- `Manufacturer`
- `ProductVersion`
- `ProductName`

## Conditions

Many properties are not set until the installation is launched. These properties are populated with information from the target system. For example, the `VersionNT` property is not set until the installation is launched. This property is set to the version of Windows that the target machine is running, if the operating system is a Windows NT-based system. For example, the value of `VersionNT` is 600 on a Windows Vista system.

Properties set at run time can be used to create conditional installations. If you want your product to be installed only on Windows Vista, you can use conditional logic to check the end user's system, and install the product if all conditions are met.

# Windows Installer Property Reference

Many properties can be set during an installation. The following tables list most of them with their functions and, in many cases, the syntax needed to put these properties into action. Many of the properties can be set from within InstallShield, while others are initialized by the Windows Installer service at run time.

**Note** ■ By default, Windows Installer writes the final value of every Windows Installer property contained in your project to a log file generated by launching MsiExec with the /L argument. Starting with Windows Installer version 2.0, you can prevent certain properties (such as those containing passwords) from being written to the log file by creating a property called MsiHiddenProperties in the Property Manager and setting its value to a semicolon-delimited list of property names. For more information about this property, see [MsiHiddenProperties](#) in the Windows Installer Help Library.

Any of the properties that are with all-uppercase names can be set at the command line. Properties with all-uppercase names are called *public properties*. The following lists are organized according to the functions of the properties. Each table has a brief description of the kinds of properties it contains.

The following categories of Windows Installer properties are described in this topic. Click a link to go directly to a category.

- [Special Folder and File Properties](#)
- [Feature Installation Properties](#)
- [Other Configurable Properties](#)
- [User-Supplied Information](#)
- [Properties for Creating Predetermined User Accounts](#)
- [Product-Specific Properties](#)
- [System Folders Set by the Installer](#)
- [Operating System Properties Set by the Installer](#)
- [Hardware Properties Set by the Installer](#)
- [PowerShell Properties](#)
- [Virtual Machine Properties](#)
- [Status Properties Updated by the Installer](#)
- [Date and Time Properties](#)
- [InstallScript Engine-Related Properties](#)
- [SQL-Related Properties](#)
- [MDAC Properties](#)

**Note** ■ Do not confuse installer properties with path variables, which are surrounded by angle brackets (<>). While they both represent directories, you can use Windows Installer properties at run time, but path variables are used to point to source files only during setup design and at build time.

## Special Folder and File Properties

Special folder properties are those properties that define where files are stored or installed on the target system. File properties refer to specific files.

To use a folder property in your installation, enclose it in square brackets: []. For example, to install a component to a Bin folder under the default destination folder, enter `[INSTALLDIR]Bin` in the component's Destination Folder setting.

**Table 1** - Folder Properties

Property Name	Description
<b>INSTALLDIR</b>	<p>This property contains the default destination folder for the files in your features and components. For more information, see <a href="#">Setting the Default Product Destination Folder (INSTALLDIR)</a>.</p> <p>INSTALLDIR is available directly as a variable in your InstallScript code.</p>
<b>ISDEBUGLOG</b>	<p>To generate a log file for the feature prerequisites in the installation, set this property to the full path and file name for the log file. You can use directory properties and environment variables in the path.</p> <p>This property is used for troubleshooting feature prerequisites, and it is typically set through the command line when the <code>/debuglog</code> command-line parameter is used, as follows:</p> <pre>Setup.exe /debuglog"C:\Path\setup.log" /v"ISDEBUGLOG=prereq.log"</pre>
<b>ISPREREQDIR</b>	<p>This property identifies the path to the running InstallShield prerequisite. The path includes the final slash. You can use this property to refer to files within the InstallShield prerequisite—for example:</p> <pre>[ISPREREQDIR]MyConfigFile.ini</pre> <p>For more information, see <a href="#">Specifying Command-Line Parameters for an InstallShield Prerequisite</a>.</p>
<b>SETUPEXEDIR</b>	<p>This property stores the path to Setup.exe. For example, if the path to Setup.exe is <code>C:\MySetups\MyApp\Setup.exe</code>, the value of SETUPEXEDIR is <code>C:\MySetups\MyApp</code>.</p> <p>For more information, see <a href="#">SETUPEXEDIR</a>.</p>
<b>SETUPEXENAME</b>	<p>This property identifies the name of the setup launcher file that was created when the project was built. The installation updates the value of this property at run time if the setup launcher file was renamed. The following path identifies the full path to this file:</p> <pre>[SETUPEXEDIR]\[SETUPEXENAME]</pre>
<b>SourceDir</b>	<p>This property stores the folder where the running .msi file is located.</p>

**Table 1** - Folder Properties (cont.)

Property Name	Description
<b>TARGETDIR</b>	<p>The TARGETDIR property is the location where the Windows Installer package is copied (and its data files uncompressed) during an Administrative installation.</p> <p>In an InstallScript MSI project, this value is represented by the InstallScript <i>MSI_TARGETDIR</i> variable.</p>

## Feature Installation Properties

The following section provides information on feature installation properties, with which the end user can specify how features should be installed.

**Table 2** - Feature Installation Properties

Property Name	Description
<b>ADDDEFAULT</b>	The ADDDEFAULT property stores a list of features, separated by commas, that are to be installed in their default configuration. Users can install all features in their default configuration by setting the value of this property to ALL.
<b>ADDLOCAL</b>	This property stores a list of features, separated by commas, that are to be installed locally. Each feature has a Remote Installation property that determines whether features selected for installation are to be installed locally or run from the source medium.
<b>ADDSOURCE</b>	This property stores a list of features, separated by commas, that are to be run from the source medium. If this property is set to ALL, all the features will run from the source medium.
<b>ADVERTISE</b>	This property stores a list of features, separated by commas, that are to be advertised.
<b>REINSTALL</b>	This property stores a list of features, separated by commas, that are to be reinstalled. If REINSTALL is set to ALL, all of the features that are already installed on the user's system will be reinstalled.
<b>REINSTALLMODE</b>	<p>This property contains a string of letters that specify the reinstall type. These options correspond to the values available for the Msiexec.exe /f command-line parameter. For more information on this property, see <a href="#">REINSTALLMODE Property</a> in the Windows Installer Help Library.</p> <p>REINSTALLMODE is always set in conjunction with REINSTALL.</p>

**Table 2** • Feature Installation Properties (cont.)

Property Name	Description
<b>ReinstallModeText</b>	<p>This property contains the reinstallation options that will be set when the user selects Repair in the MaintenanceType dialog. The value of ReinstallModeText is passed as an argument to the control event ReinstallMode, which accepts the same options that are available for the REINSTALLMODE property.</p> <p>ReinstallModeText is not a predefined Windows Installer property. Nonetheless, it is provided in the Property Manager for every new project, with a default value of <i>omus</i>, for use in the control event described above.</p>
<b>REMOVE</b>	This property stores a list of features, separated by commas, that will be removed. If REMOVE is set to ALL, all features will be removed.
<b>COMPADDLOCAL</b>	This property stores a list of component IDs, separated by commas, that are to be installed locally. The feature for the component that takes up the least amount of disk space will be installed.
<b>COMPADDSOURCE</b>	This property stores a list of component IDs, separated by commas, that are to be run from the source medium. The feature for the component that takes up the least amount of disk space will be installed.
<b>PATCH</b>	When installing a patch, this property contains the full path to the patch package.

## Other Configurable Properties

The following section contains information on various other configurable properties.

**Table 3** • Additional Configurable Properties

Property Name	Description
<b>ACTION</b>	This property specifies which sequence to perform (installation, advertisement, or administration). Possible values are INSTALL, ADVERTISE, and ADMIN. The ACTION property is automatically set based on the command line used to launch the installation.

**Table 3** • Additional Configurable Properties (cont.)

Property Name	Description
<b>ALLUSERS</b>	<p>Specifies whether Windows Installer should attempt to perform a per-machine or per-user installation.</p> <p>If the value of ALLUSERS is set to 1, Windows Installer attempts a per-machine installation. For per-machine installations, configuration information such as shortcuts and registry entries are stored in the All Users profile:</p> <ul style="list-style-type: none"> <li>On Windows Vista and later systems, if User Account Control is enabled and the user does not have administrative privileges, the user must be able to provide administrative credentials in order to install the product.</li> <li>On other systems, if the user does not have administrative privileges, the installation displays an error message and exits.</li> </ul>  <p><b>Project</b> • This property is set to 1 by default in Basic MSI and InstallScript MSI projects. To learn more, see <a href="#">Per-User vs. Per-Machine Installations</a>.</p> <p>If the value of ALLUSERS is not set or it is an empty string (""), Windows Installer performs a per-user installation, and the configuration information is stored in the user's personal profile.</p> <p>If the value of ALLUSERS is set to 2, Windows Installer attempts to perform a per-machine installation on Windows Vista and later systems. On earlier platforms, if the user has administrative privileges, Windows Installer attempts to perform a per-machine installation; otherwise, Windows Installer performs a per-user installation.</p>  <p><b>Project</b> • This property is set to 1 in InstallScript MSI projects to help avoid ALLUSERS-related issues when the installation is run silently. The property can be overridden with the <b>SdCustomerInformation</b> or <b>SdCustomerInformationEx</b> dialog functions in InstallScript MSI projects.</p>  <p><b>Note</b> • ALLUSERS has no effect on InstallScript variables like <code>FOLDER_PROGRAMS</code>. ALLUSERS has no effect until the Execute sequence runs.</p>
<b>ARPAUTHORIZEDCDFPREFIX</b>	This property stores the URL for the update channel of the application.

**Table 3** • Additional Configurable Properties (cont.)

Property Name	Description
<b>ARPCOMMENTS</b>	<p>This property contains the comments about this product that are displayed in Add or Remove Programs.</p> <p>This value is set in the ARP Comments setting in the General Information view. You should provide a string entry to facilitate globalizing your installation.</p>
<b>ARPCONTACT</b>	<p>This property contains support contact information, such as an email address or a telephone number.</p> <p>This value is set in the Support Contact setting in the General Information view. You should provide a string entry to facilitate globalizing your installation.</p>
<b>ARPINSTALLLOCATION</b>	<p>This property stores the fully qualified path to the application's primary folder. You can set ARPINSTALLLOCATION to the value of INSTALLDIR with a custom action of type "Set a property".</p>
<b>ARNOREPAIR</b>	<p>If this property is set to 1, no Repair button will be displayed in the Programs Wizard.</p>
<b>ARPREADME</b>	<p>Holds the fully qualified path or the URL for the product's Readme file.</p> <p>This value is set in the Read Me setting in the General Information view. You should provide a string entry to facilitate globalizing your installation.</p>
<b>ARPSIZE</b>	<p>This property stores the estimated size, in kilobytes, of the application.</p>
<b>ARPSYSTEMCOMPONENT</b>	<p>Set this property to 1 to keep your program from appearing in Add or Remove Programs.</p>
<b>ARPURLINFOABOUT</b>	<p>This property stores the URL for the application's home page or the publisher's home page.</p> <p>This value is set in the Publisher/Product URL setting in the General Information view. You should provide a string entry to facilitate globalizing your installation.</p>
<b>ARPURLUPDATEINFO</b>	<p>This property stores the URL for update information on your application.</p> <p>This value is set in the Product Update URL setting in the General Information view. You should provide a string entry to facilitate globalizing your installation.</p>

**Table 3** • Additional Configurable Properties (cont.)

Property Name	Description
<b>ARPNOMODIFY</b>	Setting this property prevents the product from being modified from Add or Remove Programs.
<b>ARPNOREMOVE</b>	Setting this property prevents the product from being removed through Add or Remove Programs.
<b>AVAILABLEFREEREG</b>	This property allows you to set the amount of additional free registry space, in kilobytes, required by your application.
<b>CCP_DRIVE</b>	This property holds the root path on the installation disk for any of the qualifying products for a competitive upgrade.
<b>DISABLEADVTSHORTCUTS</b>	Setting this property disables the creation of advertised shortcuts.
<b>DISABLEMEDIA</b>	This setting prevents the installer from adding media information to the source list.
<b>DISABLEROLLBACK</b>	Set this property to 1 to stop the installer from creating a rollback script that will save copies of changed or deleted files during the installation process.
<b>EXECUTEACTION</b>	This property sets the top-level action initiated by the ExecuteAction action.
<b>EXECUTEMODE</b>	This property sets the mode of execution performed by the installer. The value None means that no changes are made to the system. The default value, Script, means that all changes made to the system are run through a script execution.
<b>INSTALLLEVEL</b>	This property holds a value that corresponds to the values of the features. If the level of features to be installed is less than or equal to the INSTALLLEVEL property, then a feature is installed. This is primarily used for different setup types, such as Typical or Custom.
<b>LOGACTION</b>	List of action names, separated by semicolons, that will be logged.

**Table 3** • Additional Configurable Properties (cont.)

Property Name	Description
<b>MSIINSTALLPERUSER</b>	<p>This property indicates that the Windows Installer should install the package for only the current user:</p> <ul style="list-style-type: none"> <li>• If the <b>ALLUSERS</b> property is set to 2 and <b>MSIINSTALLPERUSER</b> is set to an empty string (""), the Windows Installer performs a per-machine installation.</li> <li>• If the <b>ALLUSERS</b> property is set to 2 and <b>MSIINSTALLPERUSER</b> is set to 1, the Windows Installer performs a per-user installation.</li> </ul> <p>This property is available with Windows Installer 5 and on Windows 7 or Windows Server 2008 R2. Earlier versions of Windows Installer and Windows ignore this property.</p> <p>For more information, see the following:</p> <ul style="list-style-type: none"> <li>• <a href="#">Per-User vs. Per-Machine Installations</a></li> <li>• <a href="#">MSIINSTALLPERUSER Property</a> on the MSDN Web site</li> </ul>
<b>Privileged</b>	<p>This property will run an installation with elevated privileges if the user is an administrator or if the application is an administrator-assigned application.</p>
<b>PROMPTROLLBACKCOST</b>	<p>This property specifies what will happen if there is insufficient disk space to continue the installation. Depending on the user interface level, the rollback could happen automatically, without any input from the user, or it could ask the user to continue with rollback disabled.</p>
<b>PRIMARYFOLDER</b>	<p>The folder that you specify with this property will be the “primary” folder for the installation. The path to this folder will be used to determine the values for the PrimaryVolumePath property, the PrimaryVolumeSpaceAvailable property, the PrimaryVolumeSpaceRequired property, and the PrimaryVolumeSpaceRemaining property.</p>
<b>REBOOT</b>	<p>This property allows you to force or suppress a reboot after the installation completes. Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>F</b>—To force a reboot when your installation is complete.</li> <li>• <b>S</b>—To suppress any reboot except one caused by the ForceReboot action.</li> <li>• <b>R</b>—To suppress any reboot caused by Windows Installer actions.</li> </ul>

**Table 3** • Additional Configurable Properties (cont.)

Property Name	Description
<b>ROOTDRIVE</b>	In Administration mode this property sets the default drive to the first writable network drive found. In all other modes, this property sets the default drive to the writable local drive with the most disk space available.
<b>SCRIPTFILE</b>	This property defines the location of the script file that contains all operations executed during the installation.
<b>SEQUENCE</b>	This property specifies an .msi database table that lists the order in which the actions in the table will run.
<b>SHORTFILENAMES</b>	In Administration mode, this property may be set to indicate that only short file names should be used.
<b>TRANSFORMS</b>	This property stores a list of transforms to be applied to an MSI database. These transforms can be set only in Installation and Advertisement mode. The syntax for this property, if you are applying a transform to two tables, is as follows: c:\transforms\trans1;trans2. Note that transforms are applied in the order that they appear in the string.
<b>TRANSFORMSATSOURCE</b>	By setting this property to 1, you are specifying the installer to look for the transforms at the installation source.
<b>LIMITUI</b>	Setting this property limits the user interface level at basic. This is useful if you do not create a custom user interface to interact with the installer's built-in UI.
<b>DefaultUIFont</b>	This property should be set to one of the predefined styles found in the TextStyle table in order to specify your default font. If this property is not set, the installer will use the system font, which may disrupt your formatting.

## User-Supplied Information

The following section contains information about input taken from the end user. Such input can include the end user's name, company, or language.

**Table 4** • User-Supplied Information

Property Name	Description
<b>AdminProperties</b>	AdminProperties holds a list of properties set during an administration installation. These properties can be external (user name) or they can be internal (other properties on this page).

**Table 4** • User-Supplied Information (cont.)

Property Name	Description
<b>COMPANYNAME</b>	This property stores the organization name for the end user performing the installation. This information is taken from the <b>Customer Information</b> dialog box (for Basic MSI projects), or from the <b>SdCustomerInformation</b> or <b>SdCustomerInformationEx</b> dialogs (for InstallScript MSI projects).
<b>ISX_SERIALNUM</b>	This property stores the serial number that the end user enters in the Serial Number field on the <b>CustomerInformation</b> dialog.
<b>UserLanguageID</b>	This property retains the default language identifier for the end user.
<b>USERNAME</b>	This property stores the name of the end user performing the installation, which is taken from the <b>Customer Information</b> dialog (for Basic MSI projects), or from the <b>SdCustomerInformation</b> or <b>SdCustomerInformationEx</b> dialogs (for InstallScript MSI projects).
<b>ProductLanguage</b>	This property stores the numeric language ID for the product.

## Properties for Creating Predetermined User Accounts

The following table describes the properties that let you create one or more Windows user accounts without using logon dialogs.

**Table 5** • Properties for Creating Predetermined User Accounts

Property Name	Description
<b>ISNetApiLogonUsername</b>	<p>Set the value of this property to the user account that you want the installation to create. Use either of the following formats:</p> <ul style="list-style-type: none"> <li>• <i>MachineName\UserName</i></li> <li>• <i>DomainName\UserName</i></li> </ul> <p>For more information, see <a href="#">Creating Predetermined User Accounts at Run Time</a>.</p>
<b>ISNetApiLogonGroup</b>	<p>Set the value of this property to the group to which you want the user account to belong.</p> <p>For more information, see <a href="#">Creating Predetermined User Accounts at Run Time</a>.</p>
<b>ISNetApiLogonPassword</b>	<p><b>ISNetApiLogonPassword</b>—Set the value of this property to the password that you want to be configured for the user account.</p> <p>For more information, see <a href="#">Creating Predetermined User Accounts at Run Time</a>.</p>

## Product-Specific Properties

Information on product-specific properties that can be set in the Property table is listed below. Examples of these types of properties include technical support numbers, product name, and serial number.

**Table 6 • Product-Specific Properties**

Property Name	Description
<b>ARPHELPLINK</b>	<p>This property retains the Internet address for technical support.</p> <p>This value is set in the Support URL setting in the General Information view. You should provide a string entry to facilitate globalizing your installation.</p>
<b>ARPHELPTELEPHONE</b>	<p>This property retains your technical support telephone numbers.</p> <p>This value is set in the Support Phone Number setting in the General Information view. You should provide a string entry to facilitate globalizing your installation.</p>
<b>ProductCode</b>	<p>The ProductCode is the GUID for this particular version of the product. This ID must be different for different language versions and different release versions. This property is set in the General Information view.</p>
<b>ProductName</b>	<p>This property stores the name of the product—for example, InstallShield. This property is set in the General Information view.</p>
<b>ProductState</b>	<p>The installer sets this property to the installed state of the product. This property can hold one of four numeric values:</p> <ul style="list-style-type: none"> <li><b>-1</b>—The product has not been installed or advertised.</li> <li><b>1</b>—The product has been advertised, but not installed.</li> <li><b>2</b>—The product has been installed for another user.</li> <li><b>5</b>—The product has been installed and is available to the current user.</li> </ul>
<b>ProductVersion</b>	<p>The ProductVersion property stores the major, minor, and build version numbers in the format <i>AA.BB.CCCC</i>. This property is set in the General Information view.</p>
<b>Manufacturer</b>	<p>Stores the name of the product manufacturer.</p> <p>This value is set in the Publisher setting in the General Information view. You should provide a string entry to facilitate globalizing your project.</p>
<b>DiskPrompt</b>	<p>This property holds a string which is displayed by a message box prompting for a disk. You should also include empty text for additional information printed on the disk label, as in “Disk 1”.</p>

**Table 6** • Product-Specific Properties (cont.)

Property Name	Description
<b>DiskSerial</b>	The DiskSerial property should be set to the internal serial number for this release.
<b>ComponentDownload</b>	This property retains the URL for downloading a product by its string identifier (GUID).
<b>LeftUnit</b>	This property places units to the left of the number. This is necessary for languages that require this structure.
<b>UpgradeCode</b>	This is a GUID used to search for a related set of products that are already installed.
<b>IsAdminPackage</b>	This property is set to 1 if the current installation package was created through an administrative installation. You can use this property to detect post-administrative installations.

