) to an InstallShield Basic MSI project (.ism).
- Convert a Visual Studio merge module project (.vdproj) to an InstallShield Merge Module project (.ism).
- Import a Visual Studio setup or merge module project (.vdproj) into an InstallShield Basic MSI or Merge Module project (.ism).

| -9070                   | An error occurred while converting the prerequisites. | This error occurs if you import a Visual Studio setup project that contains a prerequisite but InstallShield encounters a problem when trying to map the Visual Studio prerequisite to an equivalent InstallShield prerequisite.  
To resolve this error, request technical support, or consider creating an InstallShield prerequisite that installs the required redistributable, and add that InstallShield prerequisite to your project. For more information, see Defining InstallShield Prerequisites and Working with InstallShield Prerequisites that Are Included in Installation Projects. |
| -9071                   | InstallShield has no equivalent InstallShield prerequisite for '%1'. The prerequisite was not converted. | This warning occurs if you import a Visual Studio setup project that contains a prerequisite but InstallShield does not have an equivalent InstallShield prerequisite.  
To resolve this warning, consider creating an InstallShield prerequisite that installs the required redistributable, and add that InstallShield prerequisite to your project. For more information, see Defining InstallShield Prerequisites and Working with InstallShield Prerequisites that Are Included in Installation Projects. |
| -9074                   | An error occurred while converting the project outputs. | This error occurs if you convert a Visual Studio setup or merge module project that contains one or more project outputs but InstallShield encounters a problem when incorporating the project outputs into the InstallShield project.  
To resolve this error, request technical support. |
| -9075                   | An error occurred while converting the project output '%1'. Type: %2 | This error occurs if you convert a Visual Studio setup or merge module project that contains one or more project outputs but InstallShield encounters a problem when incorporating the project outputs into the InstallShield project.  
To resolve this error, request technical support. |
| -9076                   | The project output type '%1' is invalid. The project output '%2' was not converted. | This error occurs if you convert a Visual Studio setup or merge module project that contains one or more project outputs but one of the project outputs is invalid.  
To resolve this error, review the project output in your Visual Studio project, and try to resolve any issues with it. Then convert the Visual Studio project to an InstallShield project. |
### Table 13-11 • Visual Studio Project Import Errors and Warnings (cont.)

<table>
<thead>
<tr>
<th>Error or Warning Number</th>
<th>Message</th>
<th>Troubleshooting Tips</th>
</tr>
</thead>
<tbody>
<tr>
<td>-9077</td>
<td>File key ‘%1’ already exists in the InstallShield project. The project output ‘%2’ was not converted.</td>
<td>This warning occurs if you have a Visual Studio project that contains a project output that has a file that is associated with a particular file key, and you import that project into a InstallShield project that already contains a file with that same file key. This scenario may occur if you import the same Visual Studio project into your InstallShield project more than once. <tr>
<td>-9079</td>
<td>The Visual Studio project ‘%1’ could not be found in the current Visual Studio solution. The project output ‘%2’ was not converted.</td>
<td>If you want to import into an InstallShield project a Visual Studio setup or merge module project that contains a project output, the Visual Studio project must be in the same solution as all of its project dependencies. Otherwise, this error occurs when you try to import the Visual Studio project. To resolve this error, ensure that your InstallShield project is in the same Visual Studio solution that contains the Visual Studio setup or merge module project that you are importing. In addition, ensure that the solution also includes all of the other Visual Studio projects that are dependencies of the Visual Studio setup or merge module project. Then you can import the Visual Studio setup or merge module project into your InstallShield project.</td>
</tr>
<tr>
<td>-9080</td>
<td>The project output group ‘%1’ could not be found in the Visual Studio project ‘%2’. The project output ‘%3’ was not converted.</td>
<td>This error occurs if you convert a Visual Studio setup or merge module project that contains a project output group but InstallShield encounters a problem when incorporating a project output of that group into the InstallShield project. To resolve this error, request technical support.</td>
</tr>

Error Number

Message

Troubleshooting Tips

-302

Could not find key DISPLAYTEXT
under section <SectionName> in
file <Path>\Default.cdf

The display name for one of your components could not be
read. Enter this information manually in the Display Name
property for the feature created from your component.

-303

Could not find key COMMENT
under section <SectionName> in
file <Path>\Default.cdf

The comments for one of your component could not be
found. Enter this information manually in the Comments
property of the appropriate component.

-306

Could not find key <KeyName>
under section <SectionName> in
file <.ipr file>.

If your project was created with a version of InstallShield
Professional earlier than InstallShield Professional 7.0, you
can ignore this warning.

-341

Error Opening file:
<Path<\Default.cdf

There was an error importing your components. As a result,
no features were created. Verify the component settings in
your InstallShield Professional, save, and open your project
in InstallShield again.

-342

Could not find section
[COMPONENTS] in file
<Path>\Default.cdf

There was an error importing your components. As a result,
no features were created. Verify the component settings in
your InstallShield Professional project, save, and open your
project in InstallShield again.

-343

Could not find section
<SectionName> in file
<Path>\Default.cdf

There was an error importing one of your components. As a
result, that component was not migrated. Verify the
component settings in your InstallShield Professional
project, save, and open your project in InstallShield again.

-401

Error opening file
<Path>\Default.reg

The registry information associated with your InstallShield
Professional project could not be read. As a result, no
registry information was migrated. Verify the registry
settings in your InstallShield Professional project, save, and
open your project in InstallShield again.

-402

Could not find section [DATA] in
file <Path>\Default.re

The registry information associated with your InstallShield
Professional project could not be read. As a result, no
registry information was migrated. Verify the registry
settings in your InstallShield Professional project, save, and
open your project in InstallShield again.

-403

Could not find section
<SectionName> in file
<Path>\Default.re

A portion of your registry information could not be read. As
a result, that registry data was not migrated. Verify the
registry settings in your InstallShield Professional project,
save, and open your project in InstallShield again.

</table>
Because of the differences in architecture between InstallShield Professional and InstallShield 2020, upgrading your installation project might involve some manual adjustment.

If you need to manually adjust settings within your project, a warning appears in the Output window after your project is upgraded. Refer to the associated help topic to learn what you need to do. (cont.)

Upgrade Warnings (Upgrading from InstallShield Professional)

Upgrade Warning 289: File Link Does Not Exist for Dynamically Linked File

InstallShield 2020

In InstallShield Professional, dynamically linking to your source files allows you to add the contents of complete folders and subfolders to your setup without hard-coding paths or file names. If you add files to the source folder or remove files, the list of included files was dynamically updated when you build your release.

Upgrading to InstallShield 2020

When you upgrade an InstallShield Professional project to InstallShield 2020, and include a file via dynamic file linking that does not exist, Upgrade Warning 289 appears. The warning informs you that a file link has been created, but the file does not exist.

Upgrade Warning -305: Include In Build Property for the InstallShield Professional Component Could Not Be Directly Migrated

InstallShield 2020

If a component in your InstallShield Professional project had its Include In Build property set to No, the corresponding feature will have its Release Flags property set to EXCLUDEFROMBUILD. To exclude the feature from your setup, you need to manually set a release flag in the Releases view or the Filtering Settings panel of the Release Wizard.

Note • Because the release flag in the Releases view indicates which features to include in the setup, the flag you specify in the Releases view must be something other than EXCLUDEFROMBUILD.
Upgrade Warning -480: Incrementing the Shared .dll Reference Count for Files in a File Group

InstallsHield 2020

In InstallShield Professional versions 6.x and earlier, setting the shared property for a file group resulted in incrementing the shared .dll reference count for all files in that file group on installation. This upgrade migrates this setting to the shared attribute of the component created, in InstallShield 2020, for this file group.

Shared .dll Reference Count Behavior

In InstallShield 2020, setting the shared attribute of a component results in incrementing of the shared .dll reference count of only the key file for that component. By definition, there can be only one key file per component. In order to increment the shared reference count for multiple files, each file requires its own component and the file must be the key file in that component.

Note • For .exe, .dll, and .ocx files, you can use the Component Wizard to quickly create components for large numbers of files.

In InstallShield 2020, even if a file is not marked as shared, if a shared .dll reference count already exists for a file, it is automatically incremented by the installation of that file and decremented by the uninstallation of that file.

Additionally, reference counts are maintained for components based on the component GUID (or Component Code property). Therefore, the shared property of a component is useful only where there might be file sharing with legacy installations, or if other components with differing component GUIDs install this file.

Upgrade Warning -481: Incrementing the Shared DLL Reference Count for Dynamically Linked Files in a File Group

InstallsHield 2020

In InstallShield Professional version 6.x and previous, setting the shared property for a file group which contained a dynamic file link resulted in incrementing the shared DLL reference count for all files in that file group on installation—regardless of the file link type. This upgrade migrates this setting to the shared attribute of the component created, in InstallShield 2020, for this file group.

Shared DLL Reference Count Behavior

In InstallShield 2020, setting the shared attribute of a component results in incrementing of the shared DLL reference count of only the key file for that component. Because dynamically linked files cannot be used as key files, the shared reference count is not incremented for any of the component’s files.

A component can have only one key file. Therefore, in order to increment the shared reference count for multiple files, each file must be in its own component and the file must be the component’s key file. Files must be statically linked if you want the reference count to increment the shared DLL reference count for each file.
Note • For EXE, DLL and OCX files, you can use the Component Wizard to quickly create components for large numbers of files.

In InstallShield 2020—even if a file is not marked as shared—if a shared DLL reference count already exists for a file, it is automatically incremented by the installation of that file and decremented by the uninstallation of that file.

Additionally, reference counts are maintained for components based on the component GUID (or Component Code property). Therefore, the shared property of a component is useful only where there might be file sharing with legacy installations, or if other components with differing component GUIDs install this file.

Upgrade Warning -486: Specifying Shortcut Icons

InstallShield 2020

Shortcut Creation in InstallShield Professional

In InstallShield Professional version 6.x and earlier, shortcut icons were authored from the target machine’s perspective. For example, if the shortcut’s icon was installed to <TARGETDIR>\MyIcon.ico, that was the qualified path specified for the shortcut icon. At run time, the shortcut creation process would bind to the icon on the target machine.

Shortcut Creation

In InstallShield 2020, shortcut icons must be linked to at design time. Instead of specifying a path on the target machine as the icon file, the project file must specify a path on the build machine as the icon file. The build engine then creates a separate stream for your icon in the installation. The installation then uses that stream at run time during its icon creation process. This means that the setup no longer has to install the icon it is using for its shortcuts.

When upgrading your InstallShield Professional projects, InstallShield 2020 attempts to match the target icon path with a file that exists in your setup project. If unable to do so, this warning is displayed.

Correcting the Path to the Shortcut Icon

Tip • To correct the shortcut icon path:

1. Go to the Shortcuts view in the IDE and click the shortcut specified in the warning message.

2. In the Icon File property field, browse to the icon file.

Note • Shortcut icons are required in InstallShield 2020. If an icon is not specified, the build engine uses the first icon index of the shortcut’s target file as the shortcut icon.
Upgrade Warning -487: Overwriting Files Upon Installation

InstallShield 2020

**Installing Files Based on the File Group’s Overwrite Property**

In InstallShield Professional version 6.x and earlier, you had the ability to set overwrite properties for individual file groups. One file group could install files based on date, while another installed files only if the file version is older than the file version on the target machine.

**Installing Files Based on File Versioning Rules**

InstallShield 2020 uses a methodology called file versioning rules to determine which files need to be installed on the target machine. The only option at the component level to override file versioning rules is to set the Never Overwrite property to Yes.

**File Versioning Alternatives**

Although the default file versioning rules are satisfactory for most applications, there might be cases where an application's requirements necessitate that you control the rules used to decide if a file should be overwritten. To this end, there are a couple of alternatives to file versioning that can be used either individually or in conjunction with each other to modify file versioning rules.

**REINSTALLMODE**

The REINSTALLMODE technique for overriding file versioning rules is a global mechanism for establishing custom versioning rules. Using this technique affects versioning rules for all files in the installation.

<table>
<thead>
<tr>
<th>Task</th>
<th>To use the REINSTALLMODE property:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Open the Property Manager.</td>
</tr>
<tr>
<td>2.</td>
<td>Create a property called REINSTALLMODE.</td>
</tr>
<tr>
<td>3.</td>
<td>Set the value of this property based on the option codes specified for the REINSTALLMODE property.</td>
</tr>
</tbody>
</table>

The installer reads this property at install time and uses its settings to override file versioning. This setting is also used by the installer during a reinstallation or repair of the application.

**Companion Files**

The companion files technique for overriding file versioning rules enables you to configure a file so that it installs based on the installation of a companion file. This technique is useful when it makes sense to bind the installation states of several files together.

For example, you can bind a non-versioned user data file to a versioned .exe file. If the .exe is not installed, the user data is not installed.
Upgrade Warning -488: Obsolete Event Encountered in Script File

An obsolete event was encountered in your script file. While most InstallShield Professional script events are supported in InstallShield 2020, there are some that are not available.

Events With Comparable Functionality

- OnInstallingFile
- OnUninstallingFile

These two events have been replaced with the OnInstallFilesActionBefore and OnInstallFilesActionAfter. These events are called in Install, Uninstall, and Maintenance modes.

The OnInstallFilesActionBefore event is called when the installation is preparing to add or remove files from the target machine based on the Action state of the component containing those files. On uninstall, all related actions that require the source file have already been performed—such as removing any shortcuts to the file and unregistering the file’s COM data.

The OnInstallFilesActionAfter event is called when the installation has finished adding or removing files from the target machine. On Install, the related install actions for a file have yet to be performed, such as the registration of NT Services and creation of ODBC entries.

Note: When using the OnInstallFilesActionBefore and OnInstallFilesActionAfter events, you can use the Windows Installer API function MsiGetComponentState to determine the action state of a component.

Event with Partial Support

The OnSelfRegistrationError event is called if you are using the XCopyFile function to copy your application files to the source media.

Unsupported Events

The following events are not supported in InstallShield 2020:

- OnFileReadOnly
- OnFileLocked
- OnNextDisk
- OnRemovingSharedFile
- OnFileError
- OnInternetError
- OnMD5Error
Upgrade Warning 495: ODBC Core Not Installed by Default

The ODBC core is not installed by default. If this is required by your setup project, select the MDAC merge module from the Redistributables view.

MDAC Prerequisite for ODBC Installation

Although InstallShield Professional provided an object that installed the ODBC core as well as ODBC drivers, InstallShield 2020 does not directly support this functionality. Because Microsoft requires you to install ODBC as a subset of MDAC, the Windows Installer does not support direct installation of the ODBC core.

Upgrade Errors and Warnings (Upgrading from InstallShield—Windows Installer Edition)

This table provides tips for troubleshooting errors and warnings that may occur when you upgrade a project (.ism file) created using a version of InstallShield—Windows Installer Edition to InstallShield.

Table 13-14 • Upgrade Errors and Warnings

<table>
<thead>
<tr>
<th>Error or Warning Number</th>
<th>Message</th>
<th>Troubleshooting Tips</th>
</tr>
</thead>
<tbody>
<tr>
<td>-100</td>
<td>This error occurs if you are upgrading a project that has a registry value set as a keypath for a component.</td>
<td>You cannot set a registry value as a keypath for a component. To avoid this error, remove that keypath from the component and attempt the upgrade again.</td>
</tr>
<tr>
<td>-201</td>
<td>This error occurs if your project contains a component with duplicate file names in it. The upgrader keeps only one of these files and deletes the rest.</td>
<td>To avoid this problem, make sure that you do not have duplicate file names within the same component.</td>
</tr>
<tr>
<td>-2007</td>
<td>These errors occur if the upgrader cannot read information from the old table structure, or it cannot write information to the new table structure.</td>
<td>Once the file has been upgraded, you need to navigate to the areas that failed and reinsert your settings.</td>
</tr>
<tr>
<td>-2011</td>
<td>The scripting billboard is no longer supported in the Basic MSI project. This property is not being upgraded.</td>
<td>To add support for this property after your project is upgraded, you can convert your project to an InstallScript MSI project and add your billboards in the Support Files/Billboards view.</td>
</tr>
</tbody>
</table>
Table 13-14 • Upgrade Errors and Warnings (cont.)

<table>
<thead>
<tr>
<th>Error or Warning Number</th>
<th>Message</th>
<th>Troubleshooting Tips</th>
</tr>
</thead>
<tbody>
<tr>

HRESULT Values for Windows Installer Run-time Errors

InstallShield 2020

ISRegSrv.dll is the InstallShield DLL that is called from custom actions to register and unregister self-registering files on the target system. The DLL displays the Windows Installer run-time error 1904 or 1905 when it fails for particular reasons.

[3] could be one of InstallShield’s custom HRESULTs.

Table 13-15 • HRESULT Values for Windows Installer Run-time Errors

<table>
<thead>
<tr>
<th>HRESULT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-2147220475</td>
<td>Invalid file extension as a self-register file.</td>
</tr>
<tr>
<td>-2147220474</td>
<td>Executable file extension, but not actually an executable.</td>
</tr>
<tr>
<td>-2147220473</td>
<td>Generic registration failure.</td>
</tr>
<tr>
<td>-2147220472</td>
<td>Generic unregistration failure.</td>

DIFxAPI Errors (InstallScript Projects)

InstallShield 2020

This table lists DIFxAPI errors that can be returned calling DIFx driver functions. If the return value from a DIFx driver function is a Win32 error (a positive return value), ISERR_WIN_BASE is added to the error so that it is less than ISERR_SUCCESS. For the most updated documentation on Win32 errors, see the MSDN Library.

Table 13-16 • DIFxAPI Errors (InstallScript)

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISERR_ISERVICE_NOT_ENABLED</td>
<td>Indicates that DIFx support has not been enabled or was disabled using Disable (SERVICE_DIFX_*) For information on enabling DIFx support, see Installing Device Drivers.</td>
</tr>
<tr>
<td>ISERR_WIN_BASE + ERROR_INVALID_FUNCTION</td>
<td>Indicates that the difxapi.dll was not found (in SUPPORTDIR) or that an exported function could not be found. Verify that you have enabled DIFx support in your project.</td>
</tr>
<tr>
<td>ERROR_DEPENDENT_APPLICATIONS_EXIST</td>
<td>The function removed an association between the driver package and the specified application but the function did not uninstall the driver package because other applications are associated with the driver package.</td>
</tr>
<tr>
<td>ISERR_WIN_BASE + ERROR_ALREADY_EXISTS</td>
<td>The driver package is already preinstalled and was not preinstalled again.</td>
</tr>
<tr>
<td>ISERR_WIN_BASE + ERROR_INSUFFICIENT_BUFFER</td>
<td>The pDestInfPath buffer is not large enough to retrieve the requested .inf file path.</td>
</tr>
</tbody>
</table>
### Table 13-16 • DIFxAPI Errors (InstallScript) (cont.)

<td>ERROR_INVALID_CATALOG_DATA</td>
<td>The catalog file for the driver package is not valid or was not found.</td>
</tr>
</tbody>
</table>
"String PRODUCT_NAME was not found in string table" Error

InstallShield 2020

While converting an InstallScript MSI project to an InstallScript project, you may encounter this error when your setup project does not run during the conversion. You should verify if SHELL_OBJECT_FOLDER = @PRODUCT_NAME, is in your script.
**Note** • Setting SHELL_OBJECT_FOLDER in OnFirstUIBefore is not necessary. If you have the following line in your script, you should delete it:

```plaintext
SHELL_OBJECT_FOLDER = @PRODUCT_NAME;"
```

### InstallScript Error Information

**InstallShield 2020 » InstallScript Language Reference**

The InstallScript compiler displays error messages in the Output window. This window, which is normally positioned near the bottom of the main window, has a Compile tab. If the Output window is not present, on the View menu in InstallShield, click Output.

The following types of error messages are displayed to identify errors in your setup script:

<table>
<thead>
<tr>
<th>Table 13-17 • Error Message Types</th>

### InstallScript Syntax or Compiler Errors

**InstallShield 2020 » InstallScript Language Reference**

Syntax errors prevent the file Setup.inx from being created and cause the compiler to display one of the error messages in the list below. A single syntax error can cause the compiler to generate more than one error message. The first error message is triggered by the syntax error. The others are triggered because the compiler is not able to resolve the statement or statements that follow the error.

**Tip** • If your script generates more than one syntax error, correct the first one in the list and then recompile. By correcting the first error, you might eliminate one or more of the others.

InstallScript Limits

Error C8001

InstallShield 2020 » InstallScript Language Reference

Message
'program' : multiple main programs defined

Description
The keyword program was encountered after the main program block.

Troubleshooting Tips
A script can contain only one main program block—beginning with the keyword program and ending with the keyword endprogram. Restructure your script to use only one main program block.

If your script consists of multiple source files, this error message occurs if more than one of those source files contains a main program block.

Declarations
Program Block
The Structure of a Setup Script

Error C8002

InstallShield 2020 » InstallScript Language Reference

Message
'text' : function name expected

Description
The compiler expected to encounter a function name at the location indicated by text.

Troubleshooting Information
Check for a missing or mistyped function name before a parameter list.
Check for missing semicolons in preceding lines.
Error C8003

Message

'name' : function has no prototype declaration

Description

The function specified by *name* has not been declared in a prototype statement.

Troubleshooting Information

If the function has not been declared, insert a prototype statement before the current block (main program or function definition).

If the function has been declared ahead of the current block, compare the function declaration in the prototype statement with the function header in the function definition. Be sure the spelling of the function name is identical in both places and that the number and types of parameters matches.

If the function has been declared later in the script, move the declaration before the current block.

Declarations
Declaring Functions

Error C8004

Message

'name' : identifier already declared

Description

The identifier specified by *name* has already been declared in the current block. Identifiers can be declared only once in the same block.

Troubleshooting Information

Examine the main program block or function block where the error occurred to find the first declaration of the identifier. If the second declaration is simply a duplicate of the first, delete it. If you intended the second declaration to be a different variable than the first, rename the identifier in the second declaration and update all statements in the script that reference it.

If you cannot find a previous declaration of the variable, you may be declaring an identifier whose name is reserved in InstallScript. Reserved words are syntax colored in the script editor.

Reserved Words

Error C8005

InstallShield 2020 » InstallScript Language Reference

Message
'name' : function was declared as DLL function

Description
The function definition for the function specified by name is invalid because that function has been declared in a prototype statement as a DLL function.

Troubleshooting Information
If the function is not a DLL function, remove the DLL file name from the function prototype.

If the name of the user-defined function conflicts with the DLL function name, rename the user-defined function and update all statements in the script that reference it. Be sure the user-defined function has been declared in a prototype statement.

Error C8006

InstallShield 2020 » InstallScript Language Reference

Message
'text' : missing '(' after function name

Description
The compiler expected to find the opening parenthesis that follows a function name in a function definition; the character or characters indicated by text were encountered instead.

Troubleshooting Information
Check that the function’s parameter list is enclosed within parentheses. If the function takes no parameters, the parentheses will be empty.

Verify that only space characters come between the function name and its parameter list.

Building Functions

Error C8012

Message
'text' : semicolon expected

Description
The character or characters specified by text were encountered at a location where a semicolon was expected.

Troubleshooting Information
Insert a semicolon to terminate the statement that appears just before the error location.

Error C8013

Message
unexpected end of source file

Description
The compiler reached the end of the source file without encountering the keyword required to close the current program or function block.

Troubleshooting Tips
• If your script contains function definitions, check that each function definition is terminated with the keyword end and a semicolon.
• Check that typedef blocks are closed with an end statement.
• Check that all flow control blocks are correctly closed.
• Check that all #if, #ifdef, and #ifndef statements have a matching #endif statement.

Error C8016

Message
'name' : undefined label:

Description
The identifier specified by name is used in a goto statement to reference a label that has not been defined.

Troubleshooting Information
The error is located in the block directly above the error location. Find the goto statement that references name. If the goto statement is in a program block, it must reference a label that has been defined in the program block. If the goto statement is in a function definition, it must reference a label that has been defined in that function definition. Determine where you want control to flow and define the label at that location.

See Also
goto
if Structure with goto

Error C8017

Message
'text' : expected typedef (struct) name

Description
The character or characters specified by text were encountered at a location where a typedef declaration was expected.

Troubleshooting Information
Check that a data type has been specified for the variable being declared. Verify that the reserved word for that data type is spelled correctly and is in all upper case.

If more than one variable is declared for that data type, check that the individual identifier names are separated by commas and not some other punctuation mark.

Verify that the data declaration is terminated with a semicolon.

If the error occurs in a function prototype that declares a pointer to a structure as a parameter, check that the structure has been declared ahead of the function prototype.

Errors and Warnings

Error C8018

Message
'text' : typedef object illegal in this context

Description
The structure type specified by text was encountered at a location where it is not allowed.

Troubleshooting Information
This error occurs in a function prototype that declares a structure type as one of its parameters. This is not allowed. Instead, declare the parameter as a pointer to a structure by following the name of the structure type with the keyword POINTER, as shown below:

```c
typedef RECT
begin
   SHORT sX;
   SHORT sY;
end;

RECT Rectangle;
RECT POINTER pRect;

prototype SizeRectangle(RECT POINTER);
```

InstallShield 2020 » InstallScript Language Reference

Message
'text' : right bracket expected

Description
The character or characters specified by text were encountered at a location where a right bracket was expected.

Troubleshooting Information
This error occurs when the closing right bracket is missing from a reference to an array.

Error C8024
InstallShield 2020 » InstallScript Language Reference

Message
'text' : invalid array/string size

Description
The character or characters specified by text may not be used to declare the size of a string or array.

Troubleshooting Information
If the size indicator is a constant, verify that it is spelled correctly.
Verify that the size of the array is greater than 0.

See Also
String Indexing

Error C8025
InstallShield 2020 » InstallScript Language Reference

Message
'text' : undefined identifier
**Description**

The identifier specified by `text` has not been declared.

**Troubleshooting Information**

All identifiers in a script must be declared before they can be referenced in the main program block or in a function block. Check that the identifier has been declared. If it has, check that spelling used in the declaration matches the spelling of the identifier at the error location.

---

**Note** • Your script might be calling an unsupported function. See Unsupported Functions for more information.

"INSTALLDIR": undefined identifier" when Compiling After Conversion

Error C8025 specifies that the identifier (INSTALLDIR in this case) has not been declared. All identifiers in a script must be declared before they can be referenced in the main program block or in a function block.

---

**Note** • The exact error message for error C8025 is not a specific error. It is issued to anything undefined.

As part of the changes that take place during the conversion process (from InstallScript MSI to an InstallScript project), INSTALLDIR should have been changed to TARGETDIR throughout various IDE elements. Error C8025 occurs when the value of TARGETDIR is not set in your script.

Therefore, the value of TARGETDIR must be set in your script, as it is by default in the `OnFirstUIBefore` event handler function.

You can use the following code to set TARGETDIR:

```plaintext
if ( ALLUSERS ) then
    TARGETDIR = PROGRAMFILES ^ IFX_COMPANY_NAME ^ IFX_PRODUCT_NAME;
else
    TARGETDIR = FOLDER_APPDATA ^ IFX_COMPANY_NAME ^ IFX_PRODUCT_NAME;
```

Error C8028

InstallShield 2020 » InstallScript Language Reference

Message

'text' : unresolved operator

Description

The character or characters specified by text were encountered after an expression that could not be resolved.

Troubleshooting Information

This error occurs when an operand is missing from an expression. Examine each operator in the expression and make sure that each one has the operands it requires.

See Also

Operators
Chapter 13
Errors and Warnings

Error C8031

Message
'text' : uncalled function

Description
The character or characters specified by text were encountered after a function name, where the opening parenthesis of the argument list was expected.

This error occurs in statements in which the result of a function call is assigned to a variable. The message is triggered by an error in the argument list that follows the function name.

Troubleshooting Information
Check that the argument list is delimited from the function name by an opening parenthesis.

If the argument list was not specified, insert it after the function name; when calling a function that takes no parameters, place empty set of opening and closing parentheses after the function name.

Building Functions
Declarations
Declaring Functions

Error C8032

Message
'text' : missing member reference

Description
The character or characters specified by text were encountered at a location were a member name was expected.

Troubleshooting Information
The line of code at the error location references a structure rather than a member of a structure. Determine which member of the structure you intended to reference and insert that member name. Remember to use the member operator to delimit the structure name and the member name.

See Also
Data Structures
Member Operator (.)
Error C8033

Message
'text' : unsubscripted array

Description
The identifier that precedes the character or characters specified by text is an unsubscripted array variable. InstallScript does not allow references to a complete array structure. You must reference elements in the array individually.

Troubleshooting Information
Determine which element of the array you want to reference and indicate its position in the array with a subscript. The subscript must be placed within square brackets and positioned immediately after the array name.

Error C8034

Message
'text' : missing expression

Description
The character or characters specified by text were encountered at a location were an expression was expected.

Troubleshooting Information
This error generally occurs in an assignment statement when the value to be assigned is missing. Insert an expression to the right of the assignment operator.

If the error occurs in a statement that references a constant, verify that the definition of that constant includes both the constant name and a value.

See Also
#define
Assignment Operator

Error C8035

Error C8037

Message
'text' : variable required

Description
The constant, literal value or structure member specified by text is being passed as an argument in a parameter position that requires a variable.

Troubleshooting Information
Declare a variable of the type required for the parameter; assign the constant or literal value to that variable; then pass the variable instead of the constant or literal value.

InstallShield does not allow a structure member to be passed by reference. Declare a variable of the same type as the structure member; assign the value of the structure member to the new variable; then pass the variable instead. When the function returns, assign the value of variable to the structure member.
Error C8038

InstallShield 2020 » InstallScript Language Reference

Message
'text' : numeric value required

Description
The non-numeric argument specified by text was passed in a parameter position requiring a numeric argument.

Troubleshooting Information
Make sure all arguments passed are of the correct data types for the parameter positions they occupy. Also make sure no arguments are missing.

The statement at the location indicated by text specifies a process that is not allowed or is invalid in the current context.

**Troubleshooting Tips**
Examine the statement at the error location. Verify that the process is valid. Examples of invalid statements are assignment statements with a constant or an arithmetic operation on the left side of the assignment operator and an end statement directly below a label.

If the statement at the error location is valid, examine statement blocks (such as record declarations, control statements and function definitions) in the lines above the error location. Verify that each statement block is terminated with the correct keyword.

Error C8080

**Message**
'text' : missing arguments for function

**Description**
The character or characters specified by text were encountered after a function call where an argument list was expected.
Troubleshooting Information

Determine which arguments are required by the function and revise the call to include a complete argument list within parentheses.

Error C8081

InstallShield 2020 » InstallScript Language Reference

Message
'text' : invalid result for assignment

Description
The character or characters specified by text cannot be assigned the value specified by the assignment statement.

Troubleshooting Information
This error occurs when you attempt to assign a value to a structure. InstallScript does not allow direct assignment to a structure. You must assign a value to each member of the structure individually.

Error C8082

InstallShield 2020 » InstallScript Language Reference

Message
'text' : missing '(' after switch

Description
The character or characters specified by text were encountered in a switch...endswitch block at a location where a left parenthesis was expected.

Troubleshooting Information
Examine the switch statement in which this error occurred. The expression that follows the keyword switch must be enclosed within parentheses.

See Also
switch...endswitch
Error C8083

Message
'text' : missing ')' after switch

Description
The character or characters specified by text were encountered in a switch...endswitch block at a location where a right parenthesis was expected.

Troubleshooting Information
Examine the switch statement in which this error occurred. The expression that follows the keyword switch must be enclosed within parentheses.

See Also
switch...endswitch

Error C8084

Message
'text' : missing 'case' after switch

Description
The character or characters specified by text were encountered in a switch...endswitch block at a location where a case statement was expected.

Troubleshooting Information
This error will occur if the switch statement is terminated with a semicolon or is not followed immediately by a case statement.

See Also
switch...endswitch

Error C8085

Message
'text' : missing '='
Description
The character or characters specified by text were encountered in a for...endfor block at a location where an equal sign was expected.

Troubleshooting Information
This error occurs when the equal sign is missing in the expression that follows the keyword for. Examine the for statement at which the error occurred and verify that the expression that follows the keyword for is structured correctly.

See Also
for...endfor

Error C8086
InstallShield 2020 » InstallScript Language Reference

Message
'text' : missing 'to' or 'downto'

Description
The character or characters specified by text were encountered in a for...endfor block at a location where an equal sign was expected.

Troubleshooting Information
This error occurs when the keyword to or downto is missing in a for statement.

See Also
for...endfor

Error C8087
InstallShield 2020 » InstallScript Language Reference

Message
cannot return value from program

Description
The main program block contains a return statement. You cannot return a value from a program.

Troubleshooting Information
Remove the return statement from the program block.

Error C8089

InstallShield 2020 » InstallScript Language Reference

**Message**
'endfor' : not inside for statement

**Description**
The keyword endfor could not be matched to a previous for statement.

**Troubleshooting Information**
Examine the for...endfor block at the error location. Verify that the keyword endfor has a corresponding for statement. This error is often triggered after an earlier error in a for...endfor block.

**See Also**
for...endfor

Error C8090

InstallShield 2020 » InstallScript Language Reference

**Message**
'until' : not inside repeat statement
Description
The keyword until could not be matched to a previous repeat statement.

Troubleshooting Information
Examine the repeat...until block at the error location. Verify that the keyword until has a corresponding repeat statement. This error is often triggered after an earlier error in a repeat...until block.

See Also
repeat...until

Error C8091

InstallScript 2020 » InstallScript Language Reference

Message
'endwhile' : not inside while statement

Description
The keyword endwhile could not be matched to a previous while statement.

Troubleshooting Information
Examine the while...endwhile block at the error location. Verify that the keyword endwhile has a corresponding while statement. This error is often triggered after an earlier error in a while...endwhile block.

See Also
while...endwhile

Error C8092

InstallScript 2020 » InstallScript Language Reference

Message
'name' : function called but not defined

Description
The function specified by name has been prototyped and called in the body of the script, but it has not been defined.

Troubleshooting Information
This error can occur if the function name is not spelled identically in the prototype, the function call and the function definition. It can also occur if the function definition appears in a file that should have been included (with an #include statement) but was not.
See Also
Building Functions
Declarations
Declaring Functions

Error C8093

InstallShield 2020 » InstallScript Language Reference

Message
'name' : size required for string in typedef

Description
The identifier specified by name is a string that has been defined as a member in a typedef block, but it does not include a size specification.

Troubleshooting Information
Specify the size of all STRING declarations in a structure—InstallScript's autosizing feature does not work in typedef statements.

See Also
String Size and Autosize
Data Structures

Error C8097

InstallShield 2020 » InstallScript Language Reference

Message
'text' : syntax error

Description
The character or characters specified by text triggered an unclassified syntax error.

Troubleshooting Information
This error message is triggered for syntax errors for which there is not a specific error message.

Error C8098

InstallShield 2020 » InstallScript Language Reference

Message
'text' : missing '.name' after DLL name
**Description**
The character or characters specified by text were encountered after a DLL file name, where a function in the DLL file was expected.

**Troubleshooting Information**
When calling a function from a DLL, specify the function name, not the DLL file name.

**Error C8099**
InstallShield 2020 » InstallScript Language Reference

**Message**
'text' : DLL function name expected

**Description**
The character or characters specified by text were encountered after a DLL file name, where a function in the DLL file was expected.

**Troubleshooting Information**
This error occurs when the function name specified with a DLL file name has not been declared in a prototype statement. Verify that this function has been prototyped; if it has, check the spelling of the function name.

**Error C8100**
InstallShield 2020 » InstallScript Language Reference

**Message**
'name' : function not defined for this DLL

**Description**
The function specified by name has not been prototyped for the DLL whose name precedes it.

**Troubleshooting Information**
This error occurs when you have prototyped functions from two or more DLLs and then called one of those functions with the wrong DLL name.

**Error C8101**
InstallShield 2020 » InstallScript Language Reference

**Message**
'name' : must specify DLL for this function
**Description**

The function specified by `name` was prototyped twice from two different DLLs.

**Troubleshooting Information**

When calling functions with identical names from two or more DLLs, you must qualify the function name by prefixing it with the DLL name followed by a period, as in the example below:

```c
prototype MYDLL.UsefulFunction(INT, POINTER);
prototype YOURDLL.UsefulFunction(INT, POINTER);

export prototype MyFunc(HWND);
```

```c
function MyFunc(hMSI)
    NUMBER nValue;
    POINTER psvString;
begin
    MYDLL.UsefulFunction(nValue, psvString);
end;
```

**Error C8112**

**InstallShield 2020 » InstallScript Language Reference**

**Message**

'name' : typedef includes instance of self

**Description**

The data type of the member specified by `name` is invalid. A typedef cannot contain a member that is an instance of itself.

**Troubleshooting Information**

Restructure your typedefs to avoid this error.

**See Also**

Data Structures

**Error C8113**

**InstallShield 2020 » InstallScript Language Reference**

**Message**

'external' : local variables cannot be external

**Description**

The keyword external was encountered in data declaration within a function block.
Troubleshooting Information
Data that is local to a function cannot be declared external.

Error C8114

Message
'text' : preprocessor user define error

Description
This message is triggered by an #error directive.

See Also
#error

Error C8115

Message
'function name' : return type mismatch with prototype

Description
This message occurs when the return type of a script-defined function (the data type of the value returned by the function) is not the same in the function definition as it is in the function declaration. Note that if you do not explicitly specify a return type, the return type is assumed to be NUMBER.

Declaring Functions

Error C8126

Message
'text' : string variable required
**Description**
The character or characters specified by `text` were encountered at a location where a string declaration was expected.

**Troubleshooting Information**
To declare an array other than a character array (that is, a string), use parentheses rather than brackets; for example:

```plaintext
NUMBER nArray(3);
```

**Error C8127**

**Message**
`label illegal within try/catch/endcatch`

**Description**
You cannot define a label within a `try...catch...endcatch` statement.

**Troubleshooting Tips**
Examine the statement at the error location. Modify your code so that a label is no longer defined within the `try...catch...endcatch` statement.

**See Also**
`try, catch, and endcatch`

**Error C8128**

**Message**
`goto illegal within try/catch/endcatch`

**Description**
You cannot use a `goto` statement within a `try...catch...endcatch` statement.

**Troubleshooting Tips**
Examine the statement at the error location. Modify your code so that a `goto` statement is no longer used within the `try...catch...endcatch` statement.

**See Also**
`try, catch, and endcatch`
Chapter 13
Errors and Warnings

Error C8522

Message
Access is denied.

Description
InstallShield could not open the specified file.

Troubleshooting Information
This error message may occur because the specified file is read-only. In the Windows Explorer, locate the file and check its properties.

InstallScript Fatal Errors

Fatal errors are those that prevent the compilation from continuing. They are caused by missing include files, incorrectly specified file names, disk I/O errors, and insufficient system resources; the compiler also has certain built-in limitations, such as the limit on include files, that will trigger a fatal error if exceeded.

Error F8501

Message
I/O error on action file

Description
An error occurred when InstallShield attempted to access an intermediate file created during compilation.

Troubleshooting Information
Each time you compile your setup, InstallShield creates intermediate files with the following file extensions: .dbg, .ino, .inx and .obs. After compilation, these files remain in the scripts folder. This message is displayed when an error occurs on an attempt to access the action file; that file has the extension .obs. Among the possible causes:

- The disk is full. Create more available disk space by deleting unwanted files; then compile again.
- There are insufficient system resources (file handles and/or memory). Close any other applications that are open; then compile again. If the error occurs on a system with sufficient disk space and system resources, investigate other obvious reasons why file access might fail:
  - The action file may be damaged. Rename it or delete it from the Scripts folder; then compile again.
  - If the action file is in a shared folder on a file server, verify that you have network rights to write to that folder.
  - If an action file exists from a previous compile, check that its file attributes have not been changed to read-only, system, or hidden. Check too that the file is not already open by another application or user.
Error F8502

Message
I/O error on debug file

Description
An error occurred when InstallShield attempted to access an intermediate file created during compilation.

Troubleshooting Information
Each time you compile your setup, InstallShield creates intermediate files with the following file extensions: .dbg, .ino, .inx and .obs. After compilation, these files remain in the scripts folder. This message is displayed when an error occurs on an attempt to access the debug file; that file has the extension .dbg. Among the possible causes:

- The disk is full. Create more available disk space by deleting unwanted files; then compile again.
- There are insufficient system resources (file handles and/or memory). Close any other applications that are open; then compile again. If the error occurs on a system with sufficient disk space and system resources, investigate other obvious reasons why file access might fail:
  - The debug file may be damaged. Rename it or delete it from the Scripts folder; then compile again.
  - If the debug file is in a shared folder on a file server, verify that you have network rights to write to that folder.
  - If a .dbg file exists from a previous compile, check that its file attributes have not been changed to read-only, system, or hidden. Check too that the file is not already open by another application or user.

Error F8503

Message
Can’t open script input file

Description
The compiler was unable to open the script file specified.

Troubleshooting Information
Verify the location and name of the file. You may have misspelled the file name or specified an incorrect path.

Error F8504

Message
Can’t open .inx output file
Description
The compiler was unable to create the file for the compiled script.

Troubleshooting Information
This error is generated if InstallShield cannot create or recreate the .inx file. Under normal circumstances, the following problems can cause this error:

- The disk is full. Create more available disk space by deleting unwanted files; then compile again.
- There are insufficient system resources (file handles and/or memory). Close any other applications that are open; then compile again. If the error occurs on a system with sufficient disk space and system resources, investigate other obvious reasons why file access might fail:
  - If the target file is in a shared folder on a file server, verify that you have network rights to write to that folder.
  - If an .inx file exists from a previous compile, check that its file attributes have not been changed to read-only, system, or hidden. Check too that the file is not already open by another application or user.

Error F8505

Message
Can’t open .dbg debug file

Description
The compiler was unable to create the debug file. This file contains the information required to run the script with the debugger.

Troubleshooting Information
The following problems will cause this error:

- The disk is full. Create more available disk space by deleting unwanted files; then compile again.
- There are insufficient system resources (file handles and/or memory). Close any other applications that are open; then compile again.

If the error occurs on a system with sufficient disk space and system resources, investigate other obvious reasons why file access might fail:

- If the debug file is in a shared folder on a file server, verify that you have network rights to write to that folder.
- If a .dbg file exists from a previous compilation, check that its file attributes have not been changed to read-only, system, or hidden. Check too that the file is not already open by another application or user.
Error F8506

Message
Out of memory

Description
The compiler was unable to allocate sufficient memory to complete the compilation.

Troubleshooting Information
Close any other applications that are open; then compile again. If the problem persists, restart Windows; then load InstallShield and compile again.

Error F8508

Message
too many macro expansions in line

Description
The specified line contains too many macros; the maximum number of macros per line is 100.

Troubleshooting Information
Reduce the number of macros on the line by breaking the line into two or more lines.

Error F8509

Message
invalid delimiter for include file name

Description
The file name specified after the preprocessor directive #include is missing the initial quotation mark or angled bracket (< ).

Troubleshooting Information
File names specified with the preprocessor directive #include must be enclosed by quotation marks (“file name”) or angled brackets (<file name>). Insert a quotation mark or opening angled bracket before the file name. Note that if you insert an initial quotation mark, the file name must be followed by a closing quotation mark; if you insert an opening angled bracket, the file name must be followed by a closing angled bracket (> ).

#include

Error F8511

InstallShield 2020 » InstallScript Language Reference

Message
cannot open include file

Description
The compiler was unable to find or open a file that has been included in the script.

Troubleshooting Tips
The following problems can cause this error:

- The file name in an #include statement is misspelled.
- A file name in an #include statement is specified without a full path, but the file cannot be found in the source directory.
- You do not have rights to open files on the network drive where the file resides.
- The file is damaged.

See Also
#include
Error F8512

Message
include file plus path is too large

Description
The path specified in an #include statement exceeds the maximum length of 256 characters

Troubleshooting Information
Move the included files to a folder that can be referenced with a path whose length is less than 256 characters.

See Also
#include

Error F8513

Message
too many nested #include files

Description
InstallScript allows nesting of include files up to a maximum of 8 levels. This limit has been exceeded.

Troubleshooting Information
Reduce the number of nested levels.

See Also
#include

Error F8514

Message
#if statements too deeply nested

Description
InstallScript allows nesting of #if statements up to a maximum of 10 levels. This limit has been exceeded.

Troubleshooting Information
Reduce the number of nested levels.
See Also

#if...#else...#endif

Error F8515

InstallShield 2020 » InstallScript Language Reference

Message
macro expansion buffer overflow

Description
The expansion of macros in the error line exceeds the maximum of 1024 characters.

Troubleshooting Information
Restructure your code to eliminate this error.

Error F8516

InstallShield 2020 » InstallScript Language Reference

Message
maximum error count reached

Description
The maximum number of errors specified on the Compile/Link tab of the Settings dialog box has been reached.

Troubleshooting Information
For more information about the Compile/Link tab of the Settings dialog box, see Compile/Link Tab.

Error F8517

InstallShield 2020 » InstallScript Language Reference

Message
too many include files

Description
The maximum number of include was exceeded.
Troubleshooting Information

A setup script can include no more than 100 source files. Combine two or more source files to bring the total number down to 100.

See Also

#include

Error F8518

InstallShield 2020 » InstallScript Language Reference

Message

I/O error on link file

Description

An error occurred when InstallShield attempted to write to the link file.

Troubleshooting Information

Each time you compile your setup, InstallShield creates intermediate files with the following file extensions: .dbg, .ino, .inx and .obs. After compilation, these files remain in the scripts folder. This message is displayed when an error occurs on an attempt to access the link file (.ino).

This error might be caused by the following:

• The disk is full. Create more available disk space by deleting unwanted files and then recompile.
• The link file is damaged. Rename it or delete it from Scripts folder and then recompile.

Error F8519

InstallShield 2020 » InstallScript Language Reference

Message

user define fatal error

Description

This message is triggered by an #error directive.

#error

InstallScript Internal Errors

InstallShield 2020 » InstallScript Language Reference

An internal error may occur if syntax errors exist.

C9001 internal error
Error C9001

Message
'text' : internal error

Description
The character or characters specified by text triggered an unclassified syntax error.

Troubleshooting Information
This error message is triggered by syntax errors for which there is not a specific error message.

InstallScript Warnings

The compiler issues warning messages to alert you to irregularities in the script that may result in inefficiencies or run-time errors.

⚠️ Caution • Warnings do not interrupt script compilation unless “Warnings as errors” is selected in the Compiler Settings dialog, or if the number of warnings exceeds the maximum specified. The default maximum value is 50.

Table 13-20 • InstallScript Warnings

<table>
<thead>
<tr>
<th>Warning Number</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>C7501</td>
<td>macro redefinition</td>
</tr>
<tr>
<td>C7502</td>
<td>string/array size exceeds recommended limit</td>
</tr>
<tr>
<td>C7503</td>
<td>function defined but never called</td>
</tr>
<tr>
<td>C7505</td>
<td>typedef definition differs from previous</td>
</tr>
</tbody>
</table>

Warning C7501

Message
'name' : macro redefinition

Description
The identifier specified by name has already been used in a #define statement.
Troubleshooting Information

If the second definition is simply a duplicate of the first, delete it. If you intended the second definition to be different from the first, rename the identifier in the second definition and update all statements in the script that reference it.

See Also
#define

Warning C7502

InstallShield 2020 » InstallScript Language Reference

Message
'size' : string/array size exceeds recommended limit

Description
The numeric value specified by size indicates the size of a string or array that is larger than InstallScript’s recommended maximum.

Troubleshooting Information
To avoid unexpected effects, reduce the size of the array.

See Also
String Indexing
String Size and Autosize

Warning C7503

InstallShield 2020 » InstallScript Language Reference

Message
'name' : function defined but never called

Description
The function specified by name is not called in your setup.

Troubleshooting Information
To reduce the size of your setup, remove the unused function from your script.

Warning C7505

InstallShield 2020

Message
'name' : typedef definition differs from previous
**Description**

The data structure specified by *name* is defined in multiple library files (obl files).

**Troubleshooting Information**

If the definitions are simply duplicates, delete all but one. If you intended the definitions to be different, rename the data structures to have unique names and update all statements in the script that reference them.
Virtualization Conversion Errors and Warnings

InstallShield 2020

When you are converting a Windows Installer package to a virtual application, errors and warnings may occur. Some of the errors and warnings are applicable to any type of package virtualization, and others are specific to the virtualization solution for which you are preparing packages.

</tr>
<tr>
<td>Message:</td>
<td>Unable to determine the full path for driver 'DriverName'</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this error when a driver referenced in the ODBCDataSource table is not being installed by the package.</td>
</tr>
</tbody>
</table>
Warning -9016: Contents of Table Ignored

InstallShield 2020

The following table documents this message:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>Contents of table ‘TableName’ will be ignored</td>
</tr>
<tr>
<td>Cause:</td>
<td>This error message identifies a known limitation of Citrix conversion.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>If the contents of the table is deemed critical, repackage the application, and then rebuild the Citrix profile.</td>
</tr>
</tbody>
</table>
Warning -9017: .NET 1.x Assembly Not Supported

InstallShield 2020

The following table documents this message:

Table 13-18 • Warning -9017: .NET 1.x Assembly Not Supported

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
</tbody>
</table>

Message: Assembly 'AssemblyName' is a .NET 1.x assembly and will not be converted correctly. Only .NET 2.0/3.0 assemblies are currently supported. You may wish to repackage this package first.

Cause: You encounter this error when attempting to convert a package containing a .NET 1.x assembly. Only .NET 2.0/3.0 assemblies are currently supported.

Resolution: Repackage the application, and then rebuild the Citrix profile.

Warning -9018: Custom Actions Ignored

InstallShield 2020

The following table documents this message:

Table 13-19 • Warning -9018: Custom Actions Ignored

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
</tbody>
</table>

Message: Custom action 'CustomActionName' will be ignored.

Cause: When converting a Windows Installer package to a Citrix profile, all custom actions are ignored. Any modifications to a target machine that a custom action in this Windows Installer package may create will not be propagated into the Citrix profile.

Note • When a custom action that does not modify the system or perform any part of the installation (such as a predefined custom action or a Type 19 custom action) is encountered, no message is generated. If a Type 51 custom action is encountered (which sets a property from a formatted text string), it is automatically resolved. If a Type 35 custom action is encountered, it is resolved only if it is referenced in the Directory table.
Warning -9019: Conditionalized Components

InstallShield 2020

The following table documents this message:

Table 13-20 • Warning -9019: Conditionalized Components

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>There exist one or more conditionalized components which may not be converted correctly</td>
</tr>
<tr>
<td>Cause:</td>
<td>This warning is generated when attempting to convert conditionalized components because conditions on components are not evaluated. As a result, InstallShield includes the component in the virtual package.</td>
</tr>
</tbody>
</table>
| Resolution: | Repackage the application on a machine that has a similar environment to the machines where the profile will be deployed. Then rebuild the virtual application.  
If you do not want to include the component in the virtual package, modify your .msi package or your project file to exclude that component. Then rebuild the virtual application. If you do want the virtual package to contain this component, you can ignore this warning. |
Error -9020: Directory With Null Parent

InstallShield 2020

The following table documents this message:

Table 13-21 • Error -9020: Directory With Null Parent

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Error</td>
</tr>
<tr>
<td>Message:</td>
<td>Directory 'DirectoryName' has a null parent and will be ignored.</td>
</tr>
<tr>
<td>Cause:</td>
<td>This error occurs if a directory table entry (other than TARGETDIR) is null.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>Evaluate the ThinApp application to see if it works. If it does not work properly, you may want to consider repackaging the package.</td>
</tr>
</tbody>
</table>

Error -9021: Unable to Extract COM Data

InstallShield 2020

The following table documents this message:

Table 13-22 • Error -9021: Unable to Extract COM Data

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Error</td>
</tr>
<tr>
<td>Message:</td>
<td>Unable to extract COM data for 'FileName'</td>
</tr>
<tr>
<td>Cause:</td>
<td>This Windows Installer package has an entry in the TypeLib or SelfReg table that contains COM data that InstallShield cannot convert to application data. Depending upon which file cannot be COM extracted, it is possible that this application will still work properly in Citrix XenApp isolation environment if you repackage this Windows Installer package with COM table mapping turned off. COM data is stored in the Windows Registry. So, if you repackage this Windows Installer package, the capture process will be able to obtain all of this data because it captures all modifications to the Registry and does not have to rely on COM extraction.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>To resolve this issue, you need to repackage your Windows Installer package with COM table mapping turned off.</td>
</tr>
</tbody>
</table>
Error -9022: Complus Table

InstallShield 2020

The following table documents this message:

Table 13-23 • Error -9022: Complus Table

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Error</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'Complus'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this error when the Windows Installer package that you are converting includes a Complus table. During the conversion process, the Complus table is not read.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>The Complus table contains information needed to install COM+ applications. While Citrix XenApp supports communicating with COM+ applications, it does not support installing COM+ services. Therefore, this application cannot be deployed on Citrix XenApp.</td>
</tr>
</tbody>
</table>

Error -9024: FileSFPCatalog

InstallShield 2020

The following table documents this message:

Table 13-24 • Error -9024: FileSFPCatalog

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Error</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'FileSFPCatalog'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this error when the Windows Installer package that you are converting includes a FileSFPCatalog table. During the conversion process, the FileSFPCatalog table is not read.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>The FileSFPCatalog table associates specified files with the catalog files used by system file protection. If this file is necessary for the function of the application, you need to use Repackager to repackage the application.</td>
</tr>
</tbody>
</table>
Warning -9026: LaunchCondition Table

The following table documents this message:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Warning</td>
</tr>
<tr>
<td>Message</td>
<td>The conversion process does not support data in the MSI table 'LaunchCondition'.</td>
</tr>
<tr>
<td>Cause</td>
<td>You encounter this warning when the Windows Installer package that you are converting includes a LaunchCondition table. During the conversion process, the LaunchCondition table is not read.</td>
</tr>
<tr>
<td>Resolution</td>
<td>The LaunchCondition table contains a list of conditions that all must be satisfied for the installation to begin. For example, if an application requires Windows XP to run, Windows XP is listed in the LaunchCondition table. Because this table is not read, no check is performed. Therefore, when a user on an operating system other than Windows XP launches this Citrix profile, the application may not function properly. To resolve this issue, perform one of the following tasks:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Option 1: Set Requirements on the Profile Requirements Page</strong>—If the launch conditions only include operating system, service pack, and language requirements, open this package in the Citrix Assistant, and set those Operating System and Language requirements on the Profile Requirements page. Then deploy this application as a Citrix profile.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Option 2: Determine if Launch Conditions are Met</strong>—Review the launch conditions listed in the table, and determine if the desktops in your enterprise meet those requirements. If all of the desktops meet those requirements, you can deploy this application as a Citrix profile. If the desktops do not meet those requirements (such as having Internet Explorer 6.0 instead of 7.0), upgrade those desktops to meet these requirements, and then deploy this application as a Citrix profile.</td>
</tr>
</tbody>
</table>

Warning -9027: LockPermissions Table

The following table documents this message:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Warning</td>
</tr>
<tr>
<td>Message</td>
<td>The conversion process does not support data in the MSI table 'LockPermissions'.</td>
</tr>
</tbody>
</table>
The following table documents this message.

Table 13-27 • Error -9028: MoveFile Table

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Error</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'MoveFile'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this error when the Windows Installer package that you are converting includes a MoveFile table. During the conversion process, the MoveFile table is not read.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>This MoveFile table contains a list of files to be moved or copied from a specified source directory to a specified destination directory. Because this table is not read, you need to do one of the following to resolve this issue:</td>
</tr>
<tr>
<td></td>
<td>• Option 1: Edit the Windows Installer Package—Open the Windows Installer package in InstallShield and modify it to eliminate the use of the MoveFile table by installing additional files in the specified directories.</td>
</tr>
<tr>
<td></td>
<td>• Option 2: Repackage the Application—Use the Repackaging Wizard to repackage this application, and then build the Repackager project to generate a revised Windows Installer package.</td>
</tr>
<tr>
<td></td>
<td>• Option 3: Write a Pre-Launch Script—Write a pre-launch script that performs the file moving operations identified in the MoveFile table upon application launch.</td>
</tr>
</tbody>
</table>
Error -9029: MsiDriverPackages Table

The following table documents this message:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type:</strong></td>
<td>Error</td>
</tr>
<tr>
<td><strong>Message:</strong></td>
<td>The conversion process does not support data in the MSI table 'MsiDriverPackages'.</td>
</tr>
<tr>
<td><strong>Cause:</strong></td>
<td>You encounter this error when the Windows Installer package that you are converting includes a MsiDriverPackages table. During the conversion process, the MsiDriverPackages table is not read.</td>
</tr>
<tr>
<td><strong>Resolution:</strong></td>
<td>The MsiDriverPackages table includes one record for each driver package component in the application. Citrix XenApp does not support any type of driver. For example, when installing a printer, you can install the printer software within the isolation environment, but not the printer drivers. Therefore, to resolve this issue, you need to install any required drivers outside of the isolation environment on the user desktop machines.</td>
</tr>
</tbody>
</table>

Warning -9030: ODBCTranslator Table

The following table documents this message:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type:</strong></td>
<td>Warning</td>
</tr>
<tr>
<td><strong>Message:</strong></td>
<td>The conversion process does not support data in the MSI table 'ODBCTranslator'.</td>
</tr>
<tr>
<td><strong>Cause:</strong></td>
<td>You encounter this error when the Windows Installer package that you are converting includes a ODBCTranslator table. During the conversion process, the ODBCTranslator table is not read.</td>
</tr>
<tr>
<td><strong>Resolution:</strong></td>
<td>The ODBCTranslator table lists the ODBC translators belonging to the installation. ODBC translators translate one form of raw data into another form that can be used with a specific database type. Ignoring the ODBCTranslator table should not prevent your application from functioning properly. However, if it does, you need to use Repackager to repackage the application.</td>
</tr>
</tbody>
</table>
**Warning -9031: RemoveFile Table**

InstallShield 2020

The following table documents this message:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'RemoveFile'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this error when the Windows Installer package that you are converting includes a <code>RemoveFile</code> table. During the conversion process, the <code>RemoveFile</code> table is not read. This warning is displayed only if the application installation removes files during install (not uninstall).</td>
</tr>
<tr>
<td>Resolution:</td>
<td>The <code>RemoveFile</code> table contains a list of files to be removed. If this file removal requirement is just a clean-up step, that does not impact the function of the application, you do not need to address this issue. However, if the existence of the files listed in the <code>RemoveFile</code> table prevents the application from functioning, you need to set the isolation option of the files to <code>Ignore</code> so that they are not visible to the isolation environment. The <code>Ignore</code> option directs the isolation environment to always look for the file on the system (ignoring the one inside the isolation environment).</td>
</tr>
</tbody>
</table>

**Warning -9032: RemoveIniFile Table**

InstallShield 2020

The following table documents this message:

<table>

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Error</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'ISSQLScriptFile'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this error when the Windows Installer package that you are converting includes a ISSQLScriptFile table. During the conversion process, the ISSQLScriptFile table is not read.</td>
</tr>
</tbody>
</table>
| Resolution: | The ISSQLScriptFile table lists SQL scripts. When a Windows Installer package is installed, it can run an SQL script to update a database. An application running as a Citrix profile cannot update a database. To resolve this issue, you need to update the database prior to using the converted Citrix profile using one of the following methods:  
  - Use scripts to update the database manually.  
  - Update it by running the Windows Installer installation on one of the machines in your network that has access to that database. |

Error -9040: ISVRoot Table

<td>This is an internal error.</td>
</tr>
<tr>
<td>Resolution</td>
<td>Contact InstallShield Technical Support.</td>
</tr>
</tbody>
</table>

Table 13-74 • Warning -9137: Destination Directory Cannot Be Found
Warning -9138: Ignoring a DuplicateFile Table Entry

InstallShield 2020

The following table documents this message:

Table 13-75 • Warning -9138: Ignoring a DuplicateFile Table Entry

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>Ignoring a DuplicateFile table entry because unable to resolve the property used for the DestFolder: 'INVALIDPATH'</td>
</tr>
<tr>
<td>Cause:</td>
<td>You might encounter this error when the Windows Installer package that you are converting includes one or more entries in the DuplicateFile table, and a property that is used in the DestFolder column for one of those entries in the DuplicateFile table cannot be resolved. For example, if the destination for a duplicate file is set by a custom action, that destination cannot be resolved during the conversion.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>The DuplicateFile table contains a list of files that need to be duplicated during installation, either to a different directory than the original file or to the same directory but with a different name. Because a destination in this table cannot be resolved, you need to do one of the following to resolve this issue:</td>
</tr>
<tr>
<td></td>
<td>• Option 1: Edit the Windows Installer Package—Open the Windows Installer package in InstallShield and modify it to eliminate the use of the problematic entry in the DuplicateFile table by including any additional copies of that file.</td>
</tr>
<tr>
<td></td>
<td>• Option 2: Repackage the Application—Use the Repackaging Wizard to repackage this application, and then build the Repackager project to generate a revised Windows Installer package.</td>
</tr>
<tr>
<td></td>
<td>• Option 3: Write a Pre-Launch Script—Write a pre-launch script that—upon application launch—performs the file copy operations for the problematic entry in the DuplicateFile table.</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>

Steps to Take Before Calling Technical Support

Before contacting InstallShield Technical Support, perform the following steps to attempt to clearly identify the problem you are having:

- **Check package**—To determine if this error is caused by a problem with the specific package you are converting, try to build a Citrix profile of a simple package that contains only one file.
- **Check machine and OS**—To determine if this error is caused by a configuration on a particular machine or operating system, attempt to build this Citrix profile on another machine or operating system.
- **Check individual files**—To determine if this is error limited to a specific item, find out if removing or excluding a particular item will build error free.