## System Folders Set by the Installer

The following properties hold the fully qualified path to many of the folders on the end user's system. Many of these properties can be used directly in your script, without having to call MsiGetProperty.

**Table 7** • System Folder Properties

Property Name	Description
<b>AppDataFolder</b>	This property holds the full path to the current user's Application Data folder.
<b>CommonAppDataFolder</b>	This property holds the full path to the All Users Application Data folder.
<b>CommonFilesFolder</b>	The value of this property is the full path to the 32-bit Common Files folder.
<b>CommonFiles64Folder</b>	The value of this property is the full path to the 64-bit Common Files folder. This property requires Windows Installer version 2.0.
<b>DesktopFolder</b>	This property is used to hold the full path to the Desktop folder for the current user. If the ALLUSERS property is set, the DesktopFolder property should hold the full path to the All Users desktop folder.
<b>FavoritesFolder</b>	The FavoritesFolder property retains the full path to the Favorites folder for the current user.
<b>FontsFolder</b>	This property holds the full path to the Fonts folder.

**Table 7** ▪ System Folder Properties (cont.)

Property Name	Description
<b>PersonalFolder</b>	This property holds the full path to the current user's Personal folder.
<b>ProgramFilesFolder</b>	This property holds the full path to the current user's Program Files folder.
<b>ProgramFiles64Folder</b>	This property holds the full path to the current user's 64-bit Program Files folder. This property requires Windows Installer version 2.0.
<b>ProgramMenuFolder</b>	This property is used to hold the full path to the <b>Program</b> menu for the current user. If the ALLUSERS property is set, the ProgramMenuFolder property should hold the full path to the All Users Programs menu.
<b>SendToFolder</b>	This property holds the full path to the current user's SendTo folder.
<b>StartMenuFolder</b>	This property is used to hold the full path to the Start menu folder for the current user. If the ALLUSERS property is set, the StartMenuFolder property should hold the full path to the All Users Start Menu folder.
<b>StartupFolder</b>	This property is used to hold the full path to the Startup folder for the current user. If the ALLUSERS property is set, the StartupFolder property should hold the full path to the All Users Startup menu.
<b>SystemFolder</b>	This property holds the full path to the 32-bit System folder.
<b>System64Folder</b>	This property holds the full path to the 64-bit System folder. This property requires Windows Installer version 2.0.
<b>TempFolder</b>	This property holds the full path to the Temp folder.
<b>TemplateFolder</b>	This property holds the full path to the current user's Template folder.
<b>WindowsFolder</b>	This property holds the full path to the user's Windows folder.
<b>WindowsVolume</b>	This property is set to the drive where Windows is installed.

## Operating System Properties Set by the Installer

The following properties are set by the installer at run time. They refer to environment variables on the target system.

**Table 8 • Operating System Properties**

Property Name	Description
<b>AdminUser</b>	This property is set by the installer at installation and is only set if the user has administrative privileges.
<b>ComputerName</b>	This property stores the name of the computer that the installation is running on. It is set by a call to the Windows API <b>GetComputerName</b> at the initialization of the installer.
<b>LogonUser</b>	This property stores the name of the user performing the installation. It is set by a call to the Windows API <b>GetUserName</b> .
<b>OLEAdvtSupport</b>	This property is set by the installer during initialization.
<b>ServicePackLevel</b>	If an operating system service pack is installed, this property stores the numeric value for that update.
<b>SharedWindows</b>	This property is set when Shared Windows is being used on the target system.
<b>ShellAdvtSupport</b>	This property is set by the installer during initialization if the target system supports feature advertisement. This property is automatically set on Windows 98 or later, or on earlier systems if Internet Explorer 4.01 is installed.
<b>SystemLanguageID</b>	This property stores the default language identifier for the target system. The value is defined by the installer by calling <b>GetSystemDefaultLangID</b> at initialization.
<b>TerminalServer</b>	This property is set by the installer at initialization if the target system is a server with Windows Terminal Server.
<b>TTCSupport</b>	This property is set by the installer at initialization if the target system supports true type font collections (TTC). The following systems support TTC: JPN - 932, Taiwan - 950, China - 936, Korea - 949, Hong Kong - 950.
<b>Version9X</b>	This property stores the version number of Windows 95 and 98 operating systems as an integer. The following formula is used to determine this integer: $(\text{MajorVersion} * 100) + \text{MinorVersion}$ . On Windows 95, Version9X is set to 400, on Windows 98 it is set to 410, and on Windows Millennium Edition it is set to 490. Version9X is not set on Windows NT-based systems.

**Table 8 •** Operating System Properties (cont.)

Property Name	Description
<b>VersionDatabase</b>	This property stores a version number of the database used during the installation.
<b>VersionNT</b>	This property stores the version number of Windows NT-based operating systems as an integer. The following formula is used to determine this integer: (MajorVersion * 100) + MinorVersion. Refer to the Windows Installer Help Library to learn the VersionNT property for a specific operating system.
<b>VersionNT64</b>	This property stores the version number of a Windows NT-based operating system as an integer on 64-bit systems only. The following formula is used to determine this integer: (MajorVersion * 100) + MinorVersion. This property requires Windows Installer version 2.0.
<b>WindowsBuild</b>	This property stores the build number for the operating system being run.
<b>MsiNTProductType</b>	This property stores the type of NT operating system being run on the target machine. This property requires Windows Installer version 2.0.
<b>MsiNTSuiteBackOffice</b>	This property is set to 1 if Microsoft BackOffice components are installed. In all other cases this property is not set. This property requires Windows Installer version 2.0.
<b>MsiNTSuiteDataCenter</b>	This property is set to 1 if Windows 2000 Datacenter Server is installed. In all other cases this property is not set.
<b>MsiNTSuiteEnterprise</b>	This property is set to 1 if Windows 2000 Advanced Server is installed. In all other cases this property is not set.
<b>MsiNTSuiteEnterprise</b>	This property is set to 1 if Windows 2000 Advanced Server is installed. In all other cases this property is not set.
<b>MsiNTSuiteSmallBusiness</b>	This property is set to 1 if Microsoft Small Business Server is installed. In all other cases this property is not set.
<b>MsiNTSuiteSmallBusinessRestricted</b>	This property is set to 1 if Microsoft Small Business Server is installed with the restrictive client license. In all other cases this property is not set.
<b>MsiNTSuitePersonal</b>	This property is set to 1 if the operating system is Workstation Personal. In all other cases this property is not set.

**Table 8** • Operating System Properties (cont.)

Property Name	Description
<b>MsiNetAssemblySupport</b>	This property is set if the operating system supports .NET Framework assemblies. In all other cases this property is not set.
<b>MsiWin32AssemblySupport</b>	This property is set if the operating system supports Win32 assemblies. In all other cases this property is not set.

## Hardware Properties Set by the Installer

The following properties are set by the installer at run time and store settings on certain hardware profiles for the end user's system.

**Table 9** • Hardware Properties

Property Name	Description
<b>Alpha</b>	This property stores the numeric value of the processor level, and it is only defined if the setup is running on an Alpha processor. (This property is supported only with Windows Installer version 1.0.)
<b>BorderSide</b>	This property sets the pixel width of the side window borders.
<b>BorderTop</b>	This property sets the pixel width of the top window border.
<b>CaptionHeight</b>	This property sets the pixel height of the caption area.
<b>ColorBits</b>	This property stores the number of adjacent color bits for each pixel (that is, the color depth of the user's monitor). For example, if the user's monitor is using 256 colors, ColorBits is set to 8.
<b>Intel</b>	This property stores the numeric value of the processor level, and it is defined only if the setup is running on an Intel 32-bit processor.
<b>Intel64</b>	This property stores the numeric value of the processor level, and it is defined only if the setup is running on an Intel 64-bit processor. This property requires Windows Installer version 2.0.
<b>PhysicalMemory</b>	This property stores the installed amount of physical memory, in megabytes.
<b>ScreenX</b>	This property defines the width of the screen, in pixels.
<b>ScreenY</b>	This property defines the height of the screen, in pixels.
<b>TextHeight</b>	This property sets the height of text characters.

**Table 9** ▪ Hardware Properties (cont.)

Property Name	Description
<b>VirtualMemory</b>	The amount of available page file space, in megabytes, is stored in this property.

## PowerShell Properties

The following PowerShell-related properties are available at run time:

**Table 10** ▪ PowerShell Properties

Property Name	Description
<b>IS_CLR_VERSION</b>	<p>This property identifies a semicolon-delimited list of .NET Framework versions that a custom action should attempt to load to run your managed code and PowerShell scripts. In most scenarios, this property is not set in the installation package. It is set at the command line. To specify that version 1.1 is required, use the following command-line parameter:</p> <pre>IS_CLR_VERSION=v1.1.4322</pre> <p>Note that the complete version number of the .NET Framework should be specified for the property value. If more than one version is acceptable, you can specify a semicolon-delimited list of versions. The first one that can be loaded is used. For the following example command-line parameter, the action attempts to load version 2.0. If that version is not present, the action attempts to load version 1.1. If version 1.1 is not present, the action fails.</p> <pre>IS_CLR_VERSION=v2.0.50727;v1.1.4322</pre> <p>To specify that the action should attempt to load whatever is the latest version of the .NET Framework that is installed if none of the specified versions are installed, add a semicolon to the end of the property value, as shown in the following example:</p> <pre>IS_CLR_VERSION=v2.0.50727;v1.1.4322;</pre> <p>The semicolon at the end of the property value also indicates that if none of the specified versions are present but a version of the .NET Framework is already loaded, the action uses the currently loaded version, even if it is not the latest version that is installed.</p> <p>If issues with the action occur at run time because of .NET Framework version mismatches, you may want to instruct end users to set the <code>IS_CLR_VERSION</code> property at the command line when they run your installation.</p> <p>To learn more, see:</p> <ul style="list-style-type: none"> <li>● <a href="#">Calling a PowerShell Custom Action</a></li> <li>● <a href="#">Run-Time Requirements for Managed-Code Custom Actions</a></li> </ul>
<b>POWERSHELLVERSION</b>	The predefined PowerShell system search sets the value of this property if PowerShell is installed.

## Virtual Machine Properties

To use Windows Installer properties to detect the presence of a virtual machine and determine the type of virtual machine, you first need to create a custom action that calls the ISDetectVM function in the SetAllUsers.dll file. For instructions, see [Detecting Whether the Installation Is Being Run on a Virtual Machine](#).

The custom action sets the following Windows Installer properties at run time:

**Table 11** • Virtual Machine Properties

Property Name	Description
<b>IS_VM_DETECTED</b>	<p>If the value of this property is 1, one of the following virtual machine environments is present:</p> <ul style="list-style-type: none"> <li>• Microsoft Hyper-V</li> <li>• A VMware product such as VMware Player, VMware Workstation, or VMware Server</li> <li>• Microsoft Virtual PC</li> </ul> <p>If the value is not set, no virtual machine has been detected.</p>
<b>IS_VM_TYPE</b>	<p>This property indicates the type of virtual machine that is present on a target system. Available values are:</p> <ul style="list-style-type: none"> <li>• <b>0</b>—No virtual machine has been detected.</li> <li>• <b>1</b>—The installation is running on a VMware product such as VMware Player, VMware Workstation, or VMware Server.</li> <li>• <b>2</b>—The installation is running on a Microsoft Hyper-V machine.</li> <li>• <b>3</b>—The installation is running on a Microsoft Virtual PC machine.</li> <li>• <b>4</b>—The type of virtual machine is not known.</li> </ul>

## Status Properties Updated by the Installer

The following properties are set by the installer at run time. These properties identify the status of the installation.

**Table 12** • Status Properties

Property Name	Description
<b>AFTERREBOOT</b>	This property is set to 1 by the installer after a reboot triggered by the ForceReboot action.
<b>CostingComplete</b>	This property is set to 1 as soon as costing has begun and is set to 0 when costing is complete.
<b>RollbackDisabled</b>	The installer sets the RollbackDisabled property whenever rollback has been disabled. This property is not set by default.
<b>Installed</b>	This property determines if the product is already installed.

**Table 12** ▪ Status Properties (cont.)

Property Name	Description
<b>OutOfDiskSpace</b>	This property is set to True if any of the drives that are targets for the install do not have enough disk space. Otherwise, it is set to False.
<b>OutOfNoRbDiskSpace</b>	This property is set to True if any disk targeted during an installation does not have enough free disk space and if rollback capability is turned off. It is set to False if all of the target disks have sufficient space.
<b>Preselected</b>	This property determines if features have been preselected, and if so, does not display the selection dialog.
<b>PrimaryVolumePath</b>	The installer sets this property to the path specified in the PRIMARYFOLDER property.
<b>PrimaryVolumeSpaceAvailable</b>	This installer sets this property to a string representing the total number of bytes, in units of 512, available on the volume specified by the PRIMARYFOLDER property.
<b>PrimaryVolumeSpaceRequired</b>	This property stores a string representing the total amount of disk space required, in bytes (expressed in units of 512 bytes), by the currently selected features.
<b>PrimaryVolumeSpaceRemaining</b>	The installer sets this property to a string representing the number of remaining bytes available on the system, in units of 512, if all selected features were to be installed.
<b>Resume</b>	This property stores the text string displayed to the user when an installation is resumed from a suspended setup.
<b>UpdateStarted</b>	This property is set once changes to the system have taken place as a result of the installation process.
<b>ReplacedInUseFiles</b>	This property is set if a file that is currently in use is overwritten. Custom actions that check to see if a reboot is required will use this property.
<b>NOUSERNAME</b>	Setting this property to 1 stops the installer from setting the USERNAME property. By default, this property is not set and the USERNAME property is set from the registry.
<b>NOCOMPANYNAME</b>	Setting this property to 1 stops the installer from setting the COMPANYNAME property. By default, this property is not set and the COMPANYNAME property is set from the registry.

## Date and Time Properties

**Table 13** • Date and Time Properties

Property Name	Description
<b>Date</b>	This property holds the current date.
<b>Time</b>	This property holds the current time.

## InstallScript Engine-Related Properties

These properties contain information related to the InstallScript engine.

**Table 14** • InstallScript Engine-Related Properties

Property Name	Description
<b>STANDARD_USE_SETUPEXE</b>	 <p><b>Project</b> • This property applies to InstallScript MSI projects.</p> <p>InstallScript MSI projects must be run by launching Setup.exe. This localizable property holds the message that is displayed to an end user who launches your .msi database directly, instead of launching Setup.exe.</p>

## SQL-Related Properties

These properties contain data related to SQL connections and SQL scripts that are configured in the SQL Scripts view.

**Table 15** • InstallScript Engine-Related Properties

Property Name	Description
<b>IS_SQLSERVER_ALIAS_ONLY</b>	<p>Specify to show only the SQL Server aliases in the SQL Server browse combo box and list box controls.</p> <p>To learn more, see <a href="#">Overriding the Default SQL Run-Time Behavior</a>.</p>
<b>IS_SQLSERVER_AUTHENTICATION</b>	<p>This property identifies the type of authentication that you want to use to connect to the specified catalog. The default property is IS_SQLSERVER_AUTHENTICATION. The following numbers are valid property values:</p> <ul style="list-style-type: none"> <li>• <b>0</b>—Windows authentication credential of the current user</li> <li>• <b>1</b>—Server authentication</li> </ul> <p>To learn more, see <a href="#">Using Windows Installer Properties for SQL Login Settings</a>.</p>

**Table 15** • InstallScript Engine-Related Properties (cont.)

Property Name	Description
<b>IS_SQLSERVER_CONNECTIONS_TO_VALIDATE</b>	<p>Overrides the connections that will be tested when clicking the Next button on the SQLLogin dialog.</p> <p>To learn more, see <a href="#">Overriding the Default SQL Run-Time Behavior</a>.</p>
<b>IS_SQLSERVER_CXNS_ABSENT_FROM_INSTALL</b>	<p>Specifies one or more SQL connections that should be skipped during installation or uninstallation.</p> <p>To learn more, see <a href="#">Overriding the Default SQL Run-Time Behavior</a>.</p>
<b>IS_SQLSERVER_DATABASE</b>	<p>This property identifies the name of the SQL catalog to which you want to create a connection during the installation.</p> <p>To learn more, see <a href="#">Using Windows Installer Properties for SQL Login Settings</a>.</p>
<b>IS_SQLSERVER_DO_NOT_USE_REG</b>	<p>Specifies not to use the stored SQL Server login information written in the registry.</p> <p>To learn more, see <a href="#">Overriding the Default SQL Run-Time Behavior</a>.</p>
<b>IS_SQLSERVER_LOCAL_ONLY</b>	<p>Specifies to show only the local SQL Server in the SQL Server browse combo box and list box controls.</p> <p>To learn more, see <a href="#">Overriding the Default SQL Run-Time Behavior</a>.</p>
<b>IS_SQLSERVER_PASSWORD</b>	<p>This property identifies the password that should be used for server authentication.</p> <p>To learn more, see <a href="#">Using Windows Installer Properties for SQL Login Settings</a>.</p>
<b>IS_SQLSERVER_REMOTE_ONLY</b>	<p>Specifies to show only the remote SQL Servers in the SQL Server browse combo box and list box controls.</p> <p>To learn more, see <a href="#">Overriding the Default SQL Run-Time Behavior</a>.</p>
<b>IS_SQLSERVER_SERVER</b>	<p>This property identifies the name of the target server instance (for Microsoft SQL Server and MySQL) or the connect URL string or local net service name (for Oracle).</p> <p>To learn more, see <a href="#">Using Windows Installer Properties for SQL Login Settings</a>.</p>
<b>IS_SQLSERVER_USERNAME</b>	<p>This property identifies the login ID that should be used for server authentication.</p> <p>To learn more, see <a href="#">Using Windows Installer Properties for SQL Login Settings</a>.</p>

## MDAC Properties

These properties apply to version checking for MDAC.

**Table 16** • MDAC Properties

Property Name	Description
<b>ISINSTALL_MDAC_BYVERSION</b>	Create and set this property to Yes if you want InstallShield to perform default version checking.
<b>ISINSTALL_MDAC_SKIP</b>	Create and set this property in the Project Manager if you are performing your own version checking and do not want InstallShield to install MDAC.

## SETUPEXEDIR

**Project** • The following project types support the SETUPEXEDIR property:

- InstallScript MSI
- Basic MSI

To determine the location from which an InstallScript installation was run, use SRCDIR or PACKAGE\_LOCATION.

SETUPEXEDIR is a property that contains the path to Setup.exe. For example, if the path to Setup.exe is C:\MySetups\MyApp\Setup.exe, the value of SETUPEXEDIR is C:\MySetups\MyApp.

### Using SETUPEXEDIR

SETUPEXEDIR is an alternative to the directory identifier SourceDir. A potential problem with using SourceDir is that it points to the location of the running .msi package. In the case of a compressed installation, the .msi package is streamed to a temporary location and run from there. Because of this, the value of SourceDir will be some temporary location on the end user's machine, which might not be the value that you want.

### Limitations of SETUPEXEDIR

There are two limitations to using SETUPEXEDIR:

- SETUPEXEDIR is set by Setup.exe. If the end user runs the .msi package directly, SETUPEXEDIR is not set. To account for this, you could have a dual implementation in your installation—one that uses SETUPEXEDIR and one that uses SourceDir. You could test for the existence of SETUPEXEDIR and, if it does not exist, you could conditionally use your SourceDir implementation.
- SETUPEXEDIR might not be set at uninstallation. If the end user triggers the uninstallation by running Setup.exe, SETUPEXEDIR is set. If they run the uninstallation from Add or Remove Programs, SETUPEXEDIR is not set.