Application Features Requiring Pre- or Post-Conversion Actions

Some application features are ignored when creating a Citrix profile. Therefore, some additional pre- or post-conversion actions must be taken in order for the virtual application to work.

One action you could take to try to include ignored features in a virtual application is to first repackage the application using the Repackaging Wizard, and then convert the repackaged application to a virtual package.

One action you could take to try to include ignored features in a virtual application is to first repackage the application using the Repackaging Wizard that is included with Repackager, and then convert the repackaged application to a virtual package.

**Edition** • Repackager is included with AdminStudio.
The following table lists the application features which require additional, manual conversion steps:

**Table 13-128 • Application Features Ignored During Profile Conversion**

<table>
<thead>
<tr>
<th>Windows Installer Feature</th>
<th>Manual Conversion Steps</th>
</tr>
</thead>
</table>
| **User-Defined Custom Actions** | When converting a Windows Installer package to a Citrix profile, all custom actions are ignored. For user-defined custom actions, a warning message is generated. Any modifications to a target machine that a custom action in this Windows Installer package may create will not be propagated into the Citrix profile.  

The resolution that you should perform depends upon the purpose of the custom action:  

- If the custom action merely automatically enters a value or makes some other kind of minor modification, you can ignore this warning.  

- If the custom action does something which could change the behavior of the installation (such as setting a Property), you may need to resolve this issue.  

To resolve this issue, first attempt to launch the converted package on Citrix XenApp. If you receive any application errors, you need to repackage this application, by performing the following steps.  

  **To successfully convert a package with user-defined custom actions:**  

  1. Use the Repackaging Wizard to repackage this application. The Repackaging Wizard monitors system changes as an application is installed, and then that data is converted into a Repackager project.  

  2. Build the Repackager project to generate a revised Windows Installer package. This new Windows Installer package does not contain any custom actions, but (as a result of being repackaged) it will include the functionality performed by the original custom action. |

| Services                                                                 | Citrix XenApp does not support any type of services. Therefore, to resolve this issue, you need to install any required services outside of the isolation environment on the user desktop machines.  

  **To successfully convert a package with services:**  

  1. If you have an application and a service bundled in the same Windows Installer package, you need to create a separate Windows Installer package containing just the service.  

  2. Install the service on each of the user desktop machines. The Citrix profile of this application should now be able to run in an isolation environment on machines that already have the service installed. |
While Citrix XenApp supports communicating with COM+ applications, it does not support installing COM+ services. Therefore, an application that contains COM+ services cannot be deployed on Citrix XenApp.

Automation Interface

InstallShield 2020

The InstallShield Help Library explains how to use the InstallShield interface to author all elements of your installation and then build a release. For advanced developers, InstallShield exposes a COM interface that allows you to perform many of the same tasks from a program, such as a Visual Basic executable, or a script, such as a VBScript file in Windows Scripting Host. By calling methods, setting properties, accessing collections, and so on, through the automation interface, you can open a project and modify its features and component data in many of the same ways that you would in the InstallShield interface.

The highest-level object in the automation interface is the ISWiProject object. The first thing you must do to access the interface is create this object. Then, you can use its objects, methods, and properties to modify your project.

**Note** • The automation interface affects a project only at design time and not run time.

For information on automation interface support in Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, and Merge Module projects, see the following sections:

- Automation Objects
- Automation Collections

For information on automation interface support in Advanced UI and Suite/Advanced UI projects, see the following sections:

- Automation Objects for Advanced UI and Suite/Advanced UI Projects
- Automation Collections for Advanced UI and Suite/Advanced UI Projects

**See Also**

Using the Automation Interface on a 64-Bit System

Automation Objects

InstallShield 2020 • Automation Interface

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Each InstallShield automation object represents an installation element such as a feature, a component, or a file. This section describes each of the InstallShield automation objects.

The highest-level object in the automation interface is the ISWiProject object. The first thing you must do to access the interface is create this object. Then, you can use its objects, methods, and properties to modify your project.
Note • The examples provided in the Automation Objects subsections use Visual Basic sample code, not VBScript.

See Also
Using the Automation Interface on a 64-Bit System

ISWiProject Object

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

• Basic MSI
• DIM
• InstallScript
• InstallScript MSI
• InstallScript Object
• Merge Module

Project-specific differences are noted where appropriate.

Note • The examples provided in the Automation Objects subsections use Visual Basic sample code, not VBScript.

ISWiProject contains the interface for opening, closing, and saving an InstallShield project file (.ism or .dim). When InstallShield is installed on your system, you can instantiate a copy of ISWiProject with the following VB and VBScript syntax:

Set m_ISWiProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")

To open an installation project, call the OpenProject method, as follows:

' Build path to the .ism file
strFile = "C:\InstallShield 2020 Projects\Test.ism"
m_ISWiProject.OpenProject strFile

Important • If you are using the automation interface on a 64-bit machine, you may need to load the automation interface through a 32-bit executable file. Otherwise, you may encounter an error when you instantiate a copy of ISWiProject, or any other object. For more information, see Using the Automation Interface on a 64-Bit System.

Build Status Events

The ISWiProject object raises the following status events:

• Public Event ProgressIncrement(ByVal lncrement As Long, pbCancel As Boolean)
• Public Event ProgressMax(ByVal lMax As Long, pbCancel As Boolean)
• Public Event StatusMessage(ByVal sMessage As String, pbCancel As Boolean)
These events are raised during the build process and provide status updates. You can set pbCancel to stop the build. For sample code that demonstrates how to use these events, see Using Build Status Events.

Many feature properties and attributes are available in the automation interface through this object’s methods, properties, and collections. The following table lists the ISWiProject Object members. Remember that some methods, properties, and collections are only available for a particular project type.
## Members

**Table 13-1 • ISWiProject Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActiveLanguage</td>
<td>Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object</td>
<td>Read-Write Property</td>
<td>Gets or sets the default language of the project. Specify a single language as a language ID. The automation interface uses the default language whenever you get or set a localizable property, such as ISWiShortcut’s DisplayName. In InstallShield, localizable properties must use a string entry. If the property has a string identifier, the string that you enter for the property becomes the string entry’s value for the default language.</td>
</tr>

</table>
| **EnableSwidtag** | Basic MSI                  | Read-Write Property | Enables or disables the creation of a software identification tag for an installation. Following is sample code that disables tag creation:  
\[
pProject.EnableSwidtag = False
\]
For more information about software tagging, see Including a Software Identification Tag for Your Product. |
| **ExportProject** | Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Method | Causes the project file to use the XML representation, which is better suited for source code integration. |
| **ExportStrings** | Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Method | Exports string entries to a text file. |
| **ForceUpgrade** | Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Method | Upgrades the project from an earlier version of InstallShield to the current version. |
| **GenerateGUID** | Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Method | Generates a new, unique GUID that is returned as a string. |

<td>Read-Write Property</td>
<td>Enables you to skip the upgrade validators that normally run at the end of the build.</td>
</tr>
</tbody>
</table>
SwidtagProperty

Gets or sets value for the software identification tag settings in the General Information view. This property takes one of the following options for the first parameter:

- **eswtpUniqueld (0)** — This parameter specifies the value for the Unique ID setting in the General Information view.
- **eswtpTagCreatorName (2)** — This parameter specifies the value for the Tag Creator setting in the General Information view.
- **eswtpTagCreatorRegid (3)** — This parameter specifies the value for the Tag Creator ID setting in the General Information view.
- **eswtpSfwCreatorName (4)** — This parameter specifies the value for the Software Creator setting in the General Information view.
- **eswtpSfwCreatorRegid (5)** — This parameter specifies the value for the Software Creator ID setting in the General Information view.
- **eswtpSfwLicensorName (6)** — This parameter specifies the value for the Software Licensor setting in the General Information view.
- **eswtpSfwLicensorRegid (7)** — This parameter specifies the value for the Software Licensor ID setting in the General Information view.
- **eswtpEntitlementRequired (8)** — This parameter specifies whether your product requires users to have a corresponding software entitlement in order for software reconciliation to be considered successful.

Following is sample code that uses this property:

```csharp
pProject.SwidtagProperty(eswtpTagCreatorRegid) = "regid.1986-12.com.mycompany"
```

UpgradeCode

Gets or sets the Upgrade Code property as a string GUID. The GUID must be surrounded by braces—`{12345678-1234-1234-1234-1234567890AB}`, for example.

This property is not available for merge module projects.

<td></td>
<td></td>
<td>- <strong>eswtpSfwLicensorName (6)</strong> — This parameter specifies the value for the Software Licensor setting in the General Information view.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <strong>eswtpSfwLicensorRegid (7)</strong> — This parameter specifies the value for the Software Licensor ID setting in the General Information view.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <strong>eswtpEntitlementRequired (8)</strong> — This parameter specifies whether your product requires users to have a corresponding software entitlement in order for software reconciliation to be considered successful.</td>
</tr>
<tr>
<td>UpgradeCode</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Read-Write Property</td>
<td>Gets or sets the Upgrade Code property as a string GUID. The GUID must be surrounded by braces—<code>(12345678-1234-1234-1234-1234567890AB)</code>, for example. This property is not available for merge module projects.</td>
</tr>
</tbody>
</table>
AddAdvancedFile Method

The AddAdvancedFile method applies to the following project types.

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

The AddAdvancedFile method creates an advanced file object with the specified name and (optionally) in the specified disk image in the current project.

Table 13-1 • ISWiProject Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UseXMLProjectFormat</td>
<td>Basic MSI, DIM, InstallScript,</td>
<td>Read-Write Boolean Property</td>
<td>Specifies whether the project file should use the XML file format.</td>
</tr>
<tr>
<td></td>
<td>InstallScript MSI, InstallScript Object, Merge Module</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Syntax

AddAdvancedFile (FileName As String, Optional DiskType As ISWiDiskType = edtDisk1) As ISWiAdvancedFile

Parameters

Table 13-2 • AddAdvancedFile Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Pass the fully qualified filename for the advanced file that you want to add.</td>
</tr>
<tr>
<td>DiskType</td>
<td>This optional parameter specifies the Advanced Files folder in which you want to add the advanced file. Specify one of the following values.</td>
</tr>
<tr>
<td></td>
<td>• edtDisk1 (1)—Add the advanced file to the Disk 1 folder. This is the default value for this optional parameter.</td>
</tr>
<tr>
<td></td>
<td>• edtLastDisk (-1)—Add the advanced file to the Last Disk folder.</td>
</tr>
<tr>
<td></td>
<td>• edtOther (0)—Add the advanced file to the Other folder.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic lines demonstrate this method:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("ISwiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pAdvancedFile As ISWiAdvancedFile

pProj.SaveProject
pProj.CloseProject
```

Applies To

• ISWiProject

AddAutomaticUpgradeEntry Method

InstallShield 2020 » Automation Interface

This information applies to the following project types:

• Basic MSI
• InstallScript MSI

Call the AddAutomaticUpgradeEntry method to create a new IswiAutomaticUpgradeEntry item and return a handle to that object.
Chapter 13
Automation Interface

Syntax

AddAutomaticUpgradeEntry()

Example

The following Visual Basic lines demonstrate this method:

'#############################################################
' # THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PROJECT PATH
'#############################################################
set pProject = CreateObject("ISWiAutomation Interface Version.ISWiProject")
pProject.OpenProject("C:\Documents and Settings\Testlab\My Documents\MySetups\your project name-21.ism")

'#############################################################
' 'To create a new entry

dim pAutoEntry
set pAutoEntry = pProject.AddAutomaticUpgradeEntry()
pAutoEntry.Name = "AutoEntry"
pAutoEntry.ReleaseFlags = "AutoFlag"
pAutoEntry.UpgradedSetupPath = "AutoPath"

'#############################################################
' 'To find and delete an existing entry

set pAutoEntry = nothing
set pAutoEntry = pProject.IswiAutoUpgradeEntries("AutoEntry")
pAutoEntry.Delete
pProject.SaveProject
pProject.CloseProject

Applies To

- ISWiProject

AddComponent Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
• **Merge Module**

The `AddComponent` method creates a component object with the specified name in the current project. When the component is added, a GUID is automatically generated for it (see the GUID property for `ISWiComponent`). After you have added the component, you can set its other properties and associate it with a feature.

**Syntax**

```
AddComponent (ComponentKey As String) As ISWiComponent
```

**Parameters**

**Table 13-3 • AddComponent Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ComponentKey</td>
<td>The component key is the same as the name of the component that is displayed in the Setup Design views. This string must contain only alphanumeric characters, dots (.), or underscores (_), and it must begin with a letter or an underscore. ComponentKey must be unique among your project's component names. Component names are case-sensitive.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate this method:

```vbnet
Dim pComponent As ISWiComponent
Set pComponent = m_pProject.AddComponent("New_Component")
```

**Applies To**

• `ISWiProject`

**AddCustomAction Method**

```
InstallShield 2020 » Automation Interface
```

**Project • This information applies to the following project types:**

• Basic MSI
• DIM
• InstallScript MSI
• Merge Module

Call the `AddCustomAction` method to add a custom action to the current project. To insert a custom action into a sequence, use the `InsertCustomAction` method.
Chapter 13
Automation Interface

Syntax
AddCustomAction (CustomActionKey As String) as ISWiCustomAction

Parameters

Table 13-4 • AddCustomAction Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CustomActionKey</td>
<td>The string name of the custom action you want to create.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

AddFeature Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

The AddFeature method creates a feature with the specified name. AddFeature is a member of ISWiProject. The new feature is added to the current project as a top-level feature, but when this method is a member of an ISWiFeature object, the new feature is added as a subfeature of the current feature.

The feature is created with the same default properties that new features have when you add them in InstallShield.

After you have added the feature, you can set its other properties and associate components with it.
Syntax

AddFeature (FeatureKey As String) As ISWiFeature

Parameters

Table 13-5 • AddFeature Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FeatureKey</td>
<td>The feature key is the same as the name of the feature that is displayed in the Setup Design and Features views. The name becomes the index for the new ISWiFeature object. This string must contain only alphanumeric characters, dots (.), or underscores (_), and it must begin with a letter or an underscore. FeatureKey must be unique among your project's feature names. Feature names are case-sensitive.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic lines demonstrate calling AddFeature to add a feature, a subfeature, and then associate an existing component with the subfeature:

```vbnet
Dim pProject As ISWiProject
Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\SampleApp.ism"

Dim pFeat1, pFeat2 As ISWiFeature
Dim sFeat1Name, sFeat2Name As String

sFeat1Name = "ParentFeature"
sFeat2Name = "SubFeature"

' Add the feature ParentFeature, then SubFeature under ParentFeature
Set pFeat1 = pProject.AddFeature(sFeat1Name)
Set pFeat2 = pFeat1.AddFeature(sFeat2Name)

Dim pComp
Dim sCompName As String

' Add the existing component NewComponent1 to SubFeature
sCompName = "NewComponent1"
Set pComp = pProject.ISWiComponents.Item(sCompName)
pFeat2.AttachComponent pComp

pProject.SaveProject
pProject.CloseProject
```

Applies To

- ISWiProject
- ISWiFeature
AddLanguage Method

Support for multilanguage installations is available with InstallShield Premier Edition.

Project • This information applies to the following project types:
- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the AddLanguage method to add a language to the current project. Using this method is similar to adding a language in the General Information view in InstallShield. You can set the properties of the new language with the ISWiLanguage object.

Syntax

AddLanguage (LangId As String)

Parameters

Table 13-6 • AddLanguage Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LangId</td>
<td>Pass the language ID (as a string) that you want to add to the current project. For example: oProject.AddLanguage “1035”</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

See Also
- Translating String Entries
- Run-Time Language Support in InstallShield
- Localizing the End-User Interface
AddPatchConfig Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

•  Basic MSI
•  InstallScript MSI

Call the AddPatchConfig method to add a patch configuration to your project. Using this method is similar to adding a patch configuration with the Patch Design view of the IDE. You can set the properties of the new patch configuration with the object.

Syntax

AddPatchConfig (PatchConfigKey As String) As ISWiPatchConfig

Parameters

Table 13-7 • AddPatchConfig Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PatchConfigKey</td>
<td>Holds the name of your new patch configuration.</td>
</tr>
</tbody>
</table>

Appplies To

•  ISWiProject

AddPathVariable Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

•  Basic MSI
•  DIM
•  InstallScript
•  InstallScript MSI
•  InstallScript Object
•  Merge Module

Call the AddPathVariable method to add a path variable to your project. Using this method is similar to adding a path variable in the Path Variables view in InstallShield. You can set the properties of the new path variable with the ISWiPathVariable object.
Important • Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.

Syntax

AddPathVariable (sName As String) As ISWiPathVariable

Parameters

Table 13-8 • AddPathVariable Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sName</td>
<td>Specifies the name of the path variable.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

AddProductConfig Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI
- Merge Module

This method adds a product configuration to your project. Using this method is similar to adding a product configuration with the Release Wizard or the Releases view of the IDE. You can set the properties of the new product configuration with the ISWiProductConfig object.

Syntax

AddProductConfig (ProductConfigKey As String) As ISWiProductConfig

Parameters

Table 13-9 • AddProductConfig Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProductConfigKey</td>
<td>Holds the name of your new product configuration.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject
AddProperty Method

**InstallShield 2020 » Automation Interface**

*Project* • *The AddProperty method applies to the following project types.*

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The AddProperty method creates a Windows Installer property with the specified name in the current project.

**Syntax**

`AddProperty (Name As String) As ISWiProperty`

**Parameters**

**Table 13-10 • AddProperty Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Pass the name for the Windows Installer property that you want to add.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate the AddProperty method:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

Dim pProperty As ISWiProperty
Set pProperty = pProj.AddProperty ("MYPROP")
pProperty.Value = "MyPropValue"

pProj.SaveProject
pProj.CloseProject
```

**Applies To**

- ISWiProject

AddSetupFile Method

**InstallShield 2020 » Automation Interface**

*Project* • *The AddSetupFile method applies to the following project types.*
The AddSetupFile method creates a support file with the specified name in the current project.

**Syntax**

AddSetupFile (FileName As String) As ISWiSetupFile

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Pass the fully qualified file name for the support file that you want to add.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate the AddSetupFile method:

```vbp
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupFile As ISWiSetupFile

Set pSetupFile = pProj.AddSetupFile ("C:\My Files\MySupportFile.ext")

pProj.SaveProject
pProj.CloseProject
```

**Applies To**

- ISWiProject

### AddSetupType Method

InstallShield 2020 » Automation Interface

**Project** • This information applies to the following project types:

- InstallScript
- InstallScript Object

The AddSetupType method creates a setup type with the specified name in the current project.
**Syntax**

AddSetupType (Name As String) As ISWiSetupType

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Pass the name for the setup type that you want to add. The name should be the text that you want to use as the display name. The automation interface automatically generates a valid primary key for the new setup type based on the name that you specify for this parameter.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate the AddSetupType method:

```vbnet
dim pProj as ISWiProject
set pProj = createobject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.openProject "C:\MySetups\Project1.ism"
dim pSetupType as ISWiSetupType
set pSetupType = pProj.addsetuptype ("Client Setup - Save Space")
pProj.saveProject
pProj.closeProject
```

**Applies To**

- ISWiProject

**AddSQLServerConnection Method**

This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the AddSQLServerConnection method to add a new server connection to your project.
Chapter 13
Automation Interface

Syntax
Function AddSQLServerConnection(strConnectionName As String) As ISWiSQLConnection

Parameters

Table 13-13 • AddSQLServerConnection Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectionName</td>
<td>Specify the name of the new connection you want to establish.</td>
</tr>
</tbody>
</table>

Return Values
This method returns ISWiSQLConnection object.

Applies To
• ISWiProject

AddUpgradeTableEntry Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:
• Basic MSI
• InstallScript MSI

Call the AddUpgradeTableEntry method to create a new ISWiUpgradeTableEntry item and return a handle to that object.

Syntax
AddUpgradeTableEntry()

Example
The following Visual Basic lines demonstrate this method:

'###############################################
'# THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PROJECT PATH
'###############################################
set pProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject("C:\Documents and Settings\Testlab\My Documents\MySetups\your project name-21.ism")

'###############################################
'To create a new entry

dim pTableEntry
set pTableEntry = pProject.AddUpgradeTableEntry()
pTableEntry.UpgradeCode = "{12345678-1234-1234-1234-123456789012}"
pTableEntry.VersionMin = "1.0"
pTableEntry.VersionMax = "2.0"
pTableEntry.Language = "0"
pTableEntry.Remove = ""
pTableEntry.ActionProperty = "ACTIONPROP_AUTOMATION"
pTableEntry.Attributes = 5

'###############################################################
'To find and delete an existing entry

set pTableEntry = pProject.IswiUpgradeTableEntries("{12345678-1234-1234-1234-123456789012}")
pTableEntry.Delete

pProject.SaveProject
pProject.CloseProject

**Applies To**
- ISWiProject

**BuildPatchConfiguration Method**

**InstallShield 2020 » Automation Interface**

*Project* • *This information applies to the following project types:*
- Basic MSI
- InstallScript MSI

Call BuildPatchConfiguration to build the patch configuration identified by the strPatchConfiguration parameter. This action has the same effect as right-clicking on a patch configuration in the Patch Design view and then selecting Build a Patch.
**Syntax**

`BuildPatchConfiguration (strPatchConfigName as string)`

**Parameters**

**Table 13-14 • BuildPatchConfiguration Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strPatchConfigName</td>
<td>Enter the fully qualified path to your project.</td>
</tr>
</tbody>
</table>

**Properties**

**Table 13-15 • Properties Associated with BuildPatchConfiguration Method**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PatchConfigErrorCount</td>
<td>Include the error count associated with a particular build.</td>
</tr>
<tr>
<td>PatchConfigWarningCount</td>
<td>Include the warning count associated with a particular build.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate this method:

```vbnet
'Create the project object
dim pProject
set pProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")

'Call the OpenProject method
'####################################################################
'# THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PROJECT PATH
'####################################################################
pProject.OpenProject("\Your project.ism")
pProject.OpenProject("C:\Documents and Settings\Testlab\My Documents\MySetups\your project name-21.ism")

'Call the OpenProject method
'##############################################################################
'# THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PATCH CONFIGURATION NAME
'##############################################################################
pProject.BuildPatchConfiguration "Config1"

MsgBox "Patch Configifuration Config1 build with " & _
    pProject.PatchConfigErrorCount & " Errors and " & _
    pProject.PatchConfigWarningCount & " Warnings"
```

**Applies To**

- ISWiProject
BuildPCPFile Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

The BuildPCPFile method builds a patch package (.msp) file based on the settings in a patch creation properties (.pcp) file. You do not need to have a project open in order to create a patch.

Syntax

BuildPCPFile (strPCPFile As String, strPatchFile As String, strLogFile As String, bCreateUpdateExe As Boolean) As Long

Parameters

Table 13-16 • BuildPCPFile Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strPCPFile</td>
<td>Specify the fully qualified path to a .pcp file. You can create or modify a .pcp file through the Patch Design view.</td>
</tr>
<tr>
<td>strPatchFile</td>
<td>Specify the fully qualified path for the .msp file you want to create. Any existing file with this name is overwritten. The file cannot be created if the directory you provided does not exist.</td>
</tr>
<tr>
<td>strLogFile</td>
<td>Specify the fully qualified path to the .log file that records this method’s status and success in creating the patch package. If the file exists, the current status is appended to it.</td>
</tr>
<tr>
<td>bCreateUpdateExe</td>
<td>Set this option to True to have the package wrapped in an executable that applies the patch.</td>
</tr>
</tbody>
</table>

Return Values

BuildPCPFile() returns the result returned by the Windows Installer function UiCreatePatchPackage.

Applies To

- ISWiProject
CloseProject Method

This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

To close the project file (.ism or .dim) that you opened with OpenProject, call CloseProject.

Syntax

CloseProject()

Return Values

CloseProject always returns 0.

Applies To

- ISWiProject

CreatePatch Method

This method is deprecated for new development and has been replaced with the BuildPCPFile and BuildPatchConfiguration methods. To facilitate backward compatibility with existing build scripts, the CreatePatch method calls the BuildPCPFile method.

This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Syntax

CreatePatch()

Applies To

- ISWiProject
See Also
BuildPCPFile Method
BuildPatchConfiguration Method

CreateProject Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Project-specific differences are noted where appropriate.

The CreateProject method creates a new InstallShield project file (.ism) for a Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, or Merge Module project; it create a new InstallShield DIM project file (.dim) for DIM projects.

Syntax

CreateProject (strISWiProjectFile As String, ByVal projectType As ISWiProjectType)

Parameters

Table 13-17 • CreateProject Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strISWiProjectFile</td>
<td>Enter the fully qualified path to the .ism or .dim file that you want to create. Include the full file name.</td>
</tr>
<tr>
<td>projectType</td>
<td>Specify what type of project you want to create. Valid values are:</td>
</tr>
<tr>
<td>eptMsi (1)</td>
<td>Creates a Basic MSI project.</td>
</tr>
<tr>
<td>eptScript (-1)</td>
<td>Creates an InstallScript MSI project.</td>
</tr>
<tr>
<td>eptPro (9)</td>
<td>Creates an InstallScript project.</td>
</tr>
<tr>
<td>eptProObj (10)</td>
<td>Creates an InstallScript Object project.</td>
</tr>
<tr>
<td>eptMsm (2)</td>
<td>Creates a Merge Module project.</td>
</tr>
<tr>
<td>eptMsm (2)</td>
<td>Creates a Merge Module project.</td>
</tr>
<tr>
<td>eptDim (15)</td>
<td>Creates a DIM project.</td>
</tr>
</tbody>
</table>

Example

The following sample code creates a Basic MSI project called TestProject.ism.
Dim pProject As ISWiAutoAutomation Interface Version.ISWiProject
Set pProject = CreateObject("ISWiAutoAutomation Interface Version.ISWiProject")

Dim sProjectName As String
sProjectName = "C:\InstallShield 2020 Projects\TestProject.ism"

pProject.CreateProject sProjectName, eptMsi
pProject.OpenProject sProjectName, False
pProject.CloseProject

**Applies To**
- ISWiProject

---

**DeleteAdvancedFile Method**

InstallShield 2020 » Automation Interface

- **Project**
  - This information applies to the following project types:
    - Basic MSI
    - InstallScript
    - InstallScript MSI
    - InstallScript Object

The DeleteAdvancedFile method deletes the specified advanced file from the current project.

**Syntax**

DeleteAdvancedFile (pAdvancedFile As ISWiAdvancedFile) As Long

**Parameters**

**Table 13-18 • DeleteAdvancedFile Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pAdvancedFile</td>
<td>Specify the advanced file object to be deleted.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate the DeleteAdvancedFile method:

```vba
Dim pProj As ISWiProject
Set pProj = CreateObject("ISWiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pAdvancedFile As ISWiAdvancedFile

Set pAdvancedFile = pProj.ISWiAdvancedFiles.Item(1)
pProj.DeleteAdvancedFile pAdvancedFile
```
DeleteComponent Method

InstallShield 2020 » Automation Interface

This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call DeleteComponent to delete a component in the project. Similar to deleting a component in the Setup Design views, DeleteComponent both removes a component from its feature and permanently deletes it from the project.

**Syntax**

DeleteComponent (Component As ISWiComponent)

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component</td>
<td>Specify the ISWiComponent object that the method will delete.</td>
</tr>
</tbody>
</table>

**Example**

You can use the following lines to delete all components that are associated with the feature FeatureName1:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

Dim pFeat As ISWiFeature
Dim pComp As ISWiComponent

Set pFeat = pProj.ISWiFeatures.Item("FeatureName1")
For Each pComp In pFeat.ISWiComponents
    pProj.DeleteComponent pComp
```
DeleteCustomAction Method

InstallShield 2020 » Automation Interface

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Call the DeleteCustomAction method to completely delete a custom action from the current project.

**Syntax**

DeleteCustomAction (CustomAction As ISWiCustomAction)

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| CustomAction   | Pass the ISWiCustomAction object you want to delete from the current project.

Apply To

- ISWiProject

DeleteMergeModule Method

InstallShield 2020 » Automation Interface

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the DeleteMergeModule method to completely delete a merge module from the current project.
**Syntax**

`DeleteMergeModule (FileName As String)`

**Parameters**

Table 13-21 • DeleteMergeModule Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Pass the fully qualified file name for the merge module (.msm) file that you want to delete from the project.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject Object

---

**DeletePatchConfig Method**

InstallShield 2020 » Automation Interface

*Project* • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the `DeletePatchConfig` method to delete a patch configuration from your project. Using this method is similar to deleting a patch configuration in the Patch Design view of the IDE.

**Syntax**

`DeletePatchConfig (PatchConfig As ISWiPatchConfig)`

**Parameters**

Table 13-22 • DeletePatchConfig Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PatchConfigKey</td>
<td>Pass the name of the patch configuration that you want to delete.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject
DeletePathVariable Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the DeletePathVariable method to delete a path variable from your project. Using this method is similar to deleting a path variable from the Path Variables view in InstallShield.

Important • Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.

Syntax

DeletePathVariable (pPathVar ISWiPathVariable) As Long

Parameters

Table 13-23 • DeletePathVariable Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pPathVar</td>
<td>Pass the ISWiPathVariable object for the path variable that you want to delete.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

DeleteProductConfig Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI
- Merge Module

Call the DeleteProductConfig method to delete a product configuration from your project. Using this method is similar to deleting a product configuration in the Releases view of the IDE.
Syntax
DeleteProductConfig (ProductConfig As ISWiProductConfig)

Parameters

Table 13-24 • DeleteProductConfig Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProductConfigKey</td>
<td>Pass the name of the product configuration that you want to delete.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

DeleteProperty Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Call the DeleteProperty method to delete a property from the Property table. The function returns 0 if successful.

Syntax

Public Function DeleteProperty(ByVal pProperty As ISWiProperty) As Long

Parameters

Table 13-25 • DeleteProperty Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
<td>Pass the name of the property you want to delete.</td>
</tr>
</tbody>
</table>

Example

Dim proj As IswiAutoAutomation Interface Version.ISWiProject
Set proj = New IswiAutoAutomation Interface Version.ISWiProject
proj.OpenProject “c:\mysetups\your project name-3.ism”
Dim pProp As IswiAutoAutomation Interface Version.ISWiProperty
Set pProp = proj.ISWiProperties.Item("MyProperty")
proj.DeleteProperty pProp
Applies To

- ISWiProject

DeleteSetupFile Method

InstallShield 2020 » Automation Interface

Project • The DeleteSetupFile method applies to the following project types.

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

The DeleteSetupFile method deletes the specified support file from the current project.

Syntax

DeleteSetupFile (pSetupFile As ISWiSetupFile) As Long

Parameters

Table 13-26 • DeleteSetupFile Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pSetupFile</td>
<td>The support file object to be deleted.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic lines demonstrate the DeleteSetupFile method:

```vbnet
dim pProj as ISWiProject
set pProj = createobject("iswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
dim pSetupFile as ISWiSetupFile

set pSetupFile = pProj.ISWiSetupFiles.Item("MySupportFile.abc")
pProj.DeleteSetupFile pSetupFile

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject
DeleteSetupType Method

InstallShield 2020 » Automation Interface

**Project** • This information applies to the following project types:
- InstallScript
- InstallScript Object

The DeleteSetupType method deletes the specified setup type from the current project.

**Syntax**

DeleteSetupType (pSetupType As ISWiSetupType) As Long

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pSetupType</td>
<td>The setup type object to be deleted.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate the DeleteSetupType method:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupType As ISWiSetupType
Set pSetupType = pProj.ISWiSetupTypes.Item(1)
pProj.DeleteSetupType pSetupType

pProj.SaveProject
pProj.CloseProject
```

**Applies To**

- ISWiProject

DeleteSQLConnection Method

InstallShield 2020 » Automation Interface

**Project** • This information applies to the following project types:
- Basic MSI
- DIM
Call the DeleteSQLConnection method to remove a SQL Server Connection from the project.

**Syntax**

```vbscript
Function DeleteSQLConnection(Connection As ISWiSQLConnection) As Long
```

**Parameters**

**Table 13-28 • DeleteSQLConnection Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Specify the connection you want to remove from the project.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

---

**DeselectLanguage Method**

InstallShield 2020 » Automation Interface

**Project • This information applies to the following project types:**

- Basic MSI
- DiM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the DeselectLanguage method to deselect a language from the current project.
Syntax

DeselectLanguage (LangId As String)

Parameters

Table 13-29 • DeselectLanguage Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LangId</td>
<td>Pass the language ID you want to deselect in a string, as in oProject.DeleteLanguage &quot;1036&quot;.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

ExportProject Method

InstallShield 2020 • Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call ExportProject to convert an .ism file to XML format before checking it into a source code control program.

Note • When a project file format is converted to either XML or binary format, the project file extension remains *.ism.

The .isv file format has been deprecated to version 2.x of InstallShield for Windows Installer and versions of InstallShield Developer prior to 8.x.
Syntax

ExportProject (strISWiTextProjectFile As String, Optional strISWiProjectFile As String) As Long

Parameters

Table 13-30 • ExportProject Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strISWiTextProjectFile</td>
<td>Enter the fully qualified path to the .isv file.</td>
</tr>
<tr>
<td>strISWiProjectFile</td>
<td>Enter the fully qualified path to the .ism file. This parameter is optional only if the .ism file is already open.</td>
</tr>
</tbody>
</table>

Applies To

• ISWiProject

ExportStrings Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

• Basic MSI
• DIM
• InstallScript
• InstallScript MSI
• InstallScript Object
• Merge Module

Call ExportStrings to copy all or a portion of the string entries for a specific language to a tab-delimited Unicode text file (.txt). You can provide the .txt file to a translator who can update the file with translated text. After it has been translated, you can import the translated string entries into your project by calling the ImportStrings method.
**Syntax**

ExportStrings (strfile As String, dTimeStamp As Date, sLang As String) As Boolean

**Parameters**

**Table 13-31 • ExportStrings Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strfile</td>
<td>Enter the fully qualified path to the text file that will contain the exported strings. If the file exists, the automation interface overwrites it. ExportStrings creates a Unicode file.</td>
</tr>
<tr>
<td>dTimeStamp</td>
<td>All string entries have a date and time that they were last modified. This timestamp is useful if you want to give the translator only the string entries that are new or have been modified since the last round of translations. To export only the string entries that have been modified since a specific date, specify the earliest date for the string entries you want to export. The automation interface exports the string entries that have changed on or since that date. To export all of the entries for the specified language, enter the number 0.</td>
</tr>
<tr>
<td>sLang</td>
<td>Specify the identifier for the language whose string entries you want to export to the text file.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

Translating String Entries
Run-Time Language Support in InstallShield

**ForceUpgrade Method (Advanced UI and Suite/Advanced UI)**

*InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI*

- **Project**
  - This information applies to the following project types:
    - Basic MSI
    - DIM
    - InstallScript
    - InstallScript MSI
    - InstallScript Object
    - Merge Module

The ForceUpgrade method upgrades the project from an earlier version of InstallShield to the current version.
Chapter 13
Automation Interface

Syntax
ForceUpgrade (ISWiProjectFile As String)

Parameters

Table 13-32 • ForceUpgrade Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISWiProjectFile</td>
<td>Enter the fully qualified path to the project file (.ism) that you want to upgrade. Include the full file name.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

GenerateGUID Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

The GenerateGUID method generates a new, unique GUID that is returned as a string.

Applies To

- ISWiProject

ImportProject Method

InstallShield 2020 » Automation Interface

Note • This method has been deprecated to version 2.x of InstallShield for Windows Installer and versions of InstallShield Developer prior to 8.x.

Call ImportProject to convert an .isv file to an .ism file. If you access your project from a source code control program, InstallShield saves it as a text (.isv) file. However, OpenProject and ISCmdBld.exe both require a standard InstallShield project (.ism) file.
Later, you can call `ExportProject` to convert the .ism file back to an .isv file before checking it in to your source control program.

ImportProject fails if the project is already open in the automation interface or in InstallShield.

**Syntax**

ImportProject (strISWiProjectFile As String, strISWiTextProjectFile As String) As Long

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strISWiProjectFile</td>
<td>Enter the fully qualified path to the resulting .ism file.</td>
</tr>
<tr>
<td>strISWiTextProjectFile</td>
<td>Enter the fully qualified path to the .isv file.</td>
</tr>
</tbody>
</table>

**Error Codes**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1007</td>
<td>The project file is already open.</td>
</tr>
<tr>
<td>1009</td>
<td>Could not import the project.</td>
</tr>
<tr>
<td>1012</td>
<td>The .isv file is missing.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

**ImportStrings Method**

This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
Call ImportStrings to import the contents of a tab-delimited text file (.txt) into the project for a specific language. This method is useful when you have exported the entries to a text file and had them translated.

Syntax

ImportStrings (strfile As String, sLang As Integer, Optional Enum eiType, Optional strLogFile As String) As Boolean

Parameters

Table 13-35 • ImportStrings Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strfile</td>
<td>Enter the fully qualified path to the text file that contains the string entries that you want to import.</td>
</tr>
<tr>
<td>sLang</td>
<td>Specify the identifier for the language whose string entries you want to import to the project.</td>
</tr>
<tr>
<td>eiType</td>
<td>Specify how you want to handle conflicts when importing string entries:</td>
</tr>
<tr>
<td></td>
<td>• eiIgnore (0)—Do not replace the string entry’s value if it already exists in the project for the specified language.</td>
</tr>
<tr>
<td></td>
<td>• eiOverwrite (1)—Replace the project’s existing string entry with the one in the text file. This is the default value for this optional parameter.</td>
</tr>
<tr>
<td>strLogFile</td>
<td>Specify the fully qualified path to the log file that should contain the status and success of importing the string entries. The log file records any conflicts in importing string entries and lists any improperly formatted, hence unusable, entries. If the log file exists, it is overwritten.</td>
</tr>
</tbody>
</table>

Note • This parameter is optional.

Applies To

- ISWiProject

OpenProject Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:
To open your project so that you can modify it through the automation interface, call OpenProject with the fully qualified path to your .ism or .dim file. This method is equivalent to loading a project in InstallShield.

**Note** • The ISWIPer Project.OpenProject method fails if the project is open in InstallShield.
Syntax

OpenProject (strISWiProjectFile As String, Optional ByVal bReadOnly As Boolean) As Long

Parameters

Table 13-36 • OpenProject Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strISWiProjectFile</td>
<td>Enter the fully qualified path to the project file (.ism or .dim).</td>
</tr>
<tr>
<td>bReadOnly</td>
<td>Determines whether the project is opened with write privileges. True opens the project as a read-only file. The default value for this optional parameter is False.</td>
</tr>
</tbody>
</table>

Return Values and Errors

Table 13-37 • OpenProject Method Return Values and Errors

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Project successfully opened.</td>
</tr>
<tr>
<td>1</td>
<td>Project opened, but is locked by some other process.</td>
</tr>
<tr>
<td>2</td>
<td>Attempted to open project for write access, but project opened in read-only mode.</td>
</tr>
<tr>
<td>3</td>
<td>There was a problem creating the merge module catalog. Verify that the merge module search path is correct (via the File Locations tab of the Options dialog box or using -o for the Standalone Build), verify that no merge modules on the merge module path are corrupt, or self-register IsMMUpdater2.dll.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Error Code 1100</th>
<th>Unable to open file: %1. Ensure that the file is a valid InstallShield project.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error Code 1101</td>
<td>Unable to open file: %1. This project was created using a previous version of InstallShield Developer, InstallShield–Windows Installer or InstallShield Express.</td>
</tr>
<tr>
<td>Error Code 1102</td>
<td>Unable to open file: %1. This project was created using InstallShield Professional or InstallShield Express 2.xx.</td>
</tr>
<tr>
<td>Error Code 1103</td>
<td>Unable to open file: %1. The project was created using a more recent version of InstallShield Developer or the project has been updated to a more recent version of InstallShield, InstallShield DevStudio, or InstallShield Developer.</td>
</tr>
</tbody>
</table>

ImportProject
RemoveFeature Method

InstallShield 2020 » Automation Interface

**Project** • This information applies to the following project types:
- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

The RemoveFeature method permanently deletes a feature from the current project.

**Syntax**

```
RemoveFeature (Feature As ISWiFeature) As Long
```

**Parameters**

**Table 13-38 • RemoveFeature Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feature</td>
<td>The item in ISWiFeatures that you want to remove.</td>
</tr>
</tbody>
</table>

**Example**

The following code fragment opens a project, deletes the feature named NewFeature1, and then saves and closes the project:

```
Dim pProj As ISWiProject
Dim pFeat As ISWiFeature

Set pProj = New ISWiProject
pProj.OpenProject "C:\Test\SampleProject.ism"

Set pFeat = pProj.ISWiFeatures.Item("NewFeature1")
pProj.RemoveFeature pFeat

pProj.SaveProject
pProj.CloseProject
```

When RemoveFeature is a member of ISWiFeature, it cannot be used to delete the current feature. However, you can call it to delete a subfeature, such as the first subfeature under NewFeature1 in the following example:

```
Set pFeat = pProj.ISWiFeatures.Item("NewFeature1")
pProj.RemoveFeature pFeat.Feaut(1)
```

**Applies To**

- ISWiProject
SaveProject Method

InstallShield 2020 » Automation Interface

- ISWiFeature

**SaveProject Method**

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

To save any changes that you have made to your project file through the automation interface, call the SaveProject method.

**Syntax**

SaveProject ()

**Return Values and Errors**

Table 13-39 • SaveProject Method Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERROR_SUCCESS (0)</td>
<td>Project is saved.</td>
</tr>
</tbody>
</table>

Error Code 1104

Unable to save file: %1. The project is open in read-only mode or is being used by another process.

**Applies To**

- ISWiProject

**ISWiAdvancedFile Object**

InstallShield 2020 » Automation Interface

- ISWiFeature
ISWiAdvancedFile represents an advanced file in your project. The advanced file can be an existing one from the Support Files view (or the Support Files/Billboards view) in InstallShield or one added by calling AddAdvancedFile.

Use the project’s ISWiAdvancedFiles collection to access a specific advanced file. You must specify either an index number or the file key for the Item property of ISWiAdvancedFiles.

**Members**

**Table 13-40 • ISWiAdvancedFile Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Read-Only Property</td>
<td>Stores the file key of the advanced file. See the description of ISWiFile above for more information about the file key.</td>
</tr>
<tr>
<td>BuildSourcePath</td>
<td>Read-Write Property</td>
<td>Stores the advanced file’s fully qualified source filename. Any path variables are resolved to the actual path.</td>
</tr>
<tr>
<td>Disk</td>
<td>Read-Write Property</td>
<td>This enumerated integer property specifies the Advanced Files folder in which you want to add the advanced file. Specify one of the following values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• edtDisk1 (1)—Specifies the Disk 1 folder.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• edtLastDisk (-1)—Specifies the Last Disk folder.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• edtOther (0)—Specifies the Other folder.</td>
</tr>
</tbody>
</table>

**Example**

The file key is visible in the IDE only as the first entry in the Direct Editor view’s ISDisk1 table. Instead of using the file key, you could write code similar to the following example to check for a certain file name:

```vba
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pAdvancedFile As ISWiAdvancedFile

For Each pAdvancedFile In pProj.ISWiAdvancedFiles
    If UCase(pAdvancedFile.BuildSourcePath) = "C:\MY FILES\MYADVANCEDFILE.EXT" Then
        Exit For
    End If
Next

pProj.SaveProject
pProj.CloseProject
```

If the file `C:\My Files\MyAdvancedFile.ext` is found among the project’s setup files, the For loop ends, and `pAdvancedFile` holds a copy of the ISWiAdvancedFile object for `C:\My Files\MyAdvancedFile.ext`.

**Applies To**

- ISWiProject
ISWiAutomaticUpgradeEntry Object

InstallShield 2020 » Automation Interface

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

The ISWiAutomaticUpgradeEntry object represents an automatic upgrade item in the Upgrades view of the InstallShield interface.

**Members**

**Table 13-41 • ISWiAutomaticUpgradeEntry Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete</td>
<td>Method</td>
<td>Deletes the AutomaticUpgradeEntry from the project file.</td>
</tr>
<tr>
<td>Name</td>
<td>Read-Write Property</td>
<td>Sets the name of the upgrade item as displayed in the IDE.</td>
</tr>
<tr>
<td>UpgradedSetupPath</td>
<td>Read-Write Property</td>
<td>Sets the path to the MSI package that needs to be upgraded. The build engine will create the settings required to upgrade this setup.</td>
</tr>
<tr>
<td>ReleaseFlag</td>
<td>Read-Write Property</td>
<td>Configure this upgrade entry to only be built into the setup when a certain release flag has been set.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

**Delete Method**

InstallShield 2020 » Automation Interface

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call this method to delete the ISWiAutomaticUpgradeEntry from the project file.
Syntax
Delete()

Applies To
- ISWiAutomaticUpgradeEntry

ISWiCustomAction Object

This information applies to the following project types:
- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

ISWiCustomAction represents a custom action in the Custom Actions and Sequences view (or the Custom Actions view) of InstallShield. You can retrieve a custom action by specifying an item in the ISWiCustomActions collection.
## Members

**Table 13-42 • ISWiCustomAction Object Members**

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActionType</td>
<td>Read-Write Property</td>
<td>Holds the numeric custom action type. For more information, see Custom Action Type Overview.</td>
</tr>
<tr>
<td>Comment</td>
<td>Read-Write Property</td>
<td>An optional comment for the custom action.</td>
</tr>
<tr>
<td>Name</td>
<td>Read-Write Property</td>
<td>The name of the custom action.</td>
</tr>
<tr>
<td>Source</td>
<td>Read-Write Property</td>
<td>Specifies the source of the custom action. See Creating Custom Actions in the Custom Actions and Sequences View (or the Custom Actions View) for the required Source property for different types of custom actions.</td>
</tr>
<tr>
<td>SourceEx</td>
<td>Write-Only Property</td>
<td>Sets a custom action source property, same as the Source property. SourceEx replaces the existing binary record for the new path when you change a source that is stored in the Binary table. If other custom actions use the path, their path is also updated. Source creates a new binary record when other custom actions use the path. Only the path in the custom action is updated.</td>
</tr>
<tr>
<td>Target</td>
<td>Read-Write Property</td>
<td>Specifies the target of the custom action. See Creating Custom Actions in the Custom Actions and Sequences View (or the Custom Actions View) for the required Target property for different types of custom actions.</td>
</tr>
</tbody>
</table>

## ISWiComponent Object

InstallShield 2020 » Automation Interface

**Project** • This information applies to the following project types:
- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Project-specific differences are noted where appropriate.
ISWiComponent represents a component in the InstallShield user interface. You can retrieve a component by specifying an item in the ISWiComponents collection. The component can be one created in the IDE or as a result of calling AddComponent.

Many component attributes are available in the automation interface through this object’s methods and properties. Refer to the following table to see which methods, properties, and collections are available for your project type.
## Members

### Table 13-43 • ISWiComponent Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AddComponentSubFolder</td>
<td>InstallScript, InstallScript Object</td>

<td>Basic MSI, InstallScript, InstallScript MSI, Merge Module</td>
<td>Method</td>
<td>Adds a dynamic file link to the current component.</td>
</tr>
<tr>
<td>AddEnvironmentVar</td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Method</td>
<td>Adds an environment variable to the current component.</td>
</tr>
<tr>
<td>AddFile</td>
<td>All</td>
<td>Method</td>
<td>Adds a file to the current component.</td>
</tr>
<tr>
<td>AddRemoveFile</td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Method</td>
<td>Adds a file or folder removal entry to the current component.</td>
</tr>
<tr>
<td>Attrib64BitComponent</td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Read-Write Property</td>
<td>Set this property to True to have the component registered as 64-bit. Setting this property to False causes the component to be registered as 32-bit. If the component is 64-bit and is replacing a 32-bit component, be sure to provide a new GUID via the GUID property. Note that 64-bit support requires version 2.0 of the Windows Installer service.</td>
</tr>
<tr>
<td>Comments</td>
<td>All</td>
<td>Read-Write Property</td>
<td>Gets or sets the comments for this component.</td>
</tr>
<tr>
<td>Compressed</td>
<td>InstallScript, InstallScript Object</td>
<td>Read-Write Property</td>
<td>This Boolean property gets or sets the component’s Compressed property, which specifies whether to compress the component's files (True) or leave them uncompressed (False) when the files are stored in a cabinet file by the release builder.</td>
</tr>
<tr>
<td>Condition</td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Read-Write Property</td>
<td>Contains any condition associated with the component.</td>
</tr>
</tbody>
</table>
### Table 13-43 • `ISWiComponent` Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Destination</strong></td>
<td>All</td>
<td>Read-Write Property</td>
<td>Gets or sets the component’s destination. The following formats are valid:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• (Windows Installer based projects only:) [INSTALLDIR]</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• (Windows Installer based projects only:) [ProgramFilesFolder]Subfolder</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• (InstallScript projects only:) &lt;TARGETDIR&gt;</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• (InstallScript projects only:) &lt;WINDIR&gt;\Subfolder</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• C:\FolderName</td>
</tr>
</tbody>
</table>

**Important** • Setting the Destination property for the `ISWiComponent` object resets the object’s SourceLocation property. Therefore, any code that sets the SourceLocation property should be placed after any code that sets the Destination property.

<td>Read-Write Property</td>
<td>If this Boolean property is true, the key file for this component is a device driver package; if the property is false, the key file is not a device driver package.</td>
</tr>
</tbody>
</table>
IsPlatformSelected

In conjunction with the PlatformSuiteCheck property, gets or sets the component's Platform Suite(s) property, which specifies to what platform suites, if any, the component is specific.

Use the following constants to set this property:

- epsMSBackOffice = 32 (&H20)
- epsMSSmallBusinessServer = 256 (&H100)
- epsMSSmallBusinessServerWithRestrictiveLicenses = 512 (&H200)
- epsTerminalServices = 16 (&H10)
- epsWin2kAdvSvrOrWinDotNetEnterpriseServer = 128 (&H80)
- epsWin2kOrWinDotNetDatacenterServer = 64 (&H40)
- epsWinServer = 4
- epsWinWorkstation = 8
- epsWinXPHome = 2
- epsWinXPPro = 1
- epsArchIA64 = 1024 (&H400)
- epsArchAMD64 = 2048 (&H800)
- epsArchIntel32 = 4096 (&H1000)

For example:

```vbnet
pFeature.IsPlatformSelected(epsWinXPHome) = True
```

Table 13-43 • ISWiComponent Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| KeyPath| Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | **Note** • ISWiComponent.KeyPathType must be set before setting ISWiComponent.KeyPath. Errors result if this is done in the reverse order.  

Contains the file or registry entry that serves as this component's key path. The exact type is indicated by the KeyPathType property, below.

When the key path is a key file, it contains the file key. You can view this value in the Key column of a component's file list, but be aware that file keys are subject to change when the files are dynamically linked. The file key is the same as the Name property of an ISWiFile object.

When the key path is a registry value, there is a specially formatted string that contains the registry key. The path to the registry key is enclosed in square brackets and separated from the value name with a vertical bar (or pipe character). For example, the following lines set the key path for the component m_MyComponent to the value MyName under HKEY_LOCAL_MACHINE\Software\MyCompany\Settings:

```csharp
m_MyComponent.KeyPathType = kptRegistry
m_MyComponent.KeyPath =
"[HKEY_LOCAL_MACHINE\Software\MyCompany\Settings]\MyName"
```

A file cannot serve as the key file if it is dynamically linked.
### ISWiComponent Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| **KeyPathType**| Basic MSI, InstallScript, MSI, Merge Module  | Read-Write Property | ISWiComponent.KeyPathType must be set before setting ISWiComponent.KeyPath. Errors result if this is done in the reverse order. Stores a value that points to the precise type of key path contained in the KeyPath property. Specify one of the following types:  
  - kptRegistry (1)  
  - kptFile (2)  
  - kptFolder (3)  
  - kptODBC (4)  
  Note that the automation interface can set the key path type only to kptRegistry or kptFile, but the other values are possible return values if you are reading the current key path type. |
| **Miscellaneous**| InstallScript, InstallScript Object          | Read-Write Property | Gets or sets the component’s Miscellaneous property, which associates a text string with the component.                                                                                                                                               |
| **Name**       | All                                           | Read-Only Property | Component name of the current item in the collection.                                                                                                                                                              |
| **NeverOverwrite**| Basic MSI, InstallScript, MSI, Merge Module   | Read-Write Property | Instructs the installer whether to replace an existing component. Specify True to leave the existing component or False to replace it.                                                                                      |
| **OSFilter**   | InstallScript, InstallScript Object           | Read-Write Property | Gets or sets the component’s Operating Systems setting. If the target machine's operating system does not match one of the operating systems that are specified for this setting, the component is not installed. By default, components are operating system independent, meaning that none of the component’s data are specific to certain operating systems. |

Tip • Use this property with the IsPlatformSelected property to distinguish between Windows Vista and Windows Server 2008, or between Windows 7 and Windows Server 2008 R2, or between Windows 8 and Windows Server 2012, or between Windows 8.1 and Windows Server 2012 R2.
In conjunction with the OverwriteSubOptionsVersion and OverwriteSubOptionsDate properties, gets or sets the component's Overwrite property, which specifies whether the component's files overwrite already-existing versions on the target system always, never, or conditionally based on date/time stamp or version number. Use the following constants to set this property:

- **ecomAlways (0)**—Files on the target system are always overwritten.
- **ecomByDate (1)**—Files on the target system are conditionally overwritten based on date/time stamp as specified by the OverwriteSubOptionsDate property.
- **ecomByVersion (2)**—Files on the target system are conditionally overwritten based on version number as specified by the OverwriteSubOptionsVersion property.
- **ecomByVersionThenDate (3)**—Files on the target system are conditionally overwritten based on version number or, if the file on your distribution media and the file on the target system have the same version number or if neither file has a version number, by date/time stamp as specified by the OverwriteSubOptionsVersion and OverwriteSubOptionsDate properties.
- **ecomNever (4)**—Files on the target system are never overwritten.

**Applies To**

- ISWiFeature
AddComponentSubFolder Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- InstallScript
- InstallScript Object

The AddComponentSubFolder method adds a component subfolder to the current component or component subfolder.

Syntax

AddComponentSubFolder (Name As String) As ISWiComponentSubFolder

Parameters

Table 13-44 • AddComponentSubFolder Method

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Pass the name for the subfolder that you want to add.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic lines demonstrate the AddComponentSubFolder method:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent
Dim pComponentSubFolder As ISWiComponentSubFolder

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
Set pComponentSubFolder = pComponent.AddComponentSubFolder("MyCompSubFolder")

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiComponent
- ISWiComponentSubFolder
AddDynamicFileLinking Method

InstallShield 2020 » Automation Interface

Project • The information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

Call AddDynamicFileLinking to add a dynamic file link to a specified component. All of the files that are in the folder that you specify are automatically incorporated into your installation.

Project • In Basic MSI, InstallScript MSI, and Merge Module projects, all new dynamic file links that you add use the best practice method of component creation by default. For more information, see Determining the Appropriate Component Creation Method for Dynamically Linked Files.

Syntax

AddDynamicFileLinking (sSourceFolder As String) As ISWiDynamicFileLinking

Parameters

Table 13-45 • AddDynamicFileLinking Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sSourceFolder</td>
<td>Pass the fully qualified path to the folder that contains the files that you want to be dynamically linked.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic example adds a dynamic link to MyDynamicFiles to the component MyComponent:

m_ISWiFeature.ISWiComponents("MyComponent").AddDynamicFileLinking "C:\Build 141\MyDynamicFiles"

All of the files in the MyDynamicFiles folder are added to the project. The folder is scanned before every build, and any new or changed files are automatically incorporated into your project.

Applies To

- ISWiComponent

See Also

ISWiDynamicFileLinking Object
AddEnvironmentVar Method

**InstallShield 2020 » Automation Interface**

**Project** • The AddEnvironmentVar method applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Call AddEnvironmentVar to add an environment variable to a component.

**Syntax**

AddEnvironmentVar (sName As String) As ISWiEnvironmentVar

**Parameters**

**Table 13-46 • AddEnvironmentVar Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sName</td>
<td>Specifies the name of the environment variable.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic example adds the environment variable *MyEnvironment* to the component *MyComponent*:

```vbscript
m_ISWiFeature.ISWiComponents("MyComponent").AddEnvironmentVar "MyEnvironment"
```

**Applies To**

- ISWiComponent

AddFile Method

**InstallShield 2020 » Automation Interface**

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Project-specific differences are noted where appropriate.
Call `AddFile` to add a file to a specified component or, in InstallScript projects, a component subfolder. The files that are added with this method have static file links.

**Syntax**

```
AddFile (FileName As String) As ISWiFile
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Pass the fully qualified file name for the individual file that you want to add to this component or component subfolder.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic example adds the file `MyFile.exe` to the component `MyComponent`:

```
m_ISWiFeature.ISWiComponents("MyComponent").AddFile "C:\Build 141\MyFile.exe"
```

**Applies To**

- ISWiComponent
- ISWiComponentSubFolder

---

## AddRemoveFile Method

**Project** The `AddRemoveFile` method applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The `AddRemoveFile` method adds a file or folder removal entry to the current component. This file and folder removal capability is useful for scenarios such as removing application-created files that your installation does not otherwise track.

**Syntax**

```
AddRemoveFile () As ISWiRemoveFile
```

**Applies To**

- ISWiComponent

Removing Files and Folders from Target Systems

DeviceDriverFlagsEx Property

Project • This information applies to the following project types:

Project-specific differences are noted where appropriate.

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The DeviceDriverFlagsEx property enables you to specify the flag settings for device drivers and runtime options directly from the automation layer. You can pass the following property values to this property. Pass more than one value by using OR.

Table 13-48 • DeviceDriverFlagsEx Property Values

<table>
<thead>
<tr>
<th>Value</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Not set (default).</td>
</tr>
<tr>
<td>1</td>
<td>To replace any existing driver for the device with this driver, pass this property value to the DeviceDriverFlagsEx property. If you do not pass this property and a driver already exists for the device, your driver is not installed.</td>
</tr>
<tr>
<td>2</td>
<td>To prevent the Connect Device to Computer dialog from being displayed during the installation of a device driver if a device matching the driver is not connected to a computer, pass this property value.</td>
</tr>
<tr>
<td>4</td>
<td>If you pass this property value to the DeviceDriverFlagsEx property, the installation creates an Add or Remove Programs entry for the device driver only; the installation does not create an additional entry for the installation itself. DIFxApp does not support this feature on Windows Vista and later.</td>
</tr>
<tr>
<td>8</td>
<td>By default, DIFxApp does not install unsigned driver packages or driver packages that have missing files. To override this default behavior, pass this value to the DeviceDriverFlagsEx property.</td>
</tr>
<tr>
<td>16</td>
<td>By default, when DIFxApp uninstalls a driver package, DIFxApp does not remove the binary files that were copied to the system when it installed the driver. To override this default behavior, pass this value to the DeviceDriverFlagsEx property. If you do pass this value, DIFxApp removes a binary file from the system only if the binary file is identical to the corresponding binary file in the driver store.</td>
</tr>
</tbody>
</table>

Caution • Pass this value only if you can verify that the driver’s binary files are not required by any other driver package or application.
The DeviceDriverSetRedist property applies to the following project types:

- **Basic MSI**
- **DIM**
- **InstallScript MSI**
- **Merge Module**

The DeviceDriverSetRedist property sets the custom action runtime.dll used for all device driver installations in the project. This property takes the following values:

- **eddr32Bit**—Specifies that the device drivers in this project target 32 bit machines and that the installation uses runtime dialogs for English only.
- **eddr32BitLocalized**—Specifies that the device drivers in this project target 32 bit machines and that the installation includes all localized installation runtime dialogs.
- **eddf64Bit**—Specifies that the device drivers in this project target Itanium 64 bit machines and that the installation uses runtime dialogs for English only.
- **eddf64BitLocalized**—Specifies that the device drivers in this project target Itanium 64 bit machines and that the installation includes all localized installation runtime dialogs.
- **eddf64BitAMD**—Specifies that the device drivers in this project target AMD 64 bit machines and that the installation uses runtime dialogs for English only.
- **eddf64BitAMDLocalized**—Specifies that the device drivers in this project target AMD 64 bit machines and that the installation includes all localized installation runtime dialogs.

The English runtime.dll file is smaller than the localized .dll file, so if space is an issue and you do not need the extra language runtime dialogs, use one of the English-only values (not one of the localized values).

If you use one of the localized values, the installation uses a runtime.dll that includes dialogs and text for the following languages:

- Arabic (Saudi Arabia)
- Spanish - Modern Sort (Spain)
- Norwegian (Bokmål) (Norway)

ImportINIFile Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Call the ImportINIFile method to import INI files from the automation layer.
Syntax

ImportINIFile(INIFile As String, [DirectoryID As String])

Parameters

Table 13-49 • ImportINIFile Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INIFile</td>
<td>This represents the full path to the INI file that needs to be imported.</td>
</tr>
<tr>
<td>DirectoryID</td>
<td>The directory must be a valid MSI Directory identifier such as INSTALLDIR. The directory is optional if you do not specify it. InstallShield will use the component directory.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiComponent

ImportRegFile Method

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the ImportRegFile method to import the contents of a registry (REG) file into the registry data for a specified component. This method mimics manually importing a REG file in the IDE.
**Syntax**

ImportRegFile (RegFile As String, Optional OverWrite As Boolean)

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RegFile</td>
<td>Specify the fully qualified path to the REG file that you want to import.</td>
</tr>
</tbody>
</table>
| OverWrite   | Choose one of the following options for instructing ImportRegFile how you want to handle conflicts when merging registry data:  
> True—If a value exists in the component's registry data, overwrite it with the value from the REG file.  
> False—If a value in the REG file is already present in the component's registry data, do not import that value.  
> The default value for this optional parameter is True. |

**Applies To**

- ISWiComponent

**ISWiRemoveFiles Method**

InstallShield 2020 » Automation Interface

**Project**  
This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISWiRemoveFiles method returns an ISWiRemoveFiles collection that contains all of the file and folder removal entries that are associated with the current component.
**Syntax**

$$\text{ISWiRemoveFiles As ISWiRemoveFiles}$$

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pRemoveFolder</td>
<td>Pass the ISWiRemoveFile object that you want to remove.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic code illustrates how you would set a property for a specific file removal entry in a component. For the purposes of this example, assume that the variable m_oMyComp already has a reference to a component.

```vbnet
m_oMYComp.ISWiRemoveFiles("RemoveFile1").FileName = ".txt"
```

Removing Files and Folders from Target Systems

---

**RemoveComponentSubFolder Method**

InstallShield 2020 » Automation Interface

**Project**

This information applies to the following project types:

- InstallScript
- InstallScript Object

The RemoveComponentSubFolder method removes the specified component subfolder from the current component or component subfolder.
Chapter 13
Automation Interface

Syntax

RemoveComponentSubFolder (pComponentSubFolder As ISWiComponentSubFolder) As Long

Parameters

Table 13-52 • RemoveComponentSubFolder Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pComponentSubFolder</td>
<td>Pass the subfolder object that you want to remove.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic lines demonstrate the RemoveComponentSubFolder method:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent
Dim pComponentSubFolder As ISWiComponentSubFolder

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
Set pComponentSubFolder = pComponent.ISWiComponentSubFolders.Item("MyCompSubFolder")
pComponent.RemoveComponentSubFolder pComponentSubFolder

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiComponentSubFolder

RemoveDynamicFileLinking Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

Call RemoveDynamicFileLinking to remove a dynamic file link from the current component.
Syntax

RemoveDynamicFileLinking (pSourceFolder As ISWiDynamicFileLinking) As Long

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pSourceFolder</td>
<td>Pass the ISWiDynamicFileLinking object to specify a dynamic file link that you want to remove from the project.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiComponent

RemoveEnvironmentVar Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Call RemoveEnvironmentVar to remove an environment from a specified component.

Syntax

RemoveEnvironmentVar (sName As ISWiRemoveEnvironmentVar) As Long

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sName</td>
<td>Pass the ISWiEnvironmentVar object to specify an environment variable that you want to remove.</td>
</tr>
</tbody>
</table>

Removing Files and Folders from Target Systems

ISWiComponentSubFolder Object

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- InstallScript
- InstallScript Object

The ISWiComponentSubFolder object represents a component subfolder belonging to the current component or component subfolder. The component subfolder can be an existing one from the InstallShield user interface’s Components view or one added by calling AddComponentSubFolder.

Use the project’s ISWiComponentSubFolders collection to access a specific component subfolder. You must specify either an index number or the component subfolder name for the Item property of ISWiComponentSubFolders.
Members

Table 13-57 • ISWiComponentSubFolder Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AddComponentSubFolder</td>
<td>Method</td>
<td>Adds a subfolder to the component subfolder.</td>
</tr>
<tr>
<td>AddFile</td>
<td>Method</td>
<td>Adds a file to the component subfolder.</td>
</tr>
<tr>
<td>DeleteFile</td>
<td>Method</td>
<td>Deletes a file from the component subfolder.</td>
</tr>
<tr>
<td>ISWiComponentSubFolders</td>
<td>Collection</td>

</tr>
<tr>
<td>ISWiFiles</td>
<td>Collection</td>
<td>Contains all of the files associated with this component subfolder.</td>
</tr>
<tr>
<td>Name</td>
<td>Read-Only Property</td>
<td>Stores the name of the component subfolder.</td>
</tr>
<tr>
<td>RemoveComponentSubFolder</td>
<td>Method</td>
<td>Removes a subfolder from the component subfolder.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic code illustrates the use of the ISWiComponentSubFolder object:

```vba
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent
Dim pComponentSubFolder As ISWiComponentSubFolder

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
Set pComponentSubFolder = pComponent.ISWiComponentSubFolders.Item("MyCompSubFolder")
pComponentSubFolder.AddFile("C:\My Files\MyFile.ext")

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiComponent

DeleteFile Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:
• InstallScript
• InstallScript Object

Call DeleteFile to delete a file from a specified component subfolder. The files added with this method have static file links, similar to adding files in the IDE.

Syntax

DeleteFile (pFile As ISWiFile) As Long

Parameters

Table 13-58 • DeleteFile Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pFile</td>
<td>Pass the file object that you want to delete.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic example deletes a file from the component subfolder MyCompSubFolder:

    Dim pProj As ISWiProject
    Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
    pProj.OpenProject "C:\MySetups\Project1.ism"
    Dim pFeature As ISWiFeature
    Dim pComponent As ISWiComponent
    Dim pComponentSubFolder As ISWiComponentSubFolder
    Dim pFile As ISWiFile

    Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
    Set pComponent = pFeature.ISWiComponents.Item("MyComp")
    Set pComponentSubFolder = pComponent.ISWiComponentSubFolders.Item("MyCompSubFolder")
    Set pFile = pComponentSubFolder.ISWiFiles.Item("MyFile.ext")
    pComponentSubFolder.DeleteFile pFile

    pProj.SaveProject
    pProj.CloseProject

Applies To

• ISWiComponentSubFolder

ISWiCondition Object

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

• Basic MSI
• InstallScript MSI
ISWiCondition is a subset of the ISWiFeature object. This object allows you to get and set conditional logic for any of your project’s features.

**Members**

**Table 13-59 • ISWiCondition Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>Read-Write Property</td>
<td>Gets or sets any conditions that are associated with this feature.</td>
</tr>
<tr>
<td>Level</td>
<td>Read-Write Property</td>
<td>Gets or sets the install level assigned to the feature when the condition evaluates to TRUE.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiFeature

**ISWiDynamicFileLinking Object**

This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

Project-specific differences are noted where appropriate.

ISWiDynamicFileLinking represents a dynamic file link that belongs to a component. The dynamic file link can be an existing one from the InstallShield user interface or one added by calling AddDynamicFileLinking.
### Members

### ISWiFeature Object

InstallShield 2020 » Automation Interface

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

**Project-specific differences are noted where appropriate.**

ISWiFeature represents a top-level feature or a subfeature in InstallShield. You can retrieve a feature by specifying an item in the ISWiFeatures collection.

Many feature properties and attributes are available in the automation interface through this object’s methods, properties, and collections. Refer to the following table to see which methods, properties, and collections are available for your project type.
## Members

</table>
| Need         | InstallScript            | Read-Write Property | Gets or sets the feature's File Need property, which specifies whether a warning, a severe warning, or no warning should be given to end users who deselect the feature. Use the following constants to set this property:  
  - `efnCritical (0)`—Use this option for features that your setup does not allow end users to deselect.  
  - `efnHighlyRecommended (1)`—Use this option to advise end users that the feature should be installed.  
  - `efnStandard (2)`—Use this option to let end users deselect the feature with no message issued. |
| OnInstalled  | InstallScript, InstallScript MSI | Read-Write Property | Gets or sets the feature's OnInstalled property, which specifies the function to be executed just after the feature is installed. |
| OnInstalling | InstallScript, InstallScript MSI | Read-Write Property | Gets or sets the feature's OnInstalling property, which specifies the function to be executed just before the feature is installed. |
| OnUninstalled| InstallScript, InstallScript MSI | Read-Write Property | Gets or sets the feature's OnUninstalled property, which specifies the function to be executed just after the feature is uninstalled. |
| OnUninstalling | InstallScript, InstallScript MSI | Read-Write Property | Gets or sets the feature's OnUninstalling property, which specifies the function to be executed just before the feature is uninstalled. |
| Password     | InstallScript            | Read-Write Property | Gets or sets the feature's Password property, which specifies a password for the feature. |
| ReleaseFlags | Basic MSI, InstallScript MSI | Read-Write Property | Gets or sets the release flags that are associated with this feature. Separate multiple flags with a comma.  
You can specify which release flags you want to use to filter the project's features in the ReleaseFlags property of ISWiRelease. |
Retrieves or sets the feature's Remote Installation property. Use the following constants to set this property:

- **efrLocal (0)**—Means that all of the feature's files are installed onto the target system.
- **efrSource (1)**—Causes the files belonging to this feature to run directly from the source medium, such as a CD-ROM or network server.
- **efrFollowParent (2)**—Gives a subfeature the Remote Installation property of its parent feature.

Removes a component from this feature.

Deletes the specified feature from the project.

Removes a merge module from the current feature.

Removes an InstallScript object from the current ISWiFeature.

Gets or sets the feature's Required property. This property is a Boolean.

Gets or sets a comma-delimited string that lists the names of the features that are specified in the current feature's Required Features property.
Applies To

- ISWiProject

AddCondition Method

This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddCondition method to add a condition to the current feature.

### Table 13-62 • ISWiFeature Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| SetupTypeStatus | InstallScript, InstallScript MSI  | Read-Write Property | Gets or sets the selection status of the feature in the setup type that is specified in the property's argument. Use the following constants to set this property:  
  - estSelected (10) — The feature is selected.  
  - estDeselected (11) — The feature is not selected.  

In the following Visual Basic code snippet, the Help_Files feature is not selected for the Compact setup type.

```vbs
Set pFeature = pProject.ISWiFeatures.Item("Help_Files")
Set pSetupType = pProject.ISWiSetupTypes.Item("Compact")
pFeature.SetupTypeStatus(pSetupType) = 11
```

<table>

Applies To

- ISWiFeature

AddMergeModule Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddMergeModule method to associate a merge module with the current feature. This method is similar to adding a merge module to a feature in the Redistributables view.

Syntax

AddMergeModule (FileName As String)

Parameters

Table 13-64 • AddMergeModule Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Pass the fully qualified file name for the merge module (.msm) file that you want to associate with this feature.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiFeature
AddObject Method

The AddObject method adds an InstallScript object with the specified moniker to the current feature.

**Syntax**

```
AddObject (Moniker As String) As ISWiObject
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Moniker</td>
<td>Pass the moniker for the InstallScript object that you want to add. To get an InstallScript object's moniker, create a new Professional project in the IDE and add the InstallScript object to a feature, then go to the Direct Editor view's ISFeatureExtended table and see the Moniker column.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate the AddObject method:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pObject As ISWiObject

Set pFeature = pProj.ISWiFeatures.Item(2)
Set pObject = pFeature.AddObject (@"ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9")

pProj.SaveProject
pProj.CloseProject
```

**Applies To**

- ISWiFeature

AttachComponent Method

This information applies to the following project types:

- Basic MSI
• InstallScript
• InstallScript MSI

Call the AttachComponent method to associate a component with the current feature. The component must exist (created manually in the IDE or by calling AddComponent) before you can associate it with a feature.

**Syntax**

AttachComponent (Component As ISWiComponent)

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component</td>
<td>Provide the ISWiComponent object that represents the component you want to associate with this feature.</td>
</tr>
</tbody>
</table>

• ISWiFeature

---

**DeleteCondition Method**

InstallShield 2020 » Automation Interface

> **Project**  
> *This information applies to the following project types:*

• Basic MSI
• InstallScript MSI

Call the DeleteCondition method to delete a condition from the current feature.

**Syntax**

DeleteCondition (pCondition As ISWiCondition)

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pCondition</td>
<td>The ISWiCondition object representing the condition you want to delete.</td>
</tr>
</tbody>
</table>

**Applies To**

• ISWiFeature
RemoveComponent Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:
  • Basic MSI
  • InstallScript
  • InstallScript MSI

Call RemoveComponent to remove a component from a specified feature. Similar to removing a component in the Setup Design views, RemoveComponent disassociates a component from its feature, but it does not permanently delete it from the project.

Syntax

RemoveComponent (pComponent As ISWiComponent) As Boolean

Parameters

Table 13-68 • RemoveComponent Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pComponent</td>
<td>Enter the ISWiComponent object that you want to remove.</td>
</tr>
</tbody>
</table>

Applies To

  • ISWiFeature

RemoveMergeModule Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:
  • Basic MSI
  • InstallScript MSI

Call the RemoveMergeModule method to remove a merge module from only the current feature. (To delete a merge module from the project, call the DeleteMergeModule method.)
### Syntax

```vbnet
RemoveMergeModule (FileName As String)
```

### Parameters

**Table 13-69 • RemoveMergeModule Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Pass the fully qualified file name for the merge module (.msm) file that you want to remove from this feature.</td>
</tr>
</tbody>
</table>

### Applies To

- **ISWiFeature**

### RemoveObject Method

*InstallShield 2020 » Automation Interface*

#### Project

*This information applies to InstallScript projects.*

The RemoveObject method removes the specified InstallScript object from the current feature.

#### Syntax

```vbnet
RemoveObject (Object As ISWiObject) As Long
```

### Parameters

**Table 13-70 • RemoveObject Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>The InstallScript object to be deleted.</td>
</tr>
</tbody>
</table>

### Example

The following Visual Basic lines demonstrate the RemoveObject method:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pObject As ISWiObject

Set pFeature = pProj.ISWiFeatures.Item("Help_Files")
Set pObject = pFeature.ISWiObjects.Item(1)
pFeature.RemoveObject pObject
```
Chapter 13
Automation Interface

Applies To
• ISWiFeature

ISWiFile Object

InstallShield 2020 » Automation Interface » ISWiComponent Object and ISWiComponentSubFolder Object

Project • This information applies to the following project types:
• Basic MSI
• DIM
• InstallScript
• InstallScript MSI
• InstallScript Object
• Merge Module

Project-specific differences are noted where appropriate.

ISWiFile represents a file belonging to a component or, in InstallScript projects, a component subfolder in your project. The file can be an existing one from the InstallShield user interface or one added by calling `AddFile`.

Many feature properties and attributes are available in the automation interface through this object’s methods, properties, and collections. Note that some methods, properties, and collections are available for specific project types.

Use the component’s `ISWiFiles` collection to access a specific file. You must specify either an index number or the file key for the `Item` property of `ISWiFiles`. The file key is visible in the `File` column of the `File` table in the Director Editor view of InstallShield. In Basic MSI and InstallScript MSI projects, it is also listed under the `Key` column in a component’s file list.

Unfortunately, you might not know the file key, or it might have been reassigned if the files are dynamically linked to the component. Instead of using the file key, you could write code similar to the following example to check for a certain file name:

```vba
Dim m_pFile As ISWiFile

For Each m_pFile In m_pComponent.ISWiFiles
    If UCase(m_pFile.DisplayName) = "MYFILE.EXE" Then
        Exit For
    End If
Next
```

If the file name `MyFile.exe` is found among the component’s files, the `For` loop ends, and `m_pFile` holds a copy of the ISWiFile object for `MyFile.exe`. 
## Members

</tbody>
</table>
| Languages             | Basic MSI, DIM, InstallScript MSI, Merge Module | Read-Write Property | This property should contain a string of all of the file's language IDs, in decimal and separated by commas. The following line identifies the file as English and German: m_pFile.Languages = "1031,1033"  
This property is ignored if OverrideSystemLanguage is set to True.  
You cannot modify this property if the files are dynamically linked. |
| Modified              | Basic MSI, DIM, InstallScript MSI, Merge Module | Read-Write Property | Retrieves the file's Modified file attribute. Reserved for future use.                                                                        |
| Name                  | Basic MSI, DIM, InstallScript MSI, Merge Module | Read-Write Property | Retrieves or sets a file key. See the description of ISWiFile above for more information about the file key.  
You cannot modify this property if the files are dynamically linked. |
| OverrideSystemAttributes | Basic MSI, DIM, InstallScript MSI, Merge Module | Read-Write Property | To override the development system's settings for all of the file attributes, such as Hidden, ReadOnly, Vital, and System, set this property to True.  
If you set this property to False, the Hidden, ReadOnly, Vital, and System properties are ignored.  
You cannot modify this property if the files are dynamically linked. |
| OverrideSystemLanguage | Basic MSI, DIM, InstallScript MSI, Merge Module | Read-Write Property | To override the language of the file on the development system, set this property to True.  
If you set this property to False, the Languages property is ignored.  
You cannot modify this property if the files are dynamically linked. |
| OverrideSystemSize    | Basic MSI, DIM, InstallScript MSI, Merge Module | Read-Write Property | To override the size of the file on the development system, set this property to True.  
If you set this property to False, the Size property is ignored.  
You cannot modify this property if the files are dynamically linked. |
### Table 13-71 • ISWiFile Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| **OverrideSystemVersion** | Basic MSI, DIM, InstallScript MSI, Merge Module | Read-Write Property | To override the version of the file version on the development system, set this property to True.  
If you set this property to False, the Version property is ignored.  
You cannot modify this property if the files are dynamically linked. |
| **ReadOnly**          | Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property | Retrieves or sets the Read-only file attribute. Set this property to True to mark a file as read-only. Leave it undefined or set it to False to mark a file as read-write.  
This property is ignored if OverrideSystemAttributes is set to False.  
You cannot modify this property if the files are dynamically linked. |
| **SelfRegister**      | Basic MSI, DIM, InstallScript MSI, Merge Module | Read-Write Property | Gets or sets the Self-Register file attribute. Set this property to True to mark a file as self-registering.  
You cannot modify this property if the files are dynamically linked. |
| **ShortName**         | Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property | Gets or sets the file’s short name. Your files must have corresponding short names in case the Windows Installer property SHORTFILENAMES is set because the distribution medium cannot handle long file names.  
Only the short file names are used when you deselect “Use long file names” in the Advanced Settings panel of the Release wizard.  
By default, the build process will generate short names for your files, and therefore reading the current value of a file’s ShortName property will return an empty string. However, if you explicitly set a file’s ShortName property, the build process will use the short name you specify, and reading the ShortName value will return the short name you specified.  
You cannot modify this property if the files are dynamically linked. |
| **Size**              | Basic MSI, DIM, InstallScript MSI, Merge Module | Read-Write Property | Contains the size of the file, in bytes, as a Long.  
If you are setting this property, OverrideSystemSize must first be set to True. Otherwise, InstallShield uses the actual size of the file.  
You cannot modify this property if the files are dynamically linked. |

ISWiFolder Object

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

ISWiFolder represents a program folder in a component’s Shortcuts explorer in the InstallShield user interface. You can retrieve a folder by specifying an item in the ISWiFolders collection.
Many folder attributes are available in the automation interface through this object’s methods and properties. Refer to the following table to learn which methods, properties, and collections are available for your project type.

DeleteShortcut Method

InstallShield 2020 » Automation Interface

Cube

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

Call DeleteShortcut to create a shortcut from the current folder.

Syntax

DeleteShortcut (pShortcut As ISWiShortcut) As Long

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pShortcut</td>
<td>Pass the ISWiShortcut Object to specify a shortcut that you want to delete from a folder.</td>
</tr>
</tbody>
</table>

Examples

Set pShortcut = pFolder.ISWiShortcuts("MyShortcut")
If Not pShortcut Is Nothing Then
  pFolder.DeleteShortcut pShortcut
Next
Applies To

- ISWiFolder

DeleteSubFolder Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the DeleteSubFolder method to delete the specified subfolder from the current ISWiFolder object.

Syntax

DeleteSubFolder (pSubFolder As ISWiFolder) As Long

Parameters

Table 13-76 • DeleteSubFolder Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Pass the ISWiFolder Object to specify a subfolder that you want to delete from a folder.</td>
</tr>

Example

Set pSubFolder = pFolder.SubFolders(“MySubFolder”)
If Not pSubFolder Is Nothing Then
    pFolder.DeleteSubFolder pSubFolder
    pFolder.DeleteSubFolder pSubFolder
    Next

Applies To

- ISWiFolder

ISWiLanguage Object

InstallShield 2020 » Automation Interface

Edition • Support for multilanguage installations is available with InstallShield Premier Edition.
Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

ISWiLanguage represents a language whose string entries are included in the current project.

To include or exclude languages, use the IsIncluded property on each relevant ISWiLanguage object.

### Members

ISWiLatestSetup Object

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Indicates the Latest Setup (or UpgradedImage) item for a patch configuration where you specify settings for the latest version of your installation.

Each patch configuration must contain at least one latest setup and one previous setup in order for you to create a patch. You can have multiple previous setups per latest setup.

Every application or setup that you intend to patch to a latest setup must be added to the previous setup node.

For example, your company supports versions 1.0 and 1.1 of an application, and you want to upgrade both of these applications to version 2.0. To create a single patch to upgrade both versions, you would add V1.0 and V1.1 as previous setups to the latest setup. Your latest setup would contain V2.0.

AddPreviousSetup Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddPreviousSetup method to add previous setup item to the latest setup item. Using this method is similar to adding a previous setup item with the Patch Design View of the IDE. You can set the properties of the new previous setup with the ISWiPreviousSetup object.

Syntax

AddPreviousSetup(PreviousSetupName As String) As ISWiPreviousSetup

Parameter

Table 13-81 • AddPreviousSetup Method Parameter

**ISWiMsiPatchSequence Object**

*InstallShield 2020 » Automation Interface*

- **Project**
  - This information applies to the following project types:
    - Basic MSI
    - InstallScript MSI

Contains all the information that the installer requires to determine the sequence of application of a small update patch relative to all other patches.
## Members

### Table 13-83 • ISWiMsiPatchSequence Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FamilyName</td>
<td>Read-Write Property</td>
<td>Gets the patch family name. Patches in the same patch family that target the same product version are sorted by the values in the Sequence column. The patches within the patch family are applied to the target product in the order of increasing sequence. The PatchFamily is also used to determine which patches are to be superseded. A patch may be listed in multiple rows and belong to multiple patch families if it applies to more than one product or includes multiple fixes. The Windows Installer does not interpret the PatchFamily value in any way other than comparisons for equality against other PatchFamily values. A PatchFamily value must be unique within the ProductCode targeted by the set of patches. In the complex patching scenarios the PatchFamily identifier may need to be globally unique.</td>
</tr>
<tr>
<td>Sequence</td>
<td>Read-Write Property</td>
<td>Gets or Sets the sequence of this patch within the specified PatchFamily. The value in Sequence is expressed in the format of Version data. The value contains between 1 and 4 fields and each field has a range of 0 to 65535. Members of PatchFamily are sorted and applied to the target product in the order of increasing Sequence values. For example, the following six values are increasing: 1, 1.1, 1.2, 2.01, 2.01.1, 2.01.1.1.</td>
</tr>
<tr>
<td>Supersede</td>
<td>Read-Write Property</td>
<td>Set this Boolean property to True to indicate that the small update patch supersedes the updates provided by all patches with lesser Sequence values in the same PatchFamily.</td>
</tr>
<tr>
<td>Target</td>
<td>Read-Write Property</td>
<td>Gets or Sets target product code. A value in this property is optional. If a product code GUID is set in this property and the patch is being applied to the specified product, the patch is sorted and applied as a member of the specified PatchFamily. If a product code GUID is set in this field and the patch is not being applied to the product specified by ProductCode, this row is ignored. If the value in ProductCode is NULL, the patch is sorted and applied as a member of PatchFamily for all targets of the patch regardless of the product code. A patch can have multiple rows in the same PatchFamily and a different ProductCode for each product targeted by the patch. One row for the PatchFamily can specify NULL for ProductCode. If the target product matches a row with a non-NULL ProductCode, the installer uses the matching row and ignores the row with the NULL ProductCode. If none of the specified product codes match the target, the patch is sorted and applied as a member of PatchFamily for all targets of the patch regardless of the product code.</td>
</tr>
</tbody>
</table>

- ISWiProject
ISWiObject Object

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:
• InstallScript
• InstallScript Object

The ISWiObject object represents an InstallScript object belonging to your project. The InstallScript object can be an existing one from the InstallShield user interface’s Objects view or one added by calling AddObject.

Use the project’s ISWiObjects collection to access a specific InstallScript object. You must specify either an index number or the moniker for the Item property of ISWiObjects. The moniker is visible in the IDE only as the Moniker in the Direct Editor view’s ISFeatureExtended table.

Members
None.

Example
The following Visual Basic code illustrates the use of the ISWiObject:

```vbscript
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pObject As ISWiObject

Set pFeature = pProj.ISWiFeatures.Item(2)
Set pObject = pFeature.ISWiObjects.Item("@ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9")
pFeature.RemoveObject pObject

pProj.SaveProject
pProj.CloseProject
```

• ISWiFeature

ISWiPatchConfig Object

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:
• Basic MSI
• InstallScript MSI

ISWiPatchConfig represents a patch configuration in the Patch Design view of the InstallShield user interface. You can retrieve a configuration by specifying an item in the ISWiPatchConfigs collection.
Build Status Events

The ISWiPatchConfig object raises the following status events:

- Public Event ProgressIncrement(ByVal lIncrement As Long, pbCancel As Boolean)
- Public Event ProgressMax(ByVal lMax As Long, pbCancel As Boolean)
- Public Event StatusMessage(ByVal sMessage As String, pbCancel As Boolean)

These events are raised during the patch build process and provide status updates. You can set pbCancel to stop the build. For sample code that demonstrates how to use these events, see Using Build Status Events.

Many feature properties and attributes are available in the automation interface through this object's methods, properties, and collections. The following table lists the ISWiPatchConfig object members.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>

</tbody>
</table>
| LauncherCompanyName           | Read-Write Property | Gets or sets the company name. This will override the default company name for Update.exe with your company name.  
The company name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.  
To learn more, see Customizing File Properties for the Update Launcher. |
| LauncherCopyright             | Read-Write Property | Gets or sets the launcher copyright notice. This will override the default copyright notice for Update.exe with your product’s copyright notice, enter your product’s copyright notice.  
The copyright notice is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.  
To learn more, see Customizing File Properties for the Update Launcher. |
| LauncherDescription           | Read-Write Property | Gets or sets the launcher description. This will override the default description for Update.exe with your own description, enter the appropriate description.  
The description is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.  
To learn more, see Customizing File Properties for the Update Launcher. |
### LauncherIcon

**Type:** Read-Write Property

**Description:**
Gets or sets the icon for the Update.exe file. To use your own icon for the Update.exe file, set the fully qualified name of the file that contains the icon. To specify a file, type an absolute path or a path that is relative to a path variable.

By default, the icon with index 0 is used; to specify a different icon, either select an icon in the Change Icon dialog box or append the icon’s index or resource ID (preceded by a minus sign) to the file name. For example, `C:\Temp\MyLibrary.dll,2` indicates the icon with an index of 2, and `C:\Temp\MyLibrary.dll,-100` indicates the icon with a resource ID of 100.

If you leave this setting blank, InstallShield uses a default icon for your Update.exe file.

### LauncherPassword

**Type:** Read-Write Property

**Description:**
Gets or sets the password to protect your application. You must set True for the PasswordProtected property to activate password protection.

When you password-protect your patch, any end user who wants to apply your patch must enter a case-sensitive password to launch your update.

This setting is applicable only to patches that use an Update.exe file.

### LauncherProductName

**Type:** Read-Write Property

**Description:**
Gets or sets the product name. This will override the default product name for Update.exe with your product name.

The product name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.

To learn more, see [Customizing File Properties for the Update Launcher](#).

### LauncherProductVer

**Type:** Read-Write Property

**Description:**
Gets or sets the product version. This will override the default product version for Update.exe with your product version.

The product version is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.

To learn more, see [Customizing File Properties for the Update Launcher](#).
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LeaveIntermDecompressed</td>
<td>Read-Write Property</td>
<td>Set True to leave all .msp file information in a temporary folder. This information can be useful when troubleshooting. If you do not want this information stored, select No.</td>
</tr>
</tbody>
</table>
| ListOfPatchGuidsToReplace | Read-Write Property | To replace one or more earlier installed patches with the current patch, set this property to the patch GUIDs of those patches, and separate each with a comma. For example: 
 {C86838C9-DEDC-4451-B96F-94AFB9460F15}, {C8633E5B-AC44-45d8-B487-C68B3B1F60D6}  
 Setting this property is typically not required, even if you have several patch configurations in the Patch Design view. However, if your patch does not overwrite files added in an earlier patch, it may be necessary to set this property. |
| ListOfTargetProductCodes | Read-Write Property | Set this property with the product codes that you want to target with this patch, and separate each with a comma. If you enter an asterisk (*) for this setting, InstallShield replaces it at build time by the product codes of the installations that are listed as previous images in this patch configuration. |
| ManufacturerName         | Read-Write Property | Gets or sets the name of the application’s manufacturer. |
| MinimumRequiredMsiVersion | Read-Write Property | Specify the minimum version of Windows Installer that is required by the patch. For example, for a minimum of Windows Installer 2.0, enter 200. For a minimum of Windows Installer 3.0, enter 300. For a minimum of Windows Installer 3.1, enter 301. |
Set this property to True if you want your minor-upgrade patch to essentially remove all of the patches up to the release to manufacturing (RTM) version of the product (or the most recent major upgrade of the product, if one has been installed) before applying the current minor-upgrade patch. With this option, all patches (with or without sequencing data) are removed. You do not need to target additional baseline versions and thus increase the patch payload. All end users can successfully apply the patch without applying any intermediate patches.

If you do not want your minor-upgrade patch to remove all of those earlier patches, set False. If you select this option, it may be necessary for your patch to contain the information needed to target each of the earlier minor upgrades that were created after the RTM (or the most recent major upgrade of the product, if one was created).

For example, if you are creating a minor-upgrade patch for service pack 2 and you select No for this property, your patch needs to target the minor-upgrade patch for service pack 1. You could also optionally target other baselines (such as RTM); doing so would increase the patch payload. Note that if you do not target the RTM version, any end user who has the RTM version but not the service pack 1 minor-upgrade patch would need to install service pack 1 before service pack 2.

Versions of Windows Installer earlier than 3.1 ignore this setting.

<table>

<td><strong>OptimizedInstallMode</strong></td>
<td>Read-Write Property</td>
<td>Set this property to True if you want Windows Installer 3.1 to optimize the patching process so that it reduces the time that is required to apply the current patch. If the patch only modifies a select list of tables, Windows Installer 3.1 ignores the actions that are associated with all other tables. For more information, including the list of tables, see “Patch Optimization” in the Windows Installer Help Library. If you set True for this property, Microsoft Corporation recommends that you test your patch extensively to ensure that it behaves as expected. If you do not want Windows Installer 3.1 to optimize the patching process for the current patch, set False. Windows Installer will run a complete repair of the application when the patch is applied to the target machine. Versions of Windows Installer earlier than 3.1 ignore this property. Windows Installer 3.0 optimizes patches if the patch only modifies the select list of tables. To avoid patch optimization by Windows Installer 3.0, you must use the DisableFlyWeightPatching policy. For more information, see DisableFlyWeightPatching in the Windows Installer Help Library. Versions of Windows Installer earlier than 3.0 run a complete repair of the installation when a patch is applied.</td>

ISWiPatchExternalFile Object

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI
Indicates the external file object that you want to create a binary file patch against versions of an application file that have not been shipped as part of the previous setup.

For example, if one of your application files was potentially updated by another setup, you should reference that file version to ensure that the file level patch can be successfully applied at runtime.

**Members**

ISWiPathVariable Object

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

ISWiPathVariable represents a path variable that is included in the current project. The path variable can be an existing one that was created from the Path Variables view in InstallShield, or one that was added by calling the AddPathVariable method.

Important • Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.

<td></td>
<td></td>
<td>- <code>epvtPreDefined (1)</code> — Predefined path variables are variables that are set to certain standard Windows directories. These variables cannot be renamed or modified, but they can be used in your installation project to point to predefined directories.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <code>epvtCustom (2)</code> — Custom path variables are sometimes referred to as standard path variables or user-defined variables. These variable types are defined through InstallShield. These variables do not rely on any outside sources, such as the registry or system paths.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <code>epvtEnvironment (4)</code> — Environment path variables are based on the values of your system's environment variables. You can set an environment path variable in your project to an existing environment variable on your machine.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <code>epvtRegistry (8)</code> — Registry path variables enable you to define your own variables based on the default value of a specified registry key. The registry key must already be present when you set a path variable to the value of the key.</td>
</tr>
<tr>
<td>TestValue</td>
<td>Read-Write Property</td>
<td>Retrieves or sets the test value of the path variable.</td>
</tr>
<tr>
<td>Value</td>
<td>Read-Write Property</td>
<td>Retrieves or sets the value of the path variable.</td>
</tr>
</tbody>
</table>

For Standard Path Variables

For standard variables, enter the directory to which you would like your variable to point.

**Note** • You can also refer to other path variables in the defined value by enclosing the referenced path variable name in angled brackets. For example, if you have a path variable called `MyRoot` with a value of `C:\`, you can refer to it in a path variable definition for another variable, such as `Games`. The actual path for the `Games` variable might be `C:\Programs\GameFiles`, but you can define `Games` as `<MyRoot>\Programs\GameFiles`. However, if you attempt to self-reference a path variable, the literal string is used instead. For example, defining `Games` as `<MyRoot>\Programs\<Games>` actually results in `Games` defined as `C:\Programs\<Games>`.

ISWiProductConfig Object

This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

InstallScript and InstallScript Object projects contain only one element in ISWiProductConfigs; it is named Media.

Only some of the members of ISWiProductConfig apply to InstallScript and InstallScript Object projects.
ISWiProductConfig represents a product configuration in the Releases view of the InstallShield user interface. You can retrieve a configuration by specifying an item in the ISWiProductConfigs collection.
## Members

</tbody>
</table>
| **ArchitectureValidation** | Basic MSI, Merge Module                         | Read-Write Property | Set this property to one of the following values to indicate what type of build-time architecture validation you want to perform:  
  - epvtLenient (0)—Lenient architecture validation, which is the default type of validation, does not trigger build errors or warnings if the architecture that the Template Summary property specifies does not match the architecture for one or more of the product files or the custom action files that are being included in the release.  
  - epvtStrict (1)—Strict validation may trigger build errors and warnings if the architecture that the Template Summary property specifies does not match the architecture for one or more of the product files or custom action files that are being included in the release.  
  The value of this property also influences whether InstallShield includes 32-bit or 64-bit versions of the built-in InstallShield custom action DLLs.  
To learn more, see [Selecting the Appropriate Type of Architecture Validation for Builds](#). |
| **ConfigFlags**       | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | Gets or sets a string that contains the release flags that you want to use to filter your features. Separate multiple flags with a comma. |
| **DeleteRelease**     | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Method            | Deletes the specified release from the current product configuration.        |

### AddRelease Method

InstallShield 2020 » Automation Interface

*Project* • *This information applies to the following project types:*

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
Call the AddRelease method to add a release to the current product configuration. Using this method is similar to creating a release in the Release Wizard or the Releases view of the IDE.

**Syntax**

AddRelease (ReleaseKey As String) As ISWiRelease

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ReleaseKey</td>
<td>Pass the name of the release you would like to create in the current product configuration.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProductConfig

**DeleteRelease Method**

Call the DeleteRelease method to delete a release from the current product configuration. Using this method is similar to deleting a release in the Releases view of the IDE.
Syntax

DeleteRelease (Release As ISWiRelease)

Parameters

Table 13-92 • DeleteRelease Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ReleaseKey</td>
<td>Pass the name of the release you want to delete from the current product configuration.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProductConfig

ISWiProperty Object

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

ISWiProperty represents a Windows Installer property in the Property Manager of the InstallShield user interface. You can retrieve a property by specifying an item in the ISWiProperties collection.

Members

Table 13-93 • ISWiProperty Object

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comments</td>
<td>Read-Write Property</td>
<td>Gets or sets the comments associated with the Windows Installer property.</td>
</tr>
<tr>
<td>Name</td>
<td>Read-Only Property</td>
<td>Contains the name of the property.</td>
</tr>
<tr>
<td>Value</td>
<td>Read-Write Property</td>
<td>Gets or sets the property’s value.</td>
</tr>
</tbody>
</table>

Example

The following example sets the property ApplicationUsers to “OnlyCurrentUser,” which means that the option “Only for me” is selected by default in the CustomerInformation dialog:
Dim pProject As ISWiProject

Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\ISWiProperties.ism"

Dim pProperty As ISWiProperty
Set pProperty = pProject.ISWiProperties.Item("ApplicationUsers")

pProperty.Value = "OnlyCurrentUser"
pProperty.Comments = "Make ""Only for me"" the default radio button " & _
"in the CustomerInformation dialog."

pProject.SaveProject

Applies To
• ISWiProject

ISWiRelease Object

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:
• Basic MSI
• InstallScript
• InstallScript MSI
• InstallScript Object
• Merge Module

Project specific differences are noted where appropriate.

ISWiRelease represents an existing release in the Releases view of InstallShield. You can retrieve a release by specifying an item in the ISWiReleases collection. The release must have been created through the Release Wizard, the Releases view, or the command-line tool ISCmdBld.exe.
## Members

**Table 13-94 • ISWiRelease Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BatchFileName</td>
<td>InstallScript, InstallScript Object</td>
<td>Read-Write Property</td>
<td>Gets or sets the release’s Execute Batch File property, which specifies the filename of a batch file or executable file to execute after the release build is complete.</td>
</tr>
</tbody>
</table>
| BrowsersToSupport| Basic MSI, InstallScript MSI    | Read-Write Property | This property indicates which browsers a One-Click Install type of installation will support. Specify the following value:  
  -  `eocitbIE (0)`: Internet Explorer  
  This property applies only to One-Click Web releases. |
| Build            | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Method | Builds the current release. This is a full and complete build. |
| BuildErrorCount  | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Read-Only Property | After the Build method is run on the ISWiRelease object, BuildErrorCount contains the number of errors that occurred while the build process was running. |
| BuildLocation    | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property | Gets or sets a string that identifies the top-level directory where the release will be built. |
| BuildTablesOnly  | Basic MSI, InstallScript MSI, Merge Module | Method | Builds only the Windows Installer tables of the current release. |
| BuildTablesRefreshFiles | Basic MSI, InstallScript MSI | Method | Rebuilds your .msi file and updates the Files table, including any new or changed files in your release. |
### BuildUTF8Database

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Read-Write Property</td>
<td>If you want the Windows Installer database, along with any instance or language transforms, to be built using the UTF-8 encoding, set this Boolean property to True. The UTF-8 encoding supports characters from all languages simultaneously, enabling you to mix and match, for example, Japanese and German, or Russian and Polish, both in text shown to end users and in file names and registry keys. These mixed languages work correctly regardless of the current language of the target system. However, some scenarios result in user interface issues. For example, if an end user specifies the /qb command-line option or uninstalls the product from Add or Remove Programs, Windows Installer uses very small fonts to display the user interface text in a UTF-8 database. If you set this property to True, InstallShield creates an ANSI database when you build your release. This option does not let you mix characters from languages in different code pages.</td>
</tr>
</tbody>
</table>

### BuildWarningCount

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>Read-Only Property</td>
<td>After the Build method is run on the ISWiRelease object, BuildWarningCount contains the number of warnings that occurred while the build process was running.</td>
</tr>
</tbody>
</table>
CabCompressionType

If the Compressed property is set to True, you can use this CabCompressionType property to specify the type of compression that InstallShield should use when building this release’s .cab files. Available options are:

- **ectLZX (3)**—InstallShield uses LZX compression to compress your product’s data files into .cab files. This option results in the smallest .cab files; however, it also takes the most time to extract the data from these .cab files at run time.
- **ectMSZIP (1)**—InstallShield uses MSZIP compression to compress your product’s data files into .cab files.
- **ectNone (0)**—InstallShield does not use any compression when creating the .cab files.

**Important** • Using compression generally decreases the size of your compressed files, but the build process may take more time to complete. Depending on the number and size of the files being compressed, the LZX compression and the build may take hours to complete. Therefore, if you select the LZX option, it is recommended that your build machine have the latest hardware to minimize the time that it takes for the build to complete.

CachePath

Specifies where cached installation files should be stored on the end user’s system. Use a hard-coded value such as \C:\CachedFiles.

This property is used only if the CacheWebDownload property for the current build is set to True.
### Table 13-94 • ISWiRelease Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CacheWebDownload</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Read-Write</td>
<td>Specifies whether the installation files for the current build should be cached on the target system. Set this to True to cache the installation files on the target system for use with application maintenance and repair. Use the CachePath property to indicate where the cached files should be stored on the end user’s system. This property is used only if the WebType property for the current build is set to ewtOneExe (2) (one executable).</td>
</tr>
<tr>
<td>CertificatePassword</td>
<td>Basic MSI, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>Write-Only</td>
<td>Sets the password for the .pfx file if the file has a password. InstallShield encrypts the password and stores it in your project file (.ism). At build time, InstallShield uses the password to sign files with a .pfx file. If your certificate is protected by a password but you do not enter it in this setting, signing with a .pfx file fails. <strong>Note</strong> • This property is not applicable if the certificate that you are using for signing is in a certificate store. Note that if the certificate was imported into the store with password protection, you will be prompted to enter the password at build time.</td>
</tr>
<tr>
<td>CertificateURL</td>
<td>Basic MSI, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>Read-Write</td>
<td>Gets or sets the URL that is used in your digital certificate to link to a location that you would like end users to visit to learn more about your product, organization, or company. Use a fully qualified URL—for example, <a href="http://www.mydomain.com">http://www.mydomain.com</a>.</td>
</tr>
</tbody>
</table>
### Table 13-94 • ISWiRelease Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compressed</td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Read-Write Property</td>
<td>Set this property to True if you want all of the package’s files compressed into the .msi file, the .msm file, or Setup.exe, if selected. A value of False means that your application files are placed uncompressed in subfolders of the release location. Unlike the flexibility available in the Release Wizard’s Custom Compression Settings panel, this property either compresses all or none of the files in the release.</td>
</tr>
<tr>
<td>CompressScript</td>
<td>InstallScript, InstallScript Object</td>
<td>Read-Write Property</td>
<td>This Boolean property gets or sets the release’s Compress Script property, which specifies whether the compiled script file (.inx file) is placed in a cabinet file (True) or is placed uncompressed in the Disk1 disk image folder (False).</td>
</tr>
<tr>
<td>CopyToFolder</td>
<td>InstallScript, InstallScript Object</td>
<td>Read-Write Property</td>
<td>Gets or sets the release’s Copy To Folder property, which specifies a folder location to which to copy the release’s disk image folders after the release build is complete. Existing folders with the same names as copied folders are overwritten but no folders are deleted.</td>
</tr>
<tr>
<td>CreateAutorunINF</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Read-Write Property</td>
<td>Set this property to True to create an Autorun .inf file at the root of your release location.</td>
</tr>
<tr>
<td>CreatePDF</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Read-Write Property</td>
<td>Set this property to True to generate a package definition file for your installation, False otherwise.</td>
</tr>
<tr>

<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DefaultLang</td>
<td>Basic MSI, InstallScript, InstallScript MSI, InstallScript Object</td>
<td>Read-Write Property</td>
<td>Gets or sets the language identifier for the default language of a given release. This property value overrides the default project language that is configured in the General Information view or the String Editor view. For more information, see Setting the Default Project Language.</td>
</tr>
<tr>
<td>DelayMSIEngineReboot</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Read-Write Property</td>
<td>Specifies whether you want to postpone any reboot associated with installing or updating the Windows Installer engine on the target system until after your installation has completed. Set this to True to postpone the reboot, if one is necessary. Set this to False to allow the system to reboot, if necessary, immediately after the Windows Installer engine has been installed or updated and before performing your installation. This option requires Windows Installer version 2.0.</td>
</tr>
</tbody>
</table>

**Table 13-94 • ISWiRelease Object Members (cont.)**

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| DigitalCertificateInfo | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property | Gets or sets the digital certificate that you want to use to sign your release. InstallShield lets you choose between the following options:  
- To specify the .pfx certificate file that you want to use for signing, set this property equal to the fully qualified path and file name of the .pfx file on your build machine.  
  Instead of hard-coding a path, you can use a path variable that is defined in the Path Variables view or part of the ISWiPathVariables collection. At build time, InstallShield replaces the path variable with the appropriate value.  
- To reference a certificate store that contains the certificate that you want to use for signing, set this property equal to a certificate store string. To pass a certificate store string as the value, use the following convention:  
  *Store*StoreLocation:Cert Subject  
  For Store, pass one of the following values:  
  - MY  
  - CA  
  - Trust  
  - Root  
  For StoreLocation, pass one of the following values:  
  - User  
  - Machine  
  For Cert Store, pass the subject of the certificate that you want to use.  
  To learn more, see Digital Signing and Security. |
### Table 13-94 • ISWiRelease Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DisplayDotNetOptionDialog</td>
<td>Basic MSI, DIM, InstallScript,</td>
<td>Read-Write</td>
<td>Set this property to True if you want the installation to display the .NET option message box at run time. This message box allows the end user to specify whether to install the .NET Framework.</td>
</tr>
<tr>
<td></td>
<td>InstallScript MSI, InstallScript</td>
<td>Property</td>
<td>Set this property to False if the installation should not allow end users to determine whether they want to install the .NET Framework.</td>
</tr>
<tr>
<td></td>
<td>Object, Merge Module</td>
<td></td>
<td></td>
</tr>
<tr>
<td>DistributeAfterBuild</td>
<td>Basic MSI, InstallScript MSI,</td>
<td>Read-Write</td>
<td>Set this to True if you want the build engine to automatically distribute the current release after each build to the location that you specify for the DistributeLoc or DistributeToURLLoc properties.</td>
</tr>
<tr>
<td></td>
<td>Merge Module</td>
<td>Property</td>
<td></td>
</tr>
</tbody>
</table>

**Note** • *This property does not determine whether your installation includes the .NET Framework, only whether the end user has a choice to install it.*

**Note** • *When both the DistributeLoc and DistributeToURLLoc properties are specified, the release is copied to only the FTP location.*
If you want to be able to automatically distribute your release to a folder, specify the location for this property. The DistributeAfterBuild property must be set to True.

Note • If you need to distribute your release to a path outside the FTP default folder, use a double slash (/). For example, to distribute your release to a root-level folder called myproduct, where the URL of the FTP server is ftp://ftp.mydomain.com, enter ftp://ftp.mydomain.com///myproduct for the FTP location.

When both the DistributeLoc and DistributeToURLLoc properties are specified, the release is copied to only the FTP location.
Table 13-94 • ISWiRelease Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>
KeepUnusedDirectories

Specify whether you want InstallShield to remove unused directories from the Directory table of the .msi file when you build this release. Available options are:

- **False**—If a directory that is listed in the Directory column of the Directory table is not referenced in any known location in the .msi file, InstallShield removes it from the Directory table of the .msi file that it creates at build time. For Basic MSI and InstallScript MSI projects, this occurs after any merge modules are merged, but only directories that are present in the .msi file are removed; therefore, if a merge module contains new unused directories in its Directory table, the new unused directories are added to the installation.

- **True**—InstallShield does not remove any directories from the Directory table of the .msi file that it creates at build time.

The default value is False.

**Note** • Under some conditions, predefined directories cannot be resolved, causing an installation to fail. Removing unused directories from the Directory table enables you to avoid unnecessary failures. Therefore, it is recommended that you do not keep unused directories.

LauncherCopyright

Specifies the copyright information for the Properties dialog box of the Setup.exe file. You must set the UseMyVersionInfo property to True to override the default copyright information.

To learn more, see Customizing File Properties for the Setup Launcher.

<table>

### OneClickCabJarBaseName

**Project:** Basic MSI, InstallScript MSI  
**Type:** Read-Write Property  
**Description:** Specifies the base file name for the cabinet (.cab) file generated by the build process for a One-Click installation. The “.cab” extension is appended to the name you specify here. The generated file (or files) will be created in the Disk1 folder for the current release.

This property is used only if the GenerateOneClickInstall property for the current build is set to True.

### OneClickHTMLBaseName

**Project:** Basic MSI, InstallScript MSI  
**Type:** Read-Write Property  
**Description:** Specifies the base file name of the HTML file generated by the build process. The “.htm” extension is appended to the base name you specify, and the generated file is created in the Disk1 folder of the current release location.

This property is used only if the GenerateOneClickInstall property for the current build is set to True.

### OptimizeSize

**Project:** Basic MSI, InstallScript MSI  
**Type:** Read-Write Property  
**Description:** Specifies the level of compression to use in your release’s cabinet files. Setting this property to True generally decreases the size of your compressed files, but the build process may take more time to complete.

This property is used only if your release compresses some or all of its files.
**OSFilter**

Gets or sets the release's Platform(s) setting, which specifies the operating systems that you want this release to support. If the platform specified for a component does not match one of the platforms that is selected for this property, the component is not included in the release.

Use the following constants to set this property:

- `eosOSIndepedent = 0`
- `eosWin95 = &H10 (16)`
- `eosWin98 = &H40 (64)`
- `eosWinMe = &H80 (128)`
- `eosWinNT4 = &H10000 (65536)`
- `eosWin2000 = &H100000 (1048576)`
- `eosWinXP = &H400000 (4194304)`
- `eosWinServer2003 = &H800000 (8388608)`
- `eosWinVista = &H1000000 (16777216)` — These constants are for Windows Vista and Windows Server 2008.
- `eosWin7 = &H2000000 (33554432)` — These constants are for Windows 7 and Windows Server 2008 R2.
- `eosWin8 = &H4000000 (67108864)` — These constants are for Windows 8 and Windows Server 2012.
- `eosWin81 = &H8000000 (134217728)` — These constants are for Windows 8.1 and Windows Server 2012 R2.
- `eosAll = &HFD100D0 (265355472)`

You can specify multiple platforms; for example, `eosWin7 Or eosWinServer2008 Or eosWinVista Or eosWinServer2003`.

</tr>
</tbody>
</table>
Read-Write Property

Gets or sets the command that you want to be run after InstallShield has built and signed the release.

When you are specifying a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see Specifying Commands that Run Before, During, and After Builds.

Following is sample Visual Basic code that sets two commands:

```vbnet
pISWiRelease.PostbuildEvent = "Event1" + vbCrLf + "Event2"
```

At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.

---

**Edition** • This property is available in the Premier edition of InstallShield.
PrebuildEvent

Basic MSI, InstallScript, InstallScript MSI, Merge Module

Read-Write Property

Gets or sets the command that you want to be run before InstallShield starts building the release. This event runs after InstallShield creates the release folder and log file, but before InstallShield starts building the release.

When you are specifying a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see Specifying Commands that Run Before, During, and After Builds.

Following is sample Visual Basic code that sets two commands:

```vb
pISWiRelease.PrebuildEvent = "Event1" + vbCrLf + "Event2"
```

At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.

**Edition** • This property is available in the Premier edition of InstallShield.

### RequiredExecutionLevel

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| RequiredExecutionLevel | Basic MSI, InstallScript, InstallScript MSI | Read-Write Property | Gets or sets the minimum level required by your installation’s Setup.exe file for running the installation (the setup launcher, any InstallShield prerequisites, and the .msi file) on Windows Vista and later platforms. The available options are:  
  - `erelAsInvoker (0)`—Setup.exe does not require administrative privileges, and all users can run it without administrative privileges. Setup.exe does not display any UAC messages prompting for credentials or for consent. This is the default option for Basic MSI projects.  
  - `erelAsHighestAvail (1)`—Setup.exe prefers administrative privileges. Administrators must authorize it; non-administrators run it without administrative privileges. This is the default option for InstallScript and InstallScript MSI projects.  
  - `erelAsAdmin (2)`—Setup.exe requires administrative privileges to run. Administrators must authorize it; non-administrators must authenticate as an administrator.  

For more information, see [Minimizing the Number of User Account Control Prompts During Installation](#).

### SetupCmdLine

</tr>
</tbody>
</table>

**Windows Logo** • All executable files (including .exe, .dll, .ocx, .sys, .cpl, .drv, and .scr files) in an installation must be digitally signed for the Windows logo program.
Specify any files and file patterns that you do not want to be digitally signed at build time. Note the following guidelines:

- To indicate a wild-card character, use an asterisk (*). For example, if you do not want to sign any .drv files, specify the following: 

  

  *.*

  

  Using wild-card characters is especially helpful if you include dynamically linked files in your project and you want to avoid signing any files that match a certain pattern.

- Put each file and each file pattern on its own line, with each separated by a carriage return.

- Note that the files and file patterns that should not be signed override any files and file patterns that should be signed. For example, if you specify *.*exe for the SignFilesInclude property and the SignFilesExclude property, InstallShield does not sign any .exe files.
**Table 13-94 • ISWiRelease Object Members (cont.)**

<table>
<thead>
<tr>
<th>Name</th>

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| SignFilesInPlace| Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property | Specify whether you want InstallShield to sign your original files or just the files that are built into the release:  
  - **False**—InstallShield signs a temporary copy of each file and then uses that signed temporary copy to build a release. Note that with this behavior, InstallShield will not modify or sign your original files.  
  - **True**—If you want InstallShield to sign your original files, set this property to True.  

The default value of this property is set to False.  

The benefit of specifying True for a Basic MSI or InstallScript MSI project is that it helps create one patch that updates both compressed and uncompressed versions of a release that contains originally unsigned files. |
|                 | Basic MSI, InstallScript MSI | Read-Write Property | Set this property to True to digitally sign your Setup.exe file.                                                                                   |
| SignLauncher    | This varies. (To learn more, see SignMedia.) | Read-Write Property | Set this property to indicate whether to digitally sign your media, and if so, which files should be signed.                                   |
### Table 13-94 • ISWiRelease Object Members (cont.)

<table>

<th>Description</th>
</tr>
</thead>
</table>
| SignSignedFiles     | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property | If any of the files in your project are already digitally signed, specify whether you want InstallShield to replace those existing digital signatures with the digital signature that you specify through the DigitalCertificateInfo property:  
  - **True**—Use the digital signature information that you are providing through the DigitalCertificateInfo property instead of any existing digital signature information that is already included with the file.  
  - **False**—Leave the existing digital signature information intact for any files that are already signed. This is the default value.  
  