**Note** • In an uncompressed installation, SourceDir and SETUPEXEDIR have the same value.

# Advanced UI and Suite/Advanced UI Property Reference

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

A number of properties are set during Advanced UI and Suite/Advanced UI installations. You can set the values of some of the properties from within InstallShield, while others are initialized by the Advanced UI or Suite/Advanced UI engine at run time.

Unlike Basic MSI projects, Advanced UI and Suite/Advanced UI projects do not distinguish between public properties and private properties. However, capitalization must be maintained; if you use mixed uppercase and lowercase for the name of the Advanced UI or Suite/Advanced UI property, ensure that you use the same capitalization every time that you refer to that property in your project.

Note that if a property that you define in the Property Manager view is set to a value that references a second property, and if you want the second property to be resolved in the first property's value, you may need to select the Formatted check box for the first property. To learn more, see [Property Manager View](#).

The following categories of built-in Advanced UI and Suite/Advanced UI properties are available:

- [Special Advanced UI and Suite/Advanced UI Properties](#)
- [Advanced UI and Suite/Advanced UI Folder Properties](#)
- [System Folder Properties](#)

**Note** ▪ Do not confuse Advanced UI and Suite/Advanced UI properties with path variables, which are surrounded by angle brackets (<>). While they both may represent directories, Advanced UI and Suite/Advanced UI properties are evaluated at run time, but path variables are used to point to source files only during installation authoring and at build time.

## Special Advanced UI and Suite/Advanced UI Properties

The following properties indicate various miscellaneous information for the Advanced UI and Suite/Advanced UI installation.

**Table 17** ▪ Special Advanced UI and Suite/Advanced UI Properties

Property	Description
<b>IS_CLR_VERSION</b>	<p>This property identifies a semicolon-delimited list of .NET Framework versions that a Suite/Advanced UI action should attempt to load to run your managed code and PowerShell scripts. In most scenarios, this property is not set in the installation package. It is set at the command line. To specify that version 1.1 is required, use the following command-line parameter:</p> <pre>IS_CLR_VERSION=v1.1.4322</pre> <p>Note that the complete version number of the .NET Framework should be specified for the property value. If more than one version is acceptable, you can specify a semicolon-delimited list of versions. The first one that can be loaded is used. For the following example command-line parameter, the action attempts to load version 2.0. If that version is not present, the action attempts to load version 1.1. If version 1.1 is not present, the action fails.</p> <pre>IS_CLR_VERSION=v2.0.50727;v1.1.4322</pre> <p>To specify that the action should attempt to load whatever is the latest version of the .NET Framework that is installed if none of the specified versions are installed, add a semicolon to the end of the property value, as shown in the following example:</p> <pre>IS_CLR_VERSION=v2.0.50727;v1.1.4322;</pre> <p>The semicolon at the end of the property value also indicates that if none of the specified versions are present but a version of the .NET Framework is already loaded, the action uses the currently loaded version, even if it is not the latest version that is installed.</p> <p>If issues with the action occur at run time because of .NET Framework version mismatches, you may want to instruct end users to set the <b>IS_CLR_VERSION</b> property at the command line when they run your installation.</p>
<b>ISFeatureInstall</b>	<p>This property stores a comma-delimited list of feature names that are defined in the Advanced UI or Suite/Advanced UI Setup.xml file for command-line feature selection that will be selected for installation.</p>
<b>ISFeatureRemove</b>	<p>This property stores a comma-delimited list of feature names that are defined in the Advanced UI or Suite/Advanced UI Setup.xml file for command-line feature selection that will be selected for removal.</p>

**Table 17** ▪ Special Advanced UI and Suite/Advanced UI Properties (cont.)

Property	Description
<b>ISHiddenProperties</b>	<p>This property stores a semicolon-delimited list of case-sensitive property names whose values you do not want to be written to the debug log files. This property enables you to prevent properties that contain passwords and other sensitive information from being logged.</p> <p>Note that ISHiddenProperties is useful for prevention of logging for values in the following scenarios:</p> <ul style="list-style-type: none"> <li>• The value of the property changes.</li> <li>• The end user sets the value of the property through command line when launching the Advanced UI or Suite/Advanced UI Setup.exe file.</li> <li>• The property is configured through a command line that the Advanced UI or Suite/Advanced UI installation passes to a package. This is configurable in the Packages view, on the Common tab, in the Operation area.</li> </ul> <p>If the property is logged through ISuiteExtension::LogInfo, the Suite engine cannot prevent the logging. Therefore, any code that you create to write a property value to the log file should read ISHiddenProperties to see whether the property value should be logged.</p>
<b>ISInstallMode</b>	<p>This read-only property stores a value that indicates the mode in which the Advanced UI or Suite/Advanced UI installation is running. Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>0</b>—First-time installation</li> <li>• <b>1</b>—Maintenance/UI maintenance mode selection</li> <li>• <b>2</b>—Maintenance/modify</li> <li>• <b>3</b>—Maintenance/remove</li> <li>• <b>4</b>—Maintenance/repair</li> <li>• <b>5</b>—Stage only (The installation is run in stage mode, in which the Advanced UI or Suite/Advanced UI installation is staged—or uncompressed and copied to a specified location. Note that none of the packages in the installation are run in this mode.)</li> </ul>
<b>ISInstallProgress</b>	<p>This property stores the percentage of how much of the entire Advanced UI or Suite/Advanced UI installation has been completed. It is typically used for a progress circle control on the InstallationProgress wizard page.</p>
<b>ISInstallStatus</b>	<p>This property stores progress messages from the Advanced UI or Suite/Advanced UI installation.</p>
<b>ISOnRebooted</b>	<p>If the Advanced UI or Suite/Advanced UI installation is resuming after a reboot, this property is set to True.</p>

**Table 17** ▪ Special Advanced UI and Suite/Advanced UI Properties (cont.)

Property	Description
<b>ISParcelProgress</b>	This property stores the percentage of how much of the currently running package installation has been completed. It is typically used for the Interior Property setting of the progress circle control.
<b>ISPassword</b>	<p>If you configure your Advanced UI or Suite/Advanced UI release to be password protected, the Advanced UI or Suite/Advanced UI user interface sets the <i>ISPassword</i> property. When the password is set and a password is populated in the Advanced UI or Suite/Advanced UI Setup.xml file, the value of this property is validated against the password from Setup.xml.</p> <p>To learn more, see <a href="#">Password-Protecting an Advanced UI or Suite/Advanced UI Installation</a>.</p>
<b>ISPerformDelayedReboot</b>	This property is set to True by the Advanced UI or Suite/Advanced UI user interface if the target system should be restarted when the Advanced UI or Suite/Advanced UI installation exits.
<b>ISParcelStatus</b>	This property stores progress messages from the currently running package.
<b>ISRootStagePath</b>	This property is used when the installation is run in stage mode. The property stores the path to the location where the Advanced UI or Suite/Advanced UI installation is staged—or uncompressed and copied to a specified location.
<b>ISSelectedLanguage</b>	This property stores a string that contains the decimal language identifier of the language that the installation is currently displaying. Changing this property at run time, such as in the InstallationLanguage wizard page, changes the current language of the Advanced UI or Suite/Advanced UI installation. You can use this property to set the language of the packages in your Advanced UI or Suite/Advanced UI installation.
<b>ISSilentInstall</b>	If the Advanced UI or Suite/Advanced UI installation is running silently (without a user interface), this property is set to True.
<b>ISUpdateAvailable</b>	<p>This property indicates whether an update for the currently running Advanced UI or Suite/Advanced UI installation is available for download. If an update is available, this property is set to 1.</p> <p>To learn more, see <a href="#">Supporting Downloadable Updates for an Advanced UI or Suite/Advanced UI Installation</a>.</p>
<b>ISUpdateVersion</b>	<p>This property indicates the version of the Advanced UI or Suite/Advanced UI installation that is available for download.</p> <p>To learn more, see <a href="#">Supporting Downloadable Updates for an Advanced UI or Suite/Advanced UI Installation</a>.</p>

## Advanced UI and Suite/Advanced UI Folder Properties

The following properties define where files are stored or installed on the target system.

**Table 18** • Advanced UI and Suite/Advanced UI Folder Properties

Property	Description
<b>ISLogDir</b>	<p>If logging is enabled and configured for one or more of the packages in the Advanced UI or Suite/Advanced UI installation, and if an end user launches the Advanced UI or Suite/Advanced UI installation from the command line with the <code>/log</code> parameter, this property stores path to the directory that contains the package log files.</p> <p>For more information, see <a href="#">Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation</a>.</p>
<b>ISPREREQDIR</b>	This property stores the path to an Advanced UI or Suite/Advanced UI package's files when the package is staged, or copied to the target system for use temporarily during run time.
<b>ORIGINALSETUPEXEDIR</b>	This property stores the path to the Advanced UI or Suite/Advanced UI installation's Setup.exe file. For example, if the path to Setup.exe is <code>C:\MySetups\MyApp\Setup.exe</code> , the value of <i>ORIGINALSETUPEXEDIR</i> is <code>C:\MySetups\MyApp</code> .
<b>ORIGINALSETUPEXENAME</b>	<p>This property identifies the name of the setup launcher file that was created when the project was built. The installation updates the value of this property at run time if the setup launcher file was renamed. The following path identifies the full path to this file:</p> <p>[ORIGINALSETUPEXEDIR]\[ORIGINALSETUPEXENAME]</p>
<b>SETUPEXEDIR</b>	This property stores the path to the Advanced UI or Suite/Advanced UI installation's Setup.exe file, typically a temporary location.
<b>SETUPEXENAME</b>	<p>The installation updates the value of this property at run time if the setup launcher file was renamed. The following path identifies the full path to this file:</p> <p>[SETUPEXEDIR]\[SETUPEXENAME]</p>

**Table 18** • Advanced UI and Suite/Advanced UI Folder Properties (cont.)

Property	Description
<b>SETUPSUPPORTDIR</b>	<p>This property stores the path to the folder that contains the support folders and files that are used temporarily by the Advanced UI or Suite/Advanced UI installation at run time and then removed. This location is sometimes referred to as the <i>default staging path</i>. To refer to a file that is in the Language Independent node in the Support Files view, use the following syntax:</p> <pre>[SETUPSUPPORTDIR]\MyLanguageIndependentFile.txt</pre> <p>To refer to a file that is in one of the language-specific nodes in the Support Files view, include the <b>language identifier</b> in the path. For example, the language identifier for English is 1033:</p> <pre>[SETUPSUPPORTDIR]\1033\MyEnglishFile.txt</pre>
<b>TempFolder</b>	<p>This property stores the path to the current temporary folder in the user context in which the Advanced UI or Suite/Advanced UI installation is running.</p>

## System Folder Properties

The following properties define paths to various folders on end users' systems.

**Table 19** • System Folder Properties

Property	Description
<b>AdminToolsFolder</b>	The value of this property is the full path to the end user's folder that contains administrative tools.
<b>AppDataFolder</b>	The value of this property is the full path to the end user's Application Data folder.
<b>CommonAppDataFolder</b>	The value of this property is the full path to the All Users Application Data folder.
<b>CommonDocuments</b>	The value of this property is the full path to the folder that contains documents that are common to all users.
<b>CommonFilesFolder</b>	The value of this property is the full path to the 32-bit Common Files folder.
<b>CommonFiles64Folder</b>	The value of this property is the full path to the 64-bit Common Files folder on 64-bit systems. This property is undefined on 32-bit systems.
<b>LocalAppDataFolder</b>	The value of this property is the full path to the folder that contains data files for local (non-roaming) applications.

**Table 19** ▪ System Folder Properties (cont.)

Property	Description
<b>PersonalFolder</b>	The value of this property is the full path to the end user's Personal folder.
<b>ProgramFilesFolder</b>	The value of this property is the full path to the end user's Program Files folder. On 64-bit systems, this property refers to the 32-bit location.
<b>ProgramFiles64Folder</b>	The value of this property is the full path to the end user's 64-bit Program Files folder. This property is undefined on 32-bit systems.
<b>SystemFolder</b>	The value of this property is the full path to the 32-bit system folder.
<b>System64Folder</b>	The value of this property is the full path to the 64-bit built-in system folder on 64-bit systems. This property is undefined on 32-bit systems.
<b>WindowsFolder</b>	The value of this property is the full path to the end user's Windows folder.

## Creating Properties in Windows Installer–Based Projects

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

*Project-specific differences are noted where applicable.*

For instructions on creating properties in Advanced UI and Suite Advanced UI projects, see [Creating Properties in Advanced UI and Suite/Advanced UI Projects](#).

You can create your own project-wide properties through the Property Manager. These properties allow you to set a value in one place and use it throughout your project.

### Task

#### To create a property:

1. In the View List under **Behavior and Logic**, click **Property Manager**.
2. Click the **New Property** button. InstallShield adds a new row at the bottom of the view.
3. In the **Name** column, enter a name for the new property.
4. In the **Value** column, enter a value for the property.

5. In the **Comments** column, optionally enter comments about the property.

**Tip** ▪ Use the following guidelines when entering values in the Property Manager view:

- To overwrite all of the text in a table cell, click the table cell and then type your new property name, value, or comments.
- To place the cursor at a particular place within a table cell, double-click that place. Then type your change.

## Tips for Creating Windows Installer Properties in Windows Installer–Based Projects

If you want to create a property that can be changed at the command line, use all uppercase letters in the property's name. For example, `INSTALLDIR` is a property that can be set or changed from the command line. For more information, see [Overview of Windows Installer Properties](#).

**Windows Logo** ▪ InstallShield does not verify whether the information that you enter in the Property Manager view is valid. For example, if you change the value of the `ARPHelpLink` property to **MyCompany** instead of **http://www.mycompany.com**, the link fails when an end user clicks it. InstallShield does not display an error message when you enter the data in the Property Manager or at build time. To check whether you have the correct information and syntax for a built-in Windows Installer property, see the [Windows Installer Property Reference](#).

# Creating Properties in Advanced UI and Suite/Advanced UI Projects

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

You can create your own project-wide properties through the Property Manager. These properties allow you to set a value in one place and use it throughout your project.

### Task

#### To create a property:

1. In the View List under **Behavior and Logic**, click **Property Manager**.
2. Click the **New Property** button. InstallShield adds a new row at the bottom of the view.
3. In the **Name** column, enter a name for the new property.
4. In the **Value** column, enter a value for the property.

5. In the **Formatted** column, select or clear the check box, which lets you indicate whether the text that you entered in the **Value** column is formatted.
  - To leave the property value (including square brackets and the content within them) as is, clear the **Formatted** check box.
  - If the value in the Value column contains one or more formatted expressions with property names, environment variable references, or other special strings that you want to be resolved at run time, select the **Formatted** check box. To learn about the syntax that is available for these expressions, see [Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time](#).

**Tip** • Use the following guidelines when entering values in the Property Manager view:

- To overwrite all of the text in a table cell, click the table cell and then type your new property name, value, or comments.
- To place the cursor at a particular place within a table cell, double-click that place. Then type your change.

## Changing an Existing Property

**Project** • This information applies to the following project types:

- Advanced UI
- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Suite/Advanced UI
- Transform

### Task

**To change an existing property in your project:**

1. In the View List under **Behavior and Logic**, click **Property Manager**.
2. Do one of the following:
  - To overwrite all of the text in a table cell, click the table cell and then type your new property name, value, or comments.
  - To place the cursor at a particular place within a table cell, double-click that place. Then type your change.

# Creating a Localizable Property

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

If you want a property that can have different values based on the language that your installation uses, you can create a localizable property.

## Task

**To create a localizable property:**

1. In the View List under **Behavior and Logic**, click **Property Manager**.
2. Click the arrow next to the **New Property** button, and then click **Localizable Property**. InstallShield adds a new row at the bottom of the view. A new string identifier is listed in the Value column for that property.
3. In the **Name** column, enter a name for the new property.

**Tip** ▪ You can use the String Editor view to set a different property value for each language that your project supports.

To learn how string identifiers and values are used in projects, see [Using String Entries in InstallShield](#).

# Making an Existing Property Localizable

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

If you want a property that can have different values based on the language that your installation uses, you can make that property localizable.

## Task

**To make a property localizable:**

1. In the View List under **Behavior and Logic**, click **Property Manager**.
2. Select one or more properties that you want to localize.

To select multiple consecutive properties, select the first property, press and hold SHIFT, and select the last property. To select multiple nonconsecutive properties, select the first property, press and hold CTRL, and select each additional property.

3. Click the **Make Selected Properties Localizable** button.

InstallShield adds a new string identifier in the Value column for that property.

**Tip** ▪ You can use the String Editor view to set a different property value for each language that your project supports.

To learn how string identifiers and values are used in projects, see [Using String Entries in InstallShield](#).

## Preventing a Property Value from Being Written in Windows Installer Log Files

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

By default, Windows Installer writes the final value of every Windows Installer property contained in your installation to a log file generated by launching MsiExec with the /L argument. Starting with Windows Installer version 2.0, you can prevent certain properties (such as those containing passwords) from being written in the log file.

### Task

**To prevent a property from being written in the log file:**

1. In the View List under **Behavior and Logic**, click **Property Manager**.
2. In the **Name** column, find the MsiHiddenProperties property.

If this property is not listed, click the **New Property** button to create this property, and in the **Name** column, enter **MsiHiddenProperties**.

3. In the **Value** column, enter the name of the property that you want to be hidden. To list more than one property, separate each with a semicolon (;).

For more information about this property, see [MsiHiddenProperties](#) in the Windows Installer Help Library.

# Preventing a Property Value from Being Written in Advanced UI and Suite/Advanced UI Debug Log Files

**Project** • This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

If you launch an Advanced UI or Suite/Advanced UI Setup.exe file with the /debuglog parameter, the Suite engine generates a debuglog file. By default, the debug log file includes the values of changed Advanced UI or Suite/Advanced UI properties.

In some cases, you may want to prevent the Suite engine from writing the values of specific properties to the debug log file. For example, you may want to prevent properties that contain passwords and other sensitive information from being logged.

## Task

**To prevent a property from being written in the log file:**

1. In the View List under **Behavior and Logic**, click **Property Manager**.
2. In the **Name** column, find the ISHiddenProperties property.

If this property is not listed, click the **New Property** button to create this property, and in the **Name** column, enter ISHiddenProperties.

3. In the **Value** column, enter the name of the property whose value you do not want to be logged; ensure that you use the same capitalization. To list more than one property, separate each with a semicolon (;).

Note that ISHiddenProperties is useful for prevention of logging for values in the following scenarios:

- The value of the property changes.
- The end user sets the value of the property through command line when launching the Advanced UI or Suite/Advanced UI Setup.exe file.
- The property is configured through a command line that the Advanced UI or Suite/Advanced UI installation passes to a package. This is configurable in the Packages view, on the Common tab, in the Operation area.

If the property is logged through ISuiteExtension::LogInfo, the Suite engine cannot prevent the logging. Therefore, any code that you create to write a property value to the log file should read ISHiddenProperties to see whether the property value should be logged.

# Specifying that a Public Property Should Be a Restricted Public Property

**Project** • This information applies to the following project types:

- *Basic MSI*

- *DIM*
- *InstallScript MSI*
- *Merge Module*

Restricted public properties allow network administrators to define public properties that can be changed only by a system administrator or by someone who has elevated privileges. This way, the administrator can change settings quickly without having to worry that unauthorized users on the network may tamper with the installation.

Windows Installer considers a number of public properties to be restricted public properties. For the full list of restricted public properties, see [Restricted Public Properties](#) in the Windows Installer Help Library.

To include additional public properties, add them to the `SecureCustomProperties` property.

If you perform tasks such as the following ones, InstallShield automatically adds the applicable property to the `SecureCustomProperties` property:

- When you use a public property in a system search, InstallShield adds the public property to the `SecureCustomProperties` property.
- When you add or import a dialog to a Basic MSI or Merge Module project, and the dialog contains a control that is set through a property, InstallShield adds that property to the `SecureCustomProperties` property.
- When you add a major upgrade item to your project, InstallShield adds the value of the Detect Property setting on the Advanced tab for that upgrade item to the `SecureCustomProperties` property.

This enables the custom public properties to be set in the user interface sequence and then be passed to the execute sequence.

#### Task

**To manually specify that a custom public property should be a restricted property:**

1. In the View List under **Behavior and Logic**, click **Property Manager**.
2. In the **Name** column, find the **SecureCustomProperties** property.  
  
If this property is not listed, click the **New Property** button to create this property, and in the **Name** column, enter `SecureCustomProperties`.
3. In the **Value** column, enter the public properties that you would like to restrict. Separate multiple entries with a semicolon (;).

## Getting or Setting Windows Installer Properties in InstallScript

**Project** - This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

The **MsiGetProperty** and **MsiSetProperty** functions get and set Windows Installer properties. For an example, see [Getting and Setting Properties](#).

You must include the statement `#include "iswi.h"` or `#include "ifx.h"` in order for the Windows Installer APIs to be available to your script.

## Removing a Value from a Property

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Suite/Advanced UI
- Transform

Advanced UI and Suite/Advanced UI projects do not have support for localizable properties.

You can clear a property's value without deleting the property from the Property Manager. This functionality works for localizable and non-localizable properties. For example, you might want to clear a localizable property such as ARPCOMMENTS.

### Task

#### To clear a property value:

1. In the View List under **Behavior and Logic**, click **Property Manager**.
2. Select one or more properties whose values you want to clear.

To select multiple consecutive properties, select the first property, press and hold SHIFT, and select the last property. To select multiple nonconsecutive properties, select the first property, press and hold CTRL, and select each additional property.

3. Click the **Clear Selected Properties** button.

**Note** ▪ Clearing a property makes the property non-localizable because it does not have a string identifier.

## Deleting a Property

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Basic MSI
- DIM

- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Suite/Advanced UI*
- *Transform*

If you no longer need a property in your project, you can delete it from the Property Manager view.

---

**Task****To delete a property from your project:**

1. In the View List under **Behavior and Logic**, click **Property Manager**.
2. Select one or more properties that you want to delete.

To select multiple consecutive properties, select the first property, press and hold SHIFT, and select the last property. To select multiple nonconsecutive properties, select the first property, press and hold CTRL, and select each additional property.

3. Click the **Delete Selected Properties** button.

InstallShield displays a message box that lets you specify whether you want to delete just the selected properties, or the selected properties plus any associated string entries.

# Directly Editing .msi and .msm Databases

The MSI Database and MSM Database project types let you edit Windows Installer installation databases and merge module databases directly, rather than working through an intermediate project format (.ism file). These project types extend the Direct Editor functionality to include different views that are supported in standard installation projects. The views that are supported in these project types are intended to function as they do for an .ism project.

**Project** ▪ *There is no string entry or path variable support in an MSI Database or MSM Database project.*

You can directly edit an existing .msi file or .msm file, or directly create a new database by opening a new MSI Database or MSM Database project.

## Opening Windows Installer Packages

InstallShield provides the option to either edit .msi packages directly in InstallShield by using direct edit mode or convert it to an InstallShield project (.ism), and then edit it as a Basic MSI project in InstallShield.

**Note** ▪ *Some functionality is limited when editing an .msi package in direct edit mode.*

### Task

**To open an .msi package in direct edit mode of InstallShield:**

1. On the **File** menu, click **Open**. The **Open** dialog box opens.
2. In the **Files of Type** list, select **Windows Installer Packages (\*.msi)**.
3. Select the .msi package that you want to open.
4. In the **Open as** box, ensure that **Auto** is selected.
5. Click **Open**.

**Note** ▪ *By default, InstallShield opens an .msi package in direct edit mode.*

The **Open MSI/MSM Wizard** can convert an existing Windows installer (.msi) package to an InstallShield project (.ism) file, and open the new project to modify in InstallShield.

**Note** ▪ *You can also open patch creation project files (.pcp files) in InstallShield and edit them in the Direct Editor.*

## Editing .msi and .msm Databases in Direct Edit Mode

If you want to directly edit a Windows Installer package (.msi file) or merge module (.msm file), you can open it in InstallShield in direct edit mode and then make the required changes.

**Task****To open an .msi or .msm file:**

1. On the **File** menu, click **Open**.
2. In the **Files of Type** list, select **Windows Installer Packages (\*.msi)** or **Windows Installer Modules (\*.msm)**.
3. Browse to the Windows Installer package or merge module that you want to open.
4. Click **Open**.

The selected package or merge module opens in a limited view of the InstallShield interface. Any changes made in the direct edit mode are made directly to the .msi or .msm file when you save your changes.

## Adding Files in Direct Edit Mode

When adding files in direct edit mode, you have the option to add files to the media in an uncompressed, a compressed, or a compressed and streamed state into the MSI format (MSI package or MSI database). These options appear in the Select Media Location dialog box when you drag and drop new files in the Files and Folders view in direct edit mode. You also have the option to extract COM information in that dialog box. However, this option is enabled only when dragging files to a folder or when adding a single file to a component that does not already have any existing files. As a result, the COM file is the only file in that particular component.

Deleting files removes the entry from the File table. Files on the media are not deleted, and files that have yet to be added to the media are not added until you save.

**Note** ▪ In direct edit mode, file and media tables are updated during the save process.

When a file is added, a record is created with a default sequence value. No Media table entry is made at this time. When the media or project is saved, the sequence for the newly added files is updated to correctly reflect the media, and media entries are created in the Media table.

## Adding Merge Modules in Direct Edit Mode

When you add a configurable merge module or object in the Redistributables view to an .msi database in direct edit mode, the Merge Module Properties dialog box opens. You can review or configure the merge module's properties through that dialog box. However, you can do this only when the merge module is initially merged with your installation database. That is when this dialog box is first opened. You should also note that a merge occurs as soon as you select a merge module in direct edit mode.

**Note** ▪ You cannot configure or set the destination of dependent merge modules.

You cannot un-merge modules that are not found in the merge module catalog. For example, a file is not found in the Modules\i386 folder. In that case, the check box next to the respective merge module is selected but disabled.

Once you add, configure, and merge the merge modules, any files included in the merged modules will be copied to the source media upon saving the database in InstallShield.

# Integrating InstallShield with External Applications

An important aspect of InstallShield is how it coexists and integrates with other software development tools such as Visual Studio as well as source code control software that complies with the Microsoft Source Control Interface.

Consult the help topics in this section for specific details on the extent of external application support in InstallShield.

## Using Source Code Control

InstallShield enables you to manage different versions of your project file in source code control software. InstallShield is capable of interacting with any source control system that complies with the Microsoft Source Control Interface and uses the default program on the development system. If none is installed, the source control options are not available.

---

**Tip** ▪ InstallShield also includes support for integrating with Team Foundation source control. To learn more, see [Integrating with Microsoft Visual Studio Team Foundation Server](#).

When you add an installation project to source control, InstallShield automatically converts the project file format to text (XML format) and maintains it in the source control system by default. If you choose not to check in your file in XML format, then the file will be checked in as a binary file.

---

**Note** ▪ When a project file format is converted to either XML or binary format, the project file extension remains `.ism`.

### Script File Support

InstallShield also supports the addition of any InstallScript files and SQL scripts, regardless of whether you insert, import, or add new files. It also supports all path variable types that you define in the Path Variables view to define the location of these script files. However, it is important to be aware that a corresponding folder structure exists in your source code database so that your source code control software can resolve paths.

# Using Source Code Control Integration

## Task

**A typical scenario for using InstallShield's source code control integration is outlined below:**

1. Create an InstallShield installation project.
2. **Add** the setup project to your source control program.
3. **Check the project out** of source control.
4. Edit the project.
5. Save the project.
6. **Check the project back in** to source control.

**Tip** ▪ You can streamline this process by having InstallShield automatically add new projects to source control or check out edited projects. For more information, see the Source Control tab of the Options dialog box; InstallShield displays this dialog box when you click Options on the Tools menu.

## Adding Projects to Source Control

InstallShield lets you add an InstallShield project to your source code control system after you have created your InstallShield project.

**Tip** ▪ You can omit steps 1 and 2 if you selected the **Add new projects to source control** check box on the Source Control tab of the Options dialog box; InstallShield displays this dialog box when you click Options on the Tools menu. As soon as you create the project, InstallShield adds it to your source code control system.

## Task

**To add a project to your source control system after you have created the project:**

1. Open the project in InstallShield.
2. On the **Project** menu, point to **Source Control**, and click **Add to Source Control**. The **Add to Source Control** dialog box opens.
3. Add comments (if applicable) and indicate whether you want to keep the project checked out.
4. Click **OK**. A log-on dialog box for your organization's source control system opens.
5. Enter your log-on information.
6. Browse to the location in your source control database where you want to add the project file.

**Note** ▪ Linked files are not added to source control.

When you add a file to source control, most programs make the local copy read only. If this is the case with your source control software, you need to check out the project file before making any changes.

## Checking Projects out of Source Control

InstallShield lets you check out an InstallShield project from your source code control system.

**Tip** ▪ You can omit steps 1 and 2 if you selected the **Check out the project when edited** check box on the **Source Control** tab of the **Options** dialog box; InstallShield displays this dialog box when you click **Options** on the **Tools** menu. As soon as you make a change to the project (anything that enables the **Save** button on the toolbar), InstallShield adds it to your source code control system.

### **Task** To check a project out of your source code control program:

1. Open the project in InstallShield.
2. On the **Project** menu, point to **Source Control**, and click **Check Out**.
3. If you selected the **Use dialog for checkout** check box on the **Source Control** tab of the **Options** dialog box, you are prompted for your comments in the **Check Out** dialog box.
4. Enter comments as appropriate, and then click **OK**.

Your project is now checked out of your source control program, and you can edit the local copy before checking it in.

**Note** ▪ The project is not automatically checked in to source control when you close the project in InstallShield. Check your project in (from within InstallShield) before closing it.

## Checking Projects in to Source Control

### **Task** To check a project in to your source control program from within InstallShield:

1. Open the project in InstallShield.
2. On the **Project** menu, point to **Source Control**, and click **Check In**.
3. The **Check In** dialog box prompts you for options for checking in the file. Click **OK**.

Your project is now checked into your source control program, which typically means that your project file is set to read only until you check it out of source control.

**Note** ▪ The project is not automatically checked in to source control when you close the project in InstallShield. Check your project in (from within InstallShield) before closing it.

# Unlinking Projects from Source Control

## Task

**To break the link between the project on your local machine and the one in your source control application:**

On the **Project** menu, select **Source Control**, and point to **Unlink from Source Control**.

## Integrating with Microsoft Visual Studio

With InstallShield, you can create your installation projects directly in Microsoft Visual Studio. InstallShield enables you to create, modify, or build your installation from within Microsoft Visual Studio.

### Integration Features

InstallShield is fully integrated within the Visual Studio shell. Some of the unique features of the integration include:

- All InstallShield navigation is presented within the Solution Explorer.
- Each InstallShield view is presented in a separate window so no scrolling is necessary and side-by-side viewing options are available.
- You can run InstallShield external to Visual Studio.
- InstallShield dynamically links your installation project to other Visual Studio project outputs, automatically updating your installation with your latest source files every time your product is built.
- Items identified by the InstallShield Debugger can be moved directly into the Visual Studio task list.

### Integration Benefits

Some additional benefits of using InstallShield's integrated installation authoring solution are:

- You can create and customize your installation without leaving the Visual Studio user interface, enabling use of familiar navigation and layout options.
- Your installation is automatically updated with your latest source files every time your solution is built, always staying current.
- The installation reflects the Build Configuration for the solution—for example, Debug, Release, automatically included source files from the proper build directory.
- .NET properties and dependencies can be scanned and included in an installation automatically.

**Note** - If you want to create, edit, and build your InstallShield projects directly within Visual Studio, you must use Visual Studio 2005 or later. InstallShield cannot be integrated with Visual Studio 2003 or earlier.

Visual Studio can be integrated with only one version of InstallShield at a time. The last version of InstallShield that is installed or repaired on a system is the one that is used for Visual Studio integration.

# Creating InstallShield Projects in Microsoft Visual Studio

InstallShield is integrated with Microsoft Visual Studio. From within the Visual Studio workspace, you can create InstallShield installations for solutions.

---

**Task**      **To create an InstallShield project from within Microsoft Visual Studio:**

1. On the **File** menu, point to **New** and click **Project**. The **New Project** dialog box opens.
2. *Beginning with Visual Studio 2010:* In the **Installed Templates** box, click **InstallShield Projects**. Then select the appropriate project type.

*For earlier versions of Visual Studio:* In the **Project Types** box, click **InstallShield Projects**. Then in the **Templates** box, select the appropriate project type.

3. Configure the settings for the name and project location as needed.
4. Click **OK**.

# Opening InstallShield Projects in Microsoft Visual Studio

InstallShield is integrated with Microsoft Visual Studio. From within the Visual Studio workspace, you can open InstallShield installations for solutions.

---

**Task**      **To open an InstallShield project from within Microsoft Visual Studio:**

1. On the **File** menu, point to **Open**, and choose **Project** to display the **Open Project** dialog.
2. Browse to the InstallShield file you want to open, and select it.
3. Click **Open**.

---

**Note** ▪ From within Microsoft Visual Studio, you can open only .ism files created with InstallShield X or later, InstallShield DevStudio, InstallShield Developer, InstallShield—Windows Installer Edition, or InstallShield Express, version 3.x or later. Files created in InstallShield Professional or pre-3.x versions of InstallShield Express cannot be opened.

# Using the VSSolutionFolder Path Variable with Visual Studio Solutions

---

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Basic MSI*
- *InstallScript*

- *InstallScript MSI*
- *Merge Module*
- *Suite/Advanced UI*

A predefined path variable called `VSSolutionFolder` is available in projects to reference a higher-level base directory. This support enables you to have in your InstallShield projects static links to files in sibling projects that are within the Visual Studio solution folder; if you work on the projects on a different machine, the static links that use the `VSSolutionFolder` path variable can reference the correct paths for the files in sibling projects.

The `VSSolutionFolder` path variable is defined automatically whenever an InstallShield project is opened from within a Visual Studio solution. It is also defined automatically if you are using MSBuild to build a solution that contains an InstallShield project. However, in other scenarios, when the InstallShield project is opened without the Visual Studio solution, `VSSolutionFolder` cannot be defined automatically. For example, if you open the InstallShield project in InstallShield directly, without having Visual Studio open, `VSSolutionFolder` is not defined. Similarly, if you use the command-line tool `IsCmdBld.exe`, or if you use MSBuild with an `.isproj` file, `VSSolutionFolder` is not defined. If you are using `IsCmdBld.exe` to build a release in InstallShield project, use the `-L` command-line parameter to set the value of `VSSolutionFolder`. If you are using MSBuild, use the `PathVariables` parameter to set the value of `VSSolutionFolder`. This parameter is exposed as the `ItemGroup InstallShieldPathVariableOverrides` when the default targets file is used.

If you include in your InstallShield project a source file whose path includes the `VSSolutionFolder` path variable and build it in an environment that does not support the `VSSolutionFolder` path variable, build errors such as the following ones may occur:

- -6103: Could not find file `<VSSolutionFolder>\MyFile.exe`
- -6271: File `<VSSolutionFolder>\MyFile.exe` not found. An error occurred building the `MsiFileHash` table record for this file. Verify that the file exists in the specified location.

## Adding References to Visual Studio Solutions

Use the Files and Folders view to add Visual Studio references to your installation project.

### Task

#### To add a reference:

1. In the **Solution Explorer** under **Application Data**, double-click **Files and Folders**.
2. The **Visual Studio Solution** node in the **Source computer's folders pane** contains sub-nodes for all projects contained in the current solution. Click a project to display the output groups for the project. The output groups are displayed in the **Source computer's files pane**.
3. To add a reference to an output to your installation project, drag and drop the output to the target folder in the **Destination computer's folders** pane.

**Note** ▪ To view a reference for a project, right-click the project and select **Resolve Project Output**. The **Outputs** dialog is displayed to show what files the output group resolves to.

# Using the Toolbox to Add Dialog Controls

To add dialog controls when your setup project is open in Microsoft Visual Studio, use the Toolbox.

## Accessing the Toolbox

---

**Task** *To access the InstallShield Dialogs Toolbox:*

1. Do one of the following:
  - On the **View** menu, click **Toolbox**.
  - Press **CTRL+ALT+X**.
2. Click the **InstallShield Dialogs** tab, if it is not already expanded.

## Adding Controls

---

**Task** *To add controls to a dialog:*

1. Click on the type of control you want to add to the dialog.
2. Click on the dialog, hold the mouse button down, and drag the mouse to draw the dimensions of the control. You can adjust the control's size by setting the height and width properties.

As soon as you release the mouse button, the cursor changes to the Select Tool, which you can use to resize the new control.
3. Set the control's properties. For more information, see [Editing Dialog Layout in Basic MSI Projects](#) or [Editing the Layout of a Dialog in an InstallScript or InstallScript MSI Project](#).

## Using Sticky-State Mode

The toolbox control also has a *sticky-state* mode that allows you to create additional controls of the same type without returning to the Toolbox. To enable sticky-state mode, press the CTRL key while you drag the cursor from the toolbox to the dialog.

## Using Auto Hide

The Dialog Toolbox has an auto-hide feature that allows you to hide the toolbox when it is not in use. To enable Auto Hide, click the Auto Hide button in the top-right corner of the toolbox. The toolbox is hidden on the side of the screen when you are not using it.

# Adding InstallShield Toolbars or Commands to the Visual Studio Toolbar

You can add InstallShield toolbars and individual toolbar command buttons to the Microsoft Visual Studio workspace.

## Adding InstallShield Toolbars

### Task

#### To add an InstallShield toolbar:

1. Right-click anywhere in the toolbar to display the toolbar options.
2. Select a toolbar to add it to the top of the Visual Studio workspace. The available InstallShield toolbars are InstallShield, InstallScript, InstallShield Layout, and MSI Debugger.

## Adding InstallShield Toolbar Command Buttons

### Task

#### To add an individual command button to the toolbar:

1. Right-click anywhere in the toolbar to display the toolbar options.
2. Select **Customize** from the bottom of the list. The **Customize** dialog is displayed.
3. Click the **Commands** tab.
4. Select a category from the **Categories** list to display the commands available within that particular category.
5. From the **Commands** list, click a command button and drag it to the toolbar.

**Note** ■ InstallShield Layout and MSI Debugger toolbar commands are not available as individual toolbar buttons.

# Building Releases in Microsoft Visual Studio

**Project** ■ Some of the following information is project specific, as noted where applicable.

Building a release of an InstallShield project in Visual Studio is different than building a release in InstallShield. When you are building in Visual Studio, you have the option to either build your entire solution, including the installation project, or build only the installation project.

When you create an InstallShield installation project in Visual Studio, the project has two releases by default—Debug and Release. You can use these default releases, or you can create new release. Before you can build a release, the release must be associated with a solution configuration. The Configuration Manager in Visual Studio is where you associate a release with a solution configuration.

**Project** ■ In Basic MSI, InstallScript MSI, and Merge Module projects, every release is a member of a product configuration. A product configuration provides a means for grouping together releases that share similar settings, such as the product name, product code, and package code. When you build a release for any of these project types, the default product configuration is always used. If you want to build releases in a different product configuration, make that product configuration the default.

## Selecting the Default Product Configuration (Basic MSI, InstallScript MSI, and Merge Module Projects Only)

If you want to build a release in a Basic MSI, InstallScript MSI, or Merge Module project, it must be under the default or *active* product configuration. This is indicated by a red check box icon in the Releases view:

### Task

**To make a product configuration the default configuration in your InstallShield project:**

1. In the **Solution Explorer** under **Media**, double-click **Releases**.
2. In the **Releases** explorer, right-click the product configuration that contains the release that you want to build, and then click **Default Product Configuration**.

**Tip** ▪ To create a new product configuration, right-click the **Releases** explorer and then click **New Product Configuration**. Once you have created it, you can make it the default product configuration.

## Building a Release

Visual Studio enables you to build your entire solution, including the installation project, or only the installation project.