  Note that this affects only files that meet the requirements that are specified in the SignFilesInclude and SignFilesExclude properties. |
<p>| SingleEXEFileName    | InstallScript, InstallScript Object         | Read-Write Property | Gets or sets the release’s Single Exe File Name setting, which specifies the file name (including extension) of a self-extracting executable file that runs the installation. If the property’s value is null, no self-extracting executable file is created. |
| SingleEXEIconName    | InstallScript, InstallScript Object         | Read-Write Property | Gets or sets the release’s Single Exe Icon File setting, which specifies the fully qualified name of the file from which the executable file’s icon is taken at build time. If the property’s value is null, a default icon is used. |
| SkinName             | InstallScript, InstallScript Object         | Read-Write Property | Gets or sets the release’s Specify Skin setting, which specifies the dialog box skin that is applied to this release. This property is applicable only if the UseProjectSkin property is set to True. |
| SmallInitializationDialog | Basic MSI, InstallScript, InstallScript MSI | Read-Write Property | Set this property to display a small initialization dialog when the end user runs this release.                                                                                                           |</p>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WebCreateDefaultPage</td>
<td>InstallScript</td>
<td>Read-Write Property</td>
<td>This Boolean property gets or sets the release’s Create Default Web Page setting, which specifies whether InstallShield should create a default Web page (.htm file) and place it in the Disk1 folder.</td>
</tr>
<tr>
<td>WebPageUrl</td>
<td>InstallScript</td>
<td>Read-Write Property</td>
<td>Gets or sets the release’s Web Page URL setting, which specifies the location of the Web page that should be launched if you click the Run From Web command on the Build menu in InstallShield: If nothing is entered for this property, InstallShield creates a Setup.htm file at build time and places it in the Disk1 folder. If you do enter a URL for this property, do not include the name of the page, and do not include an ending forward slash. For example, if the full URL for the Setup.htm file is <a href="http://www.mypages.com/setup/Setup.htm">http://www.mypages.com/setup/Setup.htm</a>, enter the following as the Web page URL: <a href="http://www.mypages.com/setup">http://www.mypages.com/setup</a>. When you click the Run from Web command on the Build menu, InstallShield launches the appropriate URL (<a href="http://www.mypages.com/setup/Setup.htm">http://www.mypages.com/setup/Setup.htm</a>, in the aforementioned example).</td>
</tr>
</tbody>
</table>
Table 13-94 • ISWiRelease Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WebType</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Read-Write Property</td>
<td>Indicates the configuration of your Web installation setup package. Set this property to one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• ewtDownloader (0)—Downloader. Builds this release as a combination of Setup.exe and your MSI package, where the end user downloads and launches Setup.exe, which in turn downloads and runs the MSI database, which contains all of your files.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• ewtIFTW (1)—Install from the Web. Builds this release as a combination of Setup.exe, your MSI database, and external cabinet (.cab) files. The end user downloads and runs Setup.exe, which in turn downloads and runs the MSI database. Based on the end user's setup type and feature selections, only the requested CAB files are downloaded and installed to minimize download time. Application maintenance and repair use the URL specified in the URLForYourFiles property as the installation source.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• ewtOneExe (2)—One executable. Builds this release as a single self-extracting Setup.exe. This setting is ideal for a package that is to be downloaded from many Web or FTP sites, since the installation package is self-contained. Note that the entire installation package is downloaded, so the download time is greater than the ewtIFTW (1) (Install from the Web) setting.</td>
</tr>
<tr>
<td>WrapMSIIntoCab</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Read-Write Property</td>
<td>Specifies whether to place the release's MSI database inside a cabinet (.cab) file. This property applies only if the WebType property for the current release is set to ewtDownloader (0) (Downloader).</td>
</tr>
</tbody>
</table>
Example

The following lines of Visual Basic demonstrate opening a project and showing a message box of several of a release's properties:

```vbnet
Dim pProject As ISWiProject
Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\Commercial.ism", True

Dim pProdConfig As ISWiProductConfig
Set pProdConfig = pProject.ISWiProductConfigs.Item("Version 1")
' In an InstallScript project, there is only one element
' in ISWiProductConfigs, which is named "Media".

Dim pRelease As ISWiRelease
Set pRelease = pProdConfig.ISWiReleases.Item("NewRelease1")

Dim sProps As String
sProps = pRelease.Name & " has these properties:" & vbCrLf
sProps = sProps & "Build Location: " & pRelease.BuildLocation & vbCrLf
sProps = sProps & "Compressed: " & pRelease.Compressed & vbCrLf
sProps = sProps & "Default Language: " & pRelease.DefaultLang & vbCrLf

MsgBox sProps
pProject.CloseProject
```

Build Status Events

The ISWiRelease object raises the following status events:

- Public Event ProgressIncrement(ByVal lIncrement As Long, pbCancel As Boolean)
- Public Event ProgressMax(ByVal lMax As Long, pbCancel As Boolean)
- Public Event StatusMessage(ByVal sMessage As String, pbCancel As Boolean)

These events are raised during the build process and provide status updates. You can set pbCancel to stop the build. For sample code that demonstrates how to use these events, see Using Build Status Events.

Build Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
Call the Build method to build the current release. This is a full and complete rebuild of your release.

**Syntax**

Build()

**Applies To**

- ISWiRelease

---

**BuildTablesOnly Method**

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript MSI
- Merge Module

Call the BuildTablesOnly method to build only the Windows Installer tables of the current release.

**Note** • If you have not built this setup already, a new .msi file is created, but no files are added to your setup. If you have built your setup already, the .msi file is updated when all the tables are built, but no files are transferred.

**Syntax**

BuildTablesOnly ()

**Applies To**

- ISWiRelease

---

**BuildTablesRefreshFiles Method**

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the BuildTablesOnly method to rebuild your MSI file and update the Files table, including any new or changed files in your installation.
Note • Changed files are updated only if the size or time stamp differs from the copy already included in the build. References to deleted files are removed from the setup, but the file remains in the build location. This type of build can be run only after a complete build has been performed, and it works only when the media is an uncompressed network image.

Syntax

BuildTablesRefreshFiles ()

Applies To

• ISWiRelease

CubFile Property

InstallShield 2020

Project • This information applies to the following project types:

• Basic MSI
• InstallScript MSI
• Merge Module

CubFile is a read-write property which you must specify prior to ISWiRelease.Build. This is a build option which is the same as building a release at the command line using ISCmdBld.exe.

The string parameter associated with this property is .cub file name.

Applies To

• ISWiRelease

SignMedia Property

InstallShield 2020 • Automation Interface

Project • This information applies to the following project types:

• Basic MSI
• InstallScript
• InstallScript MSI
• Merge Module

Project-specific differences are noted where appropriate.

The ISWiRelease.SignMedia property enables you to indicate whether to digitally sign your media, and if so, which files should be signed.
The following table lists the four states that can be assigned or retrieved from the ISWiRelease.SignMedia property.

Table 13-95 • ISWiRelease.SignMedia Property Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esBoth (3)</td>
<td>Read-Write Property</td>
<td>For Basic MSI and InstallScript MSI projects: Sign the Windows Installer package (.msi file) and Setup.exe. For InstallScript projects: Sign both the media header file (Data1.hdr) and Setup.exe.</td>
</tr>
<tr>
<td>esMsi (2)</td>
<td>Read-Write Property</td>
<td>For Basic MSI, InstallScript MSI, and Merge Module projects: Digitally sign only the Windows Installer package (.msi file or .msm file). For InstallScript projects: Sign the media header file (Data1.hdr).</td>
</tr>
<tr>
<td>esNone (4)</td>
<td>Read-Write Property</td>
<td>For Basic MSI, InstallScript, and InstallScript MSI projects: None of the media files (Setup.exe, Windows Installer package, or the header file) are signed at build time.</td>
</tr>
<tr>
<td>esSetupExe (1)</td>
<td>Read-Write Property</td>
<td>For Basic MSI, InstallScript, and InstallScript MSI projects: Digitally sign only Setup.exe.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiRelease Object

ISWiRemoveFile Object

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

ISWiRemoveFile represents a file or folder removal entry in the InstallShield user interface. To retrieve a file or folder removal entry, specify an item in the ISWiRemoveFiles collection.
Members

Table 13-96 • ISWiRemoveFile Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileKey</td>
<td>Read-Write Property</td>
<td>Gets or sets the FileKey property for this file or folder removal entry.</td>
</tr>

Removing Files and Folders from Target Systems

ISWiSequenceRecord Object

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:
  • Basic MSI
  • InstallScript MSI

ISWiSequenceRecord represents an action in the Custom Actions and Sequences view of the InstallShield user interface.
Members

Table 13-97 • ISWiSequenceRecord Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Read-Write Property</td>
<td>Holds the string name of the specified action.</td>
</tr>
<tr>
<td>Comment</td>
<td>Read-Write Property</td>
<td>Gets or sets comments for the specified action.</td>
</tr>
<tr>
<td>Condition</td>
<td>Read-Write Property</td>
<td>Gets or sets the condition for the specified action.</td>
</tr>
<tr>
<td>Sequence</td>
<td>Read-Write Property</td>
<td>Gets or sets the sequence number for the specified action.</td>
</tr>
</tbody>
</table>

Example

The following VBScript code displays the sequence number of the LaunchConditions action in the project’s Installation User Interface sequence.

```vbscript
Set oISM = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
oISM.OpenProject "C:\MySetups\MyProject.ism", True ' open read-only
Set oSequenceRecord = oISM.InstallUISequence("LaunchConditions")
MsgBox "LaunchConditions is at sequence number " & oSequenceRecord.Sequence
oISM.CloseProject
```

Applies To

• ISWiSequence

ISWiSetupFile Object

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

• Basic MSI
• InstallScript
• InstallScript MSI
• InstallScript Object

ISWiSetupFile represents a support file in your project. The support file can be an existing one from the Support Files view (or the Support Files/Billboards view) in InstallShield or one that is added by calling `AddSetupFile`.

Use the project’s ISWiSetupFiles collection to access a specific support file. You must specify either an index number or the file key for the Item property of ISWiSetupFiles.
Members

Table 13-98 • ISWiSetupFile Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Read-Only Property</td>
<td>Gets the name of the support file (without the path).</td>
</tr>
<tr>
<td>Language</td>
<td>Read-Write Property</td>
<td>Gets the string that identifies the language identifier for the support file; for example: m_pFile.Language = “1033”</td>
</tr>
<tr>
<td>Path</td>
<td>Read-Only Property</td>
<td>Gets the fully qualified path (including the file name) of the support file’s source location. Any path variables are resolved to the actual path.</td>
</tr>
<tr>
<td>Splash</td>
<td>Read-Write Property</td>
<td>Specifies whether this support file is a splash screen (True) or not (False).</td>
</tr>
<tr>
<td>Target</td>
<td>Read-Write Property</td>
<td>Gets or sets the support file’s target directory within SUPPORTDIR. The following line specifies the support file to be stored in the MyFolder1\MyFolder2 folder under SUPPORTDIR: m_pFile.Target = ”MyFolder1\MyFolder2”</td>
</tr>
</tbody>
</table>

Example

The file key is visible in the IDE only as the first entry in the Direct Editor view’s ISSetupFile table. Instead of using the file key, you could write code similar to the following example to check for a certain file name:

```vba
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupFile As ISWiSetupFile

For Each pSetupFile In pProj.ISWiSetupFiles
    If UCase(pSetupFile.FileName) = "MYSUPPORTFILE.EXT" Then
        Exit For
    End If
Next

pProj.SaveProject
pProj.CloseProject
```

If the file name MySupportFile.ext is found among the project’s setup files, the For loop ends, and pSetupFile holds a copy of the ISWiSetupFile object for MySupportFile.ext.
ISWiSetupType Object

InstallShield 2020 » Automation Interface

**Project** • This information applies to the following project types:

- InstallScript
- InstallScript MSI

ISWiSetupType represents a setup type belonging to your project. The setup type can be an existing one from the Setup Types view in the InstallShield user interface or one added by calling AddSetupType.

Use the project’s ISWiSetupTypes collection to access a specific setup type. You must specify either an index number or the setup type name for the Item property of ISWiSetupFiles. The setup type name is visible in the IDE in the Setup Types view’s tree control.

**Members**

Table 13-99 • ISWiSetupType Object Members

<table>
<thead>

<td>Description</td>
<td>Read-Write Property</td>
<td>This string property specifies the setup type’s description. (This description is displayed to end users during the installation process only if you call SdSetupTypeEx in your script.)</td>
</tr>
<tr>
<td>DisplayName</td>
<td>Read-Write Property</td>
<td>This string property specifies the name of this setup type as you would like it displayed to your users.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic code illustrates how you would set a property for a specific setup type:

```vba
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupType As ISWiSetupType

Set pSetupType = pProj.ISWiSetupTypes("CSSaveSpace")
pSetupType.DisplayName = "Client Setup - Save Space"

pProj.SaveProject
pProj.CloseProject
```
ISWiShellProperty Object

This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISWiShellProperty object represents a shortcut property that you want the Windows Shell to set. The properties that the Shell can set are defined in `propkey.h`, which is part of the Windows SDK.

- Setting Custom Shell Properties

ISWiShortcut Object

This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

Project-specific differences are noted where appropriate.
The ISWiShortcut object represents a shortcut in the Shortcuts explorer. The shortcut can be an existing item in an ISWiShortcuts collection or one you just created by calling AddShortcut.

Use this object’s properties to set the shortcut’s attributes in much the same manner as you would in the IDE.

</thead>
<tbody>
<tr>
<td>AddShellProperty</td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Method</td>
<td>Adds a Shell property for the current shortcut object.</td>
</tr>
</tbody>
</table>
| Arguments          | Basic MSI, InstallScript, InstallScript MSI, Merge Module | Read-Write Property | Gets or sets the command-line arguments that will be passed to the target file. You can substitute "%1" for the file name. The following statement might launch the target file in silent mode:  
```csharp
m_pShortcut.Arguments = "-s"
```
| DeleteShellProperty| Basic MSI, InstallScript MSI, Merge Module | Method     | Deletes the specified Shell property from the current shortcut object.      |
| Description        | Basic MSI, InstallScript, InstallScript MSI, Merge Module | Read-Write Property | Contains any descriptive text you have entered for this shortcut. The description is displayed as a tooltip. If this property uses a string entry, Description gives you the value for the string entry identified by the ActiveLanguage property of ISWiProject. |
| DisplayName        | Basic MSI, InstallScript, InstallScript MSI, Merge Module | Read-Write Property | Contains the display name you have entered for this shortcut. This name is a localizable value that will be used for the shortcut’s name when it is installed instead of the name that identifies the shortcut in the Shortcuts explorer. If this property uses a string entry, DisplayName gives you the value for the string identified by the ActiveLanguage property of ISWiProject. |
| DoNotHighlightAsNew| Basic MSI, InstallScript, InstallScript MSI, Merge Module | Read-Write Property | Gets or sets a Boolean property that indicates whether the shortcut is configured to be highlighted on the Start menu as new after end users install the product. This has the same effect as clearing the Highlight newly installed programs check box in the Customize Start Menu dialog box for an individual item on a target system.  
To prevent the Start menu shortcut from being highlighted as newly installed, set this Boolean property to True. To enable the shortcut to be highlighted, set this Boolean property to False.  
For more information about this highlight functionality, see Preventing a Shortcut on the Start Menu from Being Highlighted as Newly Installed. |

- ISWiFolder
AddShellProperty Method

**InstallShield 2020**

**Project** • *This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The AddShellProperty method adds a Shell property for the current shortcut object. The properties that the Shell can set are defined in propkey.h, which is part of the Windows SDK.

For more information on setting Shell properties for a shortcut, see Setting Custom Shell Properties.

**Syntax**

Function AddShellProperty (sName As String) As ISWiShellProperty

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sName</td>
<td>Pass a string to specify the name of a Shell property that you want to add to the shortcut.</td>
</tr>
</tbody>
</table>

**Return Values**

The AddShellProperty method returns an ISWiShellProperty object.

**Example**

The following sample VBScript snippet adds a Shell property to a shortcut:

```vbnet
Dim pShellProperty As ISWiShellProperty
Set pShellProperty = pShortcut.AddShellProperty("MyShellProperty")
```

**Applies To**

- ISWiShortcut

DeleteShellProperty Method

**InstallShield 2020**

**Project** • *This information applies to the following project types:*
Chapter 13
Automation Interface

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The DeleteShellProperty method deletes the specified Shell property from the current shortcut object.

For more information on setting Shell properties for a shortcut, see Setting Custom Shell Properties.

Syntax

DeleteShellProperty (pShellProp As ISWiShellProperty) As Long

Parameters

Table 13-103 • DeleteShellProperty Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pShellProp</td>
<td>Pass the ISWiShellProperty object to specify a Shell property that you want to remove from a shortcut.</td>
</tr>
</tbody>
</table>

Example

The following sample VBScript snippet deletes all of the Shell properties from a shortcut:

```vbscript
Dim pShellProperty As ISWiShellProperty
    For Each pShellProperty In pShortcut.ISWiShellProperties
        pShortcut.DeleteShellProperty pShellProperty
    Next
```

Applies To

- ISWiShortcut

ISWiSISProperty Object

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

ISWiSISProperty represents a property in the Summary Information Stream. You can retrieve a property by specifying an item in the ISWiSISProperties collection. The following Summary Information Stream property names are supported:

- Title
Several of these properties use string entries, as required by InstallShield. In that case, they contain the value for the string identified by the ActiveLanguage property of ISWiProject.

### Members

**Table 13-104 • ISWiSISProperty Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Read-Only Property</td>
<td>Contains the property’s name. Must be one of the existing Summary Information Stream properties listed above.</td>
</tr>
<tr>
<td>Value</td>
<td>Read-Write Property</td>
<td>Gets or sets the property's value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If this property uses a string entry, Value gives you the value for the string identified by the ActiveLanguage property of ISWiProject.</td>
</tr>
</tbody>
</table>

### Example

The following VBScript example sets the property Title to **Windows Installer Setup Package**:

```vb
Option Explicit

Dim pProject
Set pProject = CreateObject ("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\SampleProject.ism"

Dim pTitle, sTitle
sTitle = "Windows Installer Setup Package"
Set pTitle = pProject.ISWiSISProperties.Item("Title")
pTitle.Value = sTitle

pProject.SaveProject
pProject.CloseProject
```

### Applies To

- ISWiProject
ISWiSQLConnection Object

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

ISWiSQLConnection represents a SQL Server connection in the SQL Scripts view of the InstallShield interface. You can retrieve an ISWiSQLConnection object by using the ISWiSQLConnections collection.

Applies To

- ISWiProject

AddSQLRequirement Method

InstallShield 2020

![Project](image) • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

The AddSQLRequirement adds a SQL requirement to the target product and returns an ISWiSQLRequirement object.
**Syntax**

Function AddSQLRequirement() As ISWiSQLRequirement

**Return Values**

This method returns ISWiSQLRequirement object.

**Applies To**

- ISWiSQLConnection

---

### AddSQLScript Method

InstallShield 2020

**Project**  
This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the AddSQLScript method to add a new script file to a SQL connection.

**Note**  
The AddSQLScript method generates the ISSQLScriptFile table key with a name such as SQLScript1, SQLScript2, or SQLScript3. If you have multiple SQL script files in your project, it may be difficult to distinguish one from the other with this naming convention. Therefore, if you want to be able to specify the key, use the AddSQLScriptEx method.

**Syntax**

Function AddSQLScript() As ISWiSQLScript

**Return Values**

This method returns an ISWiSQLScript object.

**Applies To**

- ISWiSQLConnection

---

### AddSQLScriptEx Method

InstallShield 2020

**Project**  
This information applies to the following project types:

- Basic MSI
Call the AddSQLScriptEx method to add an ISSQLScriptFile entry to a SQL connection. This method generates a valid name from the passed string. The method ensures that the name of the entry that is being added to the ISSQLScriptFile table is unique and less than 47 characters in length.

**Syntax**

Function AddSQLScriptEx (ByVal sCandidateName As String) As ISWiSQLScript

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sCandidateName</td>
<td>Specifies the name of the script that you want to add to the SQL connection.</td>
</tr>
</tbody>
</table>

Note that file names may contain invalid characters or may be too long for the key. However, if you pass a file name in this parameter, the AddSQLScriptEx method creates an entry with a valid key that is based on the file name; the result is the same as if you had added the SQL script to a connection in the SQL Scripts view.

If you specify an empty string (""), the AddSQLScriptEx method generates the ISSQLScriptFile table key with a name such as SQLScript1, SQLScript2, or SQLScript3—the same as if the AddSQLScript method was used to add the ISSQLScriptFile entry.

**Return Values**

This method returns an ISWiSQLScript object.

**Applies To**

- ISWiSQLConnection

---

**DeleteSQLScript Method**

InstallShield 2020

*Project* • *This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the DeleteSQLScript method to remove a SQL script file from a SQL Connection in the InstallShield interface.
Syntax

Function DeleteSQLScript(Script As ISWiSQLScript) As Long

Parameters

Table 13-107 • DeleteSQLScript Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Specifies the name of the script you want to remove from the SQL connection in the InstallShield interface.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiSQLConnection

GetDatabaseServer Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the GetDatabaseServer method to return an ISWiSQLDatabaseServer object.

Syntax

Sub SetPredefinedRequirement(RHS As ISWiSQLServerVersion)

Return Values

This method returns the ISWiSQLDatabaseServer object.

Applies To

- ISWiSQLConnection

InsertSQLScript Method

InstallShield 2020

Project • This information applies to the following project types:

- Basic MSI
Call the InsertSQLScript method to insert an existing script file to a SQL Connection in the InstallShield interface.

**Syntax**

Function InsertSQLScript(strScriptPath As String) As ISWiSQLScript

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strScriptPath</td>
<td>Specifies the path to the script file you want to insert under the SQL</td>
</tr>
<tr>
<td></td>
<td>Connection in the InstallShield interface.</td>
</tr>
</tbody>
</table>

**Return Values**

This method returns ISWiSQLScript object.

**Applies To**

- ISWiSQLConnection
- ISWiSQLDatabaseServer

---

**RemoveSQLRequirement Method**

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

The RemoveSQLRequirement method removes a specified SQL requirement from the target product.

**Applies To**

- ISWiSQLConnection
ISWiSQLDatabaseServer Object

This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

ISWiSQLDatabaseServer represents a database server that you can choose to target by version requirements at run time. You can retrieve an ISWiSQLDatabaseServer object by using the ISWiSQLDatabaseServers collection.

</table>

**Applies To**

- ISWiSQLConnection

**SetPredefinedRequirement Method**

InstallShield 2020

**Project • This information applies to the following project types:**

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
Call the SetPredefinedRequirement method to specify requirements for adding a SQL connection to your installation project.

**Syntax**

Sub SetPredefinedRequirement(RHS As ISWISQLServerVersion)

**Constants**

The following is a list of constants associated with the ISWISQLServerVersion object type.

- essv2K
- essv2Ksp1
- essv2Ksp2
- essv2Ksp3
- essv65
- essv65sp1
- essv65sp2
- essv65sp3

- essv65sp5a
- essv65sp5aUpdate
- essv7
- essv7sp1
- essv7sp2
- essv7sp3
- essv7sp4

**Return Values**

This method returns the ISWISQLRequirement object.

**Applies To**

- ISWISQLRequirement
ISWiSQLScript Object

InstallShield 2020

This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Project-specific differences are noted where appropriate.

ISWiSQLScript represents a SQL script file in the SQL Scripts explorer of the SQL Scripts view in InstallShield. You can retrieve an ISWiSQLScript object by using the ISWiSQLScripts collection.

AddSQLScriptError Method

InstallShield 2020

*Project • This information applies to the following project types:

- Basic MSI
Call the AddSQLScriptError method to add a custom error handling entry to a SQL script.

**Syntax**

Function AddSQLScriptError()

**Return Values**

This method returns an ISWiSQLScriptError object.

**Applies To**

- ISWiSQLScript

### AddSQLScriptReplacement Method

InstallShield 2020

*Project* • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the AddSQLScriptReplacement method to specify a string and replace it with a different string in a SQL script file.

**Syntax**

Function AddSQLScriptReplacement() As ISWiSQLReplace

**Return Values**

This method returns the ISWiSQLReplace object.

**Applies To**

- ISWiSQLScript

### DeleteSQLReplace Method

InstallShield 2020

*Project* • This information applies to the following project types:
Call the DeleteSQLReplace method to remove a text replacement entry that you have added.

**Syntax**

Function DeleteSQLReplace(Replace As ISWiSQLReplace) As Long

**Applies To**

- ISWiSQLScript

---

**DeleteSQLScriptError Method**

InstallShield 2020

*Project* • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the DeleteSQLScriptError method to remove a custom error handling entry that you have added.

**Syntax**

Function DeleteSQLScriptError(ByVal pScriptError As ISWiSQLScriptError)

**Applies To**

- ISWiSQLScript

---

**ISWiSQLScriptError Object**

InstallShield 2020

*Project* • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

ISWiSQLScriptError represents a custom error handling entry for a SQL script file in the SQL Scripts view in InstallShield. You can retrieve an ISWiSQLScriptError object by using the ISWiSQLScriptErrors collection.
Members

Table 13-113 • ISWiSQLScriptError Object Members

## Automation Collections

InstallShield 2020 » Automation Interface

---

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Each InstallShield automation collection is a set of objects. For example, the ISWiFeatures collection is a set of ISWiFeature objects in the current project. This section describes each of the InstallShield automation collections.

### ISWiAdvancedFiles Collection

InstallShield 2020 » Automation Interface

---

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

ISWisAdvancedFiles is a collection that contains every advanced file (as an ISWiAdvancedFile object) in your project. For example, the following Visual Basic code illustrates how you would set a property for a specific advanced file:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject(“IswiAutoAutomation Interface Version.ISWiProject”)  
pProj.OpenProject “C:\MySetups\Project1.ism”

pProj.ISWiAdvancedFiles(1).Disk = edtOther

pProj.SaveProject
pProj.CloseProject
```
Members

Table 13-116 • ISWiAdvancedFiles Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of advanced files in the ISWiAdvancedFiles collection.</td>
</tr>
</tbody>
</table>
| Item | Read-Only Property    | Provide the index number or name of the advanced file to retrieve the ISWiAdvancedFile object. For example, the following statements create references to the first advanced file in the collection and the advanced file named CSSaveSpace:  
  
  ```vbs
  Set pSetupFile1 = pProj.ISWiAdvancedFiles.Item(1)
  Set pSetupFile2 = pProj.ISWiAdvancedFiles.Item("CSSaveSpace")
  ```

  Item is the default property for ISWiAdvancedFiles, which means that pProj.ISWiAdvancedFiles.Item("CSSaveSpace") is equivalent to pProj.ISWiAdvancedFiles("CSSaveSpace").

Applies To

- ISWiProject

ISWiAutomaticUpgradeEntries Collection

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

ISWiAutomaticUpgradeEntries returns a collection of ISWiAutomaticUpgradeEntry items as they are defined in the IDE.
Members

Table 13-117 • ISWiAutomaticUpgradeEntries Collection Members

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiAutomaticUpgradeEntries collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or upgrade code in order to retrieve the ISWiAutomaticUpgradeEntries items. Item is the default property for ISWiAutomaticUpgradeEntries, which means that m_ISWiProject.ISWiAutomaticUpgradeEntries.Item(&quot;12345678-1234-1234-1234-123456789012&quot;) is equivalent to m_ISWiProject.ISWiAutomaticUpgradeEntries(&quot;12345678-1234-1234-123456789012&quot;).</td>
</tr>
</tbody>
</table>

Example

```vba
Dim m_ISWiProj As ISWiProject
Dim m_AutomaticUpgradeEntries As ISWiAutomaticUpgradeEntries

Set m_ISWiProj = New ISWiProject
m-ISWiProj.OpenProject "C:\mysetups\build 34.ism"

For Each m_AutomaticUpgradeEntries In m_ISWiProj.ISWiAutomaticUpgradeEntries
    m_AutomaticUpgradeEntries.Name = "Upgrade Msi Item1"
Next

m_ISWiProj.SaveProject
m_ISWiProj.CloseProject
```

The following line illustrates how to access a particular automatic upgrade entry:

```vba
Set m_AutomaticUpgradeEntries = ISWiProject.ISWiAutomaticUpgradeEntries ("Upgrade Msi Item1")
```

Applies To

- ISWiProject

ISWiComponents Collection

InstallShield 2020 » Automation Interface

- Project • This information applies to the following project types:
  - Basic MSI
  - DIM
• InstallScript
• InstallScript MSI
• InstallScript Object
• Merge Module

Project-specific differences are noted where appropriate.

The ISWiComponents collection contains all of the components associated with a specified feature. ISWiComponents provides an interface for enumerating all of the components in a feature. When ISWiComponents is a member of ISWiProject, it contains all of the components in the project, not just those belonging to a specified feature.

**Members**

**Table 13-118 • ISWiComponents Collection Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiComponents collection.</td>
</tr>
</tbody>
</table>
| Item  | Read-Only Property | Provide the index number or name of the component in order to retrieve the ISWiComponent object.  

The name of the component is case-sensitive—for example, “Help_Files” and “Help_files” are two different components.

Item is the default property for ISWiComponents, which means that m_ISWiFeature.ISWiComponents.Item(“Help_Files”) is equivalent to m_ISWiFeature.ISWiComponents(“Help_Files”).

**Examples**

The following Visual Basic code opens a project, loops through each component in the feature NewFeature1, sets the RemoteInstallation property for each component to run from source, and finally saves and closes the project.

```vbnet
Dim m_ISWiProj As ISWiProject
Dim m_Feature As ISWiFeature
Dim m_Comp As ISWiComponent

Set m_ISWiProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
m_ISWiProj.OpenProject "C:\mysetups\build 34.ism"

Set m_Feature = m_ISWiProj.ISWiFeatures("NewFeature1")

If Not m_Feature Is Nothing Then
    For Each m_Comp In m_Feature.ISWiComponents
        m_Comp.RemoteInstallation = rfsSource
        Next
EndIf

m_ISWiProj.SaveProject
```
The following line illustrates how to access a particular component:

```
Set m_Comp = m_ISWiProj.ISWiFeatures("MyFeature").ISWiComponents("MyComponent")
```

### Applies To
- ISWiFeature
- ISWiProject

### ISWiComponentSubFolders Collection

InstallShield 2020 » Automation Interface

![Project](image)

*This information applies to the following project types:
- InstallScript
- InstallScript Object*

ISWiComponentSubFolders is a collection that contains every component subfolder (as an ISWiComponentSubFolder object) in the current component or component subfolder. For example, the following Visual Basic code illustrates how you would apply a method to a specific component subfolder:

```vba
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
pComponent.ISWiComponentSubFolders.Item("MyCompSubFolder").AddFile("C:\My Files\MyFile.ext")

pProj.SaveProject
pProj.CloseProject
```
**Members**

**Table 13-119 • ISWiComponentSubFolders Collection Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of component subfolders in the ISWiComponentSubFolders collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the component subfolder to retrieve the ISWiComponentSubFolder object. For example, the following statements create references to the first component subfolder in the collection and the component subfolder named MyCompSubFolder:</td>
</tr>
</tbody>
</table>

```
Set pComponentSubFolder1 = pProj.ISWiComponentSubFolders.Item(1)
Set pComponentSubFolder2 = pFeature.ISWiComponentSubFolders.Item("MyCompSubFolder")
```

Item is the default property for ISWiComponentSubFolders, which means that
pFeature.ISWiComponentSubFolders.Item("MyCompSubFolder")
is equivalent to
pFeature.ISWiComponentSubFolders("MyCompSubFolder").

**Applies To**

- ISWiComponent
- ISWiComponentSubFolder

**ISWiConditions Collection**

InstallShield 2020 » Automation Interface

**Project • This information applies to the following project types:**

- Basic MSI
- InstallScript MSI

The ISWiConditions collection contains all of the conditions associated with a specified feature. ISWiConditions provides an interface for enumerating all of the conditions in a feature.
Members

Table 13-120 • ISWiConditions Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>

</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number of the condition in order to retrieve the ISWiCondition object. Item is the default property for ISWiConditions, which means that m_ISWiFeature.ISWiConditions.Item(2) is equivalent to m_ISWiFeature.ISWiConditions(2).</td>
</tr>
</tbody>
</table>

Applies To

- ISWiFeature

ISWiCustomActions Collection

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISWiCustomActions collection contains all of the custom actions in the current project.

The VBScript example below displays a string with each custom action in the project:

```vbscript
Set pProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\MyProject.ism", True ' open read-only

sNames = "This project contains the following custom actions:" & vbNewLine

iCount = pProject.ISWiCustomActions.Count
For i = 1 to iCount
    sNames = sNames & vbTab & pProject.ISWiCustomActions(i).Name & vbNewLine
Next

pProject.CloseProject

MsgBox sNames
```
Members

Table 13-121 • ISWiCustomActions Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Returns the number of elements in the ISWiCustomActions collection.</td>
</tr>
</tbody>
</table>
| Item   | Read-Only Property | Provide the index number or name of the custom action in order to retrieve the ISWiCustomAction object.  
Name of the custom action is case-sensitive—for example, “MyAction” and “myAction” are two different actions. 
Item is the default property for ISWiCustomActions, which means that pProject.ISWiCustomActions.Item(“Action1”) is equivalent to pProject.ISWiCustomActions(“Action1”).

<td>Provide the index number or name of the environment variable to retrieve the ISWiEnvironmentVar object.</td>
</tr>
</tbody>
</table>

Applies To

• ISWiComponent
ISWiFeatures Collection

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

ISWiFeatures is a collection that contains every feature (as an ISWiFeature object) in your project.

When ISWiFeatures is a member of ISWiProject, it contains all of the top-level features in the project. To retrieve a collection of subfeatures, access the Features property of the ISWiFeature object. The result is an ISWiFeatures collection that contains the immediate subfeatures of the current top-level feature. Repeat for further levels of subfeatures.

Members

Table 13-124 • Members of ISWiFeatures Collection

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiFeatures collection.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the feature to retrieve the ISWiFeature object. For example, the following statements create a copy of the first item in the collection and of the feature named Help_Files: Set pFeat1 = m_ISWiProject.ISWiFeatures.Item(1) Set pFeat2 = m_ISWiProject.ISWiFeatures.Item(&quot;Help_Files&quot;) The name of the feature is case-sensitive—for example, &quot;Help_Files&quot; and &quot;Help_files&quot; are two different features. Item is the default property for ISWiFeatures, which means that m_ISWiProject.ISWiFeatures.Item(&quot;Help_Files&quot;) is equivalent to m_ISWiProject.ISWiFeatures(&quot;Help_Files&quot;).</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic code builds a string with all of the features and components in your project:

    Dim pFeature As ISWiFeature
    Dim pComponent As ISWiComponent

    For Each pFeature In m_ISWiProject.ISWiFeatures
' Add feature to string  
strProject = strProject & "Feature: " & pFeature.Name & vbCrLf  
strProject = strProject & "Components: "  
For Each pComponent In pFeature.ISWiComponents  
' Add feature's components to string  
strProject = strProject & pComponent.Name & " "  
Next  
strProject = strProject & vbCrLf  
Next

**Applies To**
- ISWiProject

**ISWiFiles Collection**

*InstallShield 2020 » Automation Interface » ISWiComponent Object and ISWiComponentSubFolder Object*

*Project* • This information applies to the following project types:
- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

The ISWiFiles collection contains all of the files associated with a specified component or, in InstallScript projects, a component subfolder. ISWiFiles contains several read-write properties that allow you to set component properties and file attributes as you would in the IDE.

The following Visual Basic code illustrates how you would set a property for a specific file in a component. For the purposes of this example, assume that the variable m_oMyComp already has a reference to a component.
m_oMYComp.ISWiFiles("F1028_MyFile.dll").Hidden = True

Members

Table 13-125 • ISWiFiles Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>

ISWiFolders Collection

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

ISWiFolders contains every program folder belonging to a specified component.

At minimum, each component has the default folders listed below in its ISWiFolders collection. In addition, you could have added a predefined folder to the Shortcuts explorer by right-clicking on Shortcuts and choosing “Show Folder.”

- [TaskBarFolder]
- [SendToFolder]
- [DesktopFolder]
The following code demonstrates accessing the ISWiFolder object that represents the taskbar:

```vbscript
Dim m_pFolder As ISWiFolder
Set m_pFolder = m_pComponent.ISWiFolders("[TaskBarFolder]")
```

The taskbar, in turn, has subfolders of its own. These subfolders are contained in its SubFolders property, which is itself an ISWiFolders collection. Continuing the example above, you can now create a copy of the object for the Start menu, which is a subfolder of the taskbar in the Shortcuts explorer:

```vbscript
Set m_pFolder = m_pFolder.SubFolders("[StartMenuFolder]")
```

We can go ever farther with this example and get a copy of the folder MyProgFolder under the Programs menu:

```vbscript
Set m_pFolder = m_pFolder.SubFolders("[ProgramMenuFolder]").SubFolders("MyProgFolder")
```

### Members

#### Table 13-126 • ISWiFolders Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiFolders collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the folder in order to retrieve the ISWiFolder object.</td>
</tr>
</tbody>
</table>

**Item** is the default property for ISWiFolders, which means that `m_ISWiComponent.ISWiFolders.Item("[DesktopFolder]")` is equivalent to `m_ISWiComponent.ISWiFolders("[DesktopFolder]")`.  

### Applies To

- ISWiComponent

### ISWiLanguages Collection

*InstallShield 2020 » Automation Interface*

**Edition** • Support for multilanguage installations is available with InstallShield Premier Edition.

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
• Merge Module

The ISWiLanguages collection contains all of the languages that are included in the current project.

Members

</table>
| Item     | Read-Only Property    | Provide the index number or family name of the patch sequence in order to retrieve the ISWiMsiPatchSequences Object. The family name of the patch sequence is case-sensitive—“FamilyName” and “familyname” are two different configurations. Item is the default property for ISWiMsiPatchSequences, which means that pPatchConfig.

**Applies To**

- ISWiProject
BuildPatch Method

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call BuildPatch to build the patch configuration identified by the current patch object. This action has the same effect as right-clicking on a patch configuration in the Patch Design view and then selecting Build a Patch.

Syntax

BuildPatch()

Parameter

Table 13-132 • Properties Associated with BuildPatchConfiguration Method

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PatchConfigErrorCount</td>
<td>Include the error count associated with a particular patch build.</td>
</tr>
<tr>
<td>PatchConfigWarningCount</td>
<td>Include the warning count associated with a particular patch build.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic lines demonstrate this method:
'Create the project object

`dim pProject`  
`set pProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")`

'Call the OpenProject method

'*******************************************************************************

'# THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PROJECT PATH

'*******************************************************************************

`'pProject.OpenProject("\Your project.ism")`  
`pProject.OpenProject("C:\Documents and Settings\Testlab\My Documents\MySetups\your project name-21.ism")`

'Call the OpenProject method

' Get existing configuration

Set oMyConfig = pProject.ISWiProductConfigs.Item("Product Configuration 1")

' Assume project already has release configuration...

Set oNewRelease = oMyConfig.ISWiReleases.Item("Release 1")

' Make sure release setting is uncompressed to build the patch...

oNewRelease.Compressed = False

oNewRelease.SetupEXE = True

' Create and set signing parameters...

Set oMyPatchConfig = pProject.AddPatchConfig("PatchDemo1")

oMyPatchConfig.SignPackage = True

oMyPatchConfig.SignUpdateExe = True

oMyPatchConfig.SignatureSPC = "C:\Users\TestLab\Desktop\Test.pfx"

oMyPatchConfig.SignaturePassword = "XX"

Set oMyLatestImage = oMyPatchConfig.AddUpgradedImage("LatestImg1")

Set oMyPreviousImage = oMyLatestImage.AddTargetImage("PrevImage1")

' Set base image...

oMyPreviousImage.MsiPath = "<ISProjectFolder>BaseImage\PatchDesignInterfaceDemo.msi"

' Set base MSI path to the existing patch configuration

'oMyPatchConfig.ISWiUpgradedImages.Item("LatestImg1").ISWiTargetImages.Item("PrevImage1").MsiPath = "<ISProjectFolder>BaseImage\PatchDesignInterfaceDemo.msi"

pProject.SaveProject

oNewRelease.Build()

oMyPatchConfig.BuildPatch

MsgBox "Patch Configuration Config1 build with " & _
   oMyPatchConfig.PatchConfigErrorCount & " Errors and " & _
ISWiObjects Collection

InstallShield 2020 » Automation Interface

This information applies to the following project types:

- InstallScript
- InstallScript Object

ISWiObjects is a collection that contains every InstallScript object (as an ISWiObject object) in your project. The following Visual Basic code illustrates the use of this collection:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pObject As ISWiObject

Set pFeature = pProj.ISWiFeatures.Item(2)
Set pObject = pFeature.ISWiObjects.Item("@ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9")
pFeature.RemoveObject pObject

pProj.SaveProject
pProj.CloseProject
```

</tr>
</tbody>
</table>

### Example

The VBScript example below simply displays a string with each patch configuration in the project:

```vbscript
Dim pProject
Set pProject = CreateObject ("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\Vegetarian.ism", True

Dim sNames
sNames = "This project contains the following patch configurations: " & vbNewLine & vbTab

Dim pPatchConfigs
For Each pPatchConfigs In pProject.ISWiPatchConfigs
    sNames = sNames & pPatchConfigs.Name & vbNewLine & vbTab
Next

pProject.CloseProject

WScript.Echo sNames
Object
```

The following line illustrates how to access a particular patch configuration:

```vbscript
Set pPatchConfig = pISWiProj.ISWiPatchConfigs.Item("Patch 1.1")
```

### Applies To

- ISWiProject

### ISWiPatchExternalFiles Collection

This information applies to the following project types:
- **Basic MSI**
- **InstallScript MSI**

Contains collection of external file objects belonging to the latest setup

### Members

ISWiPathVariables Collection

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:
- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

The ISWiPathVariables collection contains all of the path variables that are associated with the current project. You can add a path variable with the AddPathVariable method and delete a path variable with the DeletePathVariable method.

The following VBScript code retrieves a list of every path variable in the project and displays the path variables in a message box:

Option Explicit
Dim pProject
Set pProject = CreateObject("ISWiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\ISWiPathVariables.ism", True
Dim sPathVars
Dim pPathVar
For Each pPathVar In pProject.ISWiPathVariables
    sPathVars = sPathVars & pPathVar.Name & ": " & pPathVar.Value & vbCrLf
Next
WScript.Echo sPathVars
pProject.CloseProject
The following line illustrates how to access a particular path variable:

Set pPathVar = pProject.ISWiPathVariables.Item("MyPathVar")

**Important** • Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.

**Members**

</tr>
<tr>
<td>Item</td>
<td>Read-Only</td>
<td>Provide the index number or name of the path variable to retrieve the ISWiPathVariable object.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

**ISWiPreviousSetups Collection**

**InstallShield 2020 » Automation Interface**

**Project** • This information applies to the following project types:

- **Basic MSI**
- **InstallScript MSI**

Contains collection of all previous setups belonging to the latest setup

Each patch configuration must contain at least one latest setup and one previous setup in order for you to create a patch. You can have multiple previous setups per latest setup.

Every application or setup that you intend to patch to a latest setup must be added to the previous setup node.

For example, your company supports versions 1.0 and 1.1 of an application, and you want to upgrade both of these applications to version 2.0. To create a single patch to upgrade both versions, you would add V1.0 and V1.1 as previous setups to the latest setup. Your latest setup would contain V2.0.

ISWiProductConfigs Collection

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

• Basic MSI
• InstallScript
• InstallScript MSI
• InstallScript Object
• Merge Module

InstallScript and InstallScript Object projects contain only one element in ISWiProductConfigs; it is named Media.

The ISWiProductConfigs collection contains all of the product configurations in the current project.
Members

Table 13-143 • ISWiProductConfigs Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiProductConfigs collection.</td>

<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the product configuration in order to retrieve the ISWiProductConfig object. The name of the product configurations is case-sensitive—“Product One” and “Product one” are two different configurations. Item is the default property for ISWiProductConfigs, which means that pProject.ISWiProductConfigs.Item(&quot;Version 1&quot;) is equivalent to pProject.ISWiProductConfigs(&quot;Version 1&quot;).</td>
</tr>
</tbody>
</table>

Example

The VBScript example below simply displays a string with each product configuration in the project:

```vbnet
Dim pProject
Set pProject = CreateObject ("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\Vegetarian.ism", True

Dim sNames
sNames = "This project contains the following product configurations: " & vbCrLf & vbCrLf

Dim pProductConfigs
For Each pProductConfigs In pProject.ISWiProductConfigs
    sNames = sNames & pProductConfigs.Name & vbCrLf & vbCrLf
Next

pProject.CloseProject

WScript.Echo sNames
```

The following line illustrates how to access a particular product configuration:

```vbnet
Set pProdConfig = pISWiProj.ISWiProductConfigs.Item("Version 1.1")
```

Applies To

- ISWiProject
ISWiProperties Collection

This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISWiProperties collection contains all of the Windows Installer properties in the current project. This interface is similar to the Property Manager. You can add a property with the AddProperty method and delete a property with the DeleteProperty method.

The VBScript code below retrieves a list of every property in the project and displays them in a message box:

Option Explicit

Dim pProject
Set pProject = CreateObject ("ISWiAutoAutomation Interface Version.ISWiProject")

pProject.OpenProject "C:\MySetups\ISWiProperties.ism", True

Dim sProps
Dim pProp

For Each pProp In pProject.ISWiProperties
    sProps = sProps & pProp.Name & ": " & pProp.Value & " // " & 
    pProp.Comments & vbCrLf
Next

WScript.Echo sProps

pProject.CloseProject
Members

InsertCustomAction Method

**InstallShield 2020 » Automation Interface**

**Project** • This information applies to the following project types:
- Basic MSI
- InstallScript MSI

Call the InsertCustomAction method to insert a custom action into one of the project's sequences.

**Syntax**

```vba
InsertCustomAction (CustomAction As ISWiCustomAction, Comment As String, Condition as String, SequenceNumber as Long) as ISWiSequenceRecord
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CustomAction</td>
<td>The custom action you want to create.</td>
</tr>
<tr>
<td>Comment</td>
<td>An optional string comment about your custom action.</td>
</tr>
<tr>
<td>Condition</td>
<td>An optional string condition for your custom action.</td>
</tr>
<tr>
<td>SequenceNumber</td>
<td>The numeric sequence number for your custom action.</td>
</tr>
</tbody>
</table>

**Return Values**

The InsertCustomAction method returns an ISWiSequenceRecord object.

**Applies To**
- ISWiSequence

RemoveSequenceRecord Method

**InstallShield 2020 » Automation Interface**

**Project** • This information applies to the following project types:
- Basic MSI
- InstallScript MSI

Call the RemoveSequenceRecord method to remove an item from a sequence in the current project.
Syntax

(sName As String) As Long

Parameters

Table 13-149 • RemoveSequenceRecord Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sName</td>
<td>Pass an ISWiSequenceRecord object to specify a sequence record that you want to remove from the project.</td>
</tr>
</tbody>
</table>

Return Values

Table 13-150 • RemoveSequenceRecord Method Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The item was successfully removed from a sequence.</td>
</tr>
<tr>
<td>1</td>
<td>The item was not removed from a sequence.</td>
</tr>
</tbody>
</table>

Applies To

• ISWiSequence

ISWiSetupFiles Collection

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

• Basic MSI
• InstallScript
• InstallScript MSI
• InstallScript Object

ISWiSetupFiles is a collection that contains every support file (as an ISWiSetupFile object) in your project.
Members

Table 13-151 • ISWiSetupFiles Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only</td>
<td>Use this property to return the total number of support files in the ISWiSetupFiles collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only</td>
<td>Provide the index number or name of the support file to retrieve the ISWiSetupFile object. For example, the following statements create references to the first support file in the collection and the support file named MySupportFile.bmp: Set pSetupFile1 = pProj.ISWiSetupFiles.Item(1) Set pSetupFile2 = pProj.ISWiSetupFiles.Item(&quot;MySupportFile.bmp&quot;) Item is the default property for ISWiSetupFiles, which means that pProj.ISWiSetupFiles.Item(&quot;MySupportFile.bmp&quot;) is equivalent to pProj.ISWiSetupFiles(&quot;MySupportFile.bmp&quot;).</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic code illustrates how you would set a property for a specific support file:

Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

pProj.ISWiSetupFiles(1).Splash = True

pProj.SaveProject
pProj.CloseProject

Applies To

• ISWiProject

ISWiSetupTypes Collection

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

• InstallScript
• InstallScript MSI

ISWiSetupTypes is a collection that contains every setup type (as an ISWiSetupType object) in your project.
Members

**Table 13-152 • ISWiSetupTypes Collection Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only</td>
<td>Use this property to return the total number of setup types in the ISWiSetupTypes collection.</td>
</tr>
</tbody>
</table>
| Item      | Read-Only    | Provide the index number or name of the setup type to retrieve the ISWiSetupType object. For example, the following statements create references to the first setup type in the collection and the setup type named CSSaveSpace:  
  ```vbnet
  Set pSetupFile1 = pProj.ISWiSetupTypes.Item(1)
  Set pSetupFile2 = pProj.ISWiSetupTypes.Item("CSSaveSpace")
  ```  
  Item is the default property for ISWiSetupTypes, which means that pProj.ISWiSetupTypes.Item("CSSaveSpace") is equivalent to pProj.ISWiSetupTypes("CSSaveSpace"). |

Example

The following Visual Basic code illustrates how you would set a property for a specific setup type:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

pProj.ISWiSetupTypes("CSSaveSpace").DisplayName = "Client Setup - Save Space"

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject

**ISWiShellProperties Collection**

**InstallShield 2020 » Automation Interface**

*Project • This information applies to the following project types:*

- Basic MSI
- DiM
- InstallScript MSI
- Merge Module

ISWiShellProperties is a collection of all of the Shell properties for a specified ISWiShortcut object.
Members

Table 13-153 • ISWiShellProperties Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only</td>
<td>Use this property to return the total number of elements in the ISWiShellProperties collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only</td>
<td>Provide the index number or name of the Shell property in order to retrieve the ISWiShellProperty object.</td>
</tr>
</tbody>
</table>

Example

The following sample VBScript snippet retrieves the ISWiShellProperty object for the primary key MyShellProperty from the ISWiShellProperties collection:

```vbscript
Dim pShellProperty As ISWiShellProperty
Set pShellProperty = pShortcut.ISWiShellProperties("MyShellProperty")
```

Applies To

- ISWiShortcut

ISWiShortcuts Collection

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

ISWiShortcuts contains every shortcut belonging to a specified ISWiFolder object.

The following example makes a copy of the shortcut named MyShortcut under the program folder contained in m_pFolder:

```vbscript
Dim m_pShortcut As ISWiShortcut
Set m_pShortcut = m_pFolder.ISWiShortcuts("MyShortcut")
```
Members

Table 13-154 • ISWiShortcuts Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only</td>
<td>Use this property to return the total number of elements in the ISWiShortcuts collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only</td>
<td>Provide the index number or name of the shortcut in order to retrieve the ISWiShortcut object.</td>
</tr>
</tbody>
</table>

Item is the default property for ISWiShortcuts, which means that m_pFolder.ISWiShortcuts.Item("MyShortcut") is equivalent to m_pFolder.ISWiShortcuts("MyShortcut").

Applies To

- ISWiFolder

ISWiSISProperties Collection

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

This collection contains all of the values for the Summary Information Stream settings in the current project. By accessing an element in this collection, you can set all of the Summary Information Stream settings in the General Information view.

The following Visual Basic code reads every Summary Information Stream setting in your project and displays each setting and its value.

```vbnet
Dim pProject As ISWiProject
Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\SampleApp.ism", True

Dim sSISProps As String
sSISProps = "This package's Summary Information Stream has the following " & _
pProject.ISWiSISProperties.Count & " properties:

Dim pSISProp As ISWiSISProperty
For Each pSISProp In pProject.ISWiSISProperties
    sSISProps = sSISProps & vbNewLine & vbTab & _
        pSISProp.Name & ": " & pSISProp.Value
Next
```
MsgBox sSISProps

pProject.CloseProject

Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiSISProperties collection. Since the Summary Information Stream contains seven items at present, Count always has a value of 7.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the property in order to retrieve the ISWiSISProperty object. The name of the property is case-sensitive—“TemplateSummary” and “Templatesummary” are two different properties. Item is the default property for ISWiSISProperties, which means that pISWiProject.ISWiSISProperties.Item(&quot;Subject&quot;) is equivalent to pISWiProject.ISWiSISProperties(&quot;Subject&quot;).</td>
</tr>
</tbody>
</table>

Applies To

• ISWiProject

ISWiSQLConnections Collection

InstallShield 2020 » Automation Interface

**Project** • This information applies to the following project types:

• Basic MSI
• DIM
• InstallScript
• InstallScript MSI

The ISWiSQLConnections collection contains all of the SQL Server connections in the current project.
Members

Table 13-156 • ISWiSQLConnections Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiSQLConnections collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the connection in order to retrieve the ISWiSQLConnection object. The name of the connection is case-sensitive—&quot;SQLConnection&quot; and &quot;SQLconnection&quot; are two different items. Item is the default property for ISWiSQLConnections, which means that pISWiProject.ISWiSQLConnections.Item(&quot;SQLConnection&quot;) is equivalent to pISWiProject.ISWiSQLConnections(&quot;SQLConnection&quot;).</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

ISWiSQLDatabaseServers Collection

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

The ISWiSQLDatabaseServers collection contains all the database servers that you can choose to target by version requirements at run time.
Members

Table 13-157 • ISWiSQLDatabaseServers Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiSQLDatabaseServers collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the property in order to retrieve the ISWiSQLDatabaseServer object.</td>
</tr>
</tbody>
</table>

The name of the database server is case-sensitive—“SQLDatabaseServer” and “SQLDatabaseserver” are two different items.

Item is the default property for ISWiSQLDatabaseServers, which means that pISWiSQLConnection.ISWiSQLDatabaseServers.Item("SQLDatabaseServer") is equivalent to pISWiSQLConnection.ISWiSQLDatabaseServers("SQLDatabaseServer").

Applies To

• ISWiSQLConnection

ISWiSQLReplaces Collection

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

• Basic MSI
• DIM
• InstallScript
• InstallScript MSI

The ISWiSQLReplaces collection contains all the ISWiSQLReplace objects in the current project.
Members

<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the property in order to retrieve the ISWiSQLScript object. The name of the script is case-sensitive—“SQLScript” and “SQLscript” are two different items. Item is the default property for ISWiSQLScripts, which means that pISWiSQLConnection.ISWiSQLScripts.Item(&quot;SQLScript&quot;) is equivalent to pISWiSQLConnection.ISWiSQLScripts(&quot;SQLScript&quot;).</td>
</tr>
</tbody>
</table>

Applies To

- ISWiSQLConnection

ISWiStringEntries Collection

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

The ISWiStringEntries collection contains all of the string entries in the current language.
Members

Table 13-162 • ISWiStringEntries Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of string entries in the ISWiStringEntries collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the string entry to retrieve the ISWiStringEntry object.</td>
</tr>
</tbody>
</table>

Applies To

ISWiUpgradeTableEntries Collection

InstallShield 2020 » Automation Interface

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

The ISWiUpgradeTableEntries collection contains all the static major upgrade items, as they are defined in the Upgrades view as well as the Upgrade table in the Direct Editor.
Members

Table 13-163 • ISWiUpgradeTableEntries Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiUpgradeTableEntries collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or upgrade code in order to retrieve the ISWiUpgradeTableEntries items.</td>
</tr>
</tbody>
</table>

Example

Dim oProj As ISWiProject
Dim oUpgradeItem As ISWiUpgradeTableEntry

Set oProj = New ISWiProject
oProj.OpenProject "C:\MySetup.ism"

For Each oUpgradeItem In oProj.ISWiUpgradeTableEntries
    oUpgradeItem.Language = "1033"
Next

oProj.SaveProject
oProj.CloseProject

To target a specific item, replace the For Each loop in the above code with this code:

For Each oUpgradeItem In oProj.ISWiUpgradeTableEntries
    If oUpgradeItem.UpgradeCode = "{12345678-1234-1234-1234-123456789012}" Then
        oUpgradeItem.Language = "1033"
    End If
Next

Automation Objects for Advanced UI and Suite/Advanced UI Projects

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:

• Advanced UI
• Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

Each InstallShield automation object represents an installation element such as a feature, a component, or a file. This section describes each of the InstallShield automation objects.

The highest-level object in the automation interface is the ISWiProject object. The first thing you must do to access the interface is create this object. Then, you can use its objects, methods, and properties to modify your project.

ISWiProject Object (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:

• Advanced UI
• Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

ISWiProject contains the interface for opening, closing, and saving an Advanced UI or Suite/Advanced UI project (.issuite) file. When InstallShield is installed on your system, you can instantiate a copy of ISWiProject with the following VB and VBScript syntax:

```vbscript
Set m_ISWiProject = CreateObject("ISWiAutoSuiteAutomation Interface Version.ISWiProject")
```

To open an installation project, call the OpenProject method, as follows:

```vbscript
' Build path to the .ism file
strFile = "C:\InstallShield 2020 Projects\Test.issuite"

m_ISWiProject.OpenProject strFile
```
Important • If you are using the automation interface on a 64-bit machine, you may need to load the automation interface through a 32-bit executable file. Otherwise, you may encounter an error when you instantiate a copy of ISWiProject, or any other object. For more information, see Using the Automation Interface on a 64-Bit System.

Members

The following members of the ISWiProject object are available in the automation interface. Note that some methods, properties, and collections are available only for a particular project type.

Table 13-1 • ISWiProject Object Members

</table>
### Table 13-1 • ISWiProject Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ArpDisableRemove</td>
<td>Read-Write Boolean</td>
<td>Gets or sets the value of the Disable Remove Button setting in the General Information view. This setting is where you specify whether you want to disable the Remove button for your product’s entry in Programs and Features. The Remove button enables end users to remove the product by clicking one button, which runs your uninstaller with a reduced user interface. If the end user clicks the Remove button to remove your product, actions in the User Interface sequence of the project are executed.</td>
</tr>
<tr>
<td>ArpHelpContact</td>
<td>Read-Write String</td>
<td>Gets or sets the name of the person or department that end users should contact for technical support. On some versions of Windows, this information is displayed on the Support Info dialog box for your product’s entry in Programs and Features.</td>
</tr>
<tr>
<td>ArpHelpTelPhone</td>
<td>Read-Write String</td>
<td>Gets or sets the technical support phone number for your product. On some versions of Windows, this information is displayed on the Support Info dialog box for your product’s entry in Programs and Features.</td>
</tr>
<tr>
<td>ArpHelpUrl</td>
<td>Read-Write String</td>
<td>Gets or sets the URL that you would like end users to visit for technical support information for your product. This URL is displayed for your product’s entry in Programs and Features.</td>
</tr>
<tr>
<td>ArpIcon</td>
<td>Read-Write String</td>
<td>Gets or sets the path on your development system to the .ico, .exe or .dll file that contains the icon resource that you want to be used for your product’s entry in Programs and Features. If you want to use the icon in a file that is present on target systems (for example, in a file that is installed by one of the packages in the Advanced UI or Suite/Advanced UI installation), you can use a directory property as part of the path for the icon file. If you leave this property empty, InstallShield uses the icon that is specified in the Setup.exe Icon File setting on the Setup.exe tab in the Releases view.</td>
</tr>
</tbody>
</table>
### ArpIconIndex
- **Type:** Read-Write Integer
- **Description:** If the icon file that you specify contains more than one icon resource, you can use the ArpIconIndex property to specify the index.
  - A nonnegative integer refers to the order of the icon resources in the executable file. For example, 0 refers to the first icon in the file, 1 refers to the second icon, and 2 refers to the third icon.
  - Use a negative number to refer to a specific resource ID. For example, the icon index -12 refers to the icon with a resource ID of 12.

### ArpProductUrl
- **Type:** Read-Write String
- **Description:** Gets or sets a general URL for your company or product—for example, http://www.mycompany.com.

  On some versions of Windows, the publisher name on the Support Info dialog box is a hyperlink to this URL. The Support Info dialog box is displayed when an end user clicks the support information hyperlink for your product’s entry in Programs and Features.

### ArpPublisher
- **Type:** Read-Write String
- **Description:** Gets or sets the name of the company that created the product. This information is displayed for your product’s entry in Programs and Features.

### ArpReadMe
- **Type:** Read-Write String
- **Description:** Gets or sets a valid URL for a Readme file or Customer Support page for your product.

  On some versions of Windows, this information is displayed on the Support Info dialog box for your product’s entry in Programs and Features.

### ArpUpdateUrl
- **Type:** Read-Write String
- **Description:** Gets or sets a URL where end users can get information about product updates or download the latest version.

  On some versions of Windows, this information is displayed on the Support Info dialog box for your product’s entry in Programs and Features.

### CloseProject
- **Type:** Method
- **Description:** Closes an Advanced UI or Suite/Advanced UI project.

### CreateProject
- **Type:** Method
- **Description:** Creates a new InstallShield project file (.issuite) for an Advanced UI or Suite/Advanced UI project.

### DeleteExitCondition
- **Type:** Method
- **Description:** Removes an exit error message from the project.

### ISWiProperties
- **Type**: Collection
- **Description**: Contains all of the Advanced UI or Suite/Advanced UI properties in the current project.

### ISWiSetupFiles
- **Type**: Collection
- **Description**: Contains all of the support files in the current project.

### ISWiSuiteActions
- **Type**: Collection
- **Project**: This is available in Suite/Advanced UI projects.
- **Edition**: The Suite/Advanced UI project type is available in the Premier edition of InstallShield.
- **Description**: Contains all of the Suite/Advanced UI actions that are included in a project.

### ISWiSuiteEvent
- **Type**: Method
- **Project**: This is available in Suite/Advanced UI projects.
- **Edition**: The Suite/Advanced UI project type is available in the Premier edition of InstallShield.
- **Description**: Accesses a specific event in the project.

### ISWiSuiteEvents
- **Type**: Collection
- **Project**: This is available in Suite/Advanced UI projects.
- **Edition**: The Suite/Advanced UI project type is available in the Premier edition of InstallShield.
- **Description**: Contains all of the events that are in a project.

### ISWiSuiteFeatures
- **Type**: Collection
- **Description**: Contains every feature (as an ISWiSuiteFeature object) in your project.

When ISWiSuiteFeatures is a member of ISWiProject, it contains all of the root-level features in the project. To retrieve a collection of subfeatures, access the Features property of the ISWiSuiteFeature object. The result is an ISWiSuiteFeatures collection that contains the immediate subfeatures of the current root-level feature. Repeat for further levels of subfeatures.

<td>Collection</td>
<td>Contains every package (as an ISWiSuitePackage object) and every Windows Installer transaction (also as an ISWiSuitePackage object) in your project.</td>
</tr>
<tr>
<td>ISWiSuiteReleases</td>
<td>Collection</td>
<td>Contains all of the releases in your Advanced UI or Suite/Advanced UI project.</td>
</tr>
<tr>
<td>ProductName</td>
<td>Read-Write String Property</td>
<td>Gets or sets the name of the product. For information on how the product name is used, see Specifying a Product Name.</td>
</tr>
<tr>
<td>ProjectType</td>
<td>Read-only Integer Property</td>
<td>Gets the project type. The valid value is:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• eptSuite (16)—Advanced UI or Suite/Advanced UI project</td>
</tr>
<tr>
<td>ProductVersion</td>
<td>Read-Write String Property</td>
<td>Gets or sets the version number for your product. The version must contain only numbers. It is typically in the format aaa.bbb.ccccc or aaa.bbb.ccccc.ddddd, where aaa represents the major version number, bbb represents the minor version number, ccccc represents the build number, and ddddd represents the revision number. The maximum value for the aaa and bbb portions is 255. The maximum value for ccccc and ddddd is 65,535. Note that although you can include the fourth field (ddddd), the installation does not use this part of the product version to distinguish between different product versions. To learn more, see Specifying the Product Version.</td>
</tr>
<tr>
<td>SaveProject</td>
<td>Method</td>
<td>Saves the Advanced UI or Suite/Advanced UI project.</td>
</tr>
<tr>
<td>SuiteGuid</td>
<td>Read-Write String Property</td>
<td>Gets or sets a GUID that uniquely identifies the Advanced UI or Suite/Advanced UI installation. To have generate a different GUID, call GenerateGUID. Since this code uniquely identifies your Advanced UI or Suite/Advanced UI installation, changing the Suite GUID after you have already distributed your release is not recommended.</td>
</tr>

AddExitCondition Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddExitCondition method adds an exit condition to the project. Using this method is similar to defining an exit condition in the General Information view in InstallShield. You can set the properties of the exit condition with the ISWiSuiteExitCondition object.

**Syntax**

AddExitCondition (Message As String)

**Parameters**

**Table 13-2 • AddExitCondition Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message</td>
<td>Specify the error message that you want the Advanced UI or Suite/Advanced UI installation to display at run time if the condition that you are configuring is true. As an alternative, you can enter a string identifier whose value is the error message that you want the installation to use.</td>

AddLanguage Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

**Project** • This information applies to Suite/Advanced UI projects.
Support for multilanguage installations is available with InstallShield Premier Edition.

The AddLanguage method adds a language to the project. Using this method is similar to adding a language in the General Information view in InstallShield. You can set the properties of the new language with the ISWiLanguage object.

**Syntax**

AddLanguage (LangId As String)

**Parameters**

**Table 13-3 • AddLanguage Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LangId</td>
<td>Specify the language ID (as a string) that you want to add to the current project. For example: oProject.AddLanguage &quot;1035&quot;</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

---

The AddPathVariable method adds a path variable to the project. Using this method is similar to adding a path variable in the Path Variables view in InstallShield. You can set the properties of the new path variable with the ISWiPathVariable object.

**Important**

Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.

---

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

Edition • Support for multilanguage installations is available with InstallShield Premier Edition.

The AddPathVariable method adds a path variable to the project. Using this method is similar to adding a path variable in the Path Variables view in InstallShield. You can set the properties of the new path variable with the ISWiPathVariable object.

**Important**

Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.
**Syntax**

AddPathVariable (sName As String) As ISWiPathVariable

**Parameters**

**AddProperty Method (Advanced UI and Suite/Advanced UI)**

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddProperty method adds an Advanced UI or Suite/Advanced UI property with a specified name to the project.

**Syntax**

AddProperty (Name As String) As ISWiProperty

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specify the name of the Advanced UI or Suite/Advanced UI property that you want to add.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate this method:
Dim pProj As ISWiProject
Set pProj = CreateObject("ISWiAutoSuiteAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.issuite"

Dim pProperty As ISWiProperty
Set pProperty = pProj.AddProperty ("MYPROP")
pProperty.Value = "MyPropValue"

pProj.SaveProject
pProj.CloseProject

**Applies To**
- ISWiProject

---

### AddSetupFile Method (Advanced UI and Suite/Advanced UI)

**InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI**

**Project** • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddSetupFile method adds a support file with the specified name to the project. Using this method is similar to adding a path variable in the Support Files view in InstallShield. You can set the properties of the new path variable with the ISWiSetupFile object.

**Syntax**

AddSetupFile (FileName As String) As ISWiSetupFile

**Parameters**

**Table 13-6 • AddSetupFile Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Specify the fully qualified path and file name of the support file that you want to add.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate this method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("ISWiAutoSuiteAutomation Interface Version.ISWiProject")
```
pProj.OpenProject "C:\MySetups\Project1.issuite"
Dim pSetupFile As ISWiSetupFile

Set pSetupFile = pProj.AddSetupFile ("C:\My Files\MySupportFile.ext")

pProj.SaveProject
pProj.CloseProject

Applies To
- ISWiProject

AddSuiteAction Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to Suite/Advanced UI projects.

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddSuiteAction method adds an action to the project.

Syntax

AddSuiteAction (ActionName As String, ActionType As ISWiSuiteActionType) as ISWiSuiteAction
Parameters

Table 13-7 • AddSuiteAction Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActionName</td>
<td>Specify the name of the action that you want to add.</td>
</tr>
<tr>
<td>ActionType</td>
<td>Specify the type of action. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• esatDll (1)—Calls a function in a DLL file.</td>
</tr>
<tr>
<td></td>
<td>• esatPowerShell (2)—Runs a PowerShell script to perform system configuration tasks.</td>
</tr>
<tr>
<td></td>
<td>• esatExe (4)—Launches an executable file. The Suite/Advanced UI engine waits for the action to complete before proceeding with the next part of the installation.</td>
</tr>
<tr>
<td></td>
<td>• esatStartExe (8)—Launches an executable file. The Suite/Advanced UI engine runs the action simultaneously as the next part of the installation proceeds.</td>
</tr>
<tr>
<td></td>
<td>• esatSetProperty (16)—Sets a Suite/Advanced UI property.</td>
</tr>
<tr>
<td></td>
<td>• esatIScript (32)—Runs InstallScript code.</td>
</tr>
<tr>
<td></td>
<td>• esatClr (64)—Calls a public method in a managed assembly.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

AddSuiteFeature Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddSuiteFeature method creates a feature with the specified name. AddSuiteFeature is a member of ISWiProject. The new feature is added to the current project as a root-level feature, but when this method is a member of an ISWiSuiteFeature object, the new feature is added as a subfeature of the current feature.

The feature is created with the same default properties that new features have when you add them in InstallShield.

After you have added the feature, you can set its other properties and associate packages with it.
Syntax

AddSuiteFeature (SuiteFeatureKey As String) As ISWiSuiteFeature

Parameters

Table 13-8 • AddSuiteFeature Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SuiteFeatureKey</td>
<td>The feature key is the same as the name of the feature that is displayed in the Features view. The name becomes the index for the new ISWiSuiteFeature object. This string must contain only alphanumeric characters, dots (.), or underscores (_), and it must begin with a letter or an underscore. FeatureKey must be unique among your project's feature names. Feature names are case-sensitive.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic lines demonstrate calling AddSuiteFeature to add a feature and a subfeature:

Dim pProject As ISWiProject
Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\SampleApp.issuite"

Dim pFeat1, pFeat2 As ISWiSuiteFeature
Dim sFeat1Name, sFeat2Name As String

sFeat1Name = "ParentFeature"
sFeat2Name = "SubFeature"

' Add the feature ParentFeature, then SubFeature under ParentFeature
Set pFeat1 = pProject.AddSuiteFeature(sFeat1Name)
Set pFeat2 = pFeat1.AddSuiteSubFeature(sFeat2Name)

pProject.SaveProject
pProject.CloseProject

Applies To

• ISWiProject

AddSuitePackage Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:

• Advanced UI
• Suite/Advanced UI
Project-specific differences are noted where applicable.

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see *Advanced UI Projects vs. Suite/Advanced UI Projects*.

The AddSuitePackage method adds a package (such as an .msi package, an InstallScript package, an .exe package, or other supported type) along with the specified target file and options for adding additional files. Using this method is similar to adding a package in the Packages view in InstallShield. You can set the properties of the new package with the ISWiSuitePackage object.

**Syntax**

AddSuitePackage (PackageType As ISWiSuitePackageType, TargetFileName As String, AdditionalFiles As ISWiAdditionalFiles) As ISWiSuitePackage
**Parameters**

**Table 13-9 • AddSuitePackage Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageType</td>
<td>Specify the type of package that you are adding to the project.</td>
</tr>
<tr>
<td>TargetFileName</td>
<td>Specify the file in the package (such as the .msi file) that the Advanced UI or Suite/Advanced UI installation should invoke.</td>
</tr>
<tr>
<td>AdditionalFiles</td>
<td>Specify the type of additional files that you want to add for the package. Available options are:</td>
</tr>
</tbody>
</table>

- **eaftNothing (0)**—Add nothing. This package does not need any additional files.
- **eaftAdjacentFiles (1)**—Add adjacent files; that is, add the files next to this package.
- **eaftSubFolders (2)**—Add files in subfolders; that is, add the files below this package.
- **eaftAdjacentFilesAndSubFolders (3)**—Add adjacent files and files in subfolders; that is, add the files next to and below this package.

** Applies To**

- **ISWiProject**
AddSuiteRelease Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddSuiteRelease method adds a release with the specified name to the project. Using this method is similar to adding a release in the Releases view in InstallShield. You can set the properties of the new release with the ISWiSuiteRelease object.

Syntax

AddSuiteRelease (ReleaseName As String) as ISWiSuiteRelease

Parameters

Table 13-10 • AddSuiteRelease Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ReleaseName</td>
<td>Specify the name of the release that you want to add.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

AddSuiteTransaction Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to Suite/Advanced UI projects.

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddSuiteTransaction method adds a Windows Installer transaction to a Suite/Advanced UI project, and it returns a package. Once your project contains a transaction, you can add .msi and .msp packages to the transaction.
**Syntax**

AddSuiteTransaction () As ISWiSuitePackage

**Parameters**

The AddSuiteTransaction method does not take any parameters.

**Applies To**

- ISWiProject

---

**CloseProject Method (Advanced UI and Suite/Advanced UI)**

*InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI*

**Project**

This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition**

The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

To close the .issuite file that you opened with OpenProject, call CloseProject.

**Syntax**

CloseProject ()

**Return Values**

CloseProject always returns 0.

**Applies To**

- ISWiProject

---

**CreateProject Method (Advanced UI and Suite/Advanced UI)**

*InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI*

**Project**

This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI
The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The CreateProject method creates a new InstallShield project file (.issuite) for Advanced UI and Suite/Advanced UI projects.

**Syntax**

CreateProject (strISWiProjectFile As String, ByVal ProjectType As ISWiProjectType)

**Parameters**

**Table 13-11 • CreateProject Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strISWiProjectFile</td>
<td>Enter the fully qualified path to the .issuite file that you want to create. Include the full file name.</td>
</tr>
<tr>
<td>ProjectType</td>
<td>Specify the type of project that you want to create. The valid value is:</td>
</tr>
<tr>
<td></td>
<td>•  <strong>eptSuite (16)</strong>—Creates an Advanced UI or Suite/Advanced UI project.</td>
</tr>
</tbody>
</table>

**Example**

The following sample code creates an Advanced UI or Suite/Advanced UI project and sets its product version to 2.00.0000.

```vba
dim proj
set proj = CreateObject("ISWiAutoSuite22.ISWiProject")

proj.CreateProject "d:\scratch\packagetest.issuite", 16   '16: ISWiProjectType.eptSuite
proj.OpenProject "d:\scratch\packagetest.issuite", false
proj.ProductVersion = "2.00.0000"
proj.SaveProject
proj.CloseProject
```

**Applies To**

- ISWiProject

DeleteExitCondition Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

**Project • This information applies to the following project types:**

- Advanced UI
• Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteExitCondition method removes an exit condition from the project. Using this method is similar to removing an exit condition in the General Information view in InstallShield.

**Syntax**

DeleteExitCondition (ExitCondition As ISWiSuiteExitCondition)

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ExitCondition</td>
<td>Specify the ISWiSuiteExitCondition object that you want the method to remove from your project.</td>
</tr>
</tbody>
</table>

**Applies To**

• ISWiProject

[Creating a Custom Condition for an Advanced UI or Suite/Advanced UI Installation](#)

---

**DeleteLanguage Method (Advanced UI and Suite/Advanced UI)**

**Project** • This information applies to Suite/Advanced UI projects.

**Edition** • Support for multilanguage installations is available with InstallShield Premier Edition.

The DeleteLanguage method removes a language from the current project. Using this method is similar to removing a language in the General Information view in InstallShield.

**Syntax**

DeleteLanguage (Language As ISWiLanguage)
Parameters

Table 13-13 • DeleteLanguage Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Language</td>
<td>Specify the ISWiLanguage object that you want the method to remove from your project.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

DeletePathVariable Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeletePathVariable method removes a path variable with a specified name from the project.

Important • Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.

Syntax

DeletePathVariable (pPathVar ISWiPathVariable) As Long

Parameters

Table 13-14 • AddPathVariable Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pPathVar</td>
<td>Pass the ISWiPathVariable object for the path variable that you want to delete.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject
DeleteProperty Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteProperty method removes an Advanced UI or Suite/Advanced UI property with a specified name from the project.

**Syntax**

DeleteProperty(ByVal pProperty As ISWiProperty) As Long

**Parameters**

**Table 13-15 • DeleteProperty Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
<td>Pass the ISWiProperty object that you want to remove.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate this method:

```vbnet
Dim proj As ISWiAutoSuiteAutomation Interface Version.ISWiProject
Set proj = New ISWiAutoSuiteAutomation Interface Version.ISWiProject
proj.OpenProject "c:\mysetups\your project name-3.issuite"
Dim pProp As ISWiAutoSuiteAutomation Interface Version.ISWiProperty
Set pProp = proj.ISWiProperties.Item("MyProperty")
proj.DeleteProperty pProp
```

**Applies To**
- ISWiProject

DeleteSetupFile Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:
The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteSetupFile method removes the specified support file from the project.

**Syntax**

`DeleteSetupFile (pSetupFile As ISWiSetupFile) As Long`

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pSetupFile</td>
<td>Pass the ISWiSetupFile object that you want to delete.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate this method:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("ISWiAutoSuiteAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetsups\Project1.issuite"
Dim pSetupFile As ISWiSetupFile
Set pSetupFile = pProj.ISWiSetupFiles.Item("MySupportFile.abc")
pProj.DeleteSetupFile pSetupFile
pProj.SaveProject
pProj.CloseProject
```

**Applies To**

- ISWiProject

DeleteSuiteAction Method (Advanced UI and Suite/Advanced UI)
The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteSuiteAction method removes an action from the project.

**Syntax**

```plaintext
DeleteAction (SuiteAction As ISWiSuiteAction)
```

**Parameters**

**Table 13-17 • AddSuiteAction Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SuiteAction</td>
<td>Specify the ISWiSuiteAction object that you want to delete.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

**DeleteSuiteFeature Method (Advanced UI and Suite/Advanced UI)**

This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

The DeleteSuiteFeature method permanently removes a feature from the current project.

**Syntax**

```plaintext
DeleteSuiteFeature (Feature As ISWiSuiteFeature) As Long
```
Parameters

Table 13-18 • DeleteSuiteFeature Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feature</td>
<td>Specify the ISWiSuiteFeature object that you want to remove.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

DeleteSuitePackage Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteSuitePackage method removes a package or a Windows Installer transaction from the current project.

Syntax

DeleteSuitePackage (Package As ISWiSuitePackage) As Long

Parameters

Table 13-19 • DeleteSuitePackage Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

DeleteSuiteRelease Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteSuiteRelease method removes a release from the Advanced UI or Suite/Advanced UI project.

Syntax
DeleteSuiteRelease (SuiteRelease As ISWiSuiteRelease)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SuiteRelease</td>
<td>Pass the ISWiSuiteRelease object that you want to delete.</td>
</tr>
</tbody>
</table>

ForceUpgrade Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ForceUpgrade method upgrades the project from an earlier version of InstallShield to the current version.
**Syntax**
ForceUpgrade (ISWiProjectFile As String)

**Parameters**

**Table 13-21 • ForceUpgrade Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISWiProjectFile</td>
<td>Enter the fully qualified path to the Advanced UI or Suite/Advanced UI project file (.issuite) that you want to upgrade. Include the full file name.</td>
</tr>
</tbody>
</table>

**Applies To**
- ISWiProject

---

**GenerateGUID Method (Advanced UI and Suite/Advanced UI)**

**InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI**

*Project • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

*Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The GenerateGUID method generates a new, unique GUID that is returned as a string.

**Syntax**
GenerateGUID ()

**Applies To**
- ISWiProject

---

**ISWiSuiteEvent Method (Advanced UI and Suite/Advanced UI)**

**InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI**

*Project • This information applies to Suite/Advanced UI projects.*
**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see *Advanced UI Projects vs. Suite/Advanced UI Projects*.

The ISWiSuiteEvent accesses a specific event in the project.

**Syntax**

ISWiSuiteEvent (EventType as ISWiSuiteEventType) as ISWiSuiteEvent
Parameters

Table 13-22 • ISWiSuiteEvent Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Specify the type of event. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• esetOnBegin (0)—The OnBegin event is the first event in a Suite/Advanced UI installation. Actions that are scheduled for this event are executed during all modes (install, maintenance, repair, etc.) unless the conditional statement that is defined for the action evaluates as false.</td>
</tr>
<tr>
<td></td>
<td>• esetOnResuming (1)—The OnResuming event launches its actions when a Suite/Advanced UI installation is resuming after the target machine has been restarted.</td>
</tr>
<tr>
<td></td>
<td>• esetOnStaging (2)—The OnStaging event launches its actions immediately before the Suite/Advanced UI installation is staged; that is, before the Suite/Advanced UI installation downloads its package (if applicable), extracts its packages from the Setup.exe file (if applicable), and copies its packages to a directory that the end user specifies on the BrowseStageFolder wizard page or by setting the ISRootStagePath property through the command line.</td>
</tr>
<tr>
<td></td>
<td>• esetOnStaged (3)—The OnStaged event launches its actions after the Suite/Advanced UI installation has downloaded its packages (if applicable), extracted them from the Setup.exe file, and copied them to the staging directory.</td>
</tr>
<tr>
<td></td>
<td>• esetOnPackagesConfiguring (4)—The OnPackagesConfiguring event launches its actions immediately before the packages in the Suite/Advanced UI installation are being installed, modified, repaired, or removed.</td>
</tr>
<tr>
<td></td>
<td>• esetOnPackagesConfigured (5)—The OnPackagesConfigured event launches its actions when the packages in the Suite/Advanced UI installation have been installed, modified, repaired, or removed.</td>
</tr>
<tr>
<td>Type (cont.)</td>
<td>• esetOnRebooting (6)—The OnRebooting event launches its actions immediately before the Suite/Advanced UI installation triggers a restart of the machine.</td>
</tr>
<tr>
<td></td>
<td>• esetOnEnd (7)—The OnEnd event launches its actions immediately before the end of a successful Suite/Advanced UI installation. If the end user cancels the Suite/Advanced UI installation or the installation encounters an error, the OnEnd event does not run.</td>
</tr>
<tr>
<td></td>
<td>• esetOnPackageConfiguring (8)—This event launches the actions that the Suite/Advanced UI installation should launch before installing, removing, repairing, or modifying a package.</td>
</tr>
<tr>
<td></td>
<td>• esetOnPackageConfigured (9)—This event launches the actions that the Suite/Advanced UI installation should launch after installing, removing, repairing, or modifying a package.</td>
</tr>
</tbody>
</table>

For more information, see Types of Events in a Suite/Advanced UI Installation.

Applies To
OpenProject Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

To open your Advanced UI or Suite/Advanced UI project so that you can modify it through the automation interface, call OpenProject with the fully qualified path to your .issuite file. This method is equivalent to loading a project in InstallShield.

Note • The OpenProject method fails if the project is open in InstallShield.

Syntax

OpenProject (strISWiProjectFile As String, Optional ByVal bReadOnly As Boolean) As Long

Parameters

Table 13-23 • OpenProject Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strISWiProjectFile</td>
<td>Enter the fully qualified path to the project file (.issuite).</td>
</tr>
<tr>
<td>bReadOnly</td>
<td>Determines whether the project is opened with write privileges. True opens the project as a read-only file. The default value for this optional parameter is False.</td>
</tr>
</tbody>
</table>

Return Values and Errors

Table 13-24 • OpenProject Method Return Values and Errors

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The project was successfully opened.</td>
</tr>
<tr>
<td>1</td>
<td>The project was opened, but it is locked by some other process.</td>
</tr>
<tr>
<td>2</td>
<td>Attempted to open project for write access, but project opened in read-only mode.</td>
</tr>
</tbody>
</table>
The following Visual Basic lines demonstrate this method:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("ISWiAutoSuiteAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.issuite"
' Modify project here.
pProj.SaveProject
pProj.CloseProject
```

** Applies To **

---

## SaveProject Method (Advanced UI and Suite/Advanced UI)

This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

** Edition **
The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

To save any changes that you have made to your Advanced UI or Suite/Advanced UI project file through the automation interface, call the SaveProject method.

** Syntax **

`SaveProject()`
Return Values and Errors

Table 13-25 • SaveProject Method Values

ISWiLanguage Object (Advanced UI and Suite/Advanced UI)

Support for multilanguage installations is available with InstallShield Premier Edition.

This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiLanguage object represents a language whose string entries are included in the project; it provides access to the translated strings.

To include or exclude languages, use the IsIncluded property on each relevant ISWiLanguage object.
Members

Table 13-26 • ISWiLanguage Object Members

<table>
<thead>

AddStringEntry Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddStringEntry method adds a new string entry to a language.

Syntax

AddStringEntry (StringId) As ISWiStringEntry
Parameters

Table 13-27 • AddStringEntry Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>StringId</td>
<td>Specify the identifier for the string entry.</td>

DeleteStringEntry Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteStringEntry method removes a string entry from the project.

Syntax

DeleteStringEntry (StringEntry As ISWiStringEntry)

Parameters

Table 13-28 • DeleteStringEntry Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>StringEntry</td>
<td>Specify the ISWiStringEntry object that you want to remove from the project.</td>
</tr>
</tbody>
</table>

ISWiPathVariable Object (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

**Project**  •  This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition**  •  The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiPathVariable object represents a path variable that is included in the project. Path variables help make projects’ build paths more portable across machines.

To add or remove path variables, call ISWiProject.AddPathVariable or ISWiProjectDeletePathVariable.

**Important**  •  Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.
Members

</thead>
<tbody>
<tr>
<td>Name</td>
<td>Read-Write String Property</td>
<td>Gets or sets the name of the path variable.</td>
</tr>
<tr>
<td>PathVarType</td>
<td>Read-Write Integer Property</td>
<td>This enumerated integer property gets or sets the type of the path variable. Available values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>epvtPreDefined (1)</code>—Predefined path variables are variables that are set to certain standard Windows directories. These variables cannot be renamed or modified, but they can be used in your installation project to point to predefined directories.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>epvtCustom (2)</code>—Custom path variables are sometimes referred to as <em>standard path variables</em> or <em>user-defined variables</em>. These variable types are defined through InstallShield. These variables do not rely on any outside sources, such as the registry or system paths.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>epvtEnvironment (4)</code>—Environment path variables are based on the values of your system’s environment variables. You can set an environment path variable in your project to an existing environment variable on your machine.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>epvtRegistry (8)</code>—Registry path variables enable you to define your own variables based on the default value of a specified registry key. The registry key must already be present when you set a path variable to the value of the key.</td>
</tr>
<tr>
<td>TestValue</td>
<td>Read-Write String Property</td>
<td>Gets or sets the test value of the path variable.</td>
</tr>
</tbody>
</table>
Chapter 13

Table 13-29 • ISWiPathVariable Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>

<td>Gets or sets the value of the path variable.</td>
</tr>
<tr>
<td></td>
<td>String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Property</td>
<td></td>
</tr>
</tbody>
</table>

**For Standard Path Variables**

For standard variables, enter the directory to which you would like your variable to point.

*Note* • You can also refer to other path variables in the defined value by enclosing the referenced path variable name in angled brackets. For example, if you have a path variable called *MyRoot* with a value of `C:\`, you can refer to it in a path variable definition for another variable, such as *Games*. The actual path for the *Games* variable might be `C:\Programs\GameFiles`, but you can define *Games* as `<MyRoot>\Programs\GameFiles`. However, if you attempt to self-reference a path variable, the literal string is used instead. For example, defining *Games* as `<MyRoot>\Programs\<Games>` actually results in *Games* defined as `C:\Programs\<Games>`.

**Value (cont.)**

**For Registry Path Variables**

Enter the complete registry key, with the final “subkey” being the name of the value whose data contains the folder. For example, define *MyRegVar* as follows:

HKEY_LOCAL_MACHINE\SOFTWARE\TestKey\TestValue

Assume that TestKey has the following subkey and values:

\[HKEY_LOCAL_MACHINE\SOFTWARE\TestKey\]
\@="C:\MyPath1"
"TestValue"="C:\MyPath2"
\[HKEY_LOCAL_MACHINE\Software\TestKey\TestValue\]
\@="C:\MyPath3"

Even though HKEY_LOCAL_MACHINE\SOFTWARE\TestKey has a subkey called *TestValue*, *MyRegVar* points to the value *TestValue*, and the current value will be `C:\MyPath2`. (Note, however, that if a value named *TestValue* does not exist, InstallShield reads the default value (C:\MyPath3) of the subkey HKEY_LOCAL_MACHINE\SOFTWARE\TestKey\TestValue.)

**For Environment Path Variables**

For environment path variables, enter the name of the variable as it appears on the Environment dialog box.

**Applies To**

- ISWiProject
Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiProperty object represents an Advanced UI or Suite/Advanced UI property. You can retrieve a property by specifying an item in the ISWiProperties collection.

ISWiSetupFile Object (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI
The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSetupFile object represents a support file in your project.

To add or remove support files, call ISWiProject.AddSetupFile or ISWiProject.DeleteSetupFile.

**Members**

Table 13-31 • ISWiSetupFile Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Read-only String Property</td>
<td>Gets the name of the support file (without the path).</td>

**ISWiSuiteAction Object (Advanced UI and Suite/Advanced UI)**

*This information applies to Suite/Advanced UI projects.*
The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSuiteAction object represents an action in the Suite/Advanced UI project.

Note that some ISWiSuiteAction properties are applicable to only certain action types.

### Table 13-32 • ISWiSuiteAction Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| **RequireAdminPrivileges** | Read-Only Boolean Property | Gets or sets the value of the Requires Administrative Privileges setting in the Events view. This setting indicates whether this action requires administrative privileges on systems that have Windows Vista or later or Windows Server 2008 or later.  
To learn more, see Minimizing the Number of User Account Control Prompts During Advanced UI and Suite/Advanced UI Installations. |
| **SourcePath**         | Read-Write String Property | Gets or sets the source path to the PowerShell script (.ps1) that you want to use for your action.  
If the file is not present on target systems at run time, and if none of the packages in your Suite/Advanced UI installation are going to install it, you can reference a file that is included in your project as a support file. At run time, the file is available on the target system only during your product’s installation process.  
Instead of hard-coding a location, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value. |
| **TargetFile**         | Read-Write String Property | Gets or sets the run-time path to the file that you want to use for your action.  
If the file is not present on target systems at run time, and if none of the packages in your Suite/Advanced UI installation are going to install it, you can reference a file that is included in your project as a support file. At run time, the file is available on the target system only during your product’s installation process. |
| **Type**               | Read-Only Integer Property | Gets the type of action. Available value are:  
- esatDll (1) — Calls a function in a DLL file.  
- esatPowerShell (2) — Runs a PowerShell script to perform system configuration tasks.  
- esatExe (4) — Launches an executable file.  
- esatSetProperty (16) — Sets a Suite/Advanced UI property.  
- esatScript (32) — Runs InstallScript code.  
- esatClr (64) — Calls a public method in a managed assembly. |

<tbody>
<tr>
<td>Verb</td>
<td>Read-Write</td>
<td><strong>Note</strong> <em>This property applies to .exe actions.</em> Gets or sets the verb that should be used with the selected action’s file. If you leave this property blank, the verb that is the default one on the target system for this file is used. If the default verb is not available, the open verb is used. If neither verb is available, the first verb that is listed in the registry is used. The use of the runas verb is not recommended. If the action requires administrative privileges, select True for the action’s RequireAdminPrivileges property. For more information, see Minimizing the Number of User Account Control Prompts During Advanced UI and Suite/Advanced UI Installations.</td>
</tr>
</tbody>
</table>
| WaitForExit| Read-Write    | **Note** *This property applies to .exe actions.* Gets or sets the value of the Wait for Exit setting in the Events view. This setting is where you indicate whether you want the installation to wait for the action to complete before proceeding with the next part of the installation. Available options are:  
- **True**—The installation waits for the action to complete before resuming. This is the default option.  
- **False**—The installation runs the action simultaneously as the next part of the installation proceeds.  
If you select True for this setting, you can use the IgnoreCode, AbortCode, RebootCode, and CancelCode properties to specify the various codes that the action may return. |
A reference to the scheduling of an action during a Suite/Advanced UI event. You can schedule an action multiple times—even in a single event.

To schedule actions, call ISWiSuiteEvent.AddSuiteActionRef. To remove the references to the scheduling of actions, call ISWiSuiteEvent.DeleteSuiteActionRef.

### ISWiSuiteActionRef Object (Advanced UI and Suite/Advanced UI)

*InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI*

*Project* • This information applies to Suite/Advanced UI projects.

*Edition* • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSuiteActionRef object represents a reference to the scheduling of an action during a Suite/Advanced UI event. You can schedule an action multiple times—even in a single event.

To schedule actions, call ISWiSuiteEvent.AddSuiteActionRef. To remove the references to the scheduling of actions, call ISWiSuiteEvent.DeleteSuiteActionRef.

ISWiSuiteCondition Object (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:

• Advanced UI
• Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSuiteCondition object represents the following types of conditions:

• Exit condition (used for the Condition property of the ISWiSuiteExitCondition object)
• Feature condition (used for the Condition property of the ISWiSuiteFeature object)
• Detection condition (used for the DetectionCondition property of the ISWiSuitePackage object)
• Eligibility condition (used for the EligibleCondition property of the ISWiSuitePackage object)

The ISWiSuiteCondition object can also exist in the Conditions collection of an All, Any, or None condition group.

To add or remove conditions from a condition group, call AddCondition, AddGroup, AddExtensionCondition, or DeleteCondition.

<tr>
<td></td>
<td></td>
<td>• esctExtension (21)—An extension condition uses a C/C++ DLL that you created to implement your own custom condition that checks target systems for factors that the other types of condition checks do not evaluate.</td>
</tr>
</tbody>
</table>

To identify group conditions, use the following:
```
pCondition.Type < 10
```
AddCondition Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

- **Project** • This information applies to the following project types:
  - Advanced UI
  - Suite/Advanced UI

- **Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

  The AddCondition method adds a condition to a condition group.

  To add an extension condition to a condition group, use the AddExtensionCondition method.

**Syntax**

AddCondition (ConditionCheckName As String) As ISWiSuiteCondition
## Parameters

### Table 13-36 • AddCondition Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConditionCheckName</td>
<td>Specify the name of the type of condition check. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Platform</strong>—Check target systems for one or more characteristics such as the operating system version, the architecture, and other platform details on target systems. For descriptions of each of the settings that are displayed for this type of condition check, see Platform Condition Settings.</td>
</tr>
<tr>
<td></td>
<td>• <strong>FileExists</strong>—Check target systems for the presence of a particular file. For descriptions of each of the settings that are displayed for this type of condition check, see File Exists Condition Settings.</td>
</tr>
<tr>
<td></td>
<td>• <strong>FileVersion</strong>—Check target systems for specific information—date, version number, or content—for a particular file. For descriptions of each of the settings that are displayed for this type of condition check, see File Comparison Condition Settings.</td>
</tr>
<tr>
<td></td>
<td>• <strong>RegistryExists</strong>—Check target systems for the presence of a particular registry key, and optionally a specific value name. For descriptions of each of the settings that are displayed for this type of condition check, see Registry Exists Condition Settings.</td>
</tr>
<tr>
<td></td>
<td>• <strong>RegistryValue</strong>—Check target systems for specific information—DWORD, QWORD, string, multistring, file version, or product version—for a particular registry entry. If you do not specify a value name, the default value for the key that you specify is used for the comparison. For descriptions of each of the settings that are displayed for this type of condition check, see Registry Comparison Condition Settings.</td>
</tr>
<tr>
<td></td>
<td>• <strong>PropertyValue</strong>—Check the value of a particular built-in Advanced UI or Suite/Advanced UI property, or a property that is defined in the Property Manager view. For descriptions of each of the settings that are displayed for this type of condition check, see Property Comparison Condition Settings.</td>
</tr>
<tr>
<td></td>
<td>• <strong>MsiInstalled</strong>—Check target systems for the presence of a product that was installed by a particular .msi package. For descriptions of each of the settings that are displayed for this type of condition check, see MSI Package Condition Settings.</td>
</tr>
<tr>
<td></td>
<td>• <strong>MsiRelated</strong>—Check target systems for the presence of a version of a product that you want to update, or for the presence of future versions of a product that you do not want to downgrade. In either case, the product whose presence is being checked is installed by an .msi package. For descriptions of each of the settings that are displayed for this type of condition check, see MSI Upgrade Condition Settings.</td>

---

Table 13-36 • AddCondition Method Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| ConditionCheckName (cont.) | • ParcelRef—Check whether a different package or a feature in the Advanced UI or Suite/Advanced UI installation is eligible for installation on a target system. For example, if a patch package is eligible for installation only if the base package is eligible for installation, you can create an Eligible Package condition to tie the patch’s eligibility to the base package’s eligibility. For descriptions of each of the settings that are displayed for this type of condition check, see Eligible Package Condition Setting.  
  • IspInstalled—Check target systems for the presence of a product that was installed by a particular InstallScript package. For descriptions of each of the settings that are displayed for this type of condition check, see InstallScript Package Condition Settings.  
  • Locale—Match one or more locale-related settings on target systems. For descriptions of each of the settings that are displayed for this type of condition check, see Locale Condition Settings.  
  • SuiteInstalled—Check whether a particular version of an Advanced UI or Suite/Advanced UI installation is already installed on a target system. For descriptions of each of the settings that are displayed for this type of condition check, see Suite Installed Condition Settings.  
  • AppxInstalled—Check target systems for the presence of a particular Windows App. For descriptions of each of the settings that are displayed for this type of condition check, see Windows App Package Condition Settings.  
  • ParcelAction—Check the target state of a particular package in the Suite/Advanced UI installation. This type of condition is available only for actions that are associated with an event in the Events view or Packages view. For descriptions of each of the settings that are displayed for this type of condition check, see Package Operation Condition Settings.  
  • FeatureAction—Check the target state of a particular feature in the Suite/Advanced UI installation. This type of condition is available only for actions that are associated with an event in the Events view or Packages view. For descriptions of each of the settings that are displayed for this type of condition check, see Feature Operation Condition Settings. |

---

Project • The ParcelAction and FeatureAction type of conditions are available in Suite/Advanced UI projects.
AddExtensionCondition Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddExtensionCondition method adds an extension condition to a condition group.

Syntax

AddExtensionCondition (ConditionCheckName As String, Resource as String) As ISWiSuiteCondition

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConditionCheckName</td>
<td>Specify the name of the condition; this is part of the name of the DLL entry points.</td>
</tr>
<tr>
<td>Resource</td>
<td>Specify the name of the DLL file. For the other types of built-in conditions.</td>
</tr>
</tbody>
</table>

Applies To

### ChangeGroupType Method (Advanced UI and Suite/Advanced UI)

**InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI**

**Project** • *This information applies to the following project types:*

---
• Advanced UI
• Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ChangeGroupType method changes the All, Any, or None operator in a condition group.

Syntax

ChangeGroupType (GroupType As ISWiSuiteConditionType)

Parameters

Table 13-40 • ChangeGroupType Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GroupType</td>
<td>Specify the operator that you want to use for a condition group. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• esctAll (0)—An All condition group operates like a logical AND operation. All of the conditions that are in the All group must evaluate to true in order for the condition group to evaluate to true.</td>
</tr>
<tr>
<td></td>
<td>• esctAny (1)—An Any condition group operates like a logical OR operation. If any of the conditions that are in the Any group evaluate to true, the entire condition group evaluates to true. If none of the conditions that are in the Any group evaluate to true, the entire condition group evaluates to false.</td>
</tr>
<tr>
<td></td>
<td>• esctNone (2)—A None condition group operates like a logical NOR operation. If none of the conditions that are in the None group evaluate to true, the entire condition group evaluates to true. If any of the conditions that are in the None condition group evaluate to true, the entire condition group evaluates to false. Note that if the None condition group consists of only one conditional statement, it operates like a logical NOT operation.</td>
</tr>
</tbody>
</table>

ISWiSuiteConditionParameter Object (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:

• Advanced UI
• Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSuiteConditionParameter object represents a parameter for a condition check. It is the equivalent of the value that is configured in a condition subsetting for a conditional statement. You can retrieve a parameter value by specifying an item in the ISWiSuiteConditionParameters collection.

The ISWiSuiteConditionParameters collection contains all of the available parameters for built-in conditions. To add or remove parameters for an extension condition, call ISWiSuiteCondition.AddParameter or ISWiSuiteCondition.DeleteParameter.

ISWiSuiteDFLFilter Object (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSuiteDFLFilter object represents a filter for a dynamic link that includes additional files that a package in an Advanced UI or Suite/Advanced UI project requires.
Members

Table 13-45 • ISWiSuiteDFLFilter Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CanMove</td>
<td>Method</td>
<td>Indicates whether a filter can move up or down in the filter criteria; the result is returned as a Boolean value.</td>
</tr>
<tr>

<td>Collection</td>
<td>Contains all of the filters that are associated with a dynamic link for the additional files that a package requires.</td>
</tr>
<tr>
<td>MoveDown</td>
<td>Method</td>
<td>Moves a filter down below the filter that follows it.</td>
</tr>
<tr>
<td>MoveUp</td>
<td>Method</td>
<td>Moves a filter up above its preceding filter.</td>
</tr>
</tbody>
</table>
| Pattern      | Read-Write String Property | Specify the name of the dynamic folder whose files you want to include or exclude in your dynamic link, or specify the name of a dynamic file that you want to include in your dynamic link. To include all .htm files, you could enter *.htm in an Include File setting. To refer to the root folder (the one that contains the package file) in a path, use a dot and a backslash: .\
For example, to refer to a ReadMe.txt file in a subfolder called MyDirectory, where MyDirectory is a subfolder of the folder that contains the package, you could use the following filter: .\MyDirectory\ReadMe.txt
For more information, including background on how InstallShield determines which files and folders to include in and exclude from the release, see Defining Filters for a Dynamically Linked Folder in an Advanced UI or Suite/Advanced UI Project. |

Applies To

- ISWiSuiteDynamicFileLink

CanMove Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI
Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The CanMove method indicates whether a filter can move up or down in the filter criteria; the result is returned as a Boolean value.

Syntax

CanMove (Direction As ISWiDirection)

Parameters

Table 13-46 • CanMove Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direction</td>
<td>Specify one of the following ISWiDirection values to check whether it is possible to move the filter in this direction within the list of filter criteria:</td>
</tr>

ISWiSuiteFeature Object (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSuiteFeature object represents a root-level feature or a subfeature in an Advanced UI or Suite/Advanced UI project. You can retrieve a feature by specifying an item in the ISWiSuiteFeatures collection.
## Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AddCondition</td>
<td>Method</td>
<td>Adds a condition to a feature without a condition.</td>
</tr>
<tr>
<td>AddSuiteSubFeature</td>
<td>Method</td>
<td>Adds a subfeature to an existing feature.</td>
</tr>
<tr>
<td>AllowSelectionChange</td>
<td>Read-Write</td>
<td>Gets or sets the value of the Allow UI Selection Change setting for the feature. This setting indicates whether end users should be allowed to select or deselect the feature on the InstallationFeatures wizard page.</td>
</tr>
<tr>
<td>AttachPackage</td>
<td>Method</td>
<td>Associates a package in the project with a feature.</td>
</tr>
<tr>
<td>Condition</td>
<td>Read-only</td>
<td>This property accesses the ISWiSuiteCondition object.</td>
</tr>
<tr>
<td></td>
<td>Object</td>
<td>Gets the feature’s condition, if one is associated with the feature.</td>
</tr>
<tr>
<td>Cost</td>
<td>Read-Write</td>
<td>Gets or sets how much space (in bytes) that the feature requires on the target system.</td>
</tr>
<tr>
<td>DeleteCondition</td>
<td>Method</td>
<td>Removes a condition from a feature.</td>
</tr>
<tr>
<td>DeleteSubSuiteFeature</td>
<td>Method</td>
<td>Removes a subfeature from a feature.</td>
</tr>
<tr>
<td>Description</td>
<td>Read-Write</td>
<td>Gets or sets the description for this feature.</td>
</tr>
<tr>
<td></td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>DisplayName</td>
<td>Read-Write</td>
<td>Gets or sets the name of the feature.</td>
</tr>
</tbody>
</table>
Example

The following VBScript lines display information about a feature. Since feature can include subfeatures, the script is implemented recursively.

```vbnet
Sub WriteFeature(indent, f)
    out.WriteLine indent & f.DisplayName & " (" & f.Name & ")"
    out.WriteLine indent & "  Release Flags:" & f.ReleaseFlags
    If f.Visible Then out.WriteLine indent & "  Visible"
    If Not f.AllowSelectionChange Then out.WriteLine indent & "  Disabled"
```

**ISWiSuiteOperation Object (Advanced UI and Suite/Advanced UI)**

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSuiteOperation object represents an operation on a package.

Note that some ISWiSuiteOperation items are not applicable to all types of Advanced UI or Suite/Advanced UI package files.
## Members

**Table 13-67 • ISWiSuiteOperation Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Type of Package File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CmdLine</td>
<td>Read-Write</td>
<td>.msi, .msp, .exe, InstallScript, Basic MSI project, InstallScript project</td>
<td>If applicable, gets or sets the command line that should be used to launch the target file whenever the Advanced UI or Suite/Advanced UI installation is running with a user interface. Do not include the name of the file in this property. The value of this property can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time. For more information, including valid types of entries for this property, see Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation.</td>
</tr>
<tr>

<td>Read-Write</td>
<td>Support varies</td>
<td>Gets or sets a value to indicate whether an operation for a package is enabled.</td>
</tr>
</tbody>
</table>
ExitBehavior

The ExitBehavior property indicates the behavior that should occur if one or more of the detection conditions still indicate that the package needs to be launched. Available options are:

- `epseDetectPrompt (0)` — Ask whether to continue the setup.
  The Advanced UI or Suite/Advanced UI installation displays a message box that prompts the end user to specify whether the Advanced UI or Suite/Advanced UI installation should continue.
- `epseDetectAbort (1)` — Abort the setup.
  The Advanced UI or Suite/Advanced UI installation ends without proceeding further.
- `epseDetectIgnore (2)` — Continue the setup.
  The Advanced UI or Suite/Advanced UI installation essentially ignores the executable file’s unmet condition and proceeds to the next package in the installation (if one is required).

ForceApplicationShutdow

If the selected sideloading app package (or any package that depends on this package) is in use at installation run time, you can require that the processes that are associated with the package are forced to shut down so that registration can proceed. Use this property to indicate whether you want to force application shutdown in that scenario.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Type of Package File</th>
<th>Description</th>
</tr>
</thead>
</table>
| ExitBehavior       | Read-Write | .exe                 | If a detection condition is still not met on a target system after the package has been run, either one of the following may be true:  
  - The executable file package was not run successfully.  
  - The detection conditions that were specified for the package were not accurate.  
  For example, a detection condition may indicate that the executable file needs to be launched if a particular file does not exist on the target system. If the file is still missing even after the Advanced UI or Suite/Advanced UI installation has run the executable file package, it is possible that the condition was created erroneously.  
  The ExitBehavior property indicates the behavior that should occur if one or more of the detection conditions still indicate that the package needs to be launched. Available options are:  
  - `epseDetectPrompt (0)` — Ask whether to continue the setup.  
    The Advanced UI or Suite/Advanced UI installation displays a message box that prompts the end user to specify whether the Advanced UI or Suite/Advanced UI installation should continue.  
  - `epseDetectAbort (1)` — Abort the setup.  
    The Advanced UI or Suite/Advanced UI installation ends without proceeding further.  
  - `epseDetectIgnore (2)` — Continue the setup.  
    The Advanced UI or Suite/Advanced UI installation essentially ignores the executable file’s unmet condition and proceeds to the next package in the installation (if one is required). |
| ForceApplicationShutdow | Read-Write | .appx                | If the selected sideloading app package (or any package that depends on this package) is in use at installation run time, you can require that the processes that are associated with the package are forced to shut down so that registration can proceed. Use this property to indicate whether you want to force application shutdown in that scenario. |
If the selected package requires that the target system be restarted after the product is installed, this property gets or sets one or more return codes. If multiple return codes exist, each one separated by a comma.

For more information on Advanced UI or Suite/Advanced UI packages that require a restart, see Restarting a Target System for an Advanced UI or Suite/Advanced UI Package.

The RebootRequest property indicates the behavior that should occur if the package requires that a target system be restarted. Available options are:

- **epsrDetectExit (1)**—Allow the machine to reboot.
- **epsrDetectReboot (2)**—Prompt, then exit or reboot the machine.
- **epsrDetectIgnore (4)**—Ignore the reboot request.
- **epsrAlwaysRebootPrompt (8)**—Always prompt, then exit or reboot the machine.
- **epsrAlwaysRebootSilent (16)**—Always reboot the machine.
- **epsrDetectDelay (32)**—Delay the prompt, then exit or reboot the machine.

</tbody>
</table>
The ISWiSuitePackage object represents a package or a Windows Installer transaction that is included in an Advanced UI or Suite/Advanced UI project.

To add or remove packages and transactions, call ISWiProject.AddSuitePackage or ISWiProject.DeleteSuitePackage.

---

**Important** • Note that some ISWiSuitePackage items are not applicable to all types of Advanced UI or Suite/Advanced UI package files. Use the PackageType property to determine the package type. If one of the other ISWiSuitePackage properties returns an empty value, that property is not applicable to that package type.

Also note that the Advanced UI project type, which is available in the Professional edition of InstallShield, does not have support for most of the types of package files; the only ones that it does support are .msi, msp, and InstallScript packages.
### Members

</tr>
</tbody>
</table>
CachePath
Read-Write String Property
Gets or sets where the cached package and other package files should be stored on the end user’s system. You can enter a hard-coded value such as C:\CachedFiles, but it is recommended that you use a destination property for the path. The default value is as follows:

\[\text{LocalAppDataFolder}\text{\textbackslash}\text{Downloaded Installations}\]

The Setup.exe tab in the Releases view lets you specify whether you want to cache the packages on target systems for any packages that are run on target systems and that have a cache path defined. If you are building an uncompressed release, you may want to avoid caching packages on the target system.

The value of this property can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time.

---

CerFile
Read-Write String Property
Gets or sets the .cer file that you are using in your sideloading package.

The versions of Windows that support Windows App packages do not install a sideloading Windows App package unless they trust the source of the package. If you are using a custom certificate, such as the one that is generated in Visual Studio, the Suite/Advanced UI installation can make Windows trust the source of your package by adding the custom certificate to the certificate store of target systems.

</tbody>
</table>
IsPrimary

**Boolean Property**

- **.msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project**

- **Project** - In Suite/Advanced UI projects, this property is available for edit. In Advanced UI projects, this setting is read-only, since an Advanced UI project has support for only one primary package.

- **Edition** - The Suite/Advanced UI project type is available in the Premier edition of InstallShield.

- **Description**

  Gets or sets the Package Type setting for a package in the Packages view. This setting identifies whether the presence of this package on the target system should influence whether the Suite/Advanced UI installation runs in first-time-installation mode or maintenance mode.

  Available options for this property are:

  - **True** — The selected package is a primary package; that is, a main part of the Advanced UI or Suite/Advanced UI installation.

    At run time, if all of the primary packages in the installation are absent from the target system, the installation runs as a first-time installation. If any of the primary packages are present on the target system, the installation runs in maintenance mode.

  - **False** — The selected package is a dependency package; that is, it should not be a factor in determining which mode is used to run the Advanced UI or Suite/Advanced UI installation.

</tr>
</tbody>
</table>
### Table 13-68 • ISWISuitePackage Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Type of Package File</th>
<th>Description</th>
</tr>
</thead>
</table>
| ParcelType  | Read-Write String Property | .msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project | In Suite/Advanced UI projects, this property is available for edit. In Advanced UI projects, this property is read-only, since an Advanced UI project has support for only one primary package. Gets the type of package that identifies whether the presence of this package on the target system should influence whether the Suite/Advanced UI installation runs in first-time-installation mode or maintenance mode. Available options for this setting are:

- **esplitPrimary (0)** — The selected package is a main part of the Advanced UI or Suite/Advanced UI installation. At run time, if all of the primary packages in the installation are absent from the target system, the installation runs as a first-time installation. If any of the primary packages are present on the target system, the installation runs in maintenance mode.

- **esplitDependency (1)** — The selected package should not be a factor in determining which mode is used to run the Advanced UI or Suite/Advanced UI installation.

For more information, see Primary Packages vs. Dependency Packages in Advanced UI and Suite/Advanced UI Projects. |
ProgressCapture
String Property
.msi, .msp, Basic MSI project

Gets or sets the value of the Status Messages Reporting setting in the Packages view. This setting indicates what sort of status messages are available for displaying in the user interface of the Advanced UI or Suite/Advanced UI installation. Available options are:

- `epsptCaptureFull (3)`—Action text. The Advanced UI or Suite/Advanced UI installation’s status messages include the action text from the standard actions and custom actions in the package.

- `epsptCaptureFullVerbose (4)`—Action text and action data. The Advanced UI or Suite/Advanced UI installation’s status messages include the action text as well as action data from the standard actions and custom actions in the package.

At run time, the Advanced UI or Suite/Advanced UI installation updates the ISParcelStatus property with the action text and, if applicable, the action data in the ISParcelStatus property, which is displayed on the InstallationProgress wizard page of the Advanced UI or Suite/Advanced UI installation by default.

For example, when the InstallFiles action in an .msi package is executing, the ISParcelStatus property is updated with the action text “Copying new files” to inform end users about the current progress of the installation. If you choose to include action data in the status messages, the ISParcelStatus property may also be updated with action data such as the name, directory, and size of each file as it is being installed on the target system.

- **epsutNone (0)**—None. The Advanced UI or Suite/Advanced UI installation launches the package without running it in minor upgrade mode. That is, the Advanced UI or Suite/Advanced UI installation does not set the REINSTALL or REINSTALLMODE properties for the package.

- **epsutAuto (1)**—Automatic. The Advanced UI or Suite/Advanced UI installation launches the package in upgrade mode by setting the REINSTALL property to ALL and the REINSTALLMODE property to vomus. It does not inform the end user that the product will be upgraded.

- **epsutPrompt (2)**—Ask the user. The Advanced UI or Suite/Advanced UI installation displays a secondary window that asks the end user whether they want to continue. If the end user chooses to continue, the Advanced UI or Suite/Advanced UI installation launches the package in upgrade mode. If the end user chooses to not continue, the package does not run.
The following VBScript lines demonstrate how to display information about a package in a project. Windows Installer transactions can contain multiple packages, so the script is implemented recursively.

Sub WritePackage(indent, p)
    If p.PackageType = -1 Then ' Transaction
        out.WriteLine indent & "Transaction:
        For Each sp In p.ISWiSuitePackages
            WritePackage indent & "  ", sp
        Next
    Else
        out.WriteLine indent & IDS(p.DisplayName) & " (" & p.Name & ")"
        out.WriteLine indent & "Type: " & p.PackageType
        out.WriteLine indent & "Description: " & p.Description
        out.WriteLine indent & "Shared: " & p.SharedPackage
        out.WriteLine indent & "Release Flags: " & p.ReleaseFlags
        out.WriteLine indent & "Files:
        WriteFolder indent & "  ", p.RootFolder
    End If
End Sub

Example

The following VBScript lines demonstrate how to display information about a package in a project. Windows Installer transactions can contain multiple packages, so the script is implemented recursively.

Sub WritePackage(indent, p)
    If p.PackageType = -1 Then ' Transaction
        out.WriteLine indent & "Transaction:
        For Each sp In p.ISWiSuitePackages
            WritePackage indent & "  ", sp
        Next
    Else
        out.WriteLine indent & IDS(p.DisplayName) & " (" & p.Name & ")"
        out.WriteLine indent & "Type: " & p.PackageType
        out.WriteLine indent & "Description: " & p.Description
        out.WriteLine indent & "Shared: " & p.SharedPackage
        out.WriteLine indent & "Release Flags: " & p.ReleaseFlags
        out.WriteLine indent & "Files:
        WriteFolder indent & "  ", p.RootFolder
    End If
End Sub

</tr>
</tbody>
</table>

Project • This is available in Suite/Advanced UI projects.

Edition • The Suite/Advanced UI project type is available in the Premier edition of InstallShield.

Gets or sets a semicolon-delimited list of one or more Windows roles and features that the selected package requires be enabled on target systems that have Windows Vista or later or Windows Server 2008 or later.

The names of the roles and features should be the string that tools such as Deployment Image Servicing and Management (DISM.exe) and Package Manager (Pkgmgr.exe) use to identify the role or feature on a particular version of Windows. For a list of available Windows roles and features on each version of Windows for which you are supporting, see Microsoft TechNet.

At run time, if this package is eligible to be installed and it requires one or more Windows roles and features that are disabled, the Suite/Advanced UI installation enables them before launching the package.

For more information, see Enabling Windows Roles and Features During a Suite/Advanced UI Installation.

AddDetectCondition Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddDetectCondition method adds a detection condition to a package in an Advanced UI or Suite/Advanced UI project.

The detection condition is a condition that the Advanced UI or Suite/Advanced UI installation should use to evaluate whether the package is already installed on target systems. If this does not change from false to true (or from true to false) at run time, the Advanced UI or Suite/Advanced UI installation assumes that the package failed to install (or remove) its payload. In addition, subsequent maintenance and remove operations (or subsequent maintenance and install operations) may not behave as expected.

**Syntax**

AddDetectCondition () As ISWiSuiteCondition

**Parameters**

The AddDetectCondition method does not take any parameters.

**Applies To**

- ISWiSuitePackage

**See Also**

Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects
Types of Condition Checks in Advanced UI and Suite/Advanced UI Projects
Creating a Custom Condition for an Advanced UI or Suite/Advanced UI Installation
AddEligibleCondition Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddEligibleConditionPackage method adds an eligibility condition to a package in an Advanced UI or Suite/Advanced UI project.

The eligibility condition is a condition that the Advanced UI or Suite/Advanced UI installation should use to determine whether the target system meets the requirements that are necessary for the package to be run. For example, if the package should be run only on 64-bit systems, you could set up an x64 platform requirement in a condition; the Advanced UI or Suite/Advanced UI installation would launch the package only on 64-bit systems. You may also want to set up an eligibility condition to prevent end users from being able to install the current package version over a future newer version.

**Syntax**

AddEligibleCondition () As ISWiSuiteCondition

**Parameters**

The AddEligibleConditionPackage method does not take any parameters.

**Applies To**

- ISWiSuitePackage

**See Also**

Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects

Creating a Custom Condition for an Advanced UI or Suite/Advanced UI Installation

AddSuitePackage Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

**Project** • This information applies to Suite/Advanced UI projects.
The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddSuitePackage method adds a package (an .msi package or an .msp patch) to a Windows Installer transaction in the project. It also adds the specified target file and options for adding additional files. Using this method is similar to adding a package to a transaction in the Packages view in InstallShield. You can set the properties of the new package with the ISWiSuitePackage object.

To add other types of packages to the project, see AddSuitePackage Method (Advanced UI and Suite/Advanced UI).