### Task

**To build a release from within Visual Studio:**

1. Use the Configuration Manager in Visual Studio to map a project configuration to the appropriate solution configuration.
  - a. On the **Build** menu, click **Configuration Manager**.  
As an alternative: On the **Standard** toolbar, in the **Solution Configurations** list, select **Configuration Manager**.
  - b. In the **Active solution configuration** list, select a configuration.
  - c. In the **Project contexts** box, map the project configuration to the appropriate release in the **Configuration** column.

**Note** ▪ If the **Build** check box is cleared and you build the solution, the deselected project configuration is not built.

- d. Click the **Close** button.

2. On the **Build** menu, select the appropriate command:

**Table 1** • Build Menu Commands

Command	Description
<b>Build Solution</b>	Build the entire solution, according to what is mapped in the Configuration Manager for each project that is included in the solution.
<b>Build Installation Project Name</b>	Build only the installation project, according to the release that is specified in the Configuration column of the Configuration Manager. This option is available if your installation project is selected in the Solution Explorer.

**Tip** • To build the entire solution, you can also press **CTRL+SHIFT+B**.

## Adding .NET Assemblies to Installation Projects

InstallShield allows you to add a .NET assembly to your installation project by adding the .NET assembly file to a component.

### Task

**The recommended way to add a .NET assembly to your installation project is as follows:**

1. In the **Setup Design** view, create a component to hold the .NET assembly.
2. (Windows Installer based projects only) Make the file the key file of a component by right-clicking on the file and selecting **Set Key File** from the context menu.
3. Set the project to scan for dependencies by doing one of the following:
  - Set the **.NET Scan at Build component** property to Dependencies and Properties. In this case, the .NET assembly's Manifest, Application, and related entries are not populated in your project file. Instead, they are added to the .msi file at build time.
  - Run the **Static Scanning Wizard**. In this case, the .NET assembly's values are added during the scan. You can edit these values in the **Assembly** node under the component's **Advanced Settings**.

## Adding Project Output from a Web Service or Web Application Project

InstallShield provides enhanced Web services support. If you add a project output (any project output) from a Web Service or Web Application project, InstallShield will prompt you to add the project as a Web Service. If you choose No, the project output that you have selected is added normally. If you select Yes, InstallShield performs the following:

1. Creates a Destination Folder called IISROOTFOLDER.
2. Deploys the following Visual Studio Project Outputs into the IISROOTFOLDER:  
[Content Files] goes to the [IISROOTFOLDER]{VSIPProjectName}  
[Primary Output] goes to the [IISROOTFOLDER]{VSIPProjectName}\bin"
3. Creates an IISVirtualDirectory with a target of [IISROOTFOLDER]{VSIPProjectName}.

## Integrating with Microsoft Visual Studio Team Foundation Server

Microsoft Visual Studio Team Foundation Server (TFS) is a set of tools and technologies that enable a team to collaborate and coordinate the tasks for developing a product. InstallShield has support for integrating with Team Foundation Server. Some highlights of this integration are:

- **Source control**—Use the Source Control Explorer to integrate your InstallShield project with Team Foundation version control and manage changes to your InstallShield projects and your Visual Studio solutions.
- **Automated builds**—Use Team Foundation Build to compile, test, and deploy your InstallShield projects and your Visual Studio solutions on a regular basis. Your installation is automatically updated with your latest source files every time your solution is built, always staying current.
- **Project management**—Track work items such as bugs, tasks, and project documentation for your InstallShield projects and your Visual Studio solutions. The project status is available to your entire team from within Team System Web Access, and from within Team Explorer.

### Integration Requirements

To integrate InstallShield with Team Foundation Server, install InstallShield on each machine that you want to be able to create, update, or build InstallShield projects. Thus, InstallShield should be installed on each machine on which you want to create and update InstallShield projects. It should also be installed on a machine that is designated as a build agent for InstallShield projects that are stored in Team Foundation Server. For InstallShield licensing details, refer to the InstallShield End-User License Agreement (EULA).

**Note** • The Standalone Build is a build engine that enables you to build InstallShield projects without installing the full version of InstallShield on a build machine. If you have the Standalone Build, you can install it on a machine that is designated as a build agent for Team Foundation Server.

In order for a build agent to build some types of projects and solutions, you may need to install additional software on the build machine. For example, to build a C++ project, which requires the C++ compiler and possibly other dependencies, install Visual Studio on the build machine.

If you are using multiple build agents to build your Team Foundation Server projects, you may want to assign a particular build tag to any agents that are on machines that have InstallShield; you could also apply that special build tag to each build definition that is created for an InstallShield project. That way, only build machines that have InstallShield installed would be used to build InstallShield installations. For more information about creating build tags and assigning them to agents and build definitions, see the Visual Studio Team Foundation Server documentation.

If you are queuing a build on a 64-bit build machine, ensure that you have configured the build definition for your InstallShield project so that the 32-bit version of MSBuild is used to load the `InstallShield.Tasks.dll` file (which is a 32-bit file); otherwise, you will encounter a build error informing you that the `InstallShield.Tasks.dll` file could not be loaded. To select the 32-bit version of MSBuild, click the Process tab of your build definition in Team Explorer. Then, under the Advanced node, find the MSBuild Platform setting, and select x86. Note that if you are using a 32-bit build machine, you can select either Auto or x86 for the MSBuild Platform setting.

If you install Team Explorer on the same machine that has InstallShield and Visual Studio, you can use Team Explorer from within your InstallShield projects that are open in Visual Studio. This enables you to perform tasks such as the following:

- Use Source Control Explorer when you are working on your InstallShield projects.
- Configure builds for your InstallShield projects and Visual Studio solutions.
- Queue new builds.

Note that when you queue a build for a solution that includes an InstallShield project, the installation that is built is copied to an Install subfolder within the drop folder. When the InstallShield build detects that it is running under Team Foundation Build, it copies the installation to the final output location for the solution (OutDir)—namely, the binaries directory, which in turn is copied to the drop folder at the end of the Team Foundation Build process.

If you want to use Team Foundation source control when you are working on your InstallShield projects directly from within InstallShield (without Visual Studio integration), you can do so. To use this functionality, you need to install the Team Foundation Server MSSCCI Provider, which you can obtain from the [Visual Studio Gallery on the MSDN Web site](#). Once the Team Foundation Server MSSCCI Provider is installed, you can add InstallShield projects to Team Foundation source control, check out InstallShield projects from Team Foundation source control, and check in projects to Team Foundation source control—all from within InstallShield. To learn more about source control integration within InstallShield, see [Using Source Code Control](#).

## Adding InstallShield Projects to Team Explorer

If you have Team Explorer installed on the same machine that has InstallShield and Visual Studio, you can add your InstallShield projects (.ism and .isproj files, as well as any corresponding InstallScript files and SQL scripts) to the Team Foundation Server through Team Explorer.

If you want to add an InstallShield project to Source Control Explorer when you create the project from within Visual Studio, select the **Add to source control** check box on the New Project dialog box. Note that if you do this, you may later need to add InstallScript files and SQL script files to source control using the same method that you use for adding other files.

To add an existing InstallShield project to Source Control Explorer, add it using the same method that you use for adding other projects. (In the Solution Explorer, right-click your InstallShield project and then click Add Solution to Source Control.)

# Automating Installation Development and Build Processes

An automation interface is loosely defined as a programming interface that can be accessed by any programming language that supports COM—most importantly, usability from the late binding scripting languages like VBScript and JScript. The InstallShield automation interface is an automation interface to the InstallShield project file.

InstallShield enables you to automate development and build processes through the automation interface without having to directly open the InstallShield interface and make changes in different views. By calling methods, setting properties, accessing collections, and so on, through the automation interface, you can open a project and modify its features and component data in many of the same ways that you would in the InstallShield interface. In addition, you can build a release using the Build method of the InstallShield automation interface.

Read more about the automation interface as well as other aspects of automating build processes in this section of the documentation.

## Linking Subfolders to Features Using VBScript

The VBScript example simulates dynamically linking to subfolders. By editing .ini files, you tell the script which folders and subfolders to link to, how to create the components for the files, and with which features to associate the new components.

The following are requirements for using the VBScript example:

- You must have Windows Scripting Host to run a .vbs file.
- InstallShield must be installed on the system before you can use the automation interface and .ini file reader.
- The script expects two command-line arguments:
  - The fully qualified path to an existing setup project (.ism file).
  - The fully qualified path to an .ini file (Links.ini in this example) that describes each feature that you want a given folder's files and subfolders added to. Furthermore, each feature can point to a different .ini file (Template.ini) that describes the properties of the components that will be created for the files in each folder and subfolder.

The source files for this example are found in the following directory:

*InstallShield Program Files Folder\Samples\WindowsInstaller\Automation Interface\Add Files and Components*

Each of the files is described below.

## LinkToFeature.vbs

The script in the LinkToFeature.vbs file is designed to read the associated [Links.ini](#) file and add the files from the specified folders and subfolders to the specified features. It organizes them into components based on the model you construct in [Template.ini](#). To start the script, pass it the path to your setup project and the path to Links.ini, respectively, at the command line:

```
LinkToFeature.vbs "C:\MySetups\Malaprop.ism" "C:\Automation Interface\Links.ini"
```

You can examine some of the relevant sections of LinkToFeature.vbs to see exactly how it works. After opening the .ism file specified at the command line, the script creates a collection of every feature in the project starting at line 53. This collection is later used to make sure that the features listed in Links.ini are present in the project.

```
' The scripting dictionary is defined in Sccrun.dll
Dim pFeatCol
Set pFeatCol = CreateObject("Scripting.Dictionary")

' Create a collection of all of the feature names in the project
For Each ISWIFeature In ISWIProject.ISWIFeatures
    pFeatCol.Add ISWIFeature, ISWIFeature.Name
    DoSubFeature ISWIFeature, pFeatCol
Next
```

Next, LinkToFeature.vbs opens Links.ini using the InstallShield IniReader. As the comment on line 70 explains, you can use this utility if it serves your needs or otherwise substitute your own. Once Links.ini is open, the rest of the script is controlled by the For loop beginning at line 80 and ending at line 202:

```
For Each pLinksSection In LinksIniFile.Sections
```

The purpose of this loop is to read each section in Links.ini. Each section contains the name of a feature that you want to add the new components to and the folder where the files and subfolders can be found. After getting each key's value, there is a nested For loop, stretching from line 102 to 201, which loops through every feature in the collection pFeatCol and compares it to the name of the feature in Links.ini:

```
    For Each ISWIFeature In pFeatCol
        ' See if the feature in Links.ini matches one in the setup project.
        If (ISWIFeature.Name = linksFeature) Then
```

Since this loop is used for almost the remainder of the script, you can assume that everything that is done acts on the current feature. Next, it checks if the Action key in this Links.ini section is set to Delete and deletes all of the feature's components if so:

```
        If (linksAction = "Delete") Then
            For Each ISWIComponent In ISWIFeature.ISWiComponents
                ISWIProject.DeleteComponent ISWIComponent
            Next
        End If
```

At line 27, the script creates a collection of the specified folder and each subfolder:

```
Set pFolders = CreateObject("Scripting.Dictionary")
pFolders.Add folder, folder.Path
GetSubFolders pFolders, folder
```

From line 136 to 163, the script opens the `Template.ini` file that contains the template for all of the components that will be added to the current feature:

```
Set iniFile = CreateObject("IniReader.IniFile")
iniFile.Load (linksTemplateFile)
```

`LinkToFeature.vbs` does its real work in the `For` loop that begins on line 169 and ends on 199:

```
' Create a component for the root folder and all of its subfolders.
For Each folder In pFolders
```

Based on the description in `Template.ini`, it forms the component's name, adds it to the project, associates it with the current feature, sets the component's properties, and then adds the files in the current folder to the component.

Finally, the `.vbs` file saves and closes the setup project.

## Links.ini

Each section of this `.ini` file contains the following keys, which `LinkToFeature.vbs` reads to determine which folders and subfolders to add to each feature in your project:

**Table 1** • `.ini` File Keys in Sample File

Key	Description
<b>[LinkN]</b>	;Unique section name
<b>Feature=FeatureName</b>	;Name of existing feature in the project
<b>Source=C:\Data Files\Executables</b>	;Path to the root folder
<b>TemplateFile=Template.ini</b>	;Path to the component template <code>.ini</code> file
<b>ComponentTemplate=Template1</b>	;Section name in <code>Template.ini</code> for this feature's components
<b>Action=Delete</b>	;Delete tells <code>LinkToFeature.vbs</code> to permanently delete all of this feature's components before recreating them. Leave this value blank if you do not want the components destroyed.

## Template.ini

Each section in `Template.ini` contains information for creating all of the components that will be associated with a feature. Each section in `Links.ini` must point to a specific component template file and section. The template file and sections are described below:

**Table 2** • `Template.ini` File Sections

Section	Description
<b>[TemplateName]</b>	;Unique section name that identifies a particular template

**Table 2** • Template.ini File Sections (cont.)

Section	Description
<b>Name=DefaultName</b>	;This value is used to build the component's name in the format DLS_DefaultName_ <i>N</i>
<b>Destination=[ProgramFilesFolder]</b>	;This is the root destination folder for the components. The names of the subfolders are then added to the root so that the files are installed to the correct relative folders.
<b>Languages=1033</b>	;List the decimal value of all of the component's languages, separated by a comma
<b>Condition=VersionNT</b>	;Author any condition you want to attach to each component

## Exporting and Importing String Entries Using the Automation Interface

InstallShield stores string entries in the ISString table of the main project file (.ism file). InstallShield lets you export the string entries of a language to a text file, which you can send out for translation. After the strings have been translated, you can import the text files into the InstallShield project file.

The String Editor view in InstallShield enables you to manually export and import string entries for a particular language. To automate this process, you can use the InstallShield automation interface.

One of the functions of the automation interface is to provide you with a mechanism for exporting string entries from and importing string entries into a project. What follows is an example of how to achieve this.

### Running the Sample VBScript File

To run this sample, you must first copy the sample code shown below into a file called ImportExportStrings.vbs. Then use the command line to export or import the string entries.

#### Exporting a Language's String Entries

To export string entries using the code sample, type the following at the command line.

```
wscript.exe ImportExportStrings.vbs "C:\MyProject.ism" "C:\1033.txt" "1033" "E"
```

#### Importing a Language's String Entries

To import string entries using the code sample, type the following at the command line.

```
wscript.exe ImportExportStrings.vbs "C:\MyProject.ism" "C:\1033.txt" "1033" "I"
```

#### Sample ImportExportStrings.vbs Code

```
'/////////////////////////////////////  
'BEGIN ImportExportStrings.vbs  
,  
' This utility was designed to assist in the exporting and importing of string entries  
,
```

```
,
' File Name: ImportExportStrings.vbs
,
' Description: Sample VBScript file exports or imports string entries in a text file
,
' Usage: To use the objects in this script, make sure you have the
' following items in place on your system:
' 1. InstallShield must be installed so that
' the end-user automation is available.
' 2. You must have Windows Scripting Host (Wscript.exe) installed.
' 3. The script expects the following command-line arguments,
' in this order:
' a. The fully qualified path to an existing .ism file.
' b. The fully qualified path to a text file that contains the string entries
' c. Decimal language identifier
' d. Import or Export
,
'////////////////////////////////////
,
If Wscript.Arguments.Count < 1 Then
    Wscript.Echo "InstallShield Subfolder Utility" & _
        vbNewLine & "1st argument is the full path to the .ism file" & _
        vbNewLine & "2nd argument is the full path to the string text file" & _
        vbNewLine & "3rd argument is the decimal language identifier" & _
        vbNewLine & "4th argument is either E or I for Export or Import"
    Wscript.Quit 1
End If

' Create the end-user automation object
Dim ISWIProject
Set ISWIProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject"): CheckError

' Open the project specified at the command line
ISWIProject.OpenProject Wscript.Arguments(0): CheckError

if(Wscript.Arguments(3)="E")then
    StringsExport ISWIProject,Wscript.Arguments(1),Wscript.Arguments(2)
elseif(Wscript.Arguments(3)="I")then
    StringsImport ISWIProject,Wscript.Arguments(1),Wscript.Arguments(2)
end if

' Save and close the project
ISWIProject.SaveProject: CheckError
ISWIProject.CloseProject: CheckError

'////////////////////////////////////
' Export the language's string entries
Sub StringsExport(byref p,byval path, byval language)
    p.ExportStrings path, Date , language
    Wscript.Echo "Exported String entries for language " & language & " to " & path
End Sub

'////////////////////////////////////
' Import the string entries
Sub StringsImport(byref p,byval path, byval language)
```

```
p.ImportStrings path, language
Wscript.Echo "Imported string entries for language " & language & " from " & path
End Sub

'////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////
Sub CheckError()
    Dim message, errRec
    If Err = 0 Then Exit Sub
    message = Err.Source & " " & Hex(Err) & ": " & Err.Description
    Wscript.Echo message
    Wscript.Quit 2
End Sub

'END ImportExportStrings.vbs
```

## Running Project Reports Using the Automation Interface

This VBScript example below accesses objects in a setup project to display a report of the total number of features, components, files, and various types of files. The output is displayed in a message box, but you could also write this information to a text file.

### Requirements

The following requirements should be met:

- You must have Windows Scripting Host to run a .vbs file. (It would be very simple to modify this script to run in a Visual Basic program.)
- InstallShield must be installed on the system before you can use the automation interface.
- Before running the script, assign the fully qualified path of an existing setup project (.ism file) to the string variable sProj.

### Example Script

```
Option Explicit

' Create automation object
Dim pProj
Set pProj = CreateObject("ISwiAutoAutomation Interface Version.ISwiProject")

' Open a setup project--make sure it is not already open in the IDE
Dim sProj
sProj = "C:\MySetups\TestProject.ism"
pProj.OpenProject sProj

' Start building string that lists features, components, and files
Dim sItems
sItems = "Project Report" & vbNewLine
sItems = sItems & "For project: " & sProj & vbNewLine
sItems = sItems & "Number of features: " & pProj.ISwiFeatures.Count & vbNewLine
sItems = sItems & "Number of components: " & pProj.ISwiComponents.Count & vbNewLine
```

```
' Declare and initialize counters for files and file types
Dim i, nEXE, nDLL, nOCX
i = 0
nEXE = 0: nDLL = 0: nOCX = 0

' Loop through components to get the number of files and individual file names
Dim sFileName
Dim pComp, pFile
For Each pComp In pProj.ISWiComponents
  For Each pFile In pComp.ISWiFiles
    i = i + 1
    sFileName = pFile.DisplayName
    If Instr (1, sFileName, ".exe", vbTextCompare) > 0 Then
      nEXE = nEXE + 1
    ElseIf Instr (1, sFileName, ".dll", vbTextCompare) > 0 Then
      nDLL = nDLL + 1
    ElseIf Instr (1, sFileName, ".ocx", vbTextCompare) > 0 Then
      nOCX = nOCX + 1
    End If
  Next
Next

sItems = sItems & "Number of files: " & i & vbNewLine
sItems = sItems & vbTab & "EXEs: " & nEXE & vbNewLine
sItems = sItems & vbTab & "DLLs: " & nDLL & vbNewLine
sItems = sItems & vbTab & "OCXs: " & nOCX & vbNewLine

' Display report
Wscript.Echo sItems

' Close project
pProj.CloseProject
```

## Using Source Code Control at the Command Line

Access to installation projects stored in a [source control](#) system can be achieved through a combination of command-line calls to your source control application and limited use of the InstallShield [Automation Interface](#)—which gives you command-line-type access to much of InstallShield’s functionality. Checking in, checking out, and getting the latest version of the project is handled through your source control’s command-line support, if any.

Below are two examples of how you might use this functionality. Both examples use Microsoft Visual SourceSafe as the source control application and are written using VBScript.

You can copy and paste either example into a .vbs file, change the paths so that they are valid for your environment, and run them.

**Note** - With earlier versions of InstallShield products, you were required to convert the source control (.isv) files to InstallShield project (.ism) files, and then back to .isv files. However, with the latest versions of InstallShield products, this is no longer necessary because you can save .ism files as text files for your source control application.