### Syntax

AddSuitePackage (PackageType As ISWiSuitePackageType, TargetFileName As String, AdditionalFiles As ISWiAdditionalFiles) As ISWiSuitePackage

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageType</td>
<td>Specify the type of package that you are adding to the transaction. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• esptMsi (1)—Windows Installer package (.msi)</td>
</tr>
<tr>
<td></td>
<td>• esptMsp (2)—Windows Installer patch (.msp)</td>
</tr>
<tr>
<td>TargetFileName</td>
<td>Specify the file in the package (such as the .msi file) that the Advanced UI or Suite/Advanced UI installation should invoke.</td>
</tr>
<tr>
<td>AdditionalFiles</td>
<td>Specify the type of additional files that you want to add for the package. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• eaftNothing (0)—Add nothing. This package does not need any additional files.</td>
</tr>
<tr>
<td></td>
<td>• eaftAdjacentFiles (1)—Add adjacent files; that is, add the files next to this package.</td>
</tr>
<tr>
<td></td>
<td>• eaftSubFolders (2)—Add files in subfolders; that is, add the files below this package.</td>
</tr>
<tr>
<td></td>
<td>• eaftAdjacentFilesAndSubFolders (3)—Add adjacent files and files in subfolders; that is, add the files next to and below this package.</td>
</tr>
</tbody>
</table>

DeleteCondition Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteCondition method removes a detection or eligibility condition from a package in an Advanced UI or Suite/Advanced UI project.

**Syntax**

DeleteCondition (pCondition As ISWiSuiteCondition)

**Parameters**

**Table 13-70 • DeleteCondition Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pCondition</td>
<td>Specify the ISWiSuiteCondition object for the condition that you want to remove. The ISWiSuiteCondition object that you specify should be the condition object that is returned from the package’s EligibleCondition property or its DetectionCondition property.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiSuitePackage

**See Also**

Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects

Creating a Custom Condition for an Advanced UI or Suite/Advanced UI Installation

MoveDown Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI
Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

If your project has more than one package or transaction, the Packages view lists them in the same order in which the Advanced UI or Suite/Advanced UI installation launches them at run time. The MoveDown method moves a package or transaction down in the ordered list, below the item that follows it.

Syntax
MoveDown()  

Parameters
The MoveDown method does not take any parameters.

Applies To
• ISWiSuitePackage

MoveUp Method (Advanced UI and Suite/Advanced UI)
Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

If your project has more than one package or transaction, the Packages view lists them in the same order in which the Advanced UI or Suite/Advanced UI installation launches them at run time. The MoveUp method moves a package or transaction up in the ordered list, above the item that precedes it.

Syntax
MoveUp()  

Parameters
The MoveUp method does not take any parameters.

Applies To
• ISWiSuitePackage
ISWiSuiteRelease Object (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

*Note that some edition- and project-specific differences are noted where applicable.*

The ISWiSuiteRelease object represents a release in the Releases view of InstallShield.

To add or remove releases, call ISWiProject.AddSuiteRelease or ISWiProject.DeleteSuiteRelease.
## Members

</thead>
</table>
| DigitalCertificateInfo | Read-Write String Property | Gets or sets the digital certificate that you want to use to sign your release.  
To specify a .pfx certificate on your machine, specify the path and file name.  
To reference a certificate store that contains the certificate, use a string in the following format:  
*Store*StoreLocation:C*ert Subject  
**Store** refers to the name of the certificate store that contains the certificate: Available options are:  
• My  
• Root  
• Trust  
• CA  
**StoreLocation** refers to the location of the certificate store that contains the certificate. Available options are:  
• User  
• Machine  
**Cert Subject** refers to the subject of the certificate. |
| DigitalURL         | Read-Write String Property | Gets or sets the URL that is used in your digital certificate to link to a location that you would like end users to visit to learn more about your product, organization, or company. Use a fully qualified URL—for example, http://www.mydomain.com. |
| EnableLangSelectionDialog | Read-Write Boolean Property | Gets or sets the Languages Dialog setting on the Build tab in the Releases view. This setting lets you specify whether you want your installation to display the language selection wizard page when the installation is run with a full user interface. |
### LauncherPrivileges

This property gets or sets the Required Execution Level setting on the Setup.exe tab in the Releases view. This setting is where you specify the minimum level that is required by your project’s Setup.exe file for running on Windows Vista and later platforms. The available options are:

- **erelAsAdmin** (2) — Setup.exe requires administrative privileges to run. Administrators must authorize it; non-administrators must authenticate as an administrator.
- **erelAsHighestAvail** (1) — Setup.exe prefers administrative privileges. Administrators must authorize it; non-administrators run it without administrative privileges.
- **erelAsInvoker** (0) — Setup.exe does not require administrative privileges, and all users can run it without administrative privileges. Setup.exe does not display any UAC messages prompting for credentials or for consent. This is the default option for Advanced UI and Suite/Advanced UI projects.

InstallShield embeds an application manifest in the Setup.exe launcher. This manifest specifies the selected execution level. Operating systems earlier than Windows Vista ignore the required execution level.

<table>

PreBuildEvent

### Description

This property is available in the Premier edition of InstallShield.

Gets or sets the command that is run before InstallShield starts building the release. This event runs after InstallShield creates the release folder and log file, but before InstallShield starts building the release.

To specify more than one command, enter each command on a separate line in the string. At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.

When you are entering a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see Specifying Commands that Run Before, During, and After Builds.

PreProcessorDefines

### Description

This information applies to Suite/Advanced UI projects.

Gets or sets the preprocessor variable definitions. Preprocessor variable definitions that are specified here apply only to the current release; they are not used when compiling the script for other releases. Use the following format, with no spaces before or after equals signs or commas:

```
MYVARIABLE1=123,MYVARIABLE2
```

Such variables can be tested in the script by `#if` and `#ifdef` statements that control the flow of the script.

Entering the name of a preprocessor variable for this setting defines the variable. For example if you enter `MYVARIABLE` for this setting, the script commands in the following `#ifdef` loop are executed:

```
#ifdef MYVARIABLE
   // Commands
#endif
```

After you add or change a preprocessor variable definition for this setting, you must compile your installation for the addition or change to take effect.

<td>Read-Write String Property</td>
<td>Gets or overrides the product name that was specified in the General Information view with a new value for the selected release. For information on how the product name is used, see Specifying a Product Name.</td>
</tr>
<tr>
<td>ProductVersionOverride</td>
<td>Read-Write String Property</td>
<td>Gets or overrides the product version that was specified in the General Information view with a new value for the selected release. The version must contain only numbers. The version number is typically in the format (aaa.bbb.cc)(ppp) or (aaa.bbb.cc)(ppp).(ddddd), where (aaa) represents the major version number, (bbb) represents the minor version number, (cc)(ppp) represents the build number, and (ddddd) represents the revision number. The maximum value for the (aaa) and (bbb) portions is 255. The maximum value for (cc)(ppp) and (ddddd) is 65,535. Note that although you can include the fourth field (ddddd), the installation does not use this part of the product version to distinguish between different product versions. To learn more, see Specifying the Product Version. The product version that you specify is displayed on the Properties dialog box for Setup.exe. For more information, see Customizing File Properties for the Setup Launcher.</td>
</tr>
<tr>
<td>ReleaseFlags</td>
<td>Read-Write String Property</td>
<td>Gets or sets a string that contains the release flags that you want to use to filter your features. Separate multiple flags with a comma. Release flags enable you to customize your installation by including or excluding certain items in each release. Once you have assigned release flags to features and packages in the Advanced UI or Suite/Advanced UI project, you can create a release that includes features and packages based on those flags. By default, all features and packages are included in a release. Once you specify a flag for the ReleaseFlags property (or for the Release Flags setting on the Build tab in the Releasew view), only unflagged items and items that contain the specified release flag are included in your installation. Note • If a release does not have release flags, it will include all applicable items that have release flags. To include only unflagged items, specify a flag that does not exist. For example, you might use NoFlags. This way, only unflagged items are built into a release.</td>
</tr>
</tbody>
</table>
### SetupExeCompany

**Type**: Read-Write String Property

**Description**: Gets or sets the value to override the default company name for Setup.exe. Note that you must also select a value of True for the UseMyVersionInfo property.

The company name is displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties.

To learn more, see [Customizing File Properties for the Setup Launcher](#).

### SetupExeCopyright

**Type**: Read-Write String Property

**Description**: Gets or sets a custom copyright notice for Setup.exe. Note that you must also select a value of True for the UseMyVersionInfo property.

The copyright is displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties.

To learn more, see [Customizing File Properties for the Setup Launcher](#).

### SetupExeDescription

**Type**: Read-Write String Property

**Description**: Gets or sets a custom file description for Setup.exe. Note that you must also select a value of True for the UseMyVersionInfo property.

The description is displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties.

To learn more, see [Customizing File Properties for the Setup Launcher](#).

### SetupExeVersion

**Type**: Read-Write String Property

**Description**: Gets or sets the value to override the default product version and file version for Setup.exe with your own version number. Note that you must also select a value of True for the UseMyVersionInfo property.

The product version and file version are displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties.

Note that the file version always contains four fields. If you specify fewer than four fields for your product version, the remaining fields are filled with zeros. For example, if you specify a product version of **1.1**, the file version that is used in the version resources of Setup.exe is **1.1.0.0**.

To learn more, see [Customizing File Properties for the Setup Launcher](#).
Table 13-71 • ISWiSuiteRelease Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SetupFileName</td>
<td>Read-Write</td>
<td>Gets or sets the file name—without the .exe file extension—that InstallShield should use for the setup launcher file that it generates at build time. If this setting is blank, InstallShield uses the default value of Setup, and the setup launcher file is called Setup.exe.</td>
</tr>
<tr>
<td>Build64bitSetupExe</td>
<td>Read-Write</td>
<td>Gets or sets the value of the 64-Bit Setup Launcher setting for the current suite release. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>String</td>
<td>• TRUE - to 64-bit Setup Launcher.</td>
</tr>
<tr>
<td></td>
<td>Property</td>
<td>• FALSE - to 32-bit Setup Launcher.</td>
</tr>
<tr>
<td>SetupIcon</td>
<td>Read-Write</td>
<td>Gets or sets the release’s Setup.exe Icon File setting, which specifies the fully qualified name of the file from which the executable file’s icon is taken at build time. If the property’s value is null, a default icon is used.</td>
</tr>
<tr>
<td></td>
<td>String</td>
<td>By default, the icon with index 0 is used; to specify a different icon, add a comma (,) as well as the icon’s index or resource ID (preceded by a minus sign) after the file name. For example, C:</td>
</tr>
<tr>
<td></td>
<td>Property</td>
<td>Instead of hard-coding a path, you can use a path variable that is defined in the Path Variables view or part of the ISWiPathVariables collection. At build time, InstallShield replaces the path variable with the appropriate value.</td>
</tr>
<tr>
<td>SignatureDescription</td>
<td>Read-Write</td>
<td>Gets or sets the signature description for the Setup.exe file. The description that you specify is displayed on the User Account Control (UAC) box to the right of the “Program Name:” label. The UAC dialog box opens when an end user launches the signed file and elevated privileges are required.</td>
</tr>
<tr>
<td></td>
<td>String</td>
<td>If you leave this setting blank, InstallShield uses the name of the file without its extension as the description to the right of the “Program Name:” label on the UAC dialog box.</td>
</tr>
<tr>
<td></td>
<td>Property</td>
<td></td>
</tr>
<tr>
<td>SignEnabled</td>
<td>Read-Write</td>
<td>Gets or sets the Sign Setup.exe setting on the Signing tab in the Releases view. This setting lets you indicate whether you want to sign the Advanced UI or Suite/Advanced UI installation.</td>
</tr>
<tr>
<td>SuiteGuidOverride</td>
<td>Read-Write</td>
<td>Gets or overrides the GUID that uniquely identifies the Advanced UI or Suite/Advanced UI installation.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>UILanguages</td>
<td>Read-Write String Property</td>
<td>Gets or sets a comma-delimited string of decimal language identifiers of the user interface languages that are included in a release. Note that if a language is not selected in the Setup Languages setting in the General Information view of the project, it is not a valid language for the UILanguages property.</td>
</tr>
<tr>
<td>UpdateUrl</td>
<td>Read-Write String Property</td>
<td>If you may want to make updates for your Advanced UI or Suite/Advanced UI setup launcher available for download when they are available, use this property to specify the absolute path, including the file name, for an updated Advanced UI or Suite/Advanced UI setup launcher. This support makes it possible for end users to easily obtain a newer version of your product before installing an earlier version. For more information about updates for your Advanced UI or Suite/Advanced UI installation, including requirements for the update, see Supporting Downloadable Updates for an Advanced UI or Suite/Advanced UI Installation.</td>
</tr>
<tr>
<td>UseMyVersionInfo</td>
<td>Read-Write Boolean Property</td>
<td>Gets or sets the Use Custom Version Properties setting on the Setup.exe tab in the Releases view. This setting lets you specify whether you want to override the default copyright notice and file description for Setup.exe with your own copyright notice and file description. If you specify a value of True, enter your own custom values for the SetupExeCopyright and SetupExeDescription properties. The copyright and description are displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties. To learn more, see Customizing File Properties for the Setup Launcher.</td>
</tr>
<tr>
<td>UsePathVariableTestValues</td>
<td>Read-Write Boolean Property</td>
<td>If you used test values for any of your path variables, set this property to True to set those variables to their actual values at this time.</td>
</tr>
</tbody>
</table>

Build Method (Advanced UI and Suite/Advanced UI)

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

To build a release in an Advanced UI or Suite/Advanced UI project, call the Build method.

Is this method documented correctly? How would someone get status messages?

**Syntax**

Build ()

**Build Status Events**

The ISWiSuiteRelease object uses the following build status events:

- StatusMessage (string Message, ref bool Cancel)
- ProgressMax (int Max, ref bool Cancel)
- ProgressIncrement (int Increment, ref bool Cancel)
- TextCancel (ref bool Cancel)
- GetDotNetLibrary (out object ???)
- WarningMessage (string Message)
- ErrorMessage (string Message)
- IsCancelledByUserAnError (ref bool IsError)
- StatusMessageEx (string Message, object Tag, ref bool Cancel)

These events occur during the build process; they provide status updates. You can set pbCancel to stop the build.

**Applies To**

- ISWiRelease

**See Also**

Using Build Status Events
Automation Collections for Advanced UI and Suite/Advanced UI Projects

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

Each Advanced UI or Suite/Advanced UI automation collection is a set of objects. For example, the ISWiSuiteFeatures collection is a set of ISWiSuiteFeature objects in the current project. This section describes each of the Advanced UI or Suite/Advanced UI automation collections.

ISWiLanguages Collection

InstallShield 2020 » Automation Interface » Advanced UI and Suite/Advanced UI

Edition • Support for multilanguage installations is available with InstallShield Premier Edition.

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiLanguages collection contains all of the languages in the current language.

ISWiSuiteFeatures is a collection that contains every feature (as an ISWiSuiteFeature object) in your project.

When ISWiSuiteFeatures is a member of ISWiProject, it contains all of the root-level features in the project. To retrieve a collection of subfeatures, access the Features property of the ISWiSuiteFeature object. The result is an ISWiSuiteFeatures collection that contains the immediate subfeatures of the current root-level feature. Repeat for further levels of subfeatures.

**Members**

**Table 13-84 • ISWiSuiteFeatures Collection Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiSuiteFeatures collection.</td>
</tr>
</tbody>
</table>
| Item   | Read-Only Property | Provide the index number or name of the feature to retrieve the ISWiSuiteFeature object. For example, the following statements create a copy of the first item in the collection and of the feature named Help_Files:  
Set pFeat1 = m-ISWiProject.ISWiSuiteFeatures.Item(1)  
Set pFeat2 = m-ISWiProject.ISWiSuiteFeatures.Item("Help_Files")  
The name of the feature is case-sensitive—for example, “Help_Files” and “Help_files” are two different features.  
Item is the default property for ISWiSuiteFeatures, which means that the following two lines of code are equivalent:  
m-ISWiProject.ISWiSuiteFeatures.Item("Help_Files")  
m-ISWiProject.ISWiSuiteFeatures("Help_Files"). |

**Applies To**

- ISWiProject

Object Reference for Expressions in Advanced UI and Suite/Advanced UI Projects

InstallShield 2020 » Object Expressions for Advanced UI and Suite/Advanced UI Projects

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

In various settings of Advanced UI and Suite/Advanced UI projects, you can embed object expressions to query target systems for information about a file, a registry entry, or other items. Object expressions use this convention:

```object(Parameters, ...).property(Parameters, ...)```

Each object expression contains a reference to an object, which is a collection of object-specific properties. Objects and properties may contain parameters.

This section of the documentation explains each of the objects that are available for use in object expressions.

Table 13-1 • Objects That Are Available for Object Expressions

<table>
<thead>
<tr>
<th>Object</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feature Object</td>
<td>Check target systems for information about a feature in an Advanced UI or Suite/Advanced UI installation.</td>

Feature Object

InstallShield 2020 » Object Expressions for Advanced UI and Suite/Advanced UI Projects

To create an object expression that checks target systems for information about a feature in an Advanced UI or Suite/Advanced UI installation, use the Feature object. The Feature object has support for properties such as DisplayName, ActionState, and InstalledState.

Syntax

[@Feature(FeatureName).ActionState]
[@Feature(FeatureName).AllowSelectionChange]
[@Feature(FeatureName).Cost]
[@Feature(FeatureName).Description]
[@Feature(FeatureName).DisplayName]
[@Feature(FeatureName).InstalledState]
[@Feature(FeatureName).Visible]

Parameters

One parameter is available for the Feature object.

Table 13-2 • Parameters for the Feature Object

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FeatureName</td>
<td>Specify the name of the feature.</td>
</tr>
</tbody>
</table>

Properties

The following properties are available for the Feature object.

Table 13-3 • Properties for the Feature Object

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActionState</td>
<td>Retrieves the currently set action state of the feature. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>• 0—No action will be taken for the feature.</td>
</tr>
<tr>
<td></td>
<td>• 1—The feature will be installed.</td>
</tr>
<tr>
<td></td>
<td>• 2—The feature will be removed.</td>
</tr>
</tbody>
</table>
### Table 13-3 • Properties for the Feature Object (cont.)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| AllowSelectionChange   | Retrieves a Boolean value that indicates whether end users should be allowed to select or deselect the feature on the InstallationFeatures wizard page. Valid values are:
|                        | - true—End users should be able to select or deselect the feature through the wizard interface. This is the default option.  
|                        | - false—End users should not be able to select or deselect the feature through the wizard interface. If this feature is visible on the InstallationFeatures wizard page, it appears in a read-only state (either selected or deselected, based on other factors, such as the feature’s condition). |
| Cost                   | Retrieves how much space (in bytes) the feature requires on the target system if this value was specified in the Features view. |
| Description            | Retrieves the localized description of the feature. |
| DisplayName            | Retrieves the localized display name of the feature. |
| InstalledState         | Retrieves the installed state of the feature as determined by the package detection states of the packages in the feature. Valid values are:
|                        | - 0—The feature is not currently installed.  
|                        | - 3—The feature is installed. |
| Visible                | Retrieves a Boolean value that indicates whether the feature should be visible on the InstallationFeatures wizard page during installation. |

### Examples

The following examples demonstrate use of the Feature object in object expressions.

### Table 13-4 • Sample Feature Object Expressions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[@Feature(FeatureABC).ActionState]</td>
<td>Determine whether the Advanced UI or Suite/Advanced UI is installing the FeatureABC feature.</td>
</tr>
<tr>
<td>[@Feature(FeatureABC).Cost]</td>
<td>Determine how much space (in bytes) the feature requires.</td>
</tr>
</tbody>
</table>

File Object

To create an object expression that checks target systems for information about a file during an Advanced UI or Suite/Advanced UI installation, use the File object. The File object has support for properties such as Date and Version.

Syntax

[@File(FilePath,64Bit).Content]
[@File(FilePath,64Bit).Date(Paramater)]
[@File(FilePath,64Bit).Version]

Parameters

The following parameters are available for the File object.

Table 13-5 • Parameters for the File Object

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FilePath</td>
<td>Specify the path to the file. You can use property directory identifiers such as [ProgramFilesFolder].</td>
</tr>
</tbody>
</table>
| 64Bit       | Use this optional Boolean parameter to indicate whether the file is in a 64-bit location, such as in the System32 folder on a 64-bit system. Valid options are:  
|             | • true—Check the 64-bit location.                                           |
|             | • false—Check the 32-bit location.                                          |
|             | If you omit this property, or if or the target system is running a 32-version of Windows, the installation checks the 32-bit location. |

Properties

The following properties are available for the File object.

Table 13-6 • Properties for the File Object

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content</td>
<td>If the file is a text file (for example, .txt, .htm, .xml, .config, .ini, or .sql), retrieves the contents of the file.</td>
</tr>
</tbody>
</table>
**Table 13-6 • Properties for the File Object (cont.)**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Date     | Retrieves the date and time for the file. Optional parameters that are available for this property are:  
  • modified—Retrieves the date and time at which the file was last modified. This is the default parameter.  
  • access—Retrieves the date and time at which the file was last accessed.  
  • create—Retrieves the date and time at which the file was created.  
  
  If you omit a parameter for the Date property, the File object returns the last-modified date. |
| Version  | Retrieves the version of the file. For an unversioned file, this property returns empty. |

**Examples**

The following examples demonstrate use of the File object in object expressions

**Table 13-7 • Sample File Object Expressions**

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[@File([ProgramFilesFolder]MyCompany\MyProduct.exe,false).Date(modified)]</td>
<td>Obtain the last modified date and time for a file called MyProduct.exe.</td>
</tr>
<tr>
<td></td>
<td>On 32-bit target systems, the path may be this:</td>
</tr>
<tr>
<td></td>
<td>\Program Files\MyCompany\MyProduct.exe</td>
</tr>
<tr>
<td></td>
<td>On 64-bit target systems, the path may be this:</td>
</tr>
<tr>
<td></td>
<td>\Program Files (x86)\MyCompany\MyProduct.exe</td>
</tr>
<tr>
<td>[@File([SystemFolder]notepad.exe).Version]</td>
<td>Obtain the version number of notepad.exe in the System32 folder on 32-bit target systems or in the SysWOW64 folder on 64-bit target systems.</td>
</tr>
</tbody>
</table>

Parcel Object

To create an object expression that checks target systems for information about a package in an Advanced UI or Suite/Advanced UI installation, use the Parcel object. The Parcel object has support for properties such as Eligible, ActionState, and DetectedState.

Syntax

```plaintext
[@Parcel(PackageGUID).ActionState]
[@Parcel(PackageGUID).DetectedState]
[@Parcel(PackageGUID).Eligible]
[@Parcel(PackageGUID).ExitCode]
[@Parcel(PackageGUID).Type]
```

Parameters

One parameter is available for the Parcel object.

Table 13-8 • Parameters for the Parcel Object

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageGUID</td>
<td>Specify the GUID of the package.</td>
</tr>
</tbody>
</table>

Properties

The following properties are available for the Parcel object.

Table 13-9 • Properties for the Parcel Object

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActionState</td>
<td>Retrieves the currently set action state of the package. This value may change, depending on when at run time the property is queried. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>• 1—The package will run its install operation.</td>
</tr>
<tr>
<td></td>
<td>• 2—The package will run its modify operation.</td>
</tr>
<tr>
<td></td>
<td>• 3—The package will run its repair operation.</td>
</tr>
<tr>
<td></td>
<td>• 4—The package will run its remove operation.</td>
</tr>
<tr>
<td></td>
<td>• 5—No action will be performed for the package.</td>
</tr>
<tr>
<td>DetectedState</td>
<td>Retrieves the installed state of the package. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>• 0—The package is not installed.</td>
</tr>
<tr>
<td></td>
<td>• 1—The package is currently installed.</td>
</tr>
</tbody>
</table>
Chapter 13
Object Reference for Expressions in Advanced UI and Suite/Advanced UI Projects

Examples
The following examples demonstrate use of the Parcel object in object expressions.

Table 13-10 • Sample Parcel Object Expressions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[@Parcel(0F283EC0-E9D1-4D18-801D-0014F6CA96DF).DetectedState]</td>
<td>Determine whether the referenced package is installed.</td>
</tr>
<tr>
<td>[@Parcel(0F283EC0-E9D1-4D18-801D-0014F6CA96DF).ExitCode]</td>
<td>Obtain the exit code for the package once its scheduled operation has completed.</td>
</tr>
</tbody>
</table>

Platform Object

InstallShield 2020 • Object Expressions for Advanced UI and Suite/Advanced UI Projects

To create an object expression that checks target systems for operating system details during an Advanced UI or Suite/Advanced UI installation, use the Platform object. The Platform object has support for properties such as Architecture, FullVersion, and MajorVersion.
Syntax
[@Platform.Architecture]
[@Platform.BuildNumber]
[@Platform.CSDVersion]
[@Platform.FullVersion]
[@Platform.MajorVersion]
[@Platform.MinorVersion]
[@Platform.ProductType]
[@Platform.ServicePackVersion]
[@Platform.Value]

Parameters
The Platform object does not have any parameters.

Properties
The following properties are available for the Platform object.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Architecture</td>
<td>Retrieves the architecture (x86, x64, IA64, ARM, or Unknown) of the machine on which the Advanced UI or Suite/Advanced UI installation is running.</td>
</tr>
<tr>
<td>BuildNumber</td>
<td>Retrieves the build number version of Windows on the machine on which the Advanced UI or Suite/Advanced UI installation is running. For a list of valid build numbers, see the dwBuildNumber member of the OSVERSIONINFOEX structure that is documented in the MSDN Library.</td>
</tr>
<tr>
<td>CSDVersion</td>
<td>Retrieves the CSD version of Windows on the machine on which the Advanced UI or Suite/Advanced UI installation is running. Service Pack 2 is an example of a CSD version.</td>
</tr>
<tr>
<td>FullVersion</td>
<td>Retrieves the full version number of Windows on the machine on which the Advanced UI or Suite/Advanced UI installation is running. The value is calculated as MajorVersion X 100 + MinorVersion. For example, the version number of Windows 8.1 is 6.3. The FullVersion value on a machine with Windows 8.1 is 603.</td>
</tr>
<tr>
<td>MajorVersion</td>
<td>Retrieves the major version number of Windows on the machine on which the Advanced UI or Suite/Advanced UI installation is running.</td>
</tr>
<tr>
<td>MinorVersion</td>
<td>Retrieves the minor version number of Windows on the machine on which the Advanced UI or Suite/Advanced UI installation is running.</td>
</tr>
</tbody>
</table>
Chapter 13
Object Reference for Expressions in Advanced UI and Suite/Advanced UI Projects

Examples
The following examples demonstrate use of the Platform object in object expressions.

Table 13-12 • Sample Platform Object Expressions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[@Platform.FullVersion]</td>
<td>Obtain the version number of the target system.</td>
</tr>
<tr>
<td>[@Platform.Architecture]</td>
<td>Obtain the architecture of the target system.</td>
</tr>
</tbody>
</table>

Registry Object

InstallShield 2020 » Object Expressions for Advanced UI and Suite/Advanced UI Projects

To create an object expression that checks the registry on target systems during an Advanced UI or Suite/Advanced UI installation, use the Registry object.

Syntax

[@Registry(RegistryPath, 64Bit).KeyValue(DataValueName)]
[@Registry(RegistryPath, 64Bit).Value]
Parameters

The following parameters are available for the Registry object.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RegistryKeyPath</td>
<td>Specify the full path of the registry key that you want to check on target systems. Use the following abbreviations for the root:</td>
</tr>
<tr>
<td></td>
<td>• HKCR</td>
</tr>
<tr>
<td></td>
<td>• HKCU</td>
</tr>
<tr>
<td>64Bit</td>
<td>Use this optional Boolean parameter to indicate whether to check the 64-bit view of the registry. Valid options are:</td>
</tr>
<tr>
<td></td>
<td>• true—Check the 64-bit view of the registry.</td>
</tr>
<tr>
<td></td>
<td>• false—Check the 32-bit view of the registry.</td>
</tr>
</tbody>
</table>

If you omit this property, or if the target system is running a 32-version of Windows, the installation checks the 32-bit view of the registry.

Properties

The following properties are available for the Registry object.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KeyValue</td>
<td>Retrieve the value data of the value that is passed as a parameter for the KeyValue property.</td>
</tr>
<tr>
<td>Value</td>
<td>Retrieve the value data of the registry key’s default value.</td>
</tr>
</tbody>
</table>
Examples

The following examples demonstrate use of the Registry object in object expressions.

Table 13-15 • Sample Registry Object Expressions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[@Registry(HKLM\Software\Microsoft\Windows NT\CurrentVersion, false).KeyValue(RegisteredOwner)]</td>
<td>On 32-bit target systems, obtain the value data of the RegisteredOwner value for the following registry key: HKLM\Software\Microsoft\Windows NT\CurrentVersion. On 64-bit target systems, obtain the value data of the RegisteredOwner value for the following registry key: HKLM\Software\Wow6432Node\Microsoft\Windows NT\CurrentVersion.</td>
</tr>
<tr>
<td>[@Registry(HKLM\Software[COMPANY][PRODUCT], true).Value]</td>
<td>On 32-bit and 64-bit target systems, obtain the value data of the default value for the following registry key: HKLM\Software\My Company Name\My Product Name.</td>
</tr>
<tr>
<td>[@Registry(HKCR\Software\My Company Name\My Product Name, false).KeyValue(MyFile[[]1[]],.exe)]</td>
<td>On 32-bit target systems, obtain the value data of the MyFile[1].exe value for the following registry key: HKCU\Software\My Company Name\My Product Name. On 64-bit target systems, obtain the value data of the MyFile[1].exe value for the following registry key: HKLM\Software\Wow6432Node\My Company Name\My Product Name. To avoid treating the square brackets in the data value name as parameter parse indicators, the square brackets are escaped as shown in the sample expression.</td>
</tr>
</tbody>
</table>

InstallShield Custom Action Reference

InstallShield 2020

This section describes each of the built-in InstallShield custom actions that are added automatically to InstallShield projects to support different functionality.

Windows Logo • If you are applying for the Windows logo, the intended behavior of each custom action in your installation must be documented. This does not apply to custom action types 19 (displays an error, returns failure, and ends the installation), 35 (sets the installation directory), or 51 (sets a property). ISICE10 validates that each custom action is documented.

_serial_verifyCA_isx
Decreases the value of the property SERIALNUMVALRETRYLIMIT by 1.

_serial_verifyCA_isx_helper
Decreases the value of the property SERIALNUMVALRETRYLIMIT by 1.

CheckForProductUpdates
Uses FlexNet Connect to check for product updates.

This custom action launches an executable file called Agent.exe, and it passes the following:

/au[ProductCode] /EndOfInstall

CheckForProductUpdatesOnReboot
Uses FlexNet Connect to check for product updates on reboot.

This custom action launches an executable file called Agent.exe, and it passes the following:

/au[ProductCode] /EndOfInstall /Reboot

DLLWrapCleanup
Standard DLL wrapper that cleans extracted data.

This is a Windows Installer DLL custom action. The name of the DLL file is dllwrap.dll, and its entry point is DLLWrapCleanup.

DLLWrapStartup
Standard DLL wrapper that extracts data that describes calls.

This is a DLL custom action. The name of the DLL file is dllwrap.dll, and its entry point is DLLWrapStartup.

ISChainPackageCommit
Removes extracted files from a multi-package transaction.
**ISChainPackagePrepare**
Prepares and extracts files for a multi-package transaction.

**ISChainPackageRollback**
Removes extracted files from a multi-package transaction.

**ISComponentServiceCosting**
Extracts information from the ISComPlusApplication table and saves it in a temporary file for COM+ applications.
This is a Windows Installer DLL custom action. The name of the DLL file is iscomsrv.dll, and its entry point is ISComponentServiceCosting.

**ISComponentServiceFinalize**
Commits COM+ applications during installation and uninstallation.
This is a Windows Installer DLL custom action. The name of the DLL file is iscomsrv.dll, and its entry point is ISComponentServiceFinalize.

**ISComponentServiceInstall**
Installs COM+ applications during an installation.
This is a DLL custom action. The name of the DLL file is iscomsrv.dll, and its entry point is ISComponentServiceInstall.

**ISComponentServiceRollback**
Rolls back COM+ applications during a failed installation or uninstallation.
This is a DLL custom action. The name of the DLL file is iscomsrv.dll, and its entry point is ISComponentServiceRollback.

**ISComponentServiceUninstall**
Removes COM+ applications during uninstallation.
This is a DLL custom action. The name of the DLL file is iscomsrv.dll, and its entry point is ISComponentServiceUninstall.

**ISIISCleanup**
Removes temporary files and registry entries for an IIS installation.
This is a DLL custom action. The name of the DLL file is IISHelper.dll, and its entry point is ISIISCleanup.

**ISIISCosting**
Creates a list of actions in a temporary file for an IIS installation. Sets the CustomActionData property for other IIS actions.
This is a DLL custom action. The name of the DLL file is IISHelper.dll, and its entry point is ISIISCosting.

**ISIISInstall**
Creates Web sites, applications, virtual directories, and other items for an IIS installation.
This is a DLL custom action. The name of the DLL file is IISHelper.dll, and its entry point is ISIISInstall.
ISIISRollback
Removes Web sites, applications, virtual directories, and other items during rollback for IIS.
This is a DLL custom action. The name of the DLL file is IISHelper.dll and its entry point is ISIISRollback.

ISIISUninstall
Removes Web sites, applications, virtual directories, and other items during uninstallation for IIS.
This is a DLL custom action. The name of the DLL file is IISHelper.dll, and its entry point is ISIISUninstall.

ISInstallPrerequisites
Launches the installation of prerequisites that are associated with features.
This is a DLL custom action. The name of the DLL file is PrqLaunch.dll, and its entry point is InstallPrerequisites.

ISJITCompileActionAtInstall
Precompiles .NET assemblies at installation time.
This custom action launches a Microsoft executable file called ngen.exe.

ISJITCompileActionAtUnInstall
Deletes a precompiled .NET assemblies at uninstallation time.
This custom action launches a Microsoft executable file called ngen.exe.

ISLockPermissionsCost
Sets the CustomActionData property for the ISLockPermissionsInstall action.
This is a DLL custom action. The name of the DLL file is ISLockPermissions.dll, and its entry point is ISLockPermissionsCostAction.

ISLockPermissionsInstall
Sets permissions when the product is installed.
This is a DLL custom action. The name of the DLL file is ISLockPermissions.dll, and its entry point is ISLockPermissionsInstallAction.

ISNetApiInstall
Creates users and groups from an .ini file.
This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetApiInstall.

ISNetApiRollback
Rolls back changes for users and groups.
This is a DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetApiRollback.
**ISNetCreateIniForOneUser**
Extracts operations to a temporary file for users and groups.
This is a DLL custom action called ISNetAPI.dll.

**ISNetDeleteIniFile**
Cleans up temporary files for users and groups.
This is a DLL custom action called ISNetAPI.dll.

**ISNetGetGroups**
Puts groups into a combo box.
This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetGetGroups.

**ISNetGetServers**
Puts a list of servers into a combo box.
This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetGetServers.

**ISNetGetUsers**
Puts a list of users into a combo box.
This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetGetUsers.

**ISNetSetLogonName**
Stores the user, group, and server properties that were entered in the LogonInformation dialogs.
This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetSetLogonName.

**ISNetValidateLogonName**
Verifies that a valid user name, server, and password combination were entered in the LogonInformation dialogs.
This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetValidateLogonName.

**ISNetValidateNewUserInformation**
Stores the user, group, and server properties that were entered in the LogonInformation dialogs.
This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetValidateNewUserInformation.
**ISNetworkSharesCosting**

Extracts information from the ISNetworkShares table and saves it in a temporary file for network sharing.

This is a Windows Installer DLL custom action. The name of the DLL file is ISNetworkShares.dll, and its entry point is ISNetworkSharesCosting.

**ISNetworkSharesFinalize**

Cleans up temporary files for configuring network shares.

This is a Windows Installer DLL custom action. The name of the DLL file is ISNetworkShares.dll, and its entry point is ISNetworkSharesFinalize.

**ISNetworkSharesInstall**

Configures network sharing for one or more folders.

This is a Windows Installer DLL custom action. The name of the DLL file is ISNetworkShares.dll, and its entry point is ISNetworkSharesInstall.

**ISNetworkSharesRollback**

Rolls back network sharing for one or more folders.

This is a Windows Installer DLL custom action. The name of the DLL file is ISNetworkShares.dll, and its entry point is ISNetworkSharesRollback.

**ISNetworkSharesUninstall**

Removes network sharing for one or more folders.

This is a Windows Installer DLL custom action. The name of the DLL file is ISNetworkShares.dll, and its entry point is ISNetworkSharesUninstall.

**ISPrint**

Prints the contents of a ScrollableText control on a dialog.

This is a Windows Installer DLL custom action. The name of the DLL file is SetAllUsers.dll, and its entry point is PrintScrollableText.

**ISQuickPatchFinalize**

Cleans shared reference counts for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is QuickPatchHelper.dll, and its entry point is ISQuickPatchFinalize.

**ISQuickPatchFixShortcut**

Reinstalls shortcuts for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is QuickPatchHelper.dll, and its entry point is ISQuickPatchFixShortcut.
**ISQuickPatchHelper**
Applies clean feature states for a QuickPatch.
This is a Windows Installer DLL custom action. The name of the DLL file is QuickPatchHelper.d11, and its entry point is ISQuickPatchHelper.

**ISQuickPatchInit**
Cleans component and feature states for a QuickPatch.
This is a Windows Installer DLL custom action. The name of the DLL file is QuickPatchHelper.d11, and its entry point is ISQuickPatchInit.

**ISQuickPatchInit9X**
Cleans component and feature states for a QuickPatch.
This is a Windows Installer DLL custom action. The name of the DLL file is QuickPatchHelper.d11, and its entry point is ISQuickPatchInit9X.

**ISQuickPatchInit9X2**
Cleans component and feature states for a QuickPatch.
This is a Windows Installer DLL custom action. The name of the DLL file is QuickPatchHelper.d11, and its entry point is ISQuickPatchInit9X2.

**ISRunSetupTypeAddLocalEvent**
Runs the AddLocal events that are associated with the Next button on the SetupType dialog. This action needs to be called when the installation does not display the SetupType dialog.
This is a Windows Installer DLL custom action. The name of the DLL file is ISXExpHlp.d11, and its entry point is RunSetupTypeAddLocalEvent.

**ISSearchReplaceCosting**
Creates a temporary file that has a list of changes that need to be made in text files.
This is a DLL custom action. The name of the DLL file is isschrpl.d11, and its entry point is ISSearchReplaceCosting.

**ISSearchReplaceFinalize**
Cleans up temporary files for text file changes.
This is a DLL custom action. The name of the DLL file is isschrpl.d11, and its entry point is ISSearchReplaceFinalize.

**ISSearchReplaceInstall**
Applies text file changes when the product is installed.
This is a DLL custom action. The name of the DLL file is isschrpl.d11, and its entry point is ISSearchReplaceInstall.
**ISSearchReplaceRollback**
Rolls back text file changes and cleans up temporary files for text file changes.
This is a DLL custom action. The name of the DLL file is `isschrpl.dll`, and its entry point is ISSearchReplaceRollback.

**ISSearchReplaceUninstall**
Applies text file changes when the product is uninstalled.
This is a DLL custom action. The name of the DLL file is `isschrpl.dll`, and its entry point is ISSearchReplaceUninstall.

**ISSelfRegisterCosting**
Extracts operations to a temporary file for self-registration.
This is a Windows Installer DLL custom action. The name of the DLL file is `isregsvr.dll`, and its entry point is ISSelfRegisterCosting.

**ISSelfRegisterFiles**
Registers self-registering files.
This is a Windows Installer DLL custom action. The name of the DLL file is `isregsvr.dll`, and its entry point is ISSelfRegisterFiles.

**ISSelfRegisterFinalize**
Cleans up temporary file from self-registration.
This is a Windows Installer DLL custom action. The name of the DLL file is `isregsvr.dll`, and its entry point is ISSelfRegisterFinalize.

**ISSetAllUsers**
Sets ALLUSERS per upgrade or initial installation requirements.
This is a DLL custom action. The name of the DLL file is `SetAllUsers.dll`, and its entry point is SetAllUsers.

**ISSetTARGETDIR**
Sets TARGETDIR to `[INSTALLDIR]`.
This is a DLL custom action. The name of the DLL file is `SetAllUsers.dll`, and its entry point is SetTARGETDIR.

**ISSetupFilesCleanup**
Cleans up the temp directory of support files.
This is a DLL custom action. The name of the DLL file is `SFHelper.dll`, and its entry point is SFCleanupEx.

**ISSetupFilesExtract**
Extracts support files to a temp directory.
This is a DLL custom action. The name of the DLL file is `SFHelper.dll`, and its entry point is SFStartupEx.
**ISSQLQueryDatabases**
Finds database catalogs that are available on a specified database server.
This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLQueryDatabases`.

**ISSQLServerCosting**
Extracts operations to a temporary file for SQL scripts.
This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerCosting`.

**ISSQLServerFilteredList**
Finds available servers for SQL scripts.
This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerFilteredList`.

**ISSQLServerFinalize**
 Cleans up temporary files and the state for SQL scripts.
This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerFinalize`.

**ISSQLServerInitialize**
 Adds property names for SQL login password to `MsiHiddenProperties`.
This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerInitialize`.

**ISSQLServerInstall**
 Runs SQL scripts during an installation.
This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerInstall`.

**ISSQLServerList**
Finds available servers.
This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerList`.

**ISSQLServerRemoveLoginInfo**
Removes SQL database login credentials from the Windows registry during an uninstallation.
This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerRemoveLoginInfo`.

**ISSQLServerRollback**
Runs SQL scripts during a failed installation or uninstallation.
This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerRollback`.
ISSQLServerRollbackLoginInfo

During a failed installation or uninstallation, rolls back SQL database login credentials that are stored in the Windows registry.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLServerRollbackLoginInfo.

ISSQLServerUninstall

Runs SQL scripts during an uninstallation.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLServerUninstall.

ISSQLServerValidate

Tests server connections.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLServerValidate.

ISSQLServerWriteLoginInfo

Writes SQL database login credentials to the Windows registry during an installation.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is ISSQLServerWriteLoginInfo.

ISUnSelfRegisterFiles

Unregisters self-registering files.

This is a DLL custom action. The name of the DLL file is `isregsvr.dll`, and its entry point is ISUnSelfRegisterFiles.

ISVerifyScriptingRuntime

Verifies that an InstallScript MSI installation was launched using Setup.exe, and if not, it displays the message contained in the property STANDARD_USE_SETUPEXE. This custom action is included in all InstallScript MSI projects, and it is scheduled for the beginning of the User Interface sequence.

**Note** • The ISVerifyScriptingRuntime custom action is called in an InstallScript MSI installation in which the InstallScript UI style is the traditional style (which uses the InstallScript engine as an external UI handler). It is not called for the new style (which uses the InstallScript engine as an embedded UI handler).

To learn more, see [Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations](#).

ISXmlAppSearch

Performs a system search for XML: finds file, performs XPath queries, and stores the results in properties. Driven by the ISXmlLocator table.

This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is ISXmlAppSearch.

ISXmlCosting

Extracts operations to a temporary file for XML file changes.

This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is ISXmlCosting.
**ISXmlFinalize**
Cleans up temporary files for XML file changes.
This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is `ISXmlFinalize`.

**ISXmlInstall**
Applies XML file changes.
This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is `ISXmlInstall`.

**ISXmlRollback**
Rolls back XML file changes.
This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is `ISXmlRollback`.

**ISXmlUnInstall**
Uninstalls XML file changes.
This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is `ISXmlUnInstall`.

**LaunchProgramFileFromSetupCompleteSuccess**
Launches an executable file at the end of an installation.
This is a Windows Installer DLL custom action. The name of the DLL file is `SerialNumCAHelper.dll`, and its entry point is `LaunchProgram`.

**LaunchReadmeFileFromSetupCompleteSuccess**
Launches a readme file at the end of an installation.
This is a Windows Installer DLL custom action. The name of the DLL file is `SerialNumCAHelper.dll`, and its entry point is `LaunchReadMe`.

**setAllUsersProfile2K**
Initializes the ALLUSERSPROFILE directory identifier for Windows 2000 or later.

**SetAllUsersProfileNT**
Initializes the ALLUSERSPROFILE directory identifier for Windows NT 4.

**SetARPINSTALLLOCATION**
Sets the value of the `ARPINSTALLLOCATION` property to the fully qualified path for the application's primary folder.

**setUserProfileNT**
Initializes the USERPROFILE directory identifier.
ShowMsiLog
Displays the Windows Installer log file in Notepad if the end user selects the **Show the Windows Installer log** check box in the SetupCompleteSuccess, SetupCompleteError, or SetupInterrupted dialogs and then clicks Finish. This works only with Windows Installer 4.0 and later.

WiseScriptFinalize
Cleans up temporary files for a WiseScript custom action.
This is a DLL custom action. The name of the DLL file is **WiseScriptBridge.dll**, and its entry point is WiseScriptFinalize.

WiseScriptInitialize
Extracts required files for a WiseScript custom action.
This is a DLL custom action. The name of the DLL file is **WiseScriptBridge.dll**, and its entry point is WiseScriptInitialize.

WiseScriptRollback
Cleans up temporary files for a WiseScript custom action.
This is a DLL custom action. The name of the DLL file is **WiseScriptBridge.dll**, and its entry point is WiseScriptFinalize.

Command-Line Tools

InstallShield 2020

In addition to its graphical user interface, InstallShield provides several command-line programs that you can use during build time, for instance, as part of a batch process, or during run time to customize the behavior of your installation.
Authoring-Time Programs

Table 13-1 • Descriptions of Authoring-Time Programs

<table>
<thead>
<tr>
<th>Task</th>
<th>Program</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scan an IIS Web site and record its settings so that you can import them into an InstallShield project</td>
<td>iisscan.exe</td>
</tr>
</tbody>
</table>

Build-Time Programs

Compile.exe

InstallShield 2020

InstallShield includes a command-line compiler that you can invoke from the Command Prompt window or from a DOS batch file. This program, called Compile.exe, is in the following folder:

`InstallShield Program Files Folder/System`

---

**Note** • When you build a release from the command line using ISCmdBld.exe, the build engine automatically compiles your script; therefore, you do not need to use Compile.exe directly unless you want to use compiler options that are different from those specified for the project in InstallShield. For more information, see ISCmdBld.exe.

**Syntax**

Compile script_file [iswi_obl_file] [isrt_obl_file] [ifx_obl_file] switches

You can pass any or all of your command-line parameters to Compile.exe in the form of a command file. To specify a command file to Compile.exe, use the following syntax:

`Compile @command_file`

In this example, `command_file` is the name of a text file, including any extension. You can specify an absolute or relative path with the file name.

You can specify all or part of the command line in a command file. You can use more than one command file in a Compile command. Compile.exe accepts the command file's input as if it were specified in that location on the command line.

In the command file, each parameter must begin and end on the same line—you cannot use the backslash (`\`) to combine a parameter across two lines. In the command file, arguments can be separated by spaces or tabs (as on the command line) and by newline (`\n`) characters.
## Parameters

The following parameters are available for use with the compiler.

### Table 13-4 • Command-Line Parameters for Compile.exe

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>script_file</strong></td>
<td>Specifies the name of the setup script. Note the following:</td>
</tr>
<tr>
<td></td>
<td>• The file name can include a drive designation and an absolute or relative path. If the file name is unqualified, the compiler will search for the script in the current directory of the current drive.</td>
</tr>
<tr>
<td></td>
<td>• If the specified setup script uses #include directives to include other files in the setup, and if the file names specified by #include statements do not include a path, you must specify the location of those files with the -i switch unless they reside in the current directory. Note that included files may themselves specify #include directives; be sure the -i switch specifies a search path that can be used to find all included source files.</td>
</tr>
<tr>
<td></td>
<td>• Long path and file names must be enclosed in double quotation marks.</td>
</tr>
<tr>
<td></td>
<td>• By default, the setup script created as part of a new InstallShield project is named setup.rul.</td>
</tr>
<tr>
<td><strong>isrt_obl_file</strong></td>
<td>Specifies the name of the library file Isrt.obl. It is not necessary to include the full path for the library file, as long as the path is identified with the -libpath switch. Isrt.obl is in the following directory: InstallShield Program Files Folder\Script\Isrt\Lib</td>
</tr>
<tr>
<td></td>
<td>This parameter is required unless you are using the -c or -l switch.</td>
</tr>
<tr>
<td><strong>ifx_obl_file</strong></td>
<td>Specifies the name of the library file Ifx.obl. It is not necessary to include the full path for the library file, as long as the path is identified with the -libpath switch. Ifx.obl is in the following directory: InstallShield Program Files Folder\Script\Ifx\Lib</td>
</tr>
<tr>
<td></td>
<td>This parameter is required unless you are using the -c or -l switch.</td>
</tr>
</tbody>
</table>
### Table 13-4 • Command-Line Parameters for Compile.exe (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>iswi_obl_file</strong></td>
<td><strong>Project</strong> • This parameter applies to the following project types:</td>
</tr>
<tr>
<td></td>
<td>• Basic MSI</td>
</tr>
<tr>
<td></td>
<td>• InstallScript MSI</td>
</tr>
<tr>
<td></td>
<td>Specifies the name of the library file Iswi.obl. It is not necessary to</td>
</tr>
<tr>
<td></td>
<td>include the full path for the library file, as long as the path is</td>
</tr>
<tr>
<td></td>
<td>identified with the -libpath switch.</td>
</tr>
<tr>
<td></td>
<td>Iswi.obl is in the following directory:</td>
</tr>
<tr>
<td></td>
<td>InstallShield Program Files Folder\Script\Iswi\Lib</td>
</tr>
<tr>
<td></td>
<td>This parameter is required unless you are using the -c or -l switch.</td>
</tr>
<tr>
<td><strong>ifxobject_obl_file</strong></td>
<td><strong>Project</strong> • This parameter applies to InstallScript Object projects.</td>
</tr>
<tr>
<td></td>
<td>Specifies the name of the library file Ifxobject.obl. It is not necessary</td>
</tr>
<tr>
<td></td>
<td>to include the full path for the library file, as long as the path is</td>
</tr>
<tr>
<td></td>
<td>identified with the -libpath switch.</td>
</tr>
<tr>
<td></td>
<td>Ifxobject.obl is in the following directory:</td>
</tr>
<tr>
<td></td>
<td>InstallShield Program Files Folder\Script\Ifx\Lib</td>
</tr>
<tr>
<td></td>
<td>This parameter is required unless you are using the -c or -l switch.</td>
</tr>
</tbody>
</table>
Switches

You can pass the following switches to the compiler. If you are not specifying the full path to the script files and library files, you must specify the location of the folders that contain those files by using the -i and -libpath switches (as noted in the -i and -libpath descriptions below). All of the other switches are optional.

Table 13-5 • Switches for Compile.exe

<table>
<thead>
<tr>
<th>Switch</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/d or -d&lt;variable name=preprocessor define&gt;</td>
<td>Provides a preprocessor definition that is applicable to your InstallScript. Following is an example:</td>
</tr>
<tr>
<td></td>
<td>Compile.exe -dVARIABLENAME=Value</td>
</tr>
<tr>
<td></td>
<td>The variable name must be a valid InstallScript identifier; the value must be a constant. No space is permitted between the switch and the expression or within the expression.</td>
</tr>
<tr>
<td></td>
<td>If you reference the preprocessor in InstallScript, use either of the following formats:</td>
</tr>
<tr>
<td></td>
<td>•  #ifdef VARIABLENAME</td>
</tr>
<tr>
<td></td>
<td>•  #if VARIABLENAME=Value</td>
</tr>
<tr>
<td></td>
<td>That is, for #ifdef statements, you can use just the value name. For #if statements, use a name=value pair.</td>
</tr>
<tr>
<td></td>
<td>This parameter is optional.</td>
</tr>
</tbody>
</table>

*Note:* It is recommended that you use this command-line parameter only if a preprocessor is not defined in either of the following areas in InstallShield:

- On the Compile/Link tab of the Settings dialog box, which is displayed when you click Settings on the Build menu
- For Basic MSI and InstallScript MSI projects: In the Preprocessor Defines setting for the product configuration in the Releases view

*If you define a preprocessor in either of these areas in InstallShield and then you use the -d command-line parameter to define the same preprocessor, Compile.exe displays a cannot-define-symbol message to inform you that the preprocessor cannot be redefined through an InstallShield project or product configuration setting.*

| /e or -e                                    | Specifies the maximum number of error messages. The default value is 50. When the maximum number of error messages has been generated, compilation stops. |

| /g or -g                                    | Specifies that a debugging information file should be produced. This file is given the name of the installation and extension .dbg. |
### Table 13-5 • Switches for Compile.exe (cont.)

<table>
<thead>
<tr>
<th>Switch</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/gi or -gi</td>
<td>Specifies that debugging information should be included in the compiled script file, so a debugging information file is not needed.</td>
</tr>
<tr>
<td></td>
<td>This option makes the compiled script larger and the installation slower, and makes it easier for others to reverse engineer your code, so it should typically not be used when creating your final installation for distribution to end users.</td>
</tr>
<tr>
<td>/i or -i&lt;search path&gt;</td>
<td>Specifies a search path—a list of paths, each separated by a semicolon—that identifies the directories to search for source files that have been included in the main installation’s InstallScript code through #include statements. Long path names must be enclosed in double quotation marks.</td>
</tr>
<tr>
<td></td>
<td><strong>Project</strong> • For InstallScript and InstallScript Object projects, you must specify the full paths for the following folders:</td>
</tr>
<tr>
<td></td>
<td>- InstallShield Program Files Folder\Script\Ifx\Include</td>
</tr>
<tr>
<td></td>
<td>- InstallShield Program Files Folder\Script\Isrt\Include</td>
</tr>
<tr>
<td></td>
<td>For Basic MSI and InstallScript MSI projects, you must specify the full paths for the following folders:</td>
</tr>
<tr>
<td></td>
<td>- InstallShield Program Files Folder\Script\Iswi\Include</td>
</tr>
<tr>
<td></td>
<td>- InstallShield Program Files Folder\Script\Isrt\Include</td>
</tr>
<tr>
<td></td>
<td>The aforementioned directories contain the script header files for built-in InstallScript functionality. If you do not specify these folders, compiler errors occur.</td>
</tr>
<tr>
<td>/libpath or -libpath&lt;path&gt;</td>
<td>Specifies a single path that identifies a directory to search for libraries such as Ifx.obl, Isrt.obl, or a custom library file. To specify multiple directories, use the -libpath switch multiple times. Long path names must be enclosed in double quotation marks.</td>
</tr>
<tr>
<td></td>
<td><strong>Project</strong> • For InstallScript and InstallScript Object projects, you must specify the full paths for the following folders (unless you have used the full path with the library file names):</td>
</tr>
<tr>
<td></td>
<td>- InstallShield Program Files Folder\Script\Ifx\Lib</td>
</tr>
<tr>
<td></td>
<td>- InstallShield Program Files Folder\Script\Isrt\Lib</td>
</tr>
<tr>
<td></td>
<td>For Basic MSI and InstallScript MSI projects, you must specify the full paths for the following folders (unless you have used the full path with the library file names):</td>
</tr>
<tr>
<td></td>
<td>- InstallShield Program Files Folder\Script\Iswi\Lib</td>
</tr>
<tr>
<td></td>
<td>- InstallShield Program Files Folder\Script\Isrt\Lib</td>
</tr>
<tr>
<td></td>
<td>The aforementioned directories contain the libraries that define the built-in InstallScript functions. If you do not specify these folders or the full paths with the library names, compiler errors occur.</td>
</tr>
</tbody>
</table>
Additional Information

- When specifying file names, you can use either short or long file names; however, long file names must be enclosed within double quotation marks.

- If you specify a relative path to a file name (for example ..\..\My Functions), that path must be relative to the current directory of the current drive at the time that you invoke the compiler.

Examples

Sample Command Line for an InstallScript Project

The following command line for an InstallScript project compiles the Setup.rul script file that is located in the C:\InstallShield 2020 Projects\My InstallScript Project\script files folder:

```
"C:\Program Files\InstallShield\2020\System\Compile.exe"
"C:\InstallShield 2020 Projects\My InstallScript Project\script files\setup.rul"
ifx.obl
isrt.obl
-libpath"C:\Program Files\InstallShield\2020\Script\Ifx\Lib"
-libpath"C:\Program Files\InstallShield\2020\Script\Isrt\Lib"
-i"C:\Program Files\InstallShield\2020\Script\Ifx\Include"
-i"C:\Program Files\InstallShield\2020\Script\Isrt\Include"
-i"C:\InstallShield 2020 Projects\My InstallScript Project\script files"
```
Sample Command Line for an InstallScript MSI or Basic MSI Project

The following command line for an InstallScript MSI or Basic MSI project compiles the Setup.rul script file that is located in the C:\InstallShield 2020 Projects\My New Project\script files folder:

"C:\Program Files\InstallShield\2020\System\Compile.exe"
"C:\InstallShield 2020 Projects\My New Project\script files\setup.rul"
ISWI.obl
isrt.obl
-libpath"C:\Program Files\InstallShield\2020\Script\Iswi\Lib"
-libpath"C:\Program Files\InstallShield\2020\Script\Isrt\Lib"
-i"C:\Program Files\InstallShield\2020\Script\Ifx\Include"
-i"C:\Program Files\InstallShield\2020\Script\Isrt\Include"
-i"C:\InstallShield 2020 Projects\My New Project\script files"

See Also
Command-Line Compiler

ISCmdBld.exe
InstallShield 2020

You can build a release from the command line using ISCmdBld.exe for Windows Installer–based projects and for InstallScript projects. If your project includes InstallScript, ISCmdBld.exe also compiles it before building the release.

Syntax

The following statement illustrates running ISCmdBld.exe to build the release Othello Beta:

ISCmdBld.exe -p "C:\InstallShield 2020 Projects\My Othello Project\Othello.ism" -r "Othello Beta" -c COMP -a "Build 245"

The first parameter in the example above, starting with -p, is the path to the .ism file that you would like to build. Next, -r Othello Beta is the name of the release. The parameter -c COMP specifies that you would like your package to be compressed into one file. Finally, -a "Build 245" points to the specific product configuration.

If a command-line build completes without any errors, InstallShield sets the environment variable ERRORLEVEL to 0. If an error occurs during a command-line build, ERRORLEVEL is set to 1. If ERRORLEVEL is set to any other value, this typically indicates an invalid parameter was passed to ISCmdBld.exe, and the specific cause of the error is displayed in the Command Prompt window in which ISCmdBld.exe was running.

Command-Line Parameters

Project • Some of the ISCmdBld.exe command-line parameters are applicable to only certain project types.

Table 13-6 • ISCmdBld.exe Command-Line Parameters

<table>

<tbody>
<tr>
<td>-b &lt;build location&gt;</td>
<td>Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI</td>
<td>The fully qualified path to the folder where you want the output folders and files to be placed. UNC paths are acceptable. The built installation’s files will be located in the Disk Images\Disk1 subfolder of the location that you specify. This parameter is optional. If it is left unspecified, the build will place the build package and files in the directory specified in the File Locations tab of the Options dialog box. Enclose long file names in quotation marks.</td>
</tr>
<tr>
<td>-c &lt;release configuration&gt;</td>
<td>Basic MSI, InstallScript MSI</td>
<td>This parameter enables you to specify whether your release is compressed into one file or remains uncompressed in multiple files. The valid arguments for this parameter are COMP and UNCOMP. To specify that your release be compressed into one file, use the COMP argument. If you do not want your release compressed, use the UNCOMP argument. If the parameter is omitted for a release that already exists, the configuration is based on what was specified in the InstallShield interface. If the parameter is omitted for a new release, the files remain uncompressed.</td>
</tr>
</tbody>
</table>
Table 13-6 • ISCmdbld.exe Command-Line Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| -d <variable name=preprocessor define> | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object | Use this parameter to provide a preprocessor definition that is applicable to your InstallScript. To specify more than one preprocessor definition, separate each with a comma, as in the following example: `ISCmdbld.exe -d VARIABLENAME1=Value1,VARIABLENAME2=Value2` If you reference the preprocessor in InstallScript, use either of the following formats:  
  - `#ifdef VARIABLENAME`  
  - `#if VARIABLENAME=Value`  
  That is, for #ifdef statements, you can use just the value name. For #if statements, use a name=value pair.

This parameter is optional.  

**Note** • *It is recommended that you use this command-line parameter only if a preprocessor is not defined in either of the following areas in InstallShield:*  
  - On the Compile/Link tab of the Settings dialog box, which is displayed when you click Settings on the Build menu  
  - For Basic MSI and InstallScript MSI projects: In the Preprocessor Defines setting for the product configuration in the Releases view  

If you define a preprocessor in either of these areas in InstallShield and then you use the -d command-line parameter to define the same preprocessor, ISCmdbld.exe displays a cannot-define-symbol message to inform you that the preprocessor cannot be redefined through an InstallShield project or product configuration setting. |
| -e <Y/N> | Basic MSI, InstallScript MSI, Merge Module | For installation projects, this parameter specifies whether you want to create a Setup.exe file along with your installation. Specify -e Y to build Setup.exe or -e N to just create an installation.  
For merge module projects, the meaning of -e is different from installation projects. Specifying -e n will cause the merge module to be built and then copied to the merge modules folder. Specifying -e Y will cause the merge module to only be built but not copied to the merge modules folder. |
| -f <release flags> | Advanced UI, Basic MSI, InstallScript MSI, Suite/Advanced UI | Use this parameter to specify any release flags that you would like to include in your release. Separate multiple flags with commas. |
Table 13-6  •  ISCmdBld.exe Command-Line Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-fv &lt;version number&gt;</td>
<td>Basic MSI, InstallScript MSI</td>
<td>If you want to override the default file version for Setup.exe with your own version number, use this parameter to specify the file version, such as -fv 2.5.0.0. This is an optional parameter.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> • The file version always contains four fields. If you specify fewer than four fields for your file version, the remaining fields are filled with zeros. For example, if you specify a file version of 1.1, the file version that is used in the version resources of Setup.exe is 1.1.0.0.</td>
</tr>
<tr>
<td>-g &lt;minimum target MSI version&gt;</td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Use this parameter to specify the minimum version of Windows Installer that the installation requires on the target machine—for example, 2.0.2600.0. This parameter is optional. The default is the latest version of Windows Installer that the InstallShield interface supports.</td>
</tr>
<tr>
<td>-h</td>
<td>Basic MSI, InstallScript MSI</td>
<td>To skip the upgrade validators at the end of the build, use this parameter.</td>
</tr>
<tr>
<td>-i &lt;.ini file path&gt;</td>
<td>Basic MSI, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>Instead of passing all of your parameters on the command line, you can include them all in an initialization (.ini) file and call that file from the command line. For more information, see Passing Command-Line Build Parameters in an .ini File. Absolute and relative paths are acceptable. Enclose long file names in quotation marks.</td>
</tr>
<tr>
<td>-j &lt;minimum target Microsoft .NET Framework version&gt;</td>
<td>Basic MSI, InstallScript MSI</td>
<td>This parameter specifies the minimum version of the .NET Framework that the installation requires on the target machine—for example, 1.0.3705.2. This parameter is optional. The default is the latest version of the .NET Framework that the InstallShield interface supports.</td>
</tr>
<tr>
<td>-l &lt;path variable&gt;=&quot;new path&quot;</td>
<td>Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI</td>
<td>Use this parameter to override a path variable that has been specified in the Path Variables view. You can specify this parameter multiple times, once for each path variable override. For example: ISCmdBld.exe -l VariableName=&quot;C:\Path&quot; -l VariableName2=&quot;C:\Path2&quot; To reference a file in a sibling project that is within the same Visual Studio solution folder, use the predefined path variable called VSSolutionFolder. For more information, see Using the VSSolutionFolder Path Variable with Visual Studio Solutions.</td>
</tr>
</tbody>
</table>
Use this parameter to set the time period to check the availability of the license from the license server.

For example, in the following command line, `IsCmdBld` waits for the license availability in the configured license server for 40 secs and checks the availability in 15 secs intervals. If the license is available before 40 secs, then the build continues with the available license else the build fails with the existing reason (failed to get the license).