## Getting the Latest Version and Building Your Installation

```
Const VSSFLAG_USERRONO = 1
Const VSSFLAG_TIMEMOD = 8
Const VSSFLAG_REPREPLACE = 128

Const PROJECT_SCC_INI_LOC = "\\Server\srcsafe.ini"
Const PROJECT_SCC_FOLDER = "$/MyFiles/"
Const PROJECT_SCC_BASE_NAME = "MyProject"
Const PROJECT_SCC_LOCAL_FOLDER = "C:\Project"

' Create a ref to Microsoft Visual SourceSafe
Set VSS = CreateObject("SourceSafe")
' Point to the VSS database
VSS.open PROJECT_SCC_INI_LOC

' Get the project file
Set VSSISVFile = VSS.VSSItem (PROJECT_SCC_FOLDER + PROJECT_SCC_BASE_NAME + ".ism")
VSSISVFile.Get PROJECT_SCC_LOCAL_FOLDER + PROJECT_SCC_BASE_NAME + ".ism", SSFLAG_TIMEMOD +
VSSFLAG_USERRONO + VSSFLAG_REPREPLACE

'Get all remaining files
Set VSSIDTFolder = VSS.VSSItem (PROJECT_SCC_FOLDER + PROJECT_SCC_BASE_NAME)
VSSIDTFolder.LocalSpec = PROJECT_SCC_LOCAL_FOLDER + PROJECT_SCC_BASE_NAME
For Each VSSObj In VSSIDTFolder.Items(False)
    VSSObj.Get , VSSFLAG_TIMEMOD + VSSFLAG_USERRONO + VSSFLAG_REPREPLACE
Next

strFileBasePath = PROJECT_SCC_LOCAL_FOLDER + PROJECT_SCC_BASE_NAME + ".ism"
strCmdLine = "ISCmdBld.exe -p "" + strFileBasePath + ".ism""
' Build your installation
Set wshshell = CreateObject("Wscript.Shell")
RunCmdLine = wshshell.Run(strCmdLine, 1, True)
```

## Checking Out, Making Changes, and Checking In

```
Const VSSFLAG_USERRONO = 1
Const VSSITEM_FILE = 1

Const PROJECT_SCC_INI_LOC = "\\Server\srcsafe.ini"
Const PROJECT_SCC_FOLDER = "$/MyFiles/"
Const PROJECT_SCC_BASE_NAME = "MyProject"
Const PROJECT_SCC_LOCAL_FOLDER = "C:\Project"

' Create a ref to Microsoft Visual SourceSafe
Set VSS = CreateObject("SourceSafe")
' Point to the VSS database
VSS.open PROJECT_SCC_INI_LOC

' Check out the project file
Set VSSISVFile = VSS.VSSItem (PROJECT_SCC_FOLDER + PROJECT_SCC_BASE_NAME + ".ism")
VSSISVFile.CheckOut , PROJECT_SCC_LOCAL_FOLDER + PROJECT_SCC_BASE_NAME + ".ism", VSSFLAG_USERRONO

'Check out all remaining files
Set VSSIDTFolder = VSS.VSSItem (PROJECT_SCC_FOLDER + PROJECT_SCC_BASE_NAME)
VSSIDTFolder.LocalSpec = PROJECT_SCC_LOCAL_FOLDER + PROJECT_SCC_BASE_NAME
```

```

For Each VSSObj In VSSIDTFolder.Items(False)
    If VSSObj.Type = VSSITEM_FILE Then
        VSSObj.CheckOut , , VSSFLAG_USERRONO
    End If
Next

' Create a reference to the InstallShield Automation Interface
Set m_ISWiProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
strFileBasePath = PROJECT_SCC_LOCAL_FOLDER + PROJECT_SCC_BASE_NAME + ".ism"
' Open your project
m_ISWiProject.OpenProject strFileBasePath
' Add a feature
m_ISWiProject.AddFeature "Robofeature1"
' Save the project
m_ISWiProject.SaveProject
' Close the project
m_ISWiProject.CloseProject

' Check in the project file
Set VSSISVFile = VSS.VSSItem (PROJECT_SCC_FOLDER + PROJECT_SCC_BASE_NAME + ".ism")
VSSISVFile.CheckIn

'Check in all remaining files
Set VSSIDTFolder = VSS.VSSItem (PROJECT_SCC_FOLDER + PROJECT_SCC_BASE_NAME)
For Each VSSObj In VSSIDTFolder.Items(False)
    If VSSObj.Type = VSSITEM_FILE Then
        VSSObj.CheckIn "Check In Comment"
    End If
Next

```

## Using Build Status Events

The automation interface includes build status events—ProgressIncrement, ProgressMax, and StatusMessage—that you can use to show the progress of the build and see status updates.

### Example for Basic MSI, InstallScript, and InstallScript MSI Projects

The following Visual Basic 6 code demonstrates how to use these events in a build script in Basic MSI, InstallScript, and InstallScript MSI projects.

```

Public WithEvents pISWiRelease As ISwiAutoAutomation Interface Version.ISWiRelease

Private Sub Foo()
    Dim pISWiProject As ISwiAutoAutomation Interface Version.ISWiProject
    Set pISWiProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
    pISWiProject.OpenProject "C:\InstallShield 2021 Projects\My Project Name-1.ism", False
    Set pISWiRelease = pISWiProject.ISWiProductConfigs("Product Configuration 1").ISWiReleases("Release 1")
    pISWiRelease.Build
    pISWiProject.CloseProject
    Set pISWiRelease = Nothing
    Set pISWiProject = Nothing
End Sub

```

```
Private Sub pISWiRelease_ProgressIncrement(ByVal lIncrement As Long, pbCancel As Boolean)
    ' Place your code here
End Sub

Private Sub pISWiRelease_ProgressMax(ByVal lMax As Long, pbCancel As Boolean)
    ' Place your code here
End Sub

Private Sub pISWiRelease_StatusMessage(ByVal sMessage As String, pbCancel As Boolean)
    ' Place your code here
End Sub
```

## Example for Advanced UI and Suite/Advanced UI Projects

The following Visual Basic 6 code demonstrates how to use these events in a build script in Advanced UI and Suite/Advanced UI projects.

```
Public WithEvents pISWiSuiteRelease As ISWiAutoSuiteAutomation Interface Version.ISWiSuiteRelease

Private Sub Foo()
    Dim pISWiProject As ISWiAutoSuiteAutomation Interface Version.ISWiProject
    Set pISWiProject = CreateObject("ISWiAutoSuiteAutomation Interface Version.ISWiProject")
    pISWiProject.OpenProject "C:\InstallShield 2021 Projects\My Project Name-1.issuite", False
    Set pISWiRelease = pISWiProject.ISWiSuiteReleases("Release 1")
    pISWiSuiteRelease.Build
    pISWiProject.CloseProject
    Set pISWiSuiteRelease = Nothing
    Set pISWiProject = Nothing
End Sub

Private Sub pISWiSuiteRelease_ProgressIncrement(ByVal lIncrement As Long, pbCancel As Boolean)
    ' Place your code here
End Sub

Private Sub pISWiSuiteRelease_ProgressMax(ByVal lMax As Long, pbCancel As Boolean)
    ' Place your code here
End Sub

Private Sub pISWiSuiteRelease_StatusMessage(ByVal sMessage As String, pbCancel As Boolean)
    ' Place your code here
End Sub
```

# Using the Automation Interface on a 64-Bit System

The automation interface is a 32-bit interface; therefore, it must be loaded from a 32-bit process. If you are using the automation interface on a 64-bit machine, you may need to load the automation interface through a 32-bit executable file.

For example, if you are using VBScript with the automation interface, you may need to launch `cscript.exe` from the 32-bit system folder (`SysWow64`). Otherwise, the 64-bit scripting host may encounter an error such as the following one when creating the automation object:

Microsoft VBScript runtime error: ActiveX component can't create object: 'ISWiAutoAutomation Interface Version.ISWiProject'

# Building InstallShield Project in DevOps

InstallShield supports building the InstallShield projects in DevOps. InstallShield provides the following to build the InstallShield projects:

- [Azure DevOps Build Extension](#)
- [InstallShield StandAlone Build with Docker](#)

## Azure DevOps Build Extension

InstallShield supports the Azure DevOps Build Extension. By using this extension, InstallShield projects can be built in the Azure DevOps pipelines.

---

### Task

**To build the Install the InstallShield project in Azure DevOps pipelines,**

1. Add and install the [InstallShield Build Extension](#) to your Azure DevOps organization.  
The [Install InstallShield SAB Task](#) and [InstallShield Build Task](#) are available to your Build Pipeline tasks.
2. Configure the tasks.
3. Build the InstallShield projects stored in the repository.

### Install InstallShield SAB Task

The Install InstallShield SAB task installs the InstallShield Standalone Build setup on the Microsoft hosted machine, based on the InstallShield version configured in the task, and configures the license server with the license server details provided in the task.

To configure the Install InstallShield SAB Task, see [Install InstallShield SAB Task KB article](#).

## InstallShield Build Task

The InstallShield Build task checks the InstallShield SAB is installed on the agent or not, if not, it installs the InstallShield SAB and triggers the InstallShield project build.

To configure the InstallShield Build Task, see [InstallShield Build Task KB article](#).

# InstallShield StandAlone Build with Docker

InstallShield project can also be built via Docker Container. To build InstallShield project via Docker Container, download Docker Image and build the Docker image. For more detail, see [InstallShield StandAlone Build with Docker KB article](#).

# Reference

Reference information for InstallShield is organized into the following sections:

**Table 1** • Reference Selections

Section	Description
<b>Menu, Toolbar, and Window Reference</b>	Describes the various components of the InstallShield user interface, including menus, toolbars, and windows.
<b>Dialog Box Reference</b>	Contains reference information on each of the dialog boxes that are displayed in InstallShield.
<b>Wizard Reference</b>	Provides details about each of the wizards that are available in InstallShield.
<b>View Reference</b>	Describes each of the views that are displayed in InstallShield.
<b>InstallShield Prerequisite Editor Reference</b>	Introduces you to the InstallShield Prerequisite Editor, which is available with InstallShield. Use this tool to create InstallShield prerequisites that you can include in your projects, or to edit existing ones.
<b>Errors and Warnings</b>	Provides information about error codes and warnings that might occur when you create, compile, build, or run your installation. This section also includes reference information about errors and warnings that may occur when you migrate a project from an earlier version of an InstallShield product to the latest version.
<b>Automation Interface</b>	Contains reference material that describes the objects, methods, properties, and collections that you can use to create, modify, and build a project through the automation interface.

**Table 1** ▪ Reference Selections (cont.)

Section	Description
<b>Object Reference for Expressions in Advanced UI and Suite/Advanced UI Projects</b>	Explains each of the objects that you can use to embed object expressions in various settings of an Advanced UI or Suite/Advanced UI project. Object expressions enable you to search target systems for information about a file, registry entry, or other item. At run time, the installation expands the value of the expression and searches the target system.
<b>InstallShield Custom Action Reference</b>	Explains each of the custom actions that are available in InstallShield.
<b>Command-Line Tools</b>	Introduces tools that you can use from the command line to perform tasks such as building a release and running an installation.
<b>InstallScript Language Reference</b>	Provides in-depth information about functions, data types, event handlers, operators, and other aspects of InstallScript, a simple but powerful programming language that you can use to design your installations. This section also contains sample code that you can use in your script file.

# Menu, Toolbar, and Window Reference

This section describes the various components of the InstallShield user interface, including menus, toolbars, and windows.

- [Menus](#)
- [Toolbars](#)
- [Output Window](#)

## Menus

**Project** - The Installation Information view is available in the following project types:

- *Advanced UI*
- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Suite/Advanced UI*
- *Transform*
- *MSIX*

The menus in InstallShield are located on the menu bar, which is at the top of the InstallShield user interface. Each menu contains a list of commands. Some of these commands have icons next to them so that you can quickly associate the command with the icon.

Each of the menus in InstallShield is described in this section:

- [File Menu](#)
- [Home Menu](#)
- [Edit Menu](#)
- [View Menu](#)
- [Go Menu](#)
- [Project Menu](#)
- [Build Menu](#)
- [Tools Menu](#)
- [Window Menu](#)

- [Help Menu](#)

## File Menu

The following table lists the File menu commands, as well as associated keyboard shortcuts and icons.

**Table 1** • File Menu Commands

Command	Shortcut	Icon	Description
New	Ctrl+N		Creates a new installation project.
Open	Ctrl+O		Opens an existing installation project.
Close			Closes the current project.
Save	Ctrl+S		Saves the current project.
Save As			Enables you to save the current project file with a new name and location.
Print	Ctrl+P		Prints the script file that is displayed in the active script window.
Recent			Opens one of the most recently accessed projects.
Exit			Closes the current project and closes InstallShield.

## Home Menu

The following table lists the Home menu commands, as well as associated keyboard shortcuts and icons.

**Table 2 • Home Menu Commands**

Command	Shortcut	Icon	Description
<b>New</b>	Ctrl+N		Creates a new installation project.
<b>Open</b>	Ctrl+O		Opens an existing installation project.
<b>Save</b>	Ctrl+S		Saves the current project.
<b>Traditional View</b>			Switch to the Traditional View
<b>Complie</b>	Ctrl+F7		Complies Installscript
<b>Build</b>	F7		Build the active release
<b>Stop Build</b>	Ctrl+Break		Stop building the active release
<b>Test User Interface</b>	Ctrl+T		Tests the active Windows Installer-based release's user interface
<b>Run</b>	Ctrl+F5		Run MSIX Release - Run or registers the active release
<b>Uninstall</b>			Uninstall MSIX Release - Uninstalls the active Windows Installer-based release
<b>Debug</b>	F5		Debugs the active release
<b>Open Release Folder</b>			Open the release folder in the Windows Explorer.
<b>Build MSIX</b>			
<b>Run MSIX</b>			
<b>Uninstall MSIX</b>			
<b>Previous View</b>	ALT+UP ARROW		Takes you to the view directly above the current view as shown in the View List.

**Table 2** • Home Menu Commands (cont.)

Command	Shortcut	Icon	Description
<b>Next View</b>	ALT+DOWN ARROW		Takes you to the view directly below the current view as shown in the View List.
<b>Back</b>	ALT+LEFT ARROW		Takes you to the view that you last visited in the history of your view selections. You can use this multiple times, as long as there are multiple entries in your view history.
<b>Forward</b>	ALT+RIGHT ARROW		Takes you to the next view in the history of your view selections. You can continue until you reach the view you were at when you first clicked Back.
<b>Help</b>			Displays the Help view.

## Edit Menu

The following table lists the Edit menu commands, as well as associated keyboard shortcuts and icons.

**Table 3** • Edit Menu Commands

Command	Shortcut	Icon	Description
<b>Undo</b>	Ctrl+Z		Undoes the last action performed.
<b>Redo</b>	Ctrl+Y		Reverses the last action that was performed with the Undo command.
<b>Cut</b>	Ctrl+X		Removes the currently selected text and places it on the Clipboard.
<b>Copy</b>	Ctrl+C		Copies the currently selected text to the Clipboard.
<b>Paste</b>	Ctrl+V		Inserts the contents of the Clipboard at the insertion point, and replaces any selected text.
<b>Find</b>	Ctrl+F		Searches for the specified text, file, or folder.

**Table 3** • Edit Menu Commands (cont.)

Command	Shortcut	Icon	Description
<b>Replace</b>	Ctrl+H		Searches for and replaces the specified text.
<b>Find Next Match</b>	F3		Searches for the next occurrence of the specified text.
<b>Go To</b>	Ctrl+G		Moves the insertion point to the specified line number in the active script window.
<b>Find String ID</b>			Searches the entire installation project for occurrences of a specified string entry.
<b>Insert InstallScript Function</b>	Ctrl+I		Launches the Function wizard to add an InstallScript Function to the script
<b>Insert String Entry</b>			Inserts a string entry into the script
<b>Toggle Bookmark</b>	Alt+K		Toggle bookmark to this line
<b>Previous Bookmark</b>	Ctrl+Shift+K		Jump to the previous bookmark
<b>Next Bookmark</b>	Ctrl+K		Jump to the next bookmark

FILE	HOME	EDIT	VIEW	PROJECT	BUILD	TOOLS	WINDOW	HELP
Paste								
Clipboard		Find		Insert		Bookmark		

## View Menu

The following table lists the View menu commands, as well as associated keyboard shortcuts and icons.

**Table 4** • View Menu Commands

Command	Shortcut	Icon	Description
<b>View List</b>	F4		Shows or hides the View List.

**Table 4** • View Menu Commands (cont.)

Command	Shortcut	Icon	Description
<b>View Bar</b>			Shows or hides the View Bar.
<b>Header Bar</b>			Shows or hides the header bar, which has the tabs for the Start Page, the Project Assistant, and the Installation Designer.
<b>Status Bar</b>			Shows or hides the status bar.
<b>Variable</b>			Shows or hides the Variable window in the InstallScript Debugger.
<b>MSI Debugger</b>			Shows or hides the <a href="#">MSI Debugger toolbar</a> .
<b>Layout</b>			Shows or hides the <a href="#">Layout toolbar</a> .
<b>Controls</b>			Shows or hides the <a href="#">Controls toolbar</a> .
<b>Project Assistant</b>			Displays the Project Assistant.
<b>Microsoft App-V</b>			Displays the Microsoft App-V tab.
<b>Output Window</b>			Shows or hides the <a href="#">Output window</a> .

## Go Menu

**Note** • The Go menu is not available in the Modern View.

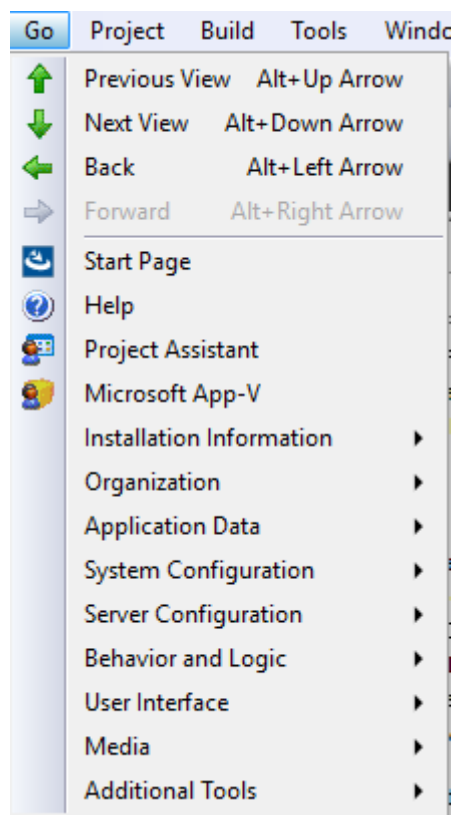

The following table lists the Go menu commands, as well as associated keyboard shortcuts and icons. Some of the view-related commands are not available from the Go menu, depending on which project type you have open in InstallShield.

**Table 5 • Go Menu Commands**

Command	Shortcut	Icon	Description
<b>Previous View</b>	ALT+UP ARROW		Takes you to the view directly above the current view as shown in the View List.
<b>Next View</b>	ALT+DOWN ARROW		Takes you to the view directly below the current view as shown in the View List.
<b>Back</b>	ALT+LEFT ARROW		Takes you to the view that you last visited in the history of your view selections. You can use this multiple times, as long as there are multiple entries in your view history.
<b>Forward</b>	ALT+RIGHT ARROW		Takes you to the next view in the history of your view selections. You can continue until you reach the view you were at when you first clicked Back.
<b>Start Page</b>			Takes you to the Start Page.
<b>Help</b>			Takes you to the Help view.
<b>Project Assistant</b>			Displays the Project Assistant.
<b>Microsoft App-V</b>			Displays the Microsoft App-V tab.
<b>VMware ThinApp</b>			Displays the VMware ThinApp tab.
<b>Installation Information</b>			Enables you to open the General Information view.
<b>Organization</b>			Enables you to display the Setup Design, Features, Components, and Setup Types.
<b>Application Data</b>			Enables you to display the Files and Folders, Redistributables (or Objects in InstallScript projects), and Prerequisites views.
<b>System Configuration</b>			Enables you to display the Shortcuts, Registry, ODBC Resources, INI File Changes, Environment Variables, XML File Changes, and Text File Changes views.
<b>Server Configuration</b>			Enables you to display the Internet Information Services, Component Services, and SQL Scripts views.