```
IsCmdBld.exe -p "C:\InstallShield 2020 projects\TestProj.ism" -licCheckTimeOut 40
```

Use this parameter if you want to validate the installation or merge module package after it is built. Pass the path of the .cub file name with this parameter.

Absolute and relative paths are acceptable. To use multiple .cub files, separate each path with a semicolon (;). Enclose long file names in quotation marks.

For example, in the following command line, the `-m` parameter indicates that validation should be performed with the InstallShield Validation Suite for Windows 7 (`ISWin7.cub`) and the Full MSI Validation Suite (`darice.cub`):

```
ISCmdBld.exe -m ..\Support\Validation\ISWin7.cub;..\Support\Validation\darice.cub
```

Specify this parameter if you do not want `Setup.rul` to be compiled as part of the build process.

Note that if you are building from the command line and specifying an .ini file with the build settings, you can specify the following in the `[Project]` section of the .ini file, instead of adding the `-n` command line build flag:

```
[Project]
CompileScript=No
```

Like the command-line build flag, this CompileScript keyword helps you specify whether `Setup.rul` should be compiled as part of the build process.

**Note** • The `-n` parameter cannot be used with the `-q3` parameter.
Table 13-6 • ISCmdBld.exe Command-Line Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-o &lt;merge module search path&gt;</td>
<td>Basic MSI, InstallScript, InstallScript MSI</td>
<td>This parameter specifies one or more comma-delimited folders that contain the merge module files (.msm) that are referenced by your project. InstallShield provides additional ways for specifying the folders that contain merge modules. For more information, see Specifying the Directories that Contain Merge Modules.</td>
</tr>
<tr>
<td>-p &lt;project location&gt;</td>
<td>Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI</td>
<td>Pass the path to the project (.ism) file. This path can be fully qualified, relative, or just the file name. If only the project file name is passed, the file is retrieved relative to the current working directory. For example: ISCmdBld.exe -p &quot;C:\InstallShield 2020 Projects\MyProject1\MyProject1.ism&quot; UNC paths are also acceptable. Enclose long file names in quotation marks. This is the only required parameter.</td>
</tr>
<tr>
<td>-patch_config &lt;patch configuration&gt;</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Use this parameter to build a standard patch. Pass the name of the patch configuration in the Patch Design view that you want to build. For example, the following command line builds the patch configuration called Version 1.2 in the MyProject1.ism project: ISCmdBld.exe -p &quot;C:\InstallShield 2020 Projects\MyProject1\MyProject1.ism&quot; -patch_config &quot;Version 1.2&quot;</td>
</tr>
<tr>
<td>-prqpath &lt;InstallShield prerequisite search path&gt;</td>
<td>Basic MSI, InstallScript, InstallScript MSI</td>
<td>This parameter specifies one or more comma-delimited folders that contain the InstallShield prerequisite files (.prq) that are referenced by your project. InstallShield provides additional ways for specifying the folders that contain InstallShield prerequisite files. For more information, see Specifying the Directories that Contain InstallShield Prerequisites.</td>
</tr>
<tr>
<td>-q1</td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Builds only the Windows Installer tables for your release. If you have not built this installation already, a new .msi file is created, but no files are added to your installation. If you have built your installation already, the .msi file is updated when all the tables are built, but, again no files are transferred. Ideally, this option is to be used to test the user interface of your installation.</td>
</tr>
</tbody>
</table>

Note • The -q1 parameter cannot be used with the -q2 or -q3 parameters.
Table 13-6 • ISCmdbld.exe Command-Line Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| -q2       | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | For Basic MSI, InstallScript MSI, and Merge Module projects: Builds the Windows Installer tables and refreshes files. This option rebuilds your .msi file and updates the Files table, including any new or changed files in your installation. Changed files are updated only if the size or time stamp differs from the copy already included in the build. References to deleted files are removed from the installation, but the file remains in the build location. This type of build can be run only after a complete build has been performed, and it works only when the media is an uncompressed network image. For InstallScript and InstallScript Object projects: Rebuilds only those portions of the release that have changed since the last build. If this parameter is not used, the entire file media library is rebuilt.  

**Note** • The -q2 parameter cannot be used with the -q1 or -q3 parameters. |
| -q3       | Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module | Compiles only Setup.rul. For Basic MSI projects, this parameter also streams ISSetup.dll into the Binary table of the .msi package, if one was previously built.  

**Note** • The -q3 parameter cannot be used with the -q2 or -q3, or -n parameters.  

**Note** • This parameter does not upgrade the project. If your project was created with InstallShield Developer 8 or earlier, you should upgrade it to the latest version of InstallShield before using -q3. For example, use -u to upgrade. |
<p>| -r &lt;release name&gt; | Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI | The release name as specified in the Releases view. You can use an existing release name or create a new one. Although this parameter is not required, you should include it if you are including -a, the parameter for product configurations. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-s</td>
<td>Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>This parameter enables you to build your release in silent mode. Silent builds are useful if you want to run the build without displaying any errors or warning messages. This parameter is optional.</td>
</tr>
<tr>
<td>-se or -SE</td>
<td>Basic MSI, InstallScript, InstallScript MSI, Suite/Advanced UI, QuickPatch, Merge Module</td>
<td>This parameter allows you to run the build without displaying any information except error messages. Use this parameter to build and get only build errors (errors, fatal errors, and validation errors). This parameter is optional.</td>
</tr>
</tbody>
</table>
| -t <Microsoft .NET Framework path> | Basic MSI, InstallScript MSI | Regasm.exe and InstallUtilLib.dll are utilities that are included with each version of the .NET Framework. This parameter specifies the path for the directory that contains the installed 32-bit version of these files that you want to use at build time for releases that include .NET installer classes and COM interop. This is not the path to .NET Framework redistributable files.  

**Note** • If you are using InstallShield on a 64-bit system, ISCmbdld.exe determines the location of the corresponding 64-bit version of the .NET Framework based on the path that you specify for this parameter, and ISCmbdld.exe uses the 64-bit location of Regasm.exe and InstallUtilLib.dll when appropriate. |
| -u | Basic MSI | This parameter enables you to upgrade—but not build—your release. You can use this parameter to upgrade an installation project that you created using InstallShield—Windows Installer Edition version 2.03 or earlier. |
| -v | Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI | This parameter enables you to create a verbose build log file that may be useful if Revenera Support is helping you troubleshoot an issue with your installation. |
**Table 13-6 • ISCmdBld.exe Command-Line Parameters (cont.)**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-w</code></td>
<td>Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>This parameter treats warnings that occur during the build process as errors. Each warning increments the error count by one.</td>
</tr>
<tr>
<td><code>-x</code></td>
<td>Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>If you want the build to stop when it encounters an error, use the <code>-x</code> parameter. If you want the build to stop when it encounters a warning, use this parameter in conjunction with the <code>-w</code> parameter.</td>
</tr>
</tbody>
</table>
| `-y <product version>` | Advanced UI, Basic MSI, InstallScript MSI, Merge Module, Suite/Advanced UI | This parameter enables you to specify a product version from the command line. This is especially helpful if you want to increment the build version (the third field) of the product version. For example, to set the product version to 1.0.5:  
  ISCmdBld.exe -y "1.0.5"  
  For information on valid product version numbers, see Specifying the Product Version.  
  This parameter is optional. |
| `-z <property name=property value>` | Advanced UI, Basic MSI, InstallScript MSI, Merge Module, Suite/Advanced UI | In Basic MSI, InstallScript MSI, and Merge Module projects, this parameter enables you to override the value of a Windows Installer property. In Advanced UI and Suite/Advanced UI projects, this parameter enables you to override the value of an Advanced UI or Suite/Advanced UI property.  
  For example, to set the value of the property called PropertyName to PropertyValue, use the following command line:  
  ISCmdBld.exe -z PropertyName=PropertyValue  
  If you want to set the value to a string that includes one or more spaces, use quotation marks; for example, to set the value of the property called PropertyName to My Property Value, use the following command line:  
  ISCmdBld.exe -z "PropertyName=My Property Value"  
  If you specify a property that does not exist in the Property table, InstallShield creates the property in the installation that it builds.  
  If you specify both the `-y` parameter to override the product version, and the `-z` parameter to override the ProductVersion property, InstallShield uses the value specified for the `-y` parameter.  
  This parameter is optional. |

ISBuild.exe

InstallShield 2020

Project • This information applies to InstallScript projects.

ISBuild.exe is a command-line tool that is available for legacy InstallScript projects. The following parameters are associated with ISBuild.exe:

Table 13-7 • Command-Line Parameters for ISBuild.exe

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-p project file</td>
<td>This specifies the fully qualified path and file name of the project file. By default, the project file is in the following location: C:\InstallShield 2020 Projects\Project Name\Project File. This parameter should be enclosed in quotation marks.</td>
</tr>
<tr>
<td>-m media name</td>
<td>This specifies the media name for the media that will be built. This parameter should be enclosed in quotation marks.</td>
</tr>
<tr>
<td>-b build location</td>
<td>This specifies the fully qualified path to the folder where you want the output folders and files to be placed. This parameter is optional.</td>
</tr>
<tr>
<td>-s</td>
<td>This runs ISBuild.exe in silent mode. This parameter is optional.</td>
</tr>
<tr>
<td>-r</td>
<td>This indicates that the media should refresh the build. The default is a complete rebuild. This parameter is optional.</td>
</tr>
</tbody>
</table>
**IISscan.exe**

InstallShield 2020

*Edition* • The ability to import IIS data into an InstallShield project is available only in the Premier edition of InstallShield.

The IIS scanner (IISscan.exe) is a tool that scans an IIS Web site and records the values of the settings that you can configure in the Internet Information Services view in InstallShield. IISscan.exe creates an XML file that contains all of the values. You can use this XML file to import the values into the Internet Information Services view. Then you can modify the settings as needed.

When you use IISscan.exe to scan a Web site, you must place the IISscan.exe file on the machine that contains the IIS Web site.

*Note* • IISscan.exe requires administrative privileges. Therefore, you may need to launch it from an elevated Command Prompt window.

IISscan.exe is installed in the following location:

*InstallShield Program Files Folder\System*

**Syntax**

iisscan.exe -website "Site Name" -outfile "C:\PathToFile\FileName.xml"

**Parameters**

*Table 13-8 • Command-Line Parameters for IISscan.exe*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-website</td>
<td>Specify the name of the Web site on the IIS server that you want to scan.</td>
</tr>
<tr>
<td>-outfile</td>
<td>Specify the full path and name of the XML file that you want the scanner to create. This parameter is optional. If you do not pass this parameter, the IIS scanner records the IIS settings in a file called iisscan.xml in the same directory that contains the IIS scanner.</td>
</tr>
</tbody>
</table>

*Tip* • InstallShield lets you configure filters if you want to prevent certain IIS data—such as Web sites, applications, virtual directories, application pool, or any of their settings—from ever being imported into the Internet Information Services view. To learn more, see Filtering IIS Data When Importing a Web Site and Its Settings into an InstallShield Project.

Managing Internet Information Services
Internet Information Services View
iSign.exe

InstallShield 2020

Project • This information applies to the following project types:

- InstallScript
- InstallScript Object

Use the command-line tool iSign.exe to digitally sign a release of an InstallScript project from the command line after you have built the release.

iSign.exe is in the following directory:

InstallShield Program Files Folder\System

iSign.exe lets you choose between the following options:

- You can specify the .pfx certificate file on your machine that you want to use for signing.
- You can reference a certificate store that contains the certificate that you want to use for signing.

Syntax

iSign.exe [options] PathToData1.hdrFile

For example, for signing with a .pfx file:

iSign.exe -pfx "C:\Temp\MyFile.pfx" -p "Password" "C:\InstallShield 2020\MyProject\Media\Release 1\Disk Images\Disk1\data1.hdr"

For signing with a certificate in a certificate store:

iSign.exe -store "Root" -sl "Machine" ss "My Certificate" "C:\InstallShield 2020\MyProject\Media\Release 1\Disk Images\Disk1\data1.hdr"

Command-Line Parameters

Following is a list of the parameters that you can use with iSign.exe. Note that some are available only if you are using a .pfx file, and some are available only if you are using a certificate in a certificate store.

Table 13-9 • Command-Line Parameters for iSign.exe

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Signing Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-pfx &lt;path to .pfx file&gt;</td>
<td>.pfx file</td>
<td>Specify the fully qualified path to the .pfx file that contains the certificate that you want to use to sign your release.</td>
</tr>
</tbody>
</table>
ReleasePackager.exe

InstallShield 2020

Project • This information applies to InstallScript projects.

Use ReleasePackager.exe to build a self-extracting executable file from the command line. This can be useful if you are building from a batch file.

ReleasePackager.exe is installed in the following location:

InstallShield Program Files Folder\System
Syntax

ReleasePackager.exe "disk_images_folder" "package_file" ["icon_file" [icon_index]]

Parameters

Table 13-10 • Command-Line Parameters for ReleasePackager.exe

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disk_images_folder</td>
<td>This optional parameter specifies the folder that contains the disk images to be incorporated in the self-extracting executable file. A typical value is: C:\InstallShield 2020 Projects\ProjectName\Media\Releasename\Disk Images</td>
</tr>
<tr>
<td>package_file</td>
<td>This parameter specifies the fully qualified name of the self-extracting executable file. A typical value is: C:\InstallShield 2020 Projects\ProjectName\Media\Releasename\Package\Packagename.exe</td>
</tr>
<tr>
<td>icon_file</td>
<td>This optional parameter specifies the fully qualified name of the file that contains the icon you want to use for your self-extracting executable file.</td>
</tr>
<tr>
<td>icon_index</td>
<td>This optional parameter specifies the numeric index of the icon from icon_file that you want to use for your self-extracting executable file. If you do not specify an index, the icon at index 0 is used.</td>
</tr>
<tr>
<td>-s</td>
<td>This optional parameter is available for running ReleasePackager.exe in silent mode. To pass this parameter to ReleasePackager.exe, the syntax is as follows: ReleasePackager.exe &quot;disk_images_folder&quot; &quot;package_file&quot; [&quot;icon_file&quot; [icon_index]] -s</td>
</tr>
</tbody>
</table>

Note that the -s parameter must be specified after the other parameters. If you do not want to specify an icon file or icon index, you must specify the default values of a null string ("") for the icon file and 0 for the icon index.

Example

ReleasePackager.exe "C:\InstallShield 2020 Projects\My Project\Media\My Release\Disk Images" "C:\InstallShield 2020 Projects\My Project\Media\My Release\Package\MyPackage.exe" "C:\My Icon Files\MyIcons.dll" 2 -s

Building a Self-Extracting Executable File from the Command Line

SetupIni.exe

InstallShield 2020

Project • This information applies to the following project types:
SetupIni.exe is a command-line tool that enables you to modify a Setup.ini file that is embedded in a Setup.exe or Update.exe file. Setup.ini is an initialization file that is created during the build process of installation projects to control certain elements of the installation.

SetupIni.exe is installed in the following location:

**InstallShield Program Files Folder\System**

### Syntax

**SetupIni.exe PathToSetup.exe Section Key Value**

### Parameters

**Table 13-11 • Command-Line Parameters for SetupIni.exe**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| PathToSetup.exe | Specify the path and file name to the Setup.exe file that contains the Setup.ini file that you want to modify.  
If the path contains spaces, enclose it within quotation marks. |
| Section         | Specify the name of the section that you want to modify.                                                                                     |
| Key             | Specify the name of the key whose value you want to set.                                                                                   |
| Value           | Specify the value that you want to use for the specified key.  
If the value contains spaces, enclose it within quotation marks. |

### Example

SetupIni.exe "C:\InstallShield 2020 Projects\My Project\Media\My Release\Package\MySetup.exe" Startup CmdLine MYPROPERTY="MyValue"

---

### MsiExec.exe Command-Line Parameters

**InstallShield 2020**

**MsiExec.exe** is the executable program of the Windows Installer used to interpret installation packages and install products on target systems. After you **build your release**, you can install your Windows Installer package (.msi) from the command line.

Your Windows Installer package can be accessed from the folder that contains your built release. The default location is as follows:

**C:\InstallShield 2020 Projects\ProjectName\ReleaseName\DiskImages\Disk1\ProductName.msi**

After building a release of your product, you can install it from the command line:

**msiexec /i "C:\InstallShield 2020 Projects\ProjectName\ReleaseName\DiskImages\Disk1\ProductName.msi"**
The table below provides a detailed description of \texttt{MsiExec.exe} command-line parameters.

**Table 13-12 • MsiExec.exe Command-Line Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| /i <package> or <product code> | Use this format to install the product Othello:  
\texttt{msiexec /i "C:\InstallShield 2020 Projects\Othello\Trial Version\Release\DiskImages\Disk1\Othello Beta.msi"}

Product Code refers to the GUID that is automatically generated in the Product Code property of your product's project view. |
| /f [p|o|d|c|a|u|m|s|v] <package> or <product code> | Installing with the /f option will repair or reinstall missing or corrupted files.  
For example, to force a reinstall of all files, use the following syntax:  
\texttt{msiexec /fa "C:\InstallShield 2020 Projects\Othello\Trial Version\Release\DiskImages\Disk1\Othello Beta.msi"}

Use the aforementioned syntax in conjunction with the following flags:

- p reinstalls a file if it is missing
- o reinstalls a file if it is missing or if an older version of the file is present on the user's system
- e reinstalls a file if it is missing or if an equivalent or older version of the file is present on the user's system
- c reinstalls a file if it is missing or if the stored checksum of the installed file does not match the new file's value
- a forces a reinstall of all files
- u or m rewrite all required user registry entries
- s overwrites any existing shortcuts
- v runs your application from the source and re-caches the local installation package |
| /a <package> | The /a option allows users with administrator privileges to install a product onto the network. |
Chapter 13
Command-Line Tools

InstallShield 2020 User Guide
ISP-2600-UG00

Table 13-12 • Msiexec.exe Command-Line Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/x &lt;package&gt; or &lt;product code&gt;</td>
<td>The /x option uninstalls a product.</td>
</tr>
</tbody>
</table>

Project • For InstallScript MSI projects in which the InstallScript UI style is the new style (which uses the InstallScript engine as an embedded UI handler): If you try to uninstall the product through the command line using the statement Msiexec.exe /x {ProductCode}, the uninstallation may be successful. However, the Windows Installer displays an error dialog near the end of the uninstallation. The error dialog indicates that the Windows Installer service could not be accessed.

To perform an uninstallation from the command line in this scenario, the current recommended method is to use one of the following:

msiexec.exe /i {ProductCode} REMOVE=ALL
msiexec.exe /x {ProductCode} /qn

This is not necessary if your InstallScript MSI project is using the traditional style for the InstallScript UI (which uses the InstallScript engine as an external UI handler).

To learn more, see Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations.

| /j [u|m] <package> | Building with the /j <package> option advertises the components of your application on the end user’s computer |
| /j [u|m] <package> /t <transform list> | • u advertises components only to the current user |
| /j [u|m] <package> /g | • m advertises components to all users of the computer |
| /j <language ID> | • g specifies language ID |
| /j <language ID> | • t applies a transform to your advertised product |

Transforms allow the synchronization of applications across different languages. For example, if you upgrade the English version of your product, you could apply a transform to automatically upgrade the French version of your product.
Use the `/L` option to specify the path to the log file. Optionally include one or more of the following flags to indicate which information to record in the log file:

- `i` logs status messages.
- `w` logs non-fatal warning messages.
- `e` logs any error messages.
- `a` logs the commencement of action sequences.
- `r` logs action-specific records.
- `u` logs user requests.
- `c` logs initial user interface parameters.
- `m` logs out-of-memory messages.
- `o` logs out-of-disk-space messages.
- `p` logs all of the properties and their values at the end of the installation.
- `v` logs verbose output.
- `x` logs extra debugging information.
- `+` appends the information to an existing log file.
- `!` flushes each line to the log.
- `*` is a wild-card character that enables you to log all information (excluding the verbose output that `v` provides and the extra debugging information that `x` provides).

For example, to generate a log file that logs everything verbosely, use the following:

```
/L*v "C:\MyLogFiles\package.log"
```

Use the `/p` option to apply a patch to an installed product. To patch an installed administrative image, combine this option with `/a` as shown:

```
/p PatchPackage /a Package
```

Setup.exe and Update.exe Command-Line Parameters

InstallShield 2020

Setup.exe can accept a number of command-line parameters. Update.exe (available only for Basic MSI and InstallScript MSI projects) accepts nearly all of the same command-line parameters. Using these parameters, end users can specify such data as the language that the installation should run in and whether to launch Setup.exe silently. For Basic MSI and InstallScript MSI, end users can also pass parameters through Setup.exe to the included .msi file.

Note • Command-line options that require a parameter must be specified with no space between the option and its parameter. For example, Setup.exe /v"ALLUSERS=2" is valid, while Setup.exe /v "ALLUSERS=2" is not. Quotation marks around an option's parameter are required only if the parameter contains spaces. If a path within a parameter contains spaces, you may need to use quotation marks within quotation marks, as in the following example:

Setup.exe /v"INSTALLDIR="c:\My Files""

Project • Some of the command-line options apply to only certain project types. Project-specific information is listed for each option.

Built-In Command-Line Parameters

This section describes valid command-line parameters for Setup.exe. The parameters are organized into the following categories:

### Properties

All public properties can be set or modified from the command line. Public properties are distinguished from private properties by the fact that they are in all capital letters. For example, COMPANYNAME is a public property.

To set a property from the command line, use the following syntax: `PROPERTY=VALUE`. If you wanted to change the value of COMPANYNAME, you would enter:

```cmd
msiexec /i "C:\InstallShield 2020 Projects\Othello\Trial Version\Release\DiskImages\Disk1\Othello.msi" COMPANYNAME="My Software Company"
```

<table>

Silent Installations

Table 13-13 • Parameters for Silent Installations

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/p&quot;password&quot;</td>
<td>Basic MSI, InstallScript MSI</td>
<td>If you configured the password-related settings for your release on the Setup.exe tab in the Releases view, the end user must specify the password with the /p option when running the installation silently. A typical command is as follows: Setup.exe /s /p&quot;password&quot;</td>
</tr>
<tr>
<td>/r</td>
<td>InstallScript, InstallScript MSI</td>
<td>Use this command line to run the installation in record mode. In order to run an InstallScript MSI or InstallScript installation in silent mode, you must first run Setup.exe with the /r option to generate a response file, which stores information about the data entered and options selected by the user at run time. Launching an InstallScript MSI or InstallScript installation with the /r parameter displays all the run-time dialogs and stores the data in a file called Setup.iss, created inside the system's Windows folder. To specify an alternative response file name and location, use the /f1 option, described below. Basic MSI projects do not create or use a response file for silent installations.</td>
</tr>
</tbody>
</table>
For an InstallScript MSI or InstallScript project, the command Setup.exe /s runs the installation in silent mode, by default based on the responses contained in a response file called Setup.iss in the same directory. (Response files are created by running Setup.exe with the /r option.) To specify an alternative file name or location of the response file, use the /f1 option.

The command Setup.exe /s also suppresses the Setup.exe initialization dialog for a Basic MSI installation, but it does not read a response file. To run a Basic MSI installation silently, use the following command line:

```
Setup.exe /s /v/qn
```

To specify the values of public properties for a silent Basic MSI installation, you can use a command such as the following one:

```
Setup.exe /s /v"/qn INSTALLDIR=D:\Destination"
```

**Note** • Using this command-line parameter to launch an installation that includes an InstallShield prerequisite does not automatically run the prerequisite installation silently. You may also need to specify a valid silent command-line parameter for the InstallShield prerequisite in the **Specify the command line for the application when the setup is running in silent mode** setting on the **Application to Run tab** in the InstallShield Prerequisite Editor.

For more information, see **Specifying Command-Line Parameters for an InstallShield Prerequisite**.

Using the /f1 option enables you to specify where the response file is (or where it should be created) and what its name is, as in the following example:

```
Setup.exe /s /f1"C:\Temp\Setup.iss"
```

Specify an absolute path; using a relative path gives unpredictable results. The /f1 option is available both when creating a response file (with the /r option) and when using a response file (with the /s option).
When running an InstallScript MSI or InstallScript installation in silent mode (using the `/s` option), the log file `Setup.log` is by default created in the same directory and with the same name (except for the extension) as the response file. The `/f2` option enables you to specify an alternative log file location and file name, as in the following example:

```
Setup.exe /s /f2"C:\Setup.log"
```

Specify an absolute path; using a relative path gives unpredictable results.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>/f2</code></td>
<td>InstallScript, InstallScript MSI</td>
<td>When running an InstallScript MSI or InstallScript installation in silent mode (using the <code>/s</code> option), the log file <code>Setup.log</code> is by default created in the same directory and with the same name (except for the extension) as the response file. The <code>/f2</code> option enables you to specify an alternative log file location and file name, as in the following example: <code>Setup.exe /s /f2&quot;C:\Setup.log&quot;</code>. Specify an absolute path; using a relative path gives unpredictable results.</td>
</tr>
</tbody>
</table>
### Special Installation Modes

#### Table 13-14 • Parameters for Special Installation Modes

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/a</td>
<td>Basic MSI, InstallScript MSI</td>
<td><img src="image" alt="Note" /> The <code>/a</code> parameter does not work with <code>Update.exe</code>. <code>Update.exe</code> launches a patch that accesses and modifies an existing cached <code>.msi</code> file on the system, and an administrative installation does not cache the <code>.msi</code> file. The <code>/a</code> option causes <code>Setup.exe</code> to perform an administrative installation. An administrative installation copies (and uncompresses) your data files to a directory that is specified by the user, but it does not create shortcuts, register COM servers, or create an uninstallation log.</td>
</tr>
<tr>
<td>/j</td>
<td>Basic MSI, InstallScript MSI</td>
<td>The <code>/j</code> option causes <code>Setup.exe</code> to perform an advertised installation. An advertised installation creates shortcuts, registers COM servers, and registers file types, but does not install your product’s files until the user invokes one of these “entry points.”</td>
</tr>
<tr>
<td>/x</td>
<td>Basic MSI, InstallScript MSI</td>
<td>The <code>/x</code> option causes <code>Setup.exe</code> to uninstall a previously installed product.</td>
</tr>
</tbody>
</table>

**Tip** • If an installation contains InstallShield prerequisites and you want to extract them from `Setup.exe`, add a path after the `/a` parameter to extract the prerequisites to that location. A sample command is `Setup.exe /a"C:\temp"`.

ISP-2600-UG00 InstallShield 2020 User Guide

Table 13-14 • Parameters for Special Installation Modes (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/uninst</td>
<td>InstallScript,</td>
<td><strong>Important</strong> • This parameter does not apply to InstallScript MSI projects in which the InstallScript UI style is the new style (which uses the InstallScript engine as an embedded UI handler). To learn more, see Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations. The /uninst option is provided for compatibility with earlier versions of InstallShield. This option causes the InstallScript engine to execute the event handler function OnUninstall, whose default code uninstalls the previously installed product.</td>
</tr>
<tr>
<td></td>
<td>InstallScript MSI</td>
<td></td>
</tr>
<tr>
<td>/removeonly</td>
<td>InstallScript,</td>
<td>The /removeonly option sets the REMOVEONLY system variable equal to a non-zero value. The default code for the OnMaintUIBefore event handler function conditionally displays the SdWelcomeMaint dialog, depending on the value of REMOVEONLY.</td>
</tr>
<tr>
<td></td>
<td>InstallScript MSI</td>
<td></td>
</tr>
<tr>
<td>/instance=&lt;InstanceId&gt;</td>
<td>Basic MSI</td>
<td>The /instance=&lt;InstanceId&gt; option—which is available for Basic MSI projects that support the installation of multiple instances of a product—lets you specify which instance you want to install, update, or uninstall. &lt;InstanceId&gt; represents the value of theInstanceId property that identifies the instance. Whenever you use this option and include a valid InstanceId value, the installation suppresses the instance selection dialog. For example, the following sample command line installs the instance that has 2 as the value of the InstanceId property: Setup.exe /instance=2 Use default to identify the instance that is installed by the base installation package, as in the following example: Setup.exe /instance=default To specify the instance that you want to uninstall, include the /x option with the /instance=&lt;InstanceId&gt; option. For more information, see Naming an Instance and Run-Time Behavior for Installing Multiple Instances of a Product.</td>
</tr>
</tbody>
</table>
### Passing Data to the Installation

#### Table 13-15 • Parameters for Passing Data to the Installation

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/v</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Use the /v option to pass command-line options and values of public properties through to Msiexec.exe.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If you want to pass more than one argument to Msiexec.exe, you can use the /v option multiple times at the command line, once for each argument. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Setup.exe /v&quot;/l*v c:\test.log&quot; /v&quot;MYPROPERTY1=value1&quot; /v&quot;/qb&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>As an alternative, you can pass multiple arguments through the /v option as in the following example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Setup.exe /v&quot;/l*v c:\test.log MYPROPERTY1=value1 /v&quot;/qb&quot;</td>
</tr>
<tr>
<td>/v&quot;ISSCRIPTCMDLINE=&quot;&lt;Option1&gt;&lt;Option2&gt;&quot;&quot;</td>
<td>Basic MSI projects that have InstallScript custom actions</td>
<td>This option specifies command-line parameters to be passed to the script. Any property supported by InstallScript MSI (where appropriate) can be specified. (The most common ones are /d and /z.) For example, the following indicates that you want to debug the script, and that the CMDLINE variable should contain TEST.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Setup.exe /v&quot;ISSCRIPTCMDLINE=&quot;-d -zTEST&quot;&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note that as shown above, when you want to specify that a double quote character is not a delimiter for the command line but a delimiter for the property, use &quot;.&quot;. Note also that as with any public Windows Installer property, this property should be specified with all uppercase letters.</td>
</tr>
<tr>
<td>/z</td>
<td>InstallScript MSI</td>
<td>The /z option is used to pass data to the InstallScript system variable CMDLINE, as in the following example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Setup.exe /z&quot;My Custom Data&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When this command line is used, the variable CMDLINE contains the string My Custom Data.</td>
</tr>
</tbody>
</table>
### Download and Cache Locations (Basic MSI and InstallScript MSI Projects)

#### Table 13-16 • Parameters for Download and Cache Locations

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/ua</td>
<td>Basic MSI, InstallScript MSI</td>
<td>In the Release Wizard, you can specify download locations for the Windows Installer installers InstMsiA.exe and InstMsiW.exe. A user can specify an alternative URL at run time using the /ua option (for the InstMsiA.exe location) and /uw option (for the InstMsiW.exe location), as in the following example: Setup.exe /ua&quot;<a href="http://www.otherlocation.com/engines">http://www.otherlocation.com/engines</a>&quot; The file name is not necessary.</td>
</tr>
<tr>
<td>/uw</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Note • You must specify the full URL with the parameters.</td>
</tr>
<tr>
<td>/um</td>
<td>Basic MSI, InstallScript MSI</td>
<td>In the Release Wizard, for a Web Downloader build, you can specify a download location for your .msi database. A user can specify an alternative URL using the /um option, as in the following example: Setup.exe /um&quot;<a href="http://www.otherlocation.com/packages/product.msi">http://www.otherlocation.com/packages/product.msi</a>&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note • You must specify the full URL with the parameter.</td>
</tr>
<tr>
<td>/b</td>
<td>Basic MSI, InstallScript MSI</td>
<td>In the Release Wizard, for a Downloader build, you can specify whether to cache the contents of a compressed package on the local system. With the /b option, the user can specify the directory in which to cache the installation files, as in the following example: Setup.exe /b&quot;C:\CacheDirectory&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note • You must specify the full URL with the parameter.</td>
</tr>
</tbody>
</table>
Debugging

Table 13-17 • Parameters for Debugging

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/d</td>
<td>Basic MSI projects with InstallScript custom actions, InstallScript, InstallScript MSI</td>
<td>For an InstallScript project, running the command <code>Setup.exe /d</code> runs the installation program with the InstallScript Debugger.</td>
</tr>
</tbody>
</table>

Note • Debugging InstallScript code requires the debug-information file `Setup.dbg` to be available. In addition, in order to debug an installation on a system other than your development machine, you need to copy certain files from your development machine to the debugging machine. To learn more, see Debugging an Installation on Any Computer.

For a Basic MSI project, the following command runs your InstallScript custom actions in the InstallScript Debugger:

```
Setup.exe /v"ISSCRIPTDEBUG=1 ISSCRIPTDEBUGPATH="path-to-Setup.dbg""
```
The `/debuglog` parameter lets you generate a log file for `Setup.exe`. To generate a log named `InstallShield.log` in the same directory as the `Setup.exe` file, pass just the command-line parameter. Note that this does not work if the `Setup.exe` file is in a read-only location. For example:

```
setup.exe /debuglog
```

To specify the name and location of the log file, pass the path and name, as in the following example:

```
Setup.exe /debuglog"C:\PathToLog\setupexe.log"
```

To generate a log file for the feature prerequisites in the installation, use the `/v` parameter to set the `ISDEBUGLOG` property to the full path and file name for the log file, as follows:

```
Setup.exe /debuglog"C:\PathToSetupLogFile\setup.log" /v"ISDEBUGLOG=prereq.log"
```

You can use directory properties and environment variables in the path for the feature prerequisite log file.

Additionally, use the option `/newlog` with the `/debuglog` parameter or set the **Always Create Debug Log** option to Yes in the IDE setting to overwrite the existing debug log and create the log(s) newly.

To overwrite the existing log named `InstallShield.log` in the same directory as the `Setup.exe` file, pass just the command-line parameter. For example, `setup.exe /debuglog /newlog`.

To specify the name and location of the existing log file to overwrite, pass the path and name, as in the following example:

```
setup.exe /debuglog"C:\PathToLog\setupexe.log" /newlog
```

**Note** • *The message “The setup command line is invalid. The Setup cannot proceed” will be shown when /newlog option was not used with /debuglog parameter or the Always Create Debug Log option is not set to Yes.*
SMS Data

Table 13-18 • Parameters for SMS Data

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| /m        | InstallScript, InstallScript MSI | The /m option causes Setup.exe to generate an SMS Management Information Format (.mif) file. Following is a typical command:  
  Setup.exe /m"SampleApp"  
  Including the “.mif” file extension is not necessary. |
| /m1       | InstallScript, InstallScript MSI | Using the /m1 parameter (along with /m) enables you to specify a serial number to be written to the .mif file. A typical command is as follows:  
  Setup.exe /m"SampleApp" /m1"1234-5678" |
| /m2       | InstallScript, InstallScript MSI | Using the /m2 parameter (along with /m) enables you to specify a locale string to be written to the .mif file. A typical command is as follows:  
  Setup.exe /m"SampleApp" /m2"ENU" |

Minimum UI

Table 13-19 • Parameters for Minimum UI

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| /passive  | Advanced UI, Suite/Advanced UI | Use the /passive parameter to runs a suite installer setup in a minimum UI mode (just displaying a progress panel):  
  Setup.exe /passive  
  To uninstall using a minimum UI mode, use the following command:  
  Setup.exe /passive /remove |
### Miscellaneous

Table 13-20 • Parameters for Miscellaneous

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/delayedstart:&lt;number of seconds&gt;</td>
<td>InstallScript</td>
<td>Specifies the amount of time (in seconds) by which initialization of the installation is delayed after Setup.exe is launched.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> • Using the -delayedstart option is recommended when manually launching an additional installation after reboot (for example, by using the RunOnce key). The delay allows the operation system to initialize completely; this prevents the problems—such as Remote Procedure Call (RPC) errors—that can occur if an installation initializes before the operating system has initialized completely. The recommended delay length is 30 seconds. Note that this option is not needed when the installation starts automatically after reboot (for example, due to a call to SdFinishReboot before reboot).</td>
</tr>
<tr>
<td>/runfromtemp</td>
<td>Basic MSI, InstallScript, InstallScript MSI</td>
<td>This parameter allows the setup author to always clone the setup and run it from the temporary directory, even if the setup does not meet the conditions for running from the temporary directory. This parameter is ignored if the setup is a self-extracting executable file (.exe).</td>
</tr>
<tr>
<td>/Clone_wait</td>
<td>InstallScript, Basic MSI, InstallScript MSI, Suite/Advanced UI</td>
<td>This parameter indicates that the original setup should wait for the cloned setup process to complete before exiting.                                                                                                       By default, the original setup is enabled to wait for the completion of the installation process. For more information on Clone_wait, see Changing the Default Clone_wait Parameter for the Setup.</td>
</tr>
<tr>
<td>/extract_all:&lt;path&gt;</td>
<td>InstallScript</td>
<td>Specifies that a self-extracting package's files should not be run but simply extracted to the location that is specified by &lt;path&gt;.</td>
</tr>
</tbody>
</table>
Chapter 13
Command-Line Tools

The build engine automatically creates an installation that supports Setup.exe cloning in cases where cloning is required (for example, multi-disk installations). If you need to do this manually, pass /h to Setup.exe and it will clone itself to a temporary location and run from that location.

/hide_progress

Basic MSI, InstallScript MSI

Suppresses the display of any small and standard progress dialogs that might be shown during initialization.

The small progress dialog is usually used for installations that display a splash screen during initialization, since a standard-size progress dialog does not leave any space for the splash screen. Specifying the /hide_progress option hides the small progress dialog for those installations, so end users would see just the splash screen without any progress indication.

Note • For InstallScript installations: If you specify /hide_progress and include a splash screen in your InstallScript installation, the length of time that the splash screen is displayed depends on whether SmallProgress=Y or SmallProgress=N is specified in Setup.ini.

• If SmallProgress=Y is specified, the splash screen is shown for as long as the progress dialog would have been displayed if /hide_progress was not specified.

• If SmallProgress=N is specified, the splash screen is shown for the length of time specified in the SplashTime key; thus, using /hide_progress and SmallProgress=Y at the same time is not recommended.

For InstallScript MSI installations: If you include a splash screen, the installation automatically switches to the small progress dialog, and the splash screen is shown only during the time that the progress dialog is displayed. Note that this is true even if /hide_progress is specified. Therefore, it is recommended that you avoid using /hide_progress with a splash screen in InstallScript MSI installations.
### Table 13-20 • Parameters for Miscellaneous (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/hide_splash</td>
<td>InstallScript,</td>
<td>Suppresses the display of the splash screen if one is included.</td>
</tr>
<tr>
<td></td>
<td>InstallScript, MSI</td>
<td></td>
</tr>
<tr>
<td>/hide_usd</td>
<td>InstallScript</td>
<td>Suppresses display of the dialog that is displayed by an update-enabled installation to let the end user select which instance of your product will be updated. This dialog is displayed by default when an update-enabled installation detects multiple previous instances. When this command-line option is used and an update-enabled installation detects multiple previous instances, the installation creates a new instance.</td>
</tr>
<tr>
<td>/ig{InstanceGUID}</td>
<td>InstallScript</td>
<td>Specifies the value of the system variable INSTANCE_GUID; for example, -ig{722C7440-B317-4B3B-AECA-0199EA4E7CDB}. If this option is not used, the installation automatically assigns a value to INSTANCE_GUID (for multi-instance installations, this value is a newly generated GUID; for standard installations, this value is the same as the value of PRODUCT_GUID). This option is useful if you have created an installation launcher—that is, a custom application that runs before your installation does to perform pre-setup tasks, such as determining the instance GUID that you want to use for the installation. Do not specify anything other than a valid GUID with this option.</td>
</tr>
<tr>
<td>/installfromweb&quot;PathToDisk1Files&quot;</td>
<td>InstallScript</td>
<td>This option is similar to the media_path option except that this option forces the installation to behave like a launched One-Click Install installation, even if the path to the media files is not a URL. Use this option if you are launching the installation from a Web page manually. In addition, this option is added automatically if the built-in Setup.ocx file is used to launch the installation.</td>
</tr>
</tbody>
</table>
### Table 13-20 • Parameters for Miscellaneous (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/media_path&quot;PathToDisk1Files&quot;</td>
<td>InstallScript</td>
<td>This option indicates that the installation should look for the Disk1 files in the location that is specified. Note that only the Setup.exe file needs to be in the original launch location; the installation obtains all other required files from the specified location (including Setup.exe, which must be present in the media location). You can specify a URL as the path to the media files; in this case, the installation behaves like a launched One-Click Install installation, which always shows the security dialog. To learn more about the behavior of One-Click Install installations, see One-Click Install Installations in InstallScript Projects.</td>
</tr>
<tr>
<td>/L&lt;LanguageID&gt;</td>
<td>Basic MSI, InstallScript, InstallScript MSI</td>
<td>This option indicates that the installation should run in the specified language as specified. You can specify the language ID as either a hexadecimal or decimal number. If you specify the hexadecimal number, be sure to proceed the value with 0x. For example, the following commands indicate that the installation should be run in German: Setup.exe -L0x0407 Setup.exe -L1031 Note that if you specify a language ID that is not supported by the installation or you specify an invalid language ID, the parameter is ignored. Also note that if this parameter is specified and it is valid, the language dialog (if enabled) is automatically suppressed.</td>
</tr>
<tr>
<td>/w</td>
<td>Basic MSI, InstallScript MSI</td>
<td>For a Basic MSI project, the /w option forces Setup.exe to wait until the installation is complete before exiting. Note • If you are using the /w option in a batch file, you may want to precede the entire Setup.exe command-line option with start /WAIT. A properly formatted example of this usage is as follows: start /WAIT setup.exe /w</td>
</tr>
<tr>
<td>/SMS</td>
<td>InstallScript MSI</td>
<td>For an InstallScript MSI project, Setup.exe automatically waits for the installation to finish before exiting, so this option (used by earlier versions of InstallShield Professional) is no longer necessary.</td>
</tr>
</tbody>
</table>
User-Defined Command-Line Parameters

**Project** • This information about user-defined command-line parameters applies to InstallScript projects.

*For user-defined command-line parameters in InstallScript MSI projects, use the -z command-line parameter that is described above.*

Along with the command-line parameters that are listed above, -bd, -f, and -zi are command-line parameters that are reserved for use in InstallScript projects. User redefinition of these command-line parameters, either uppercase or lowercase, can cause errors.

You can define your own command-line arguments, which are copied to the system variable CMDLINE as at run time. Like predefined command-line parameters, you can pass custom arguments directly to Setup.exe, place them in Setup.ini, or (for testing purposes while you are using the InstallShield IDE) place them in the Settings dialog box, which is displayed when you click Settings on the Build menu in InstallShield.

**Note** • Setup.exe initializes correctly even on systems with more than 256 MB of memory and always stays in memory until the setup is complete. Due to the nature of DOS, when you launch Setup.exe from the command line, a DOS prompt is quickly returned although Setup.exe is still in memory.

Creating a Setup Launcher

Advanced UI and Suite/Advanced UI Setup.exe Command-Line Parameters

InstallShield 2020

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the Professional edition of InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.
The Setup.exe setup launcher for Advanced UI and Suite/Advanced UI installations can accept a number of command-line parameters. Note that passing undefined parameters or invalid property definitions results in an invalid command-line error.

**Table 13-21 • Parameters for Advanced UI and Suite/Advanced UI Setup Launchers**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/d</td>
<td>The /d parameter lets you debug the InstallScript actions in your Suite/Advanced UI installation with the InstallScript Debugger.</td>
</tr>
<tr>
<td>/d&quot;PathTo.dbgFile&quot;</td>
<td>Note • Debugging InstallScript code requires the debug-information file Setup.dbg to be available. In addition, in order to debug an installation on a system other than your development machine, you need to copy certain files from your development machine to the debugging machine. To learn more, see Debugging an Installation on Any Computer.</td>
</tr>
</tbody>
</table>

The following command runs your InstallScript custom actions in the InstallScript Debugger:

```
Setup.exe /d
```

If the installation is located in a path at which they were originally compiled, you also need to specify the path to your debug symbols file (.dbg):

```
Setup.exe /d"Path-to-Setup.dbg"
```

For more information about InstallScript actions in Suite/Advanced UI projects, see Working with an Action that Runs InstallScript Code in a Suite/Advanced UI Installation.

For more information on debugging issues, see Troubleshooting Issues with an Advanced UI or Suite/Advanced UI Installation.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/debuglog</td>
<td>The /debuglog parameter lets you generate a log file for Setup.exe.</td>
</tr>
<tr>
<td>/debuglog&quot;PathToLog&quot;</td>
<td>To generate a log named InstallShield.log in the same directory as the Setup.exe file, pass just the command-line parameter. Note that this does not work if the Setup.exe file is in a read-only location. For example:</td>
</tr>
<tr>
<td></td>
<td>Setup.exe /debuglog</td>
</tr>
<tr>
<td></td>
<td>To specify the name and location of the log file, pass the path and name, as in the following example:</td>
</tr>
<tr>
<td></td>
<td>Setup.exe /debuglog&quot;C:\PathToLog\setup.exe.log&quot;</td>
</tr>
<tr>
<td></td>
<td>For more information, see Troubleshooting Issues with an Advanced UI or Suite/Advanced UI Installation.</td>
</tr>
</tbody>
</table>
The `/language:LCID` parameter indicates that the installation should run in the specified language as specified. Specify the language ID as a decimal number. For example, to indicate that the installation should be run in German, pass the language ID as follows:

```
Setup.exe /language:1031
```

Note that if you specify a language ID that is not supported by the installation or you specify an invalid language ID, the parameter is ignored. Also note that if this parameter is specified and it is valid, the language wizard page (if enabled) is automatically suppressed.

The `/log` parameter lets you generate a log file for each package in the Advanced UI or Suite/Advanced UI installation for which logging is enabled. To generate package log files in a particular folder, pass the folder path with the `/log` parameter to the Advanced UI or Suite/Advanced UI Setup.exe file. You can optionally separate the `/log` parameter and the path with a colon. For example, both of the following command lines generate a log file in the `PathToLogFiles` folder:

```
Setup.exe /log:C:\PathToLogFiles
Setup.exe /log:"C:\PathToLogFiles"
```

Note that the path to the log file location must already exist.

To generate package log files in the `%TEMP%` directory, leave out the path. For example:

```
Setup.exe /log
```

Note that logging must be enabled for a package, and the package’s logging-related settings (which vary, depending on whether the package is an .msi package, an .msp package, some other type of package) must be configured in the Packages view. For more information, see Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation.

If you configured the password-related settings for your release on the Setup.exe tab in the Releases view, the end user must specify the password with the `/password` parameter at run time during a silent installation. A typical command is as follows:

```
Setup.exe /silent /password:MyPassword
```
You can pass properties to the Advanced UI or Suite/Advanced UI installation in more than one way. Following are examples:

```
Setup.exe MyPropertyName=MyPropertyValue
Setup.exe /MyPropertyName:MyPropertyValue
```

To clear the value of a property, even if it is set by the Advanced UI or Suite/Advanced UI Setup.xml file, use the following syntax:

```
Setup.exe MyPropertyName=
```

The following properties have special meaning to the Advanced UI or Suite/Advanced UI installation when they are passed on the command line:

- **ISFeatureInstall**—This property provides a comma-delimited list of feature names that are to be installed with the current installation operation. It is intended for a silent first-time installation.

- **ISFeatureRemove**—This property provides a comma-delimited list of feature names that are to be removed with the current installation operation. It is intended for maintenance installations.

For more information, see Advanced UI and Suite/Advanced UI Property Reference.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PropertyName=Value</td>
<td>You can pass properties to the Advanced UI or Suite/Advanced UI installation in more than one way. Following are examples:</td>
</tr>
<tr>
<td>/PropertyName:Value</td>
<td>Setup.exe MyPropertyName=MyPropertyValue</td>
</tr>
<tr>
<td>PropertyName=</td>
<td>Setup.exe /MyPropertyName:MyPropertyValue</td>
</tr>
<tr>
<td>/remove</td>
<td>The /remove parameter uninstalls the packages that are currently installed on the target system and that were installed by the Advanced UI or Suite/Advanced UI installation. This option also removes the Advanced UI or Suite/Advanced UI installation’s entry in Add or Remove Programs if the maintenance condition in the Advanced UI or Suite/Advanced UI Setup.xml file is false.</td>
</tr>
<tr>
<td>/repair</td>
<td>The /repair parameter repairs the packages that are currently on the target system and that were installed by the Advanced UI or Suite/Advanced UI installation.</td>
</tr>
<tr>
<td>/silent</td>
<td>The /silent parameter runs the installation without a user interface.</td>
</tr>
</tbody>
</table>
For information on how to specify command lines that you want an Advanced UI or Suite/Advanced UI installation to use when launching one of its packages, see Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation.

Advanced UI and Suite/Advanced UI Property Reference
Creating Advanced UI and Suite/Advanced UI Installations

Setup.exe (InstallScript Projects)

Setup.exe is the main installation executable file; it performs installation initialization and launches the installation engine to execute the installation on the target system.

When you create and build a release, Setup.exe and other setup engine redistributable files are placed in the Disk1 folder. You must ship these files on Disk1 of your distribution media.
**Note** • You can rename Setup.exe to any valid file name, such as Install.exe. Note that for the installation to be launched by another installation using the DoInstall function, the launched installation’s Setup.ini file must have the new file name in the [Startup] section’s LauncherName key.

You can pass command-line options directly to Setup.exe, or you can place them in Setup.ini. For testing purposes, while you are using InstallShield, you can pass command-line options to Setup.exe through the Run/Debug tab of the Settings dialog box, which is displayed when you click Settings on the Build menu.

**Note** • A self-extracting executable file accepts any command-line parameter that Setup.exe accepts.

For a list of supported parameters, see Setup.exe and Update.exe Command-Line Parameters.
Frequently Asked Questions

InstallShield 2020

This section lists common questions (sorted by topic) and provides links to answers. Where the techniques or steps to perform a specific task are different in different project types, answers for each project type are displayed.

Project Types

- Which project type should I use?
- How do I convert my project to a different project type?
  - Why do I get “error C8025 ‘INSTALLDIR’: undefined identifier” when compiling my script after conversion?
  - Why do I get the following error: “String PRODUCT_NAME was not found in string table”?

Files and Folders

- What is the difference between INSTALLDIR and TARGETDIR?
- How does Windows Installer determine whether to overwrite an existing file?
- How do I register a COM server?
- How do I install, start, stop, delete, uninstall, or configure a Windows service?
- How do I create an empty folder?
- How do I set a key file for a dynamic file link?
- What happens if I put more than one executable file in the same component?

Features and Components

- How do I conditionally select a feature?
- How do I conditionally hide a feature?
- Why should I use uppercase directory identifiers when setting component destinations?
- How do I change the value in the Link To column for a component?
Redistributables

- How do I add the Windows Installer to my project?
- How do I add the .NET Framework to my project?

Shortcuts

- How do I create an Internet shortcut?
- How do I create a shortcut to a folder?

Registry

- How do I read data from the registry?
- How do I write a property's value to the registry?

InstallScript

- How do I find out what sort of built-in functions are available in the InstallScript language?
- What is the maximum number of statements that I can use in a compiled script file? What other limits exist for InstallScript?

INI Files

- How do I read data from an .ini file?
- How do I get all key names from an .ini file?

Properties

- How do I get or set a Windows Installer property in InstallScript?
- Why does my deferred custom action show a blank value for a Windows Installer property?

Conditions

- How do I detect administrator privileges?
- How do I detect a first-time installation?
- How do I call a function only during the installation sequence?
- How do I detect if the user has selected a specific feature?
- How do I detect if the user is running a particular operating system?

End-User Interface

- How do I populate a list box at run time?
- How do I display a file browse dialog?
- How do I display a network browse dialog?
Custom Actions

• How do I search for a file on the end user’s system?
• How do I launch my application after the installation is complete?
• How do I place a file in the .msi database and extract it during run time?
• How do I exit the installation from within a custom action?
• How can I use the INSTALLDIR variable after I have created a custom action that runs VBScript code?
• How can I change ODBC properties (like DBQ and SystemDB) through script?

SQL Scripts

• How do I override the default SQL run-time behavior?
• How can I control the execution of a SQL script based on certain conditions in an InstallScript project?
• How do I enforce a server-side installation in an InstallScript project?
• How do I enforce a SQL server-side installation in a Windows Installer-based project?
• How do I handle SQL run-time errors?
• How do I ensure that my SQL scripts run only against a full of SQL Server?

Building Releases

• How do I build my release from the command line?
• How do I change project settings from the command line?

Deployment

• How do users run my installation in silent mode?

Uninstallation

• How do I remove files that were created by my product?
• How do I remove registry data created by my product?

Answers to many other questions are available in the Knowledge Base.
### Glossary

#### InstallShield 2020

Non-Alphanumeric A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>.bin file</td>
<td>A binary file that is executable on UNIX platforms. Application files usually have a .bin extension.</td>
</tr>
<tr>
<td>.bmp file</td>
<td>A bitmap file of an image represented as an array of bits. In bitmap graphics, an image is displayed on the screen as a collection of tiny squares called pixels, which together form a pattern. Each pixel in the image corresponds with one or more bits.</td>
</tr>
<tr>
<td>.cab file</td>
<td>See cabinet file.</td>
</tr>
<tr>
<td>.command file</td>
<td>A command file that is executable on Mac OS X platforms. Application files usually have a .command extension.</td>
</tr>
<tr>
<td>.cub file</td>
<td>A validation module that stores and provides access to custom actions for internal consistency evaluators (ICEs). See also custom action and internal consistency evaluator.</td>
</tr>
<tr>
<td>.exe file</td>
<td>An executable binary file on Windows platforms. Application files usually have an .exe file extension.</td>
</tr>
<tr>
<td>.gif file</td>
<td>A graphics interchange format file supported on the Web. This type of file is in a bit-mapped graphics file format used for displaying bitmap images. These files use lossless compression, a method of compression in which no data is lost. This type of file supports up to 256 colors; it also supports transparency, where the background color can be set to transparent to let the color on the underlying page show through. This type of file format is more suitable than the .jpg file format for images with only a few distinct colors, such as line drawings.</td>
</tr>
</tbody>
</table>
### Table -1 • InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>.idt file</td>
<td>An exported Windows Installer database table.</td>
</tr>
<tr>
<td>.ism file</td>
<td>The working file that InstallShield uses to store project information. When you build a release, InstallShield uses the .ism file to create an .msi file for distribution.</td>
</tr>
<tr>
<td>.jar file</td>
<td>A Java archive file that contains the classes, images, and sound files for an installation, zipped up into a single file.</td>
</tr>
<tr>
<td>.jpg file</td>
<td>Also known as JPEG, which is the abbreviation for Joint Photographic Experts Group, the original name of the committee that wrote the standard. This type of file is one of the image file formats supported on the Web. The file uses lossy compression, a type of compression in which color and grayscale continuous-tone images are compressed and some data is lost to eliminate redundant or unnecessary information. These images support 16 million colors and are best suited for photographs and complex graphics.</td>
</tr>
<tr>
<td>.mif file</td>
<td>A management information format file used to describe a hardware or software component.</td>
</tr>
<tr>
<td>.msi file</td>
<td>The Windows Installer installation package in its finished state. It includes installation resource files and can have compressed within it all of the application’s data files. The .msi file is the one that is distributed to the end users and will interact with the Windows Installer service to install your application on their machines.</td>
</tr>
<tr>
<td>.msm file</td>
<td>The database file of a merge module. This type of file contains all of the installation properties and installation logic for the module. See also merge module.</td>
</tr>
<tr>
<td>.msp file</td>
<td>A Windows Installer patch file. This type of file consists of a summary information stream, transform storages, and cabinet files. An .msp file contains at least one database transform that adds patching information to the database of its target installation package. The installer uses this patching information to apply the patch files that are stored in the cabinet files.</td>
</tr>
<tr>
<td>.mst file</td>
<td>A transform package. This type of file is a simplified Windows Installer database that contains the differences between two .msi databases. Transforms enable administrators to apply modified settings to a database when they are deploying an installation package. See also transform.</td>
</tr>
<tr>
<td>.NET</td>
<td>An operating system platform that Microsoft created for connecting information, people, systems, and devices. The .NET environment enables developers to build, create, and deploy their applications and Web services using whatever languages they prefer via the common language run time.</td>
</tr>
<tr>
<td>.NET Compact Framework</td>
<td>A scaled-down version of the .NET Framework designed to run on resource-constrained devices, such as mobile devices. The .NET Compact Framework is currently available only for Pocket PC and Windows CE .NET devices, with support for more devices forthcoming.</td>
</tr>
</tbody>
</table>
### Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>.NET Framework</td>
<td>A programming infrastructure that Microsoft created for building, deploying, and running applications and services that use .NET technologies such as Web services. The .NET Framework consists of three main parts: the common language run time, a hierarchical set of unified class libraries, and a componentized version of Active Server Pages called ASP.NET.</td>
</tr>
<tr>
<td>.ocx file</td>
<td>An object linking and embedding (OLE) custom control file. This type of file is a cross-platform COM file that is called by an application to perform a function, such as the ability to resize windows.</td>
</tr>
<tr>
<td>.p12 file</td>
<td>A certificate file that conforms to public-key cryptography standard (PKCS) number 12, which specifies a portable format for securely storing or transporting a user’s private keys, certificates, miscellaneous secrets, and other information.</td>
</tr>
<tr>
<td>.pcp file</td>
<td>A Windows Installer patch creation properties file.</td>
</tr>
<tr>
<td>.prq file</td>
<td>A prerequisite file that contains information about a base application or component that must be installed on the target machine before the main application can be installed. Including setup prerequisites in installation projects enables developers to chain multiple installer files together into a single executable file.</td>
</tr>
<tr>
<td>.reg file</td>
<td>See registry file.</td>
</tr>
<tr>
<td>.scm file</td>
<td>A ScreenCam movie file.</td>
</tr>
<tr>
<td>.wmf file</td>
<td>A Windows metafile format file. This type of graphics file is used to exchange graphics information between Microsoft Windows-based applications.</td>
</tr>
<tr>
<td>absolute path</td>
<td>An absolute path includes all of the information necessary to locate a file by starting at the root directory of a specified drive. For example, C:\Program Files\InstallShield is the absolute path to the InstallShield folder when it is installed on drive C.</td>
</tr>
<tr>
<td>accessibility</td>
<td>The capacity or tendency to be available to all people, including those with disabilities.</td>
</tr>
<tr>
<td>acquisition phase</td>
<td>The phase of the installation process during which the installer queries the database for instructions. The acquisition phase is followed by the execution phase.</td>
</tr>
<tr>
<td>action</td>
<td>A command that performs an operation at a particular point during the execution of an installation or uninstallation wizard. Developers of installation packages can use built-in standard actions and create their own custom actions. Actions may display progress to the end user or allow the end user to cancel the operation.</td>
</tr>
<tr>
<td>active directory</td>
<td>A structure supported by Microsoft Windows 2000 that enables administrators to track and locate any object on a network. Active Directory is the directory service used in Windows 2000 Server for distributed computing environments.</td>
</tr>
</tbody>
</table>
### Table -1 • InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>active template library (ATL)</td>
<td>A set of classes for writing COM controls, resulting in smaller binaries than, for example, MFC.</td>
</tr>
<tr>
<td>ActiveX</td>
<td>A set of object-oriented programming technologies and tools. ActiveX enables developers to write applications so that other applications and the operating system can call them. ActiveX technology makes it possible to create interactive Web pages that look and behave like applications, rather than static pages.</td>
</tr>
<tr>
<td>administration</td>
<td>The act or process of managing something.</td>
</tr>
<tr>
<td>administration sequence</td>
<td>The list of actions that are executed when a user launches your installation with the /a command-line option. This is useful for network administrators who want to provide a common installation point on the network and prepare different installation criteria for multiple users. Each Administration sequence consists of a User Interface sequence and an Execute sequence.</td>
</tr>
<tr>
<td>administrative installation</td>
<td>Copies and uncompresses your data files to a directory specified by the user, but does not create shortcuts, register COM servers, or create an uninstallation log.</td>
</tr>
<tr>
<td>administrative privileges</td>
<td>The highest level of permission that can be granted to a computer user. Levels of permissions are necessary in networked environments to ensure system security and prevent damage to computer hardware and software. A user with administrative privileges can perform tasks such as install and uninstall software and change a computer’s configurations. Administrative privileges usually pertain to Windows NT 4.0, 2000, or XP machines as opposed to Windows 95, 98, or ME machines.</td>
</tr>
<tr>
<td>advertised shortcut</td>
<td>A shortcut to a product or feature that is not installed until the first time that the end user launches the shortcut. At run time of an installation, if the end user selects the &quot;This feature will be installed when required&quot; option for the product or the feature containing the shortcut, the shortcut is created but the component's files are not installed until the end user launches the shortcut. The first time the shortcut is launched, the Windows Installer service installs the component's files and other data and then the shortcut launches the target file. Every time the shortcut is used from then on, it behaves like a normal shortcut.</td>
</tr>
<tr>
<td>advertisement</td>
<td>A type of “just-in-time” installation in which features are not installed immediately during the installation process. Instead, they are installed on the fly when they are requested. When you enable feature advertisement, the feature is advertised, regardless of the mode in which the installation is running, as long as no other factors prevent it from being advertised. If you launch MsiExec. exe from the command line with the /jm option, the feature is advertised to the end user’s machine. If you use the /ju function, the feature is advertised to the current end user. In the Custom Setup dialog, the end user can control which features are immediately installed and which are available later. The two types of advertising are assigning and publishing. See also assigning; publishing.</td>
</tr>
</tbody>
</table>
### Table 1 • InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>advertisement sequence</td>
<td>The advertisement sequence contains the list of actions that are executed when a user launches your installation with the /j command-line option. Validation rule ICE78 requires the advertisement user interface sequence to be empty.</td>
</tr>
<tr>
<td>advertising</td>
<td>The process of presenting to end users features that are not installed immediately during the installation process. Instead, these features are installed on the fly when they are requested. See also advertisement.</td>
</tr>
<tr>
<td>AlwaysInstallElevated</td>
<td>A user policy that can be configured for Windows platforms under the following registry keys: HKEY_LOCAL_MACHINE\Software\Policies\Microsoft\Windows\Installer and HKEY_CURRENT_USER\Software\Policies\Microsoft\Windows\Installer. To install a package with elevated (system) privileges, set the AlwaysInstallElevated value under both of these registry keys to 1.</td>
</tr>
<tr>
<td>American Standard Code for Information Interchange (ASCII)</td>
<td>The code that represents letters, numbers, punctuation marks, and other characters such as numbers, with each character assigned a value between 0 to 127. This code enables different types of computers and computer applications to exchange data.</td>
</tr>
<tr>
<td>animation</td>
<td>Multiple graphic images that are alternately changed and displayed at a specified number of frames per second to produce the illusion of movement.</td>
</tr>
<tr>
<td>API</td>
<td>See application programming interface.</td>
</tr>
<tr>
<td>app paths</td>
<td>The registry key that Windows uses to find your application and its .dll files if their locations are not already in the system’s path. App paths entries can be set through the component’s advanced settings.</td>
</tr>
<tr>
<td>application programming interface (API)</td>
<td>A set of routines that an application uses to communicate with the computer’s operating system and that the operating system uses to make services available to the application.</td>
</tr>
<tr>
<td>ASCII</td>
<td>See American Standard Code for Information Interchange.</td>
</tr>
<tr>
<td>assigning</td>
<td>A type of advertisement. If an administrator assigns an application to a machine, the installation program automatically runs the next time that the machine starts or restarts. If the administrator assigns an application to a user, the installation program places a shortcut on the Start menu of the user’s machine. When the user selects the shortcut or launches a document associated with the assigned application, the application is installed.</td>
</tr>
<tr>
<td>asynchronous execution</td>
<td>A custom action that independently continues with the execution of its thread while the installer executes the main installation.</td>
</tr>
<tr>
<td>ATL</td>
<td>See active template library.</td>
</tr>
</tbody>
</table>
### Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>autonomic computing</td>
<td>A self-managed computing model named after, and patterned on, the human body’s autonomic nervous system. An autonomic computing system would control the functioning of computer applications and systems without input from users, similar to the way that the human body’s autonomic nervous system regulates and protects the body.</td>
</tr>
<tr>
<td>auto-repair</td>
<td>The automatic restoring of an application to its original state by the installer. A partial or complete application reinstallation might be required if any files associated with any feature are missing or corrupted.</td>
</tr>
<tr>
<td>basic UI</td>
<td>One level of the installer’s internal user interface (UI) capabilities. Typically, installation packages that are built with the basic UI level display built-in modeless dialog that show progress messages and disc prompt messages. They do not display any authored dialogs.</td>
</tr>
<tr>
<td>billboards</td>
<td>Images, such as marketing messages, that can be displayed during installation.</td>
</tr>
<tr>
<td>Binary table</td>
<td>A table that holds the binary data for items such as bitmaps and icons. It also contains data for custom actions.</td>
</tr>
<tr>
<td>bitmap</td>
<td>A representation of an image presented as an array of bits. In bitmap graphics, an image is displayed on the screen as a collection of tiny squares called pixels, which together form a pattern. Each pixel in the image corresponds with one or more bits.</td>
</tr>
<tr>
<td>cabinet file</td>
<td>A single file that holds a number of compressed files. During installation of an application, the compressed files are decompressed and copied to your computer. Cabinet files are efficient because they save space and time when distributing software. A cabinet file usually has the file extension .cab. Missing or corrupt files may prevent installations from completing. It may be necessary to replace missing or corrupt operating system files or InstallShield files by extracting them from a cabinet file.</td>
</tr>
<tr>
<td>cache</td>
<td>A cache (pronounced cash) is a temporary storage area for frequently accessed data. The purpose of caching is to store frequently used information in a location that is easy to access, resulting in a faster-running computer. There are two types of cache: memory cache and disc cache. Memory cache stores the data and the address of where the data is stored in main memory. Memory caching is useful because most applications access the same data repeatedly. Disc caching uses the main memory. It is used to hold information that has recently been requested from the hard disc or has previously been written to the hard disc. In general, installations usually use the disc cache. When data is read from or written to main memory, a copy is also saved in the memory cache. When data is called for, the computer first checks the memory cache, then the disc cache, and finally main memory.</td>
</tr>
<tr>
<td>caption</td>
<td>A text heading in a window. The windows caption is what users click and drag to position the active window on the screen.</td>
</tr>
<tr>
<td>CBT</td>
<td>See computer-based training.</td>
</tr>
<tr>
<td>CD</td>
<td>See compact disc.</td>
</tr>
</tbody>
</table>
### Table 1: InstallShield Glossary

<table>
<thead>
<tr>

<tr>
<td>COM file</td>
<td>Binary software components containing reusable code that can be shared across products. A popular example of a COM file is a Microsoft Excel spreadsheet when it is embedded in a Word document. In this example, Excel acts as the COM server and Word acts as the client.</td>
</tr>
<tr>
<td>COM server</td>
<td>An executable file that exposes objects to other applications according to the Component Object Model (COM) specification. The types of objects exposed by a COM server may include ActiveX controls, ActiveX documents, Automation objects, or MTS components.</td>
</tr>
<tr>
<td>COM+ file</td>
<td>An extended COM file. With regard to installations, COM+ adds greater support for building distributed components. For example, you can create appId keys and values in the registry and thereby configure various COM components to run remotely or with special privileges.</td>
</tr>
<tr>
<td>command</td>
<td>(1) An instruction given to a computer.</td>
</tr>
<tr>
<td></td>
<td>(2) An instruction that the operating system executes from the command line or a Command Prompt window to perform a specific task. If errors occur during installation, you may, for example, need to execute commands to run utilities, search your computer’s directories, or delete files.</td>
</tr>
<tr>
<td>command line</td>
<td>The area of the Command Prompt window in which commands are typed. A command line is used to pass commands to executable files (for example,.exe, .bin).</td>
</tr>
<tr>
<td>command prompt</td>
<td>The Command Prompt window is the interface to MS-DOS. To access the Command Prompt window, click Run on the Start menu, and then type command.com in Windows 95, 98, and ME or cmd.exe in Windows NT, 2000, or XP. If errors occur during installation, you may need to open the Command Prompt window to enter commands to run utilities or search your computer’s directories, for example.</td>
</tr>
<tr>
<td>command-line option</td>
<td>A command-line option is an argument to a command that changes how the command is executed. See also command.</td>
</tr>
</tbody>
</table>
### Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>commit execution</td>
<td>Execution of a Windows Installer action upon completion of the InstallFinalize action, which occurs when the installation has completed transferring files, registering COM servers, and creating shortcuts and registry entries.</td>
</tr>
<tr>
<td>committing databases</td>
<td>Accumulated changes made in a Windows Installer database. The changes are not reflected in the actual database until the database is committed, that is, until MsiDatabaseCommit is called.</td>
</tr>
<tr>
<td>compact disc (CD)</td>
<td>A disc used for electronically recording, storing, and playing back audio, video, and other information in digital form.</td>
</tr>
<tr>
<td>compact disc read-only memory (CD-ROM)</td>
<td>A type of compact disc that is only readable.</td>
</tr>
<tr>
<td>component</td>
<td>Elements of the application from the installation developer’s perspective. Components are not visible to the end user. When the end user selects a feature for installation, the installer determines which components are associated with that feature, and then those components are installed. Components of an application would contain, for example, the executable binary files, data files, shortcuts, help system files, and registry entries.</td>
</tr>
<tr>
<td>component object model (COM)</td>
<td>A Microsoft-developed software architecture that enables the creation of component-based applications. Component-based applications allow other components and other applications to use their features, adding functionality to these programs.</td>
</tr>
<tr>
<td>compress</td>
<td>Take one or more files and create a new file whose size is less than the total size of the original file(s) and from which the original file(s) can be re-created.</td>
</tr>
<tr>
<td>computer-based training (CBT)</td>
<td>Any instruction delivered by computer. CBTs often use graphics, sound, animation, and interaction to train people.</td>
</tr>
<tr>
<td>condition</td>
<td>A statement of logic that compares the value of a property to a fixed value or determines whether the property is defined. The condition must evaluate to true if the object, feature, component, action, or other item associated with the condition is to be installed or performed.</td>
</tr>
<tr>
<td>conditional installation</td>
<td>Installation of certain items only if certain conditions are met. For example, if an operating system condition is associated with the installation of an application, the application is installed on a target machine only if that target machine is running the specified operating system.</td>
</tr>
<tr>
<td>consume</td>
<td>What an installation does to a redistributable package such as a merge module or InstallShield object.</td>
</tr>
<tr>
<td>context menu</td>
<td>A context menu, also known as a right-click menu or a pop-up menu, opens when a user right-clicks an item on the desktop, in Windows Explorer, or in an application.</td>
</tr>
</tbody>
</table>
### InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
</table>
| converted project     | (1) A file that has been transformed from one type of file to another.  
|                       | (2) The Open MSI/MSM Wizard in InstallShield is a tool that converts .msi files and merge module (.msm) files to InstallShield installation projects (.ism files) that you can modify and build in InstallShield. |
| costing               | File costing is the process that InstallShield uses to determine the total disc space that a current installation requires.               |
| custom action         | An action that is created by an installation author as opposed to a standard action that is built into a Windows installer. The action encapsulates a function performed during the installation, uninstallation, or maintenance of an application. |
| database              | A discrete collection of data in a database management system (DBMS).                                                                     |
| database function     | A function that operates on a database.                                                                                                   |
| database handle       | A quantity that specifies a database when a database function is called.                                                                     |
| database management system (DBMS) | A set of applications that control the organization, storage, and retrieval of data for many users.                                       |
| DBMS                  | See database management system.                                                                                                          |
| DCOM                  | See distributed component object model.                                                                                                  |
| DCOM file             | Software components that are able to communicate across a network. DCOM, previously called network OLE, allows the components for a single application to be distributed across multiple networked computers. |
| decompress            | The reverse process of compression, which minimizes the size of a file by removing its space characters. This process returns the file to its original state. |
| deferred execution    | Execution of an installer action upon execution of the installation script.                                                                 |
| dependency            | A software object that is required by another software object.                                                                              |
| dialog                | Windows of information that display to the end user during installation and uninstallation. They enable the end user to interact with the operation by reading or specifying information. See also wizard. |
| dialog box            | A window that displays within an application interface that enables users to enter information or specify commands.                         |
| differential release  | A release that contains only those files that were absent from one or more of a specified set of existing releases. A differential release is used to update the versions of your product that were installed by those existing releases. |
### Table 1: InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>digital signing</td>
<td>To assure end users that the code within your application has not been tampered with or altered since publication, you can digitally sign your application. When you do so, end users are presented with a digital certificate when they download your product.</td>
</tr>
<tr>
<td>distributed component object model (DCOM)</td>
<td>An extension of the component object model (COM), a Microsoft-developed software architecture that enables the creation of component-based applications.</td>
</tr>
<tr>
<td>distribution media</td>
<td>A CD-ROM or other format of media deployed to users.</td>
</tr>
<tr>
<td>DLL</td>
<td>See dynamic link library.</td>
</tr>
<tr>
<td>drag</td>
<td>The act of selecting an item and moving it to another location.</td>
</tr>
<tr>
<td>dynamic link library (DLL)</td>
<td>A shared, code-base file containing functions that can be called from other applications.</td>
</tr>
<tr>
<td>edit field object</td>
<td>An interactive object that lets the user enter text into a field.</td>
</tr>
<tr>
<td>elevated privileges</td>
<td>Privileges that are higher than standard privileges, and are usually temporarily. Privileges are permissions to perform certain actions on a system.</td>
</tr>
<tr>
<td>end user</td>
<td>The person who installs or uninstalls your product.</td>
</tr>
<tr>
<td>end user machine</td>
<td>The machine onto which an end user installs or from which uninstalls your product.</td>
</tr>
<tr>
<td>engine</td>
<td>A program that performs essential functions and coordinates the overall operation of other programs. Engines work behind the scenes. InstallShield uses the InstallScript engine (ISScript.msi) and the Windows Installer engine to drive installations. InstallShield also has its own proprietary engine called ikernel.</td>
</tr>
<tr>
<td>environment variable</td>
<td>A variable that can be accessed by multiple programs on the target system.</td>
</tr>
<tr>
<td>EXE media type</td>
<td>All of the installation and uninstallation files that are contained in a single, self-extracting file.</td>
</tr>
<tr>
<td>executable (.bin) file</td>
<td>A file that contains a program that can run on UNIX platforms.</td>
</tr>
<tr>
<td>executable (.exe) file</td>
<td>A file that contains a program that can run on Windows platforms.</td>
</tr>
<tr>
<td>execution phase</td>
<td>The phase during which an installer’s actions are executed.</td>
</tr>
<tr>
<td>execution script</td>
<td>Installer actions for a Windows Installer installation. The execution script is generated during the acquisition phase of installation and executed during the execution phase.</td>
</tr>
</tbody>
</table>
### Table 1 • InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
</table>
| expand                              | (1) To restore a compressed file to its original size. A compressed file is a single file that contains one or more other files, for example, a cabinet file. Compressed files are reduced in size, thus, saving space.  
(2) A DOS command used to restore compressed files. During an installation, missing or corrupted operating system files or InstallShield files may need to be expanded from a compressed file to enable the installation to complete. |
| extensible markup language (XML)    | (1) A programming language that is essentially a simplified version of standard generalized markup language (SGML). It enables developers to create customized tags to organize and deliver content efficiently.  
(2) The format of the output of MultiPlatform projects.  
(3) Windows-based projects created in InstallShield can be converted to XML so that they can be saved in source code control software. |
<p>| extract                             | A language used to describe how XML information should be presented.                                                                       |
| external user interface             | The user interface developed by the author of an installation package. It does not use the internal user interface capabilities that are available with the installer. |
| extract                             | To remove, or decompress, a file from a compressed file, such as a cabinet file. A compressed file is a single file that contains one or more other files. Compressed files are reduced in size, thus, saving space. To use a file that has been compressed, it must first be “pulled out” of the compressed file. A command-line utility called Extract.exe can be used to extract files. During installation, missing or corrupted operating system files or InstallShield files may need to be extracted from a compressed file to enable the installation to complete. |
| false positive                      | A false positive is something that gives the appearance of being true by a test, but in reality is not. Most cases of false positives are found in anti-virus software. For example, anti-virus software may claim that it has found a virus in an InstallShield file, but in fact, this is not the case; their virus definitions need to be updated. |
| feature                             | Logical representations of the functionality of the product. For example, an installation could consist of a database, the main application files, and the help system files. Database, Application, and Help System would all be features of the product. Although features are visible to the end user, the actual files that comprise the features are within the components of the features. See also component. |
| file                                | An element of data storage in a file system.                                                                                               |
| file extension                      | The portion of a file name, following the final point, that indicates the kind of data stored in the file.                                   |
| InstallShield scripting run time    | See IDriver.exe.                                                                                                                          |</p>

### Table 1 • InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Immediate execution</strong></td>
<td>Installation phase terminology that generally refers to custom actions that are immediately executed when the installer builds the script in an InstallScript project.</td>
</tr>
<tr>
<td><strong>Import address table (IAT)</strong></td>
<td>The table used to import .dll files or executable files.</td>
</tr>
<tr>
<td><strong>Indirect build</strong></td>
<td>A full build that creates references to the payload files only. This means that at installation time, the payload must be in the same place where it was at build time. For example, if your payload is on a network server, then the installation looks for the payload on that same network server.</td>
</tr>
<tr>
<td><strong>Install level</strong></td>
<td>A feature’s install level partly determines whether it is selected by default for installation. That value is compared to the Windows Installer property INSTALLLEVEL to determine which features are selected for installation: if a feature’s install level property is less than or equal to the value of the INSTALLLEVEL, the feature will be installed.</td>
</tr>
<tr>
<td><strong>Installation</strong></td>
<td>The transfer of a program and its constituent files, features, and components from source media to a target system. See also installation process.</td>
</tr>
<tr>
<td><strong>Installation package</strong></td>
<td>One or more files that are used together to install or uninstall an application.</td>
</tr>
<tr>
<td><strong>Installation process</strong></td>
<td>The entire process of installing the contents of a package or application onto a target computer. The installation process consists of the acquisition phase, the execution phase, and, if the installation attempt is not successful, rollback.</td>
</tr>
<tr>
<td><strong>Installation project</strong></td>
<td>The entire collection of source files, dialogs, actions, and conditions that make up your installation and uninstallation while it is under construction.</td>
</tr>
<tr>
<td><strong>Installation sequence</strong></td>
<td>The sequence in which an applications files are installed, actions are executed, and dialogs display at run time. The installation sequence runs by default when the installation is launched, for example, by double-clicking the installation launcher.</td>
</tr>
<tr>
<td><strong>Installation type</strong></td>
<td>A predefined group of features from which the end user can select to install or uninstall.</td>
</tr>
<tr>
<td><strong>Installation-on-demand</strong></td>
<td>A Windows Installer capability that makes it possible to offer functionality to users and applications in the absence of the files themselves.</td>
</tr>
<tr>
<td><strong>INSTALLDIR</strong></td>
<td>A system variable that specifies the root destination directory for an installation.</td>
</tr>
<tr>
<td><strong>Installer</strong></td>
<td>An installation and configuration service on a computer.</td>
</tr>
<tr>
<td><strong>Installer database</strong></td>
<td>A database that contains all the necessary information for the installation of an application. It consists of many interrelated tables that together comprise a relational database of information necessary to install a group of applications.</td>
</tr>
<tr>
<td><strong>Installer function</strong></td>
<td>The application programming interface called by an application to obtain installer services.</td>
</tr>
</tbody>
</table>
installer package authoring tool
A third-party tool that lets users create installation packages.

installer properties
Variables that are used during the installation.

INSTALLLEVEL
Initial level at which features are selected “ON” for installation by default.

integrated development environment (IDE)
A software program’s interface. Also referred to as an interactive development environment.

interactive development environment (IDE)
A software program’s interface. Also referred to as an integrated development environment.

interface
The point at which independent systems communicate with each other. The user interface of an application often consists of toolbars, menus, buttons, windows, and other items.

Internal Consistency Evaluator (ICE)
Tests that can be run on a Windows Installer database (using Orca, Msival2, or the Premier or Professional editions of InstallShield) to warn about potential (or actual) authoring errors.

internal source files
Files that are included in the installation archive file.

internal user interface
Built-in capabilities of an installer that can be used to create a graphical user interface that is displayed to the end user during installation.

internet Explorer (IE)
The browser developed by Microsoft and distributed with their Windows operating systems.

ISM
See .ism file.

isolated application
An application that has been modified so that it always loads the versions of components, such as .dll files, with which it was originally developed and tested.

ISScript.msi
InstallScript engine installer. ISScript.msi installs the required files to run an installation. The InstallScript engine is also known as the InstallShield Scripting Run Time. InstallScript is a programming language used to create installations.

JAR
Acronym for Java archive file. See also .jar file.

Java Archive
See .jar file.

Java Native Interface (JNI)
A Java specification that enables Java code to call native code in a shared library. Native code in the JNI library can also invoke Java code through JNI.

Java Virtual Machine (JVM)
A simulated computer that interprets Java programs compiled into bytecode. The Java programs are usually stored in .class files.
### InstallShield Glossary

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>JNI</td>
<td>See Java Native Interface.</td>
</tr>
<tr>
<td>JPEG</td>
<td>See .jpg file.</td>
</tr>
<tr>
<td>JVM</td>
<td>See Java Virtual Machine.</td>
</tr>
<tr>
<td>KB</td>
<td>See knowledge base.</td>
</tr>
<tr>
<td>key file</td>
<td>A unique file for each component that Windows Installer uses to detect the component’s presence. In order to create advanced component settings or shortcuts, a key file must be specified.</td>
</tr>
<tr>
<td>key path</td>
<td>A unique registry value for each component that Windows Installer uses to detect the component’s presence. A component can have either a key file or a key path, but not both.</td>
</tr>
<tr>
<td>knowledge base (KB)</td>
<td>A collection of technical information, instructions, and articles that are beyond the scope of the software's help information. The Knowledge Base features tips, tricks, and techniques, answers to Frequently Asked Questions, and articles on both technical and design issues. Revenera posts periodic updates to the Knowledge Base Articles on its Web site (<a href="http://www.installshield.com">http://www.installshield.com</a>).</td>
</tr>
<tr>
<td>left-click</td>
<td>The act of selecting the left button on a mouse.</td>
</tr>
<tr>
<td>library</td>
<td>A collection of similar objects that are stored for occasional use, such as programs in source code or object code form, data files, scripts, and templates. A program library is a collection of (usually) precompiled, reusable programming routines that a programmer can &quot;call&quot; when writing code.</td>
</tr>
<tr>
<td>load-ordering group</td>
<td>One service may require another service to already be running before it starts. For this reason, services need to be grouped and set to load in a specific order. Service load-ordering groups are listed under HKEY_LOCAL_MACHINE\System\CurrentControl Set\Control\ServiceGroupOrder. The service’s Start Type property determines when it loads within its group.</td>
</tr>
<tr>
<td>localization</td>
<td>The process of adapting a product or service to a particular language and culture.</td>
</tr>
<tr>
<td>log database (LogDB)</td>
<td>A database that is on the target machine and contains a log of everything that was configured to be logged during installation and uninstallation.</td>
</tr>
<tr>
<td>log file</td>
<td>File containing a record of the activity that occurred during a software process (such as an installation, a build, a download) on a computer workstation or Web server. For example, Web servers maintain log files listing every request made to the server, summarizing files that were copied; bytes that were transferred; or which pages, images, and files are requested. A build log file lists all features, setup types, merge modules, dynamic links, and files included in the build.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>LogDB</td>
<td>See log database.</td>
</tr>
<tr>
<td>logging</td>
<td>The process of recording the activity of a software process (such as an installation, a build, or a download) in a log file.</td>
</tr>
<tr>
<td>macro</td>
<td>An instruction that represents a sequence of instructions.</td>
</tr>
<tr>
<td>maintenance mode</td>
<td>When a user runs an installation program a second (or later) time for a product already installed on their system, the installation runs in maintenance mode. Maintenance mode enables the user to modify feature selections from the first-time installation, repair the features already installed, or remove the entire program.</td>
</tr>
<tr>
<td>major upgrade</td>
<td>A comprehensive update of the product that warrants a change in the ProductCode property. A new product code is required if you want to have two versions of a product installed on the same machine.</td>
</tr>
<tr>
<td>managed application</td>
<td>An application is called a “managed application” if elevated (system) privileges are used to install the application.</td>
</tr>
<tr>
<td>MD</td>
<td>See media descriptor.</td>
</tr>
<tr>
<td>media descriptor (MD)</td>
<td>The semantics of an installable unit (IU). It provides a mapping of the elements in the deployment descriptor (DD) to some physical source for the data, which is usually files.</td>
</tr>
<tr>
<td>merge module (MM)</td>
<td>A package containing all of the logic and files needed to install distinct pieces of functionality such as run-time .dll files and virtual machines. Merge modules are built once and can be added to any installation project.</td>
</tr>
<tr>
<td>metafile</td>
<td>An image saved using the standard Windows metafile format. A metafile is a set of drawing instructions. Windows metafiles have a .wmf file extension.</td>
</tr>
<tr>
<td>MFC</td>
<td>See Microsoft Foundation Classes.</td>
</tr>
<tr>
<td>Microsoft Data Engine (MSDE)</td>
<td>A fully SQL Server-compatible data engine for building desktop and shared solutions. It provides an easy migration path to SQL Server 7.0. Solutions built with MSDE can be migrated to full SQL Server 7.0 without requiring a change in a single line of code.</td>
</tr>
<tr>
<td>Microsoft Developer Network (MSDN)</td>
<td>A set of online and offline services designed to help developers write applications using Microsoft products and technologies.</td>
</tr>
<tr>
<td>Microsoft disc operating system (MS-DOS)</td>
<td>The first operating system created by Microsoft. MS-DOS is the underlying operating system of Windows 95, 98, and ME. Windows NT, 2000, and XP operating systems support existing DOS applications.</td>
</tr>
<tr>
<td>Microsoft Foundation Classes (MFC)</td>
<td>A huge set of C++ classes that developers can use to write Win32 applications. To run an application that uses MFC, the MFC engine has to be installed on a target system.</td>
</tr>

</table>
## Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIDI</td>
<td>See musical instrument digital interface.</td>
</tr>
<tr>
<td>migrating</td>
<td>The process of moving from the use of one operating environment to another that is, in most cases, thought to be a better one. For example, moving from Windows NT Server to Windows 2000 Server would be considered a migration because it involves ensuring that new features are exploited and that old settings do not require changing; it also involves taking steps to ensure that current applications continue to work in the new environment. Migration could also mean moving from Windows NT to a UNIX-based operating system (or the reverse). You can also migrate data from one kind of database to another kind of database. This usually requires converting the data into some common format that can be output from the old database and input into the new database. Migration is also used to refer simply to the process of moving data from one storage device to another.</td>
</tr>
<tr>
<td>MIME</td>
<td>See multipurpose internet mail extensions.</td>
</tr>
<tr>
<td>minor upgrade</td>
<td>An update to a product in which the changes made to the installation do not warrant a change in the Product Code.</td>
</tr>
<tr>
<td>MM</td>
<td>See merge module.</td>
</tr>
<tr>
<td>modal</td>
<td>Requires the user to interact with it before the application can continue, restricting the user’s activities with other windows or dialog boxes. See also modeless.</td>
</tr>
<tr>
<td>modeless</td>
<td>Enables the user to interact with other windows and dialog boxes. See also modal.</td>
</tr>
<tr>
<td>MSDE</td>
<td>See Microsoft Data Engine.</td>
</tr>
<tr>
<td>MSDE named instance</td>
<td>A named instance of an installation of the Microsoft data engine (MSDE). See also named instance.</td>
</tr>
<tr>
<td>MSDE object template</td>
<td>A base for the MSDE merge module. When you add the MSDE merge module to a Windows Installer project or an InstallScript project, the InstallShield application starts with a base file (or stub) for this merge module. You need to configure this merge module, and then the application can apply your settings to the base file.</td>
</tr>
<tr>
<td>MSDN</td>
<td>See Microsoft Developer Network.</td>
</tr>
<tr>
<td>MS-DOS</td>
<td>See Microsoft disc operating system.</td>
</tr>
<tr>
<td>MS-DOS prompt</td>
<td>The Microsoft Disc-Operating System (MS-DOS) prompt is the visual indicator in the Command Prompt window signaling that MS-DOS is ready to accept a new command. The default MS-DOS prompt is C:&gt;, followed by a blinking cursor.</td>
</tr>
<tr>
<td>MSI</td>
<td>See .msi file.</td>
</tr>
<tr>
<td>MSM</td>
<td>See .msm file.</td>
</tr>
</tbody>
</table>
### Table 1: InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MSP</strong></td>
<td>See .msp file.</td>
</tr>
<tr>
<td><strong>MST</strong></td>
<td>See .mst file.</td>
</tr>
<tr>
<td><strong>multimedia</strong></td>
<td>A collection of various media such as sound, video, graphics, and animation used together to convey a message.</td>
</tr>
<tr>
<td><strong>multipurpose Internet mail extensions (MIME)</strong></td>
<td>The standard used by Web servers to identify the files that they are sending to Web clients. The MIME standard is a way of specifying both the type of file being sent and the method that should be used to turn it back into its original form.</td>
</tr>
<tr>
<td><strong>musical instrument digital interface (MIDI)</strong></td>
<td>A protocol designed for recording and playing back music on digital synthesizers. Unlike .wav files, which are digital recordings of actual sound (voice or music), MIDI files simply define the instruments and notes that are to be played, and how they should be played. A synthesizer (generally part of a MIDI-capable sound board) on the end-user’s system reads the MIDI instructions and plays the music. Since MIDI files contain only instructions and not the actual music, they are many times smaller than digital audio files of the same duration. MIDI files also use less processor power to play.</td>
</tr>
<tr>
<td><strong>named instance</strong></td>
<td>An instance is a complete and independent installation of SQL Server on a given server. One default instance and any number (up to 16) of named instances can be installed on a single server. Apart from the management tools and client connectivity components that are shared between instances, each instance is effectively standalone. Each instance has its own security, can be started and stopped independently, and can even be service packed independently of other instances on the same server.</td>
</tr>
<tr>
<td><strong>nested installation</strong></td>
<td>A type of custom action that installs or removes another installation package (sometimes called the child product) from within a running installation (called the parent product).</td>
</tr>
<tr>
<td><strong>network</strong></td>
<td>A network is two or more computers connected together to share hardware, software, and information. During installation, it may be necessary to move installation files that are on a network to your computer’s hard drive to install the software properly.</td>
</tr>
<tr>
<td><strong>NT service</strong></td>
<td>An application that is installed on Windows NT to run as a service, meaning that once it is installed, execution is automatic and transparent to any user, and a user does not have to log in for the service to start. NT manages services that are defined and described in the registry.</td>
</tr>
<tr>
<td><strong>object</strong></td>
<td>A package containing all of the logic and files needed to install distinct pieces of functionality.</td>
</tr>
<tr>
<td><strong>One Really Cool Application (ORCA)</strong></td>
<td>An external tool for editing Windows Installer files.</td>
</tr>
</tbody>
</table>
Table -1 • InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>One-Click Install</td>
<td>With a One-Click Install installation, the end user can download an application with minimal effort and can begin using the application immediately. The installation is automatically downloaded, uncompressed, and then executed automatically, with minimal user input. End users are not asked to specify a download location, and they are not required to manually launch the installation.</td>
</tr>
<tr>
<td>operating system (OS)</td>
<td>The software that controls the operation of a computer and directs the processing of programs by assigning storage space in memory and controlling input and output functions.</td>
</tr>
<tr>
<td>ORCA</td>
<td>See One Really Cool Application.</td>
</tr>
<tr>
<td>OS</td>
<td>See operating system.</td>
</tr>
<tr>
<td>package</td>
<td>All of the files needed to run an installation, including the installation database file, your application’s files (separate from the installation database file or compressed into it), and an executable file (which may have all of the above files compressed inside it).</td>
</tr>
<tr>
<td>package code</td>
<td>The globally unique identifier for an installation package. See also globally unique identifier (GUID).</td>
</tr>
<tr>
<td>panel</td>
<td>A window within a wizard that contains one or more related settings that an end user can configure. See also wizard.</td>
</tr>
<tr>
<td>parent/child installation</td>
<td>See nested installation.</td>
</tr>
<tr>
<td>patch</td>
<td>A special type of installation package that contains just the bits and portions of the application that is necessary to either update the application’s files and installation to a specific version or to fix a bug in an earlier version.</td>
</tr>
<tr>
<td>patch file</td>
<td>A patch package used for patching. A patch package (.msp) file contains the transforms and instructions necessary for upgrading one or more installed versions of a product. Windows Installer uses a patch package to patch local or administrative installations. A patch package does not include a database like a regular installation package. Instead it contains at minimum one database transform that adds patching information to the database of its target installation package. The installer uses this information to apply the patch files that are stored in the cabinet file stream of the patch package.</td>
</tr>
<tr>
<td>patching</td>
<td>The method of updating an installation that replaces only the bits being changed rather than the entire application. This means that end users can download a patch for a product that is much smaller than the entire product.</td>
</tr>
</tbody>
</table>
In a computer operating system, a path is the route through a file system to a particular file. A path name is the specification of that path. Each operating system has its own format for specifying a path name. The DOS, Windows, and OS/2 operating systems use the following format: `driveletter:directorynamesubdirectorynamefilename.suffix`. UNIX-based systems use the following format: `/directory/subdirectory/filename`.

**Path variable**

A variable that represents a location that can be defined once in a central location so that it is not necessary to change every source file’s path each time that the project is moved or the folder structure is changed. You can instead use path variables to define commonly used paths once, and they are used during the development of your installation project. These paths do not apply to the target machines where the application is being installed. Rather, they are used to link to source files that need to be included in your installation project. When the project is built, those links are evaluated and the files they point to are built into the installation package.

**PKCS**

See public-key cryptography standards.

**Platform**

The operating system for which the installation program is intended. An installation technology may be limited to creating installations for a specific platform(s).

**Preview mode**

Mode for viewing the design of the user interface, or the current appearance of dialog and billboards. *Preview mode* is a term used in Windows Installer.

**Product**

The actual application to be installed or uninstalled.

**Product code**

A string that uniquely identifies a product.

**Progress bar**

The visual indication of the progress of an executable file.

**Property**

A value that has been placed on an object within an installation project that is used during installation or uninstallation by the installer or uninstaller.

**Public property**

A global variable whose value is set by the end user or system administrator. A public property can be set or changed during installation through interaction with the user interface as well as by setting the property on the command line, by applying a transform, or by using a standard or custom action. Unlike private property values, the values of public properties can be changed. Public property names cannot contain lowercase letters.

**Public-key cryptography standards (PKCS)**

Developed by RSA Security, Inc., these specifications standardize aspects of public-key cryptography that are not covered by existing standards bodies.

**Publishing**

A type of advertising (“just-in-time” installation) in which no user-interface elements are created for the component during installation, but the component can still be installed through Add and Remove Programs of the Control Panel or when an installed component requests the published component from the installer.
### Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>qualified component</td>
<td>A method of single-level indirection that is similar to a pointer. Qualified components are primarily used to group components with parallel functionality into categories.</td>
</tr>
<tr>
<td>QuickPatch</td>
<td>A special type of patch package that contains just the bits and portions of the database necessary to update your application’s files and installation to a specific version. You can create a QuickPatch in InstallShield by using the QuickPatch type of project.</td>
</tr>
<tr>
<td>readme file</td>
<td>A text file that is included with the distribution of an application that contains important information. This information often pertains to the installation, uninstallation, or functionality that may not have been included in other product documentation.</td>
</tr>
<tr>
<td>red green blue (RGB)</td>
<td>The three colors of light that can be mixed to produce any other color. Colored images are often stored as a sequence of RGB triplets or as separate red, green, and blue overlays, though these are not the only possible representations. These three colors correspond to the three “guns” in a color cathode ray tube (CRT) and to the color receptors in the human eye.</td>
</tr>
<tr>
<td>redistributable</td>
<td>A merge module, object, or other file that may be legally distributed with an installation or application.</td>
</tr>
<tr>
<td>reduced user interface (UI)</td>
<td>The reduced UI level displays authored modeless dialogs, built-in modal error messages, and disc-prompt messages during installation. This UI level does not display any authored modal dialogs. This UI level uses the installer’s internal user interface capabilities. See also modal, modeless, and internal user interface.</td>
</tr>
<tr>
<td>reference count</td>
<td>A tally that is incremented each time a shared file is installed. It is maintained under HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\SharedDLLs.</td>
</tr>
<tr>
<td>refresh build</td>
<td>This type of build only recompiles custom code. It can also perform single file replacement, meaning it can only rebuild and add or modify a single changed file without rebuilding the entire installation. This type of build is available for InstallScript projects only.</td>
</tr>
<tr>
<td>Regedit32.exe, Regedit.exe</td>
<td>The two versions of the Windows Registry Editor. The Registry Editor enables you to edit the entries in the registry. Regedit32 provides more functionality for editing the registry. If errors occur during installation, you may need to edit the registry to complete installation. Regedit32.exe and Regedit.exe have been merged in Windows XP computers, thus these two applications perform the same functionality in the new operating systems.</td>
</tr>
<tr>
<td>registry</td>
<td>A central database used by the Windows operating system to track the personal settings and the software and hardware installed on a computer. During installation, installation choices are written to the registry.</td>
</tr>
<tr>
<td>registry file</td>
<td>A text file of a predefined format that contains keys and values that can be merged into a registry.</td>
</tr>
</tbody>
</table>
Table 1 • InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>reinstallation</strong></td>
<td>When a product has been installed on a machine and its installation is run again, the installation reinstalls the product by overwriting its existing files, shortcuts, and registry entries.</td>
</tr>
<tr>
<td><strong>relative path</strong></td>
<td>A path that includes all of the information necessary to locate a file by starting at the current folder on the current drive, for example, InstallShield\Support. That folder can be located along that relative path only if it exists in the current directory.</td>
</tr>
<tr>
<td><strong>release build</strong></td>
<td>A full rebuild fit for releasing.</td>
</tr>
<tr>
<td><strong>release notes</strong></td>
<td>A file that is included with the distribution of an application. This file contains important information about the installation and uninstallation of the application. It can also contain information that may not have been included in other product documentation.</td>
</tr>
<tr>
<td><strong>remote procedure call</strong></td>
<td>A small routine placed in a program that is used to request a service on another computer. RPC is a protocol, or agreed-upon format for transmitting data, that allows a program to request a service from a program located in another computer. The stub accepts the request from the program and forwards it to the remote procedure. When the procedure is complete, the stub receives the result and passes it back to the program that made the request.</td>
</tr>
<tr>
<td><strong>repair mode</strong></td>
<td>In repair mode, the installation checks for any type of corruption, such as missing or damaged files, incorrect registry entries, and self-registering files. If the installation detects any corruption, it attempts to repair the problem. See also maintenance mode.</td>
</tr>
<tr>
<td><strong>resiliency</strong></td>
<td>The ability for the application to reinstall components as necessary. If a component is accidentally deleted or corrupted, Windows Installer technology enables the application to essentially repair itself.</td>
</tr>
<tr>
<td><strong>restricted public property</strong></td>
<td>A global variable for which the installation author can limit the ability to set or change it. Usually, only system administrators can manipulate restricted public properties. Restrictions are used to maintain a secure environment.</td>
</tr>
<tr>
<td><strong>result set</strong></td>
<td>The set of rows created by executing a SELECT statement.</td>
</tr>
<tr>
<td><strong>RGB</strong></td>
<td>See red green blue.</td>
</tr>
<tr>
<td><strong>rich text format (RTF)</strong></td>
<td>A Microsoft file format that contains special commands to indicate formatting information such as fonts and margins. RTF lets you exchange files between different word processors and operating systems.</td>
</tr>
<tr>
<td><strong>rollback</strong></td>
<td>The installation keeps track of all changes that are made during the installation process so that, if an error occurs and the installation is aborted, the changes will be “rolled back,” that is, the machine will be restored to its original state.</td>
</tr>
<tr>
<td><strong>row</strong></td>
<td>A set of related columns that describe a specific entity, also known as a record.</td>
</tr>
</tbody>
</table>
### InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RPC stub</strong></td>
<td>See remote procedure call stub.</td>
</tr>
<tr>
<td><strong>RTF</strong></td>
<td>See rich text format.</td>
</tr>
<tr>
<td><strong>run time</strong></td>
<td>The time during which the installation interacts with the installer to install or uninstall your application on the target machine.</td>
</tr>
<tr>
<td><strong>safe mode</strong></td>
<td>Safe mode is a troubleshooting mode available in Windows 95, 98, ME, and 2000. When you start your computer in safe mode, only the operating system and mouse, keyboard, and display drivers are loaded. You may be able to start your computer in safe mode when it otherwise would not start at all. Safe mode lets you troubleshoot the operating system to determine what is not functioning properly.</td>
</tr>
<tr>
<td><strong>schema</strong></td>
<td>A description of the current structure of tables and views in a data source. The schema describes what columns are in each table, the data type of each column, and the relationships between tables.</td>
</tr>
<tr>
<td><strong>SCM</strong></td>
<td>See Service Control Manager.</td>
</tr>
<tr>
<td><strong>SDK</strong></td>
<td>See Software Development Kit.</td>
</tr>
<tr>
<td><strong>Section 508</strong></td>
<td>A United States law that amended the Rehabilitation Act to require federal agencies to make their electronic and information technology accessible to people with disabilities. Section 508 was enacted to eliminate barriers in information technology, to make available new opportunities for people with disabilities, and to encourage development of technologies that will help achieve these goals. The law applies to all federal agencies when they develop, procure, maintain, or use electronic and information technology. Under Section 508, agencies must give disabled employees and members of the public access to information that is comparable to the access available to others.</td>
</tr>
<tr>
<td><strong>security tool</strong></td>
<td>A privacy tool that detects and eliminates destructive pests, such as Trojans, spyware, addware, and hacker tools on your computer. It complements anti-virus and firewall software, extending protection against non-viral malicious software that can evade the end user’s existing security and invade privacy.</td>
</tr>
<tr>
<td><strong>self-healing</strong></td>
<td>See auto-repair.</td>
</tr>
<tr>
<td><strong>self-registering file</strong></td>
<td>A file that can enter information about itself in the Windows registry and remove that information upon uninstallation. Other types of files can be used without entering information into the registry. The installation of a self-registering file consists of installing the file to its desired location and then registering the file on your computer.</td>
</tr>
<tr>
<td><strong>sequence</strong></td>
<td>A collection of actions and dialogs that is executed sequentially in an installation project.</td>
</tr>
<tr>
<td><strong>sequence tables</strong></td>
<td>Tables that list the actions that control the installation process and specify their order of execution.</td>
</tr>
</tbody>
</table>
### InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>service</td>
<td>For Windows Installer–based or InstallScript-based projects, this is a program that runs in the background whenever a computer is running. Services perform tasks that do not require user interaction, such as software installation, process monitoring, file transfer, task scheduling, network management, and many more. In Win32, services are managed by the Service Control Manager.</td>
</tr>
<tr>
<td>Service Control Manager (SCM)</td>
<td>Maintains the system’s database of services and exposes an interface for controlling these services.</td>
</tr>
<tr>
<td>service pack (SP)</td>
<td>An update to a software product that fixes existing problems and may provide product enhancements. The next version of a product incorporates all services packs previously released.</td>
</tr>
<tr>
<td>setup</td>
<td>See installation.</td>
</tr>
<tr>
<td>setup project</td>
<td>See installation project.</td>
</tr>
<tr>
<td>Setup.inx</td>
<td>The compiled script file. It is the object code that the installer engine executes.</td>
</tr>
<tr>
<td>shortcut</td>
<td>A file that points to an application. Clicking the shortcut is a fast way to open the application. Shortcuts are usually placed on the desktop or on the Start menu. See also advertised shortcut.</td>
</tr>
<tr>
<td>silent installation</td>
<td>An installation that is run without a user interface or any end user intervention.</td>
</tr>
<tr>
<td>small update</td>
<td>A patch that upgrades a package where both the installed package and the most recent one have the same version number.</td>
</tr>
<tr>
<td>software development kit (SDK)</td>
<td>The documentation, samples, command-line compilers, debugging aids, utilities, and tools designed to enable developers to create applications and libraries that target a specific operating system. SDKs are usually provided by the manufacturer of the operating system.</td>
</tr>
<tr>
<td>source list</td>
<td>A list that specifies the locations where the installer searches for installation files. The entries in the source list can be network locations, URLs, or compact disks.</td>
</tr>
<tr>
<td>SP</td>
<td>See service pack.</td>
</tr>
<tr>
<td>splash screen</td>
<td>An image that is displayed to end users during the startup of a product installation. You can specify the image to be displayed, the length of time that it should display, and whether it contains localized images.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>spyware</td>
<td>Any technology that aids in gathering information about a person or organization without their knowledge. On the Internet, spyware is programming that is put on someone’s computer to secretly gather information about the user and relay it to advertisers or other interested parties. Spyware can be loaded on a computer as a software virus or as the result of installing a new program. Data collecting programs that are installed with the user’s knowledge are not, properly speaking, spyware, if the user fully understands what data is being collected and with whom it is being shared.</td>
</tr>
<tr>
<td>SQL</td>
<td>See Structured Query Language.</td>
</tr>
<tr>
<td>SQL statement</td>
<td>A complete phrase in SQL that begins with a keyword and completely describes an action to be taken. For example, SELECT * FROM Orders.</td>
</tr>
<tr>
<td>standard action</td>
<td>An action that is built into an installation development software product. InstallShield products also support the creation and use of custom actions. See also action, custom action.</td>
</tr>
<tr>
<td>string table</td>
<td>A database that maintains the string IDs, values, and comments for all supported languages. These strings are used in dialogs and message boxes displayed to the end user at run time.</td>
</tr>
<tr>
<td>Structured Query Language (SQL)</td>
<td>A language used to work with databases.</td>
</tr>
<tr>
<td>summary information stream</td>
<td>The properties such as title, author, package code, templates, summary, and schema that are defined for a Windows Installer package and are used by the installer to install the application.</td>
</tr>
<tr>
<td>synchronous execution</td>
<td>The opposite of asynchronous execution, where control of the process is not released until the entire process has completed.</td>
</tr>
<tr>
<td>system policy</td>
<td>The rules and regulations by which a system must abide.</td>
</tr>
<tr>
<td>system privileges</td>
<td>The system, programs, and functions available to each user.</td>
</tr>
<tr>
<td>table</td>
<td>A collection of rows of data.</td>
</tr>
<tr>
<td>TARGETDIR</td>
<td>In a Windows Installer–based installation, the TARGETDIR property specifies the root destination directory for the installation. In an InstallScript installation, the TARGETDIR system variable, by default, specifies the root destination directory for the installation.</td>
</tr>
<tr>
<td>Task Manager</td>
<td>A tool available on Windows platforms that provides information about the applications and processes running on your computer as well as your computer’s performance. Prior to installation, you may need to use the Task Manager to end running applications and processes to prevent conflicts.</td>
</tr>
</tbody>
</table>
### Table - 1 • InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>temp directory</td>
<td>A folder on your hard drive where the operating system or applications can temporarily store files while they are in use. When the application exits, the temporary files are deleted. It may be necessary to manually clean, or delete files from, the temp directory.</td>
</tr>
<tr>
<td>template</td>
<td>Something that establishes or serves as a pattern.</td>
</tr>
<tr>
<td>transform</td>
<td>A transform (.mst) file represents the differences between two installation databases. For example, network administrators may want to distribute different configurations of a product to the various departments in the company. As a result, you can create a transform for every configuration of the product, then apply the appropriate transform as needed.</td>
</tr>
<tr>
<td>transform error condition flags</td>
<td>A set of properties that are used to set the error conditions in a transform.</td>
</tr>
<tr>
<td>transform validation flags</td>
<td>The set of properties used to verify that a transform can be applied to the Windows Installer package.</td>
</tr>
<tr>
<td>tree node</td>
<td>A data structure that contains zero or more “child” nodes. Nodes are tree “roots”. Tree nodes that do not have “children” are typically referred to as “leaves”.</td>
</tr>
<tr>
<td>trees</td>
<td>Data that is structured like a tree.</td>
</tr>
<tr>
<td>UI</td>
<td>See user interface.</td>
</tr>
<tr>
<td>uncompress</td>
<td>See decompress.</td>
</tr>
<tr>
<td>uniform/universal resource locator (URL)</td>
<td>Represents the location of a Web site or page.</td>
</tr>
<tr>
<td>uninstallation</td>
<td>The undoing of an installation. Uninstallation is the installation maintenance option that enables the end user to remove the product files and reverse any changes that were made to the machine made during installation.</td>
</tr>
<tr>
<td>uninstallation log file</td>
<td>A record of all uninstallation-related events that occurred during an installation. The log file is initialized at the beginning of the installation. If this log file becomes corrupted, it may result in an error during uninstallation.</td>
</tr>
<tr>
<td>unInstallShield</td>
<td>A component included in the Setup Wizard that uninstalls the product from the end user’s PC.</td>
</tr>
<tr>
<td>unspanned CD/DVD media type</td>
<td>The payload is laid out in a CD/DVD archive, but no spanning across multiple media is used.</td>
</tr>
<tr>
<td>Update Manager (Windows or Java)</td>
<td>An optional Win32 or Java-based client application that can be used by end users to set their own update schedules, or to silence the update queries performed by the agent.</td>
</tr>
</tbody>
</table>
### Table 1 • InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>upgrade</td>
<td>A move from a lesser version of an application to a newer, usually improved version of an application.</td>
</tr>
<tr>
<td>upgrade code</td>
<td>The code required to install a newer version of existing software.</td>
</tr>
<tr>
<td>upgrading</td>
<td>The process of installing a newer version of existing software.</td>
</tr>
<tr>
<td>URL</td>
<td>See uniform/universal resource locator.</td>
</tr>
<tr>
<td>user interface (UI)</td>
<td>The user’s access to the software.</td>
</tr>
<tr>
<td>user profile</td>
<td>Record of an individual end user’s settings, such as shortcuts, favorites, and settings for application, display, and hardware. User profiles enable multiple users to share a single computer while maintaining their own preferences.</td>
</tr>
<tr>
<td>validation</td>
<td>The process of validating, that is, to confirm the true form of data.</td>
</tr>
<tr>
<td>value pack (VP)</td>
<td>An installation that upgrades the features and functions of an installed application.</td>
</tr>
<tr>
<td>variable</td>
<td>A value stored in the computer. Its value can be composed of any printable characters, numeric or text. Unlike a constant, whose value never changes, a variable’s value can be changed at any time.</td>
</tr>
<tr>
<td>volume</td>
<td>The total amount of space, in blocks, on one piece of media.</td>
</tr>
<tr>
<td>VP</td>
<td>See value pack.</td>
</tr>
<tr>
<td>Web installation</td>
<td>An installation that end users can access and run from a Web site.</td>
</tr>
<tr>
<td>WinDir</td>
<td>Stores the path to the executable file for Win16 on Win32 (WOW).</td>
</tr>
<tr>
<td>window</td>
<td>The area in which an open application appears on a screen.</td>
</tr>
<tr>
<td>Windows API</td>
<td>The Windows application programming interface (API), which provides the building blocks that are used by applications written for the Windows platform. Each API is a specific method prescribed by a computer operating system or by an application program. A programmer writing an application can make requests of the operating system or another application with the use of a Windows API. Each API has different system requirements to run properly.</td>
</tr>
<tr>
<td>Windows installation CD</td>
<td>The compact disc that contains the Windows operating system. If your computer manufacturer installed the operating system on your computer, the installation CD should have been included with your computer documentation. If you installed the Windows operating system on your computer, you used the installation CD to do so.</td>
</tr>
</tbody>
</table>
**Chapter Glossary**

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
</table>
| Windows Installer           | (1) An installation and configuration service. It is based on a data-driven model and provides all installation data and instructions in a single, complete package. In the data-driven installation model, a master set of installation tables is created where every application resource (files, registry keys, and so on) is clearly tied to the component or feature it supports. The user selects the objects to install and where to install them, and the Windows Installer manages the procedural instructions.  
(2) Refers to the service, properties, and tables of an .msi package. |
| Windows Installer service   | An operating system component that centrally manages application installation configuration and application uninstallation.                   |
| Windows NT service          | See Windows service.                                                                                                                      |
| Windows service             | Long-running executable applications that run in their own Windows sessions. For example, writing messages to an event log.                |
| Windows system folder       | Contains core operating system files, which are necessary to keep the computer running properly. Errors occurring during installation may be a result of missing or corrupt files contained in the System folder. |
| wizard                      | (1) A program utility that works as an interactive guide by walking the user step-by-step through an unfamiliar task.                   
(2) The InstallShield Wizard is the wizard that displays during the run time of an installation or uninstallation. It presents the end user with a flexible, predefined series of dialogs that walk them through the installation or uninstallation process. |
| wizard dialog               | Dialogs that display to the end user during installation and uninstallation. They enable end users to interact with the operation by reading or specifying information. |
| wizard interface            | Used by the end user to interact with a wizard at run time.                                                                               |
| WYSIWYG                     | What you see is what you get.                                                                                                             |
| XCopyFile                   | An InstallScript function that copies one or more files and subdirectories to a target directory, creating subdirectories on the target machine, if necessary. |
| XML                         | See extensible markup language.                                                                                                          |
| XSL                         | See extensible stylesheet language.                                                                                                       |