**Table 5** • Go Menu Commands (cont.)

Command	Shortcut	Icon	Description
<b>Behavior and Logic</b>			Enables you to display the InstallScript, Custom Actions and Sequences (or Custom Actions), Support Files (or Support Files/Billboards in InstallScript and InstallScript MSI projects), System Search, and Property Manager views.
<b>User Interface</b>			Enables you to display the Dialogs, Billboards, and String Editor views.
<b>Media</b>			Enables you to display the Path Variables, Upgrades, Releases, and Patch Design views.
<b>Additional Tools</b>			Enables you to display the Dependency Scanners, MSI Debugger, and Direct Editor views.
<b>Patch Settings</b>			Enables you to display the General Information, Files, Registry, and Patch Variables views.

## Project Menu

**Note** ▪ The Project menu is not available for MSIX project type.

The following table lists the Project menu commands, as well as associated icons.

**Table 6** ▪ Project Menu Commands

Command	Icon	Description
<b>Visual Studio Deployment Project Import Wizard</b>		Launches the wizard that lets you import a Visual Studio setup or merge module project into an InstallShield project.
<b>Export Components Wizard</b>		Opens the Export Components Wizard, which simplifies the process of exporting a component from a file to a new or existing project.
<b>Device Driver Wizard</b>		Opens the Device Driver Wizard, which guides you through the process of adding a device driver to your installation.
<b>Reg-Free COM Wizard</b>		Opens the Reg-Free COM Wizard, which guides you through the process of adding a COM manifest file to your project or configuring an existing manifest file.
<b>Static Scan</b>		Opens the Static Scanning Wizard, which scans the files already added to your project for any dependencies that they require.
<b>Dynamic Scan</b>		Opens the Dynamic Scanning Wizard, which monitors a running executable for all .dll and .ocx dependencies files and automatically adds them to your project.
<b>Source Paths Converter</b>		Opens the Convert Source Paths Wizard, which lets you convert existing hard-coded paths with path variables, thereby enhancing the portability of your installation project.
<b>Project Converters</b>		Provides several commands: <ul style="list-style-type: none"> <li>● <b>Convert to InstallScript MSI Project</b>—Converts your Basic MSI project to an InstallScript MSI project. For more information, see <a href="#">Converting a Basic MSI Project to an InstallScript MSI Project</a>.</li> <li>● <b>Convert to InstallScript Project</b>—Opens the <a href="#">Convert InstallScript MSI Dialog Box</a> to help you convert your InstallScript MSI project to an InstallScript project.</li> <li>● <b>Convert Compact Project to Basic MSI Project</b>—Helps you to convert your compact project to Basic MSI project.</li> </ul>

**Table 6** • Project Menu Commands (cont.)

Command	Icon	Description
Source Control		<p>Provides several commands:</p> <ul style="list-style-type: none"><li>● <b>Get Latest Version</b>— Copies the most recent version of the current project into your project folder. The project placed in your project folder is read-only.</li><li>● <b>Check Out</b>— Places a writable copy of the project into your project folder, enabling you to modify it.</li><li>● <b>Check In</b>— Stores your changes to the current project in your source control application.</li><li>● <b>Undo Check Out</b>— Undoes your checkout, canceling your changes both in the source control application and in your project folder. Your project reverts to the way it was before you checked it out.</li><li>● <b>Add to Source Control</b>— Adds the current project to your source control application.</li><li>● <b>Unlink from Source Control</b>— Breaks the link between the current project and your source control application.</li><li>● <b>Show History</b>— Displays a record of changes to your project since it was initially added to your source control application. While viewing the history, you can return to any point in your project's history and recover the file as it existed at that point.</li><li>● <b>Show Differences</b>— Compares two files, then shows you the differences, if any.</li><li>● <b>Refresh Status</b>— Refreshes the source control status.</li><li>● <b>Launch Source Control Program</b>— Opens your source code control application.</li></ul>
Project Settings		Opens the <a href="#">Project Settings Dialog Box</a> .

## Build Menu

The following table lists the Build menu commands, as well as associated keyboard shortcuts and icons.

**Table 7** • Build Menu Commands

Command	Shortcut	Icon	Description
<b>Release Wizard</b>			Opens the <a href="#">Release Wizard</a> , which lets you specify the settings for a release and build it.
<b>Compile</b>	Ctrl+F7		Compiles your script file.
<b>Build</b>	F7		Builds your release with default settings, or—if you have already built your release—rebuilds your release with your most recently saved settings.
<b>Build Tables Only</b>	SHIFT+F7		Rebuilds only the .msi file tables of your installation to enable you to see your changes take effect more quickly than with a complete rebuild.
<b>Build Tables &amp; Refresh Files</b>	ALT+F7		<p><b>Project</b> • This command is available for Windows Installer-based projects.</p> <p>Rebuilds only the .msi file tables and updates only the modified files of your installation. This type of build works only when the media is an uncompressed network image.</p>
<b>Refresh Build</b>	ALT+F7		<p><b>Project</b> • This command is available for InstallScript projects.</p> <p>Rebuilds the active media. This command regenerates only those items that you changed since the media was last built.</p>
<b>Batch Build</b>			Lets you rebuild multiple releases with different configurations simultaneously.
<b>Stop Build</b>	Ctrl+Break		Cancels the current build process.
<b>Test User Interface</b>	Ctrl+T		Enables you to run through the user interface portion of your installation without making any changes to your system. All custom actions are executed.
<b>Debug</b>	F5		Starts debugging.
<b>Run</b>	Ctrl+F5		Enables you to run your completed installation without leaving InstallShield.

**Table 7** ▪ Build Menu Commands (cont.)

Command	Shortcut	Icon	Description
Uninstall		 	<p>Uninstalls the most recently run release.</p> <hr/> <p><b>Project</b> ▪ This command is available for the following project types:</p> <ul style="list-style-type: none"> <li>• Basic MSI</li> <li>• InstallScript MSI</li> <li>• MSIX</li> </ul>
Run Package			<p>Enables you to run the installation package. This command is available only for InstallScript projects with the Network Image media type and with all files compressed into an .exe file.</p>
Debug Package			<p>Enables you to debug the installation package. This command is available only for InstallScript projects with the Network Image media type and with all files compressed into an .exe file.</p>
Run from Web			<p>Displays the One-Click Install Web page, which lets you run your completed installation without leaving InstallShield.</p>
MSI Debugger			<p>Provides several commands:</p> <ul style="list-style-type: none"> <li>• <b>Start MSI Debugging</b>— Starts debugging in the MSI Debugger view.</li> <li>• <b>Toggle Breakpoint</b>—F9 or —Sets or removes the breakpoint in the line that has the insertion point.</li> <li>• <b>Remove All Breakpoints</b>—SHIFT+F9 or —Removes all breakpoints set in the debugger.</li> <li>• <b>Step Over</b>—F10 or —Steps through the current action or dialog and continues the execution in the debugger.</li> <li>• <b>Step Into</b>—F11 or —Steps into the current custom action in the debugger.</li> <li>• <b>Stop MSI Debugging</b>—SHIFT+F5 or —Stops debugging in the MSI Debugger view.</li> </ul>

**Table 7** ▪ Build Menu Commands (cont.)

Command	Shortcut	Icon	Description
<b>Validate</b>			<p>Provides several commands:</p> <ul style="list-style-type: none"> <li>● <b>Upgrade Validation Wizard</b>—Opens the Upgrade Validation Wizard, which performs a set of tests to determine if your Basic MSI or InstallScript MSI installation will properly upgrade earlier versions of your product.</li> <li>● <b>Browse for a New Validation Module (.cub)</b>—Lets you browse to select a new or custom validation (.cub) file.</li> <li>● <b>InstallShield Validation Suite for Windows 8</b>—This suite consists of a number of InstallShield internal consistency evaluators (ISICEs) that help you identify issues that may make your installation behave unexpectedly on Windows 8 systems. This suite checks for issues that may not be revealed in the Full MSI Validation Suite.</li> <li>● <b>InstallShield Merge Module Validation Suite for Windows 8 or InstallShield Merge Module Validation Suite for Windows 7</b>—These suites consist of a number of InstallShield internal consistency evaluators (ISICEs) that help you identify issues that may make your merge module behave unexpectedly on Windows 8 (or Windows 7) systems. This suite checks for issues that may not be revealed in the Merge Module Validation Suite.</li> <li>● <b>InstallShield Certified for Windows Vista Validation Suite</b>—This suite consists of a number of InstallShield internal consistency evaluators (ISICEs) that help you identify issues that may make your installation behave unexpectedly on Windows Vista systems. This suite checks for issues that may not be revealed in the Full MSI Validation Suite.</li> <li>● <b>InstallShield Certified for Windows Vista Merge Module Validation Suite</b>—This suite consists of a number of InstallShield internal consistency evaluators (ISICEs) that help you identify issues that may make your merge module behave unexpectedly on Windows Vista systems. This suite checks for issues that may not be revealed in the Merge Module Validation Suite.</li> </ul>

Table 7 ■ Build Menu Commands (cont.)

Command	Shortcut	Icon	Description
<b>Validate (cont.)</b>			<ul style="list-style-type: none"> <li>● <b>InstallShield Best Practice Suite</b>— Scans your Basic MSI or InstallScript MSI installation to determine whether it meets best-practice guidelines.</li> </ul> <div>  <p><b>Edition</b> ■ The InstallShield Best Practice Suite is available in the Premier edition of InstallShield.</p> </div> <ul style="list-style-type: none"> <li>● <b>Full MSI Validation Suite</b>— Scans your Basic MSI or InstallScript MSI installation to determine whether it is valid. Your built .msi package is compared against the ICE rules.</li> <li>● <b>Windows 2000 Logo Validation Suite</b>— Scans your Basic MSI or InstallScript MSI installation to determine whether it meets the Designed for Windows 2000 logo requirements.</li> <li>● <b>Windows XP Logo Validation Suite</b>— Scans your Basic MSI or InstallScript MSI installation to determine whether it meets the Designed for Windows XP logo requirements.</li> <li>● <b>Windows Vista Logo Validation Suite</b>— Scans your Basic MSI or InstallScript MSI installation to determine whether it meets the Certified for Windows Vista logo requirements.</li> <li>● <b>Merge Module Validation Suite</b>— Scans your merge module package. The Merge Module Validation tool is the merge module version of the Full MSI Validation Suite. Your built merge module is compared against ICE rules to help you determine whether it will function properly.</li> <li>● <b>InstallShield Virtualization Suitability Suite</b>—Scans an .msi package running all tests related to virtualization suitability. Any tests that found issues are listed in a report, and for each issue, an associated column in the report indicates applicability to known virtualization formats (App-V v5, Server App-V, App-V-v4, ThinApp, or XenApp).</li> <li>● <b>InstallShield MSIX/UWP App Suitability Suite</b>—Scans an .msi package for signs of items that are unsuitable for the Windows App package (.appx) format. Any tests that found issues are listed in a report and for each issue, an associated column in the report indicates applicability to the known Windows App variants (UWA, Desktop, Store, WSA, or Nano).</li> <li>● <b>Recent Validation Modules</b>—Displays a list of recently used validation (.cub) files.</li> </ul> <p>To learn more, see <a href="#">Validating Projects</a> and <a href="#">Viewing Validation Results</a>.</p>
<b>Settings</b>	ALT+F6		Opens the Settings dialog box, which enables you to set preferences for how InstallShield builds your installation.

## Tools Menu

The following table lists the Tools menu commands, as well as associated icons.

**Table 8 • Tools Menu Commands**

Command	Icon	Description
<b>Open Release Folder</b>		Launches Windows Explorer, open in the DISK1 folder of the current release. If there is no release or if a release has not been built, Windows Explorer opens to your default project location.
<b>Add New Language Wizard</b>		Opens the New Language Wizard, which enables you to add support for almost any language to one or more projects.
<b>Transform Wizard</b>		Opens the Transform Wizard, which walks you through the steps of creating and applying transforms for your installation projects.
<b>MSI Log Analyzer</b>		Launches the InstallShield MSI Log Analyzer, a utility that enables you to generate reports based on an analysis of Windows Installer log files.
<b>MSI Command-Line Builder</b>		Launches the InstallShield MSI Command-Line Builder. This tool enables you to quickly build complex command-line strings for executing Windows Installer–related tasks.
<b>Difference</b>		Provides several commands: <ul style="list-style-type: none"> <li>● <b>Compare to File</b>—Opens a dialog box that lets you specify which project should be compared with the currently open project.</li> <li>● <b>End Compare</b>—Ends the previously started compare session.</li> <li>● <b>InstallShield MSI Diff</b>—Opens InstallShield MSI Diff, a tool that enables you to compare Windows Installer tables in two different Windows Installer databases. It also enables you to apply transforms and patches to Windows Installer packages and then see how the database tables are affected. To learn more, see <a href="#">InstallShield MSI Diff</a>.</li> </ul>

**Table 8** • Tools Menu Commands (cont.)

Command	Icon	Description
<b>InstallScript</b>		<p>Provides several commands:</p> <ul style="list-style-type: none"> <li>• <b>Standard Dialog Sampler</b>— Opens the Standard Dialog Sampler, which enables you to view examples of end-user dialogs. The sample dialogs are displayed without a skin.</li> <li>• <b>Skinned Dialog Sampler</b>— Opens the Skinned Dialog Sampler, which enables you to view examples of end-user dialogs. The sample dialogs are displayed with the skin that is selected in the Dialogs view.</li> <li>• <b>Cabinet File Viewer</b>— Opens the Cabinet File Viewer, a tool that lets you select a cabinet (.cab) file and view its compressed files, file groups, components, and setup types, as well as the properties of those items. It also lets you extract files from the cabinet file.</li> <li>• <b>Log File Viewer</b>— Opens the Log File Viewer, a tool that enables you to view the installation log file. The log file is created when your installation is first run and it is maintained when your installation is running in maintenance mode. You can use the log file to determine the current state of each component in the installation.</li> </ul>
<b>Check for Updates</b>		Checks for service packs and other updates to InstallShield. If updates are available, you can choose to download and install.
<b>Redistributable Downloader</b>		Launches the Redistributable Downloader Wizard to quickly download third-party redistributables, merge modules, prerequisites, and other files to your local machine.
<b>Prerequisite Editor</b>		Opens the InstallShield Prerequisite Editor, which enables you to create or modify InstallShield prerequisites that you can include in your installation project.
<b>MSIX Bundle Utility</b>		Helps to create the MSIX Bundle package, it lets you specify the payload MSIX packages, the signing information through the graphical interface, and creates the MSIX bundle package from the configured MSIX packages.
<b>Customize</b>		Displays the Customize dialog box, which enables you to customize the toolbars displayed in the InstallShield user interface.
<b>Options</b>		Displays the Options dialog box, which enables you to specify preferences for creating projects and working in InstallShield.

## Window Menu

**Note** ▪ The Window menu is not available for MSIX project type.

The following table lists the Window menu commands, as well as associated keyboard shortcuts and icons.

**Table 9** ▪ Window Menu Commands

Command	Shortcut	Icon	Description
<b>Next Script</b>	Ctrl+Tab		Opens the InstallScript view and displays the next script file in your project as shown at the bottom of the Window menu.
<b>Previous Script</b>	Ctrl+Shift+Tab		Opens the InstallScript view and displays the next script file in your project as shown at the bottom of the Window menu.
<b>Script File List</b>			Opens the InstallScript view and displays the lists of the script files included in your project.

## Help Menu

The following table lists the Help menu commands, as well as associated icons.

**Table 10** ▪ Help Menu Commands

Command	Icon	Description
<b>Support Central</b>		Displays Support Central on the Web.
<b>Community</b>		Displays the Community on the Web.

**Table 10** • Help Menu Commands (cont.)

Command	Icon	Description
<b>Contents</b>		Displays the Contents tab of the online help library.
<b>Release Notes</b>		Displays InstallShield release notes.
<b>InstallShield on the Web</b>		Connects to the InstallShield Web site.
<b>About InstallShield</b>		Displays the About InstallShield dialog box, where you can find version information and register InstallShield.

## Toolbars

The InstallShield user interface offers several toolbars that give you quick access to frequently used menu items and provide graphical tools for use in the Dialog Editor.

### Built-in Toolbars

The following toolbars are available in the InstallShield interface. When you open InstallShield, only the Standard toolbar is displayed near the top of the user interface. The Control and Dialog Layout toolbars open when you work in the Dialogs view and disappear when you leave that view.

All toolbars can be resized and repositioned, and docked and undocked.

- [Standard Toolbar](#)
- [Controls Toolbar](#)
- [Layout Toolbar](#)
- [MSI Debugger Toolbar](#)

## Standard Toolbar

Below is a description of all the buttons on the Standard toolbar.

**Table 11** • Standard Toolbar Buttons

Button	Name	Description
	New Project	Launches the New Project dialog box, which enables you to select a project type and begin a new project.
	Open	Enables you to open project files or convert installation package (.msi) files to an InstallShield installation project (.ism) file.
	Save	Saves changes to the project file.
	Undo	Click the Undo button in the Dialog Editor or the Script Editor to reverse the last change you made.
	Redo	Click the Redo button in the Dialog Editor or the Script Editor to restore the last action you reversed by clicking the Undo button.
	Viewbar	Hides or shows the viewbar, which appears on the left side of the interface.
	View List	Hides or shows the View List, which shows all the views available in the InstallShield interface.
		
		<b>Note</b> • You can also press F4 to hide or show the View List.
	Previous View	Displays the view directly above the current view, as shown in the View List.
	Next View	Displays the view directly below the current view, as shown in the View List.
	Back	Displays the view that you last visited in the history of your view selections. You can click this button multiple times, if there are multiple entries in your view history.
	Forward	Displays the next view in the history of your view selections. You can continue clicking this button until you reach the view in which you first clicked the Back button.
	Insert InstallScript Function	Launches the Function Wizard, which eases the process of writing built-in InstallScript functions.
	Release Wizard	Launches the Release Wizard, which turns a project into either a shippable Windows Installer setup package or completed merge module. The options you select in the wizard determine the layout and contents of your release.

**Table 11** ■ Standard Toolbar Buttons (cont.)

Button	Name	Description
	Compile	Compiles the InstallScript files in your project without building the entire setup.
	Build	Builds your release with default settings, or—if you have already built your release—rebuilds your release with your most recently saved settings.
	Stop Build	Cancels the current build process.
	Test User Interface	<p>Runs through the user interface portion of your installation project without making any changes to your system. All custom actions are executed.</p>  <p><b>Project</b> ■ The Test button is available for the following project types:</p> <ul style="list-style-type: none"> <li>● Basic MSI</li> <li>● InstallScript MSI</li> </ul>
	Run	<p>Runs your completed installation project.</p>  <p><b>Project</b> ■ For Basic MSI and InstallScript MSI projects—If you selected the <b>Uninstall the product automatically before installing or debugging</b> check box, InstallShield uninstalls your product before rerunning the installation or before starting the debugger. This check box is available on the Preferences tab of the Options dialog box.</p>
	Uninstall	<p>Uninstalls the most recently run release.</p>  <p><b>Project</b> ■ This button is available for the following project types:</p> <ul style="list-style-type: none"> <li>● Basic MSI</li> <li>● InstallScript MSI</li> </ul>

**Table 11** ▪ Standard Toolbar Buttons (cont.)

Button	Name	Description
	Debug	Runs the appropriate debugger, depending on the type of installation you are creating. If your project is InstallScript or InstallScript MSI, clicking Debug launches the InstallScript Debugger. If your project is Basic MSI or a Transform, clicking Debug launches the MSI Debugger.   <b>Project</b> ▪ For Basic MSI and InstallScript MSI projects—If you selected the <b>Uninstall the product automatically before installing or debugging</b> check box, InstallShield uninstalls your product before rerunning the installation or before starting the debugger. This check box is available on the Preferences tab of the Options dialog box.
	Open Release Folder	Launches Windows Explorer, open in the DISK1 folder of the current release. If there is no release or if a release has not been built, Windows Explorer opens to your default project location.
	Help View	Displays the IDE Help view where you can find answers to many of your questions regarding InstallShield.

## Controls Toolbar

The Controls toolbar provides every standard control that is available in a run-time dialog. This toolbar is displayed when you edit a dialog's layout in the Dialog Editor.

### Task

#### To draw a control on a dialog:

Click the control's button, click anywhere on the face of the dialog, drag the mouse pointer while continuing to press the mouse button, and then release the button when you have reached the intended dimensions of the control.

**Table 12** ▪ Controls Toolbar Buttons

Button	Name	Description
	Select Tool	Lets you give focus to a control on a dialog. You can then move, resize, delete, or align the control.
	Check Box	Lets you draw a <b>check box control</b> on a dialog.
	Push Button	Lets you draw a <b>push button control</b> on a dialog.
	Edit Field	Lets you draw an <b>edit field control</b> on a dialog.

**Table 12** • Controls Toolbar Buttons (cont.)

Button	Name	Description
	Combo Box	Lets you draw a <a href="#">combo box control</a> on a dialog.
	Text Area	Lets you draw a <a href="#">text area control</a> on a dialog.
	List Box	Lets you draw a <a href="#">list box control</a> on a dialog.
	Radio Button	Lets you draw a <a href="#">radio button control</a> on a dialog. A radio button must be added to a radio button group control.
	Bitmap	Lets you draw a <a href="#">bitmap control</a> on a dialog.
	Group Box	Lets you draw a <a href="#">group box control</a> on a dialog.
	Billboard	Lets you draw a <a href="#">billboard control</a> on a dialog.
	Line	Lets you draw a <a href="#">line control</a> on a dialog.
	Radio Button Group	Lets you draw a <a href="#">radio button group control</a> on a dialog.
	Selection Tree	Lets you draw a <a href="#">selection tree control</a> on a dialog.
	Progress Bar	Lets you draw a <a href="#">progress bar control</a> on a dialog.
	List View	Lets you draw a <a href="#">list view control</a> on a dialog.
	Scrollable Text	Lets you draw a <a href="#">scrollable text control</a> on a dialog.
	Icon	Lets you draw an <a href="#">icon control</a> on a dialog.
	Directory List	Lets you draw a <a href="#">directory list control</a> on a dialog.
	Directory Combo	Lets you draw a <a href="#">directory combo control</a> on a dialog.
	Volume Cost List	Lets you draw a <a href="#">volume cost list control</a> on a dialog.
	Volume Select Combo	Lets you draw a <a href="#">volume select combo control</a> on a dialog.

**Table 12** • Controls Toolbar Buttons (cont.)

Button	Name	Description
	Masked Edit	Lets you draw a <a href="#">masked edit control</a> on a dialog.
	Path Edit	Lets you draw a <a href="#">path edit control</a> on a dialog.
	Hyperlink	Lets you draw a <a href="#">hyperlink control</a> . This control displays an HTML link to an address; when the end user clicks the link, the page opens in the default browser.

## Layout Toolbar

The Layout toolbar provides several tools for aligning and resizing controls in a dialog. This toolbar is displayed when you edit a dialog's layout in the Dialog Editor.

Most buttons on this toolbar are enabled only when you have selected more than one control. To select multiple controls, select one, press the SHIFT key, and select the other; or hold the mouse button down and drag the cursor across several controls. The Layout toolbar contains the following buttons:

**Table 13** • Layout Toolbar Buttons

Button	Name	Description
	Align Left	Select two or more controls and click the Align Left button to align all of the selected controls with the left edge of the leftmost control.
	Align Right	Select two or more controls and click the Align Right button to align all of the selected controls with the right edge of the rightmost control.
	Align Top	Select two or more controls and click the Align Top button to align all of the selected controls with the top edge of the uppermost control.
	Align Bottom	Select two or more controls and click the Align Bottom button to align all of the selected controls with the bottom edge of the lowermost control.
	Center Vertical	Select a control and click the Center Vertical button to reposition the element in the vertical (x-axis) center of the dialog.
	Center Horizontal	Select a control and click the Center Horizontal button to reposition the element in the horizontal (y-axis) center of the dialog.
	Space Across	Select three or more controls on the dialog and click the Space Across button to have them evenly distributed horizontally across the dialog.
	Space Down	Select three or more controls on the dialog and click the Space Down button to have them evenly distributed vertically along the dialog.
	Make Same Width	Select two or more controls and click the Make Same Width button to resize the width of the smaller controls to the width of the largest control.

**Table 13** ▪ Layout Toolbar Buttons (cont.)

Button	Name	Description
	Make Same Height	Select two or more controls and click the Make Same Height button to resize the height of the smaller controls to the height of the largest control.
	Make Same Size	Select two or more controls and click the Make Same Size button to make the smaller controls the exact size of the largest control.
	Bring to Front	Select a control and click the Bring to Front button to place it on top of any overlapping controls. See note below.
	Send to Back	Select a control and click the Send to Back button to place it behind any overlapping controls. See note below.
	Show Grid	Click the Show Grid button to place design-time grid lines on the dialog, or to remove the grid if it is present.
		

**Note** ▪ The Bring to Front and Send to Back actions are not saved when you close and reopen your project. These actions are for use during design only. For example, you might have a dialog that displays different controls based on a condition. You can use the Bring to Front and Send to Back actions to work on these different controls while you are designing your dialog.

## MSI Debugger Toolbar

Below is a description of all the buttons in the MSI Debugger toolbar.

**Table 14** ▪ MSI Debugger Toolbar Buttons

Button	Name	Description
	Toggle Breakpoint	Click this button to set a breakpoint on an action or dialog.
	MSI Debugging	Click this button to start debugging or, while debugging, to continue stepping through the setup.
	Step Over	Click this button to step over the current action or dialog.
	Step Into	Click this button to step into the current action and launch your registered debugger.
	Remove All Breakpoints	Click this button to clear all breakpoints you have set in the MSI Debugger.
	Stop MSI Debugger	Click this button to stop debugging.

# Output Window

When you build a release for your project, the Output window opens if it is not already open, and it displays build information. It also provides other task-specific information. For example, if you validate your project, InstallShield displays validation results in the Output window. If you open a project that was created with an earlier version of InstallShield, the Output window shows upgrade information.

The following tabs appear in the Output window:

**Table 15** • Output Window Tabs

Tab	Description
<b>Build</b>	Stores distribution output information and displays build output; a link to the output file saved as a text file is included.
<b>Validate</b>	Displays validation results.
<b>Results</b>	Displays project conversion information or details about <a href="#">testing changes to XML files</a> .
<b>Compile</b>	Displays InstallScript information when you click Compile on the Build menu.
<b>Tasks</b>	<p>Provides descriptions of error and warning codes when you build, compile, or validate your project; each error or warning code is a link to a <a href="#">Knowledge Base</a> article.</p>  <p><b>Tip</b> • You can right-click a code for an error or warning and select <i>Direct Editor</i>. The affected area associated with the error or warning will be highlighted in the <i>Direct Editor</i>.</p>
<b>Distribute</b>	Displays information about distributing a release to a virtual machine. To learn more, see <a href="#">Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand</a> .

# Dialog Box Reference

Each of the dialog boxes available in the user interface of InstallShield is described in this section:

- [.NET Installer Class Arguments Dialog Box](#)
- [Add an Argument/Value Pair Dialog Box](#)
- [Add Existing Media Dialog Box](#)
- [Add Files for This Package Dialog Box](#)
- [Add MIME Type Dialog Box](#)
- [Add New Method Dialog Box](#)
- [Add New Property Dialog Box](#)
- [Add Predefined Search Dialog Box](#)
- [Add to Source Control Dialog Box](#)
- [Application Extension Mapping Dialog Box](#)
- [Application Mappings Dialog Box](#)
- [Associate Components Dialog Box](#)
- [Associate DIMs Dialog Box](#)
- [Batch Build Dialog Box](#)
- [Browse for Directory Dialog Box](#)
- [Browse for Directory/Shortcut Target Dialog Box](#)
- [Browse for File Dialog Box](#)
- [Browse for File to Run Dialog Box](#)
- [Browse for Shortcut Icon Dialog Box](#)
- [Browse for Tile Target Dialog Box](#)
- [Certificate Selection Dialog Box](#)
- [Check In Dialog Box](#)
- [Check Out Dialog Box](#)
- [Component Properties Dialog Box](#)
- [Condition Builder Dialog Box](#)
- [Content Source Path Dialog Box](#)
- [Convert InstallScript MSI Dialog Box](#)
- [Create a New Component Dialog Box](#)
- [Create a New Feature Dialog Box](#)
- [Custom Error Handling Dialog Box](#)

- [Custom Errors Dialog Box](#)
- [Customize Validation Settings Dialog Box](#)
- [Data Languages Dialog Box](#)
- [Delete Property Dialog Box](#)
- [Dependencies Dialog Box](#)
- [Dialog Images Dialog Box](#)
- [Digitally Sign Setup Dialog Box](#)
- [Differences Dialog Box](#)
- [Dynamic File Link Settings Dialog Box](#)
- [Edit Data Dialog Box](#)
- [Edit List Options Dialog Box](#)
- [Edit Registry Data Dialog Box](#)
- [Edit Virtual Machine Configurations Dialog Box](#)

- [Security Descriptor Dialog Box](#)
- [Select File Dialog Box](#)
- [Select Media Location Dialog Box](#)
- [Select String Dialog Box](#)
- [Serial Number Violation Dialog Box](#)
- [Server Locations Dialog Box](#)
- [Service Options Dialog Box for a Time Delay of an Auto-Start Service](#)
- [Service Options Dialog Box for Running Recovery Actions](#)
- [Service SID Dialog Box](#)
- [Set File\(s\) URL Dialog Box](#)
- [Settings Dialog Box](#)
- [Setup Languages Dialog Box](#)
- [SQL Server Requirement Dialog Box](#)
- [Supersedence Dialog Box](#)
- [UI Languages Dialog Box](#)
- [Update Merge Module Search Path Dialog Box](#)

## .NET Installer Class Arguments Dialog Box

The .NET Installer Class Arguments dialog box displays the arguments that you want to pass to the .NET Installer class. To launch the dialog box, click the ellipsis button (...) for the .NET Installer Class Arguments component setting. Click the Add Argument button beneath the argument that you want to add to launch the Add an Argument/Value Pair dialog box.

There are four methods on the Installer class that are called at various points during the installation: Install, Commit, Uninstall, and Rollback. You use this dialog to specify additional argument lists for the Installer class for each of the execution contexts.

---

**Note** ▪ Install custom actions are run when the component containing the Installer class custom action is installed. Uninstall custom actions are run when the component containing the Installer class custom action is uninstalled. These two types are run in the Execute sequence, right after StartServices and before RegisterUser.

### Using Arguments

For all methods, `/LogFile=` is the default argument. This results in no log being generated when these methods are run. You can complete this argument by using Windows Installer properties in [brackets]. To add arguments, type in the appropriate edit field or use the Add Argument button.

### Syntax Rules

When you click **OK**, InstallShield validates what is in the edit fields and displays a warning if the syntax is incorrect. The syntax rules include the following:

- All quotes must be matched.
- Escape characters are valid. If you use `\` in your argument, it is not counted it when checking the quote matching.
- Every space-separated argument token must consist of a name preceded by a slash and followed by an equal sign (=). A value to the right of the equal sign is optional.
- Spaces inside quotes do not count when determining what is and is not part of an argument token. For example, in the argument `/arg="hi there"`, `"hi there"` is all part of the argument token beginning with `/arg`. In the argument `/arg=hi there`, `there` is its own argument token and an invalid one.

## Add an Argument/Value Pair Dialog Box

This dialog is displayed when you click one of the Add Argument buttons in the .NET Installer Class Arguments dialog box. When you are finished creating an argument, click OK to add the argument.

### Dialog Options

#### Argument Name

Provide a name for the argument in the edit field.

### Argument Value

Select one of the values from the option button list to create an argument. To create a custom argument, select the Custom option.

### Property

Select a property from the menu to reference a property that exists in your installation project.

### Directory

Use the drop-down menu to add a reference to a directory that exists in your installation project.

### Custom

To create a custom argument, type an argument value in the edit field.

## Add Existing Media Dialog Box

The Add Existing Media dialog box opens when you click the Add button in the Release Wizard's Update panel. This dialog box lets you select a release that is in the current project from a list of releases (excluding the current release).

## Add Files for This Package Dialog Box

---

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

---

**Edition** ▪ The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The Add Files for This Package dialog box opens when you add a package—for example, an .msi package or an .exe patch—in the Packages view of an Advanced UI or Suite/Advanced UI project.

This dialog box lets you specify whether the package file that you are adding requires other files and folders that are near the package that you are adding. For example, if you are adding an uncompressed .msi package to your project, you may need to include folders and other files that contain the files that the .msi package installs on target systems. These folders and other files are typically in the same folder that contains the .msi package.

The Add Files for This Package dialog box also lets you specify whether you want to use dynamic file linking for the additional files.

The options that are available on the Add Files for This Package dialog box are:

**Table 1** ▪ Add Files for This Package Dialog Box Settings

Setting	Description
<b>Add Nothing</b>	<p>InstallShield includes only the package file in your project. If the package that you are adding to the project does not require any additional files, select this option.</p> <p>You may want to select this option if the package is compressed.</p>
<b>Add Adjacent Files</b>	<p>InstallShield includes the files that are in the same folder as the package file.</p> <p>InstallShield does not include any subfolders that are in the same folder as the package file, or any files that are in the subfolders.</p>
<b>Add Files in Subfolders</b>	<p>InstallShield includes the files that are in the subfolders of the folder that contains the package file that you are adding.</p> <p>InstallShield does not include any files that are in the same folder as the package file.</p>
<b>Add adjacent Files and Files in Subfolders</b>	<p>InstallShield includes the files that are in the same folder as the package file. InstallShield also includes the files that are in the subfolders of the folder that contains the package file that you are adding.</p>
<b>Add files dynamically found during build</b>	<p>To include the additional files as dynamic file links, select this check box. To include the additional files as static file links, clear this check box; by default, this check box is cleared.</p> <p>If the names of all of the additional files are known when you add the package to your project, you may want to use static file links for any additional files. If the additional files for your package may change over time, you may want to use dynamic file links for any additional files.</p>  <p><b>Note</b> ▪ InstallShield always includes a static link for the package file (.msi, .msp, InstallScript package, or .exe). Therefore, the name of the package file should be consistent from one build to another.</p> <p>Selecting this check box has no effect if you click the Add Nothing option.</p> <p>For more information about static and dynamic file linking, see <a href="#">Static vs. Dynamic Files for Packages in an Advanced UI or Suite/Advanced UI Project</a>.</p>

## Add MIME Type Dialog Box

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Use the Add MIME Type dialog box to add or modify the mapping between a file extension and the program or interpreter that processes those files. This dialog box opens when you click Add or Edit on the [MIME Types dialog box](#).

**Table 2** ▪ Add MIME Type Dialog Box Settings

Setting	Description
<b>File Name Extension</b>	Type the file name extension (for example, <b>.abc</b> ). This is a static file name extension.  To use a wild-card application mapping for an executable file, enter an asterisk (*).
<b>MIME Type</b>	Type the MIME type (for example, <b>application/octet-stream</b> ).

## Add New Method Dialog Box

**Project** ▪ This information applies to InstallScript Object projects.

This dialog box lets you specify the name, return type, and parameter types of a new method and automatically paste corresponding code into your object script. This dialog box opens when you right-click the InstallScript view's Methods folder and select Add New Method.

## Properties

**Table 3** • Methods Properties

Property	Description
<b>Name</b>	Enter the name for your method.
<b>Return Type</b>	Select the data type that your method returns. You can choose from String, Number, Boolean, and Array.
<b>Parameter List</b>	Enter the parameter types that can be passed to your method.

## Add New Property Dialog Box

**Project** • This information applies to the following project types:

- *InstallScript*
- *InstallScript Object*

The Add New Property dialog box lets you specify the name and attributes of a new property and automatically paste corresponding code into your script. This dialog box opens when you right-click the InstallScript view's Properties folder and then click Add New Property.

**Table 4** • Add New Property Dialog Box Settings

Setting	Description
<b>Property Name</b>	This is the global name of this property. Therefore, when trying to read from or write to this property from script, you will need to use this name. The name you enter in this box will be appended to the local variable name property.
<b>Data Type</b>	Select String, Number, or Boolean, depending on the type of data that your property requires. The local variable name will change depending on the selection that you make.
<b>Access Method</b>	Select the appropriate level of access for the property. Available options are Read/Write, Read Only, and Write Only.
<b>Array</b>	<p>If your property is an array, select this check box.</p>  <p><b>Note</b> • If you plan on using the InstallShield stock wizard for your object's design-time interface, you cannot use array properties. You can create a custom wizard that accepts array properties or you can redesign the property without using an array.</p>

**Table 4** • Add New Property Dialog Box Settings

Setting	Description
<b>Local Variable Name</b>	You can accept the default name or create your own variable name. This variable name is used when calling your variable from within the script.
<b>Default Value</b>	Enter the starting value for your property. Be sure to match the value to the data type that you chose. When you are specifying a string value, type it exactly as you would in the script; enclose the string value in quotation marks and use the appropriate escape sequences for special characters (for example, enter a backslash as <code>\\</code> ). Do not enter a string identifier or a system variable in an InstallScript Object project; the initialization of the property's value is performed when the object is added to a project, at which time string identifiers and system variables are not yet initialized.

## Add Predefined Search Dialog Box

The Add Predefined Search dialog box opens when you right-click the grid in the System Search view and then click Add predefined search.

Select a predefined value from the list in this dialog box and then click OK to add the search to the grid in the System Search view.

If you want system searches that have been published to a repository to be displayed in this dialog box, select the Show Searches in Repository check box.

## Add to Source Control Dialog Box

This dialog is displayed when you add a project to your source control program through InstallShield.

### Dialog Options

#### Comments

Enter the comments describing the file. These comments are stored in your source control program.

#### Keep checked out

Select this option to add the .ism file (in text format), but keep it checked out in your working directory.

#### Convert to XML

This option causes the .ism file to use the XML representation, which is better suited for source control. If you add a project in Binary format to source control, this option is available and is selected by default. It is recommended that you leave this option selected.

**Note** ▪ When a project file format is converted to either XML or binary format, the project file extension remains \*.ism.

## Application Extension Mapping Dialog Box

Use the Application Extension Mapping dialog box to add or modify the mapping between a file extension and the program or interpreter that processes those files. This dialog box is launched when you click Add on the [Application Mappings dialog box](#).

**Table 5** ▪ Application Extension Mapping Dialog Box Settings

Setting	Description
<b>Extension</b>	<p>Type the file name extension that is associated with your application (for example, .abc).</p> <p>To use a wild-card application mapping for an executable file, enter an asterisk (*).</p>
<b>Executable</b>	<p>Type the path, or click Browse to launch the Select Executable dialog box. This enables you to specify the executable in your project to which you want to map. Type the name of the executable file (.exe or .dll) or use the Browse button to search for the file. The executable file must be located on your Web server's local hard drive.</p>
<b>Verbs</b>	<p>The Verbs section enables you to specify which HTTP verbs should be passed to the application.</p> <ul style="list-style-type: none"> <li>• <b>All verbs</b>—Select this option to include all verbs. This option passes all requests to an application.</li> <li>• <b>Limit to</b>—Select this option to specify the HTTP verbs that should be passed to an application. Separate verbs with a comma.</li> </ul>
<b>Script Engine (IIS 6 and earlier only)</b>	<p>If you want the application to run in a directory without Execute permissions, select this check box. This setting is intended primarily for script-based applications, such as ASP and IDC, that are mapped to an interpreter.</p> <p>For a script-mapped application to run, either the Scripts Only or Scripts and Executables option must be selected for the Execute Permissions property. To allow only script-mapped applications to run, select the Scripts Only option. To allow both script-mapped applications and executable files (.exe and .dll) to run, select Scripts and Executables.</p> <p>This setting applies to IIS 6 and earlier. IIS 7 ignores this setting.</p>

**Table 5** • Application Extension Mapping Dialog Box Settings (cont.)

Setting	Description
<b>Check that file exists (IIS 6 and earlier only)</b>	<p>To instruct the Web server to verify the existence of the requested script file and to specify that the requesting user should have access permission for that script file, select this check box.</p> <p>If the script does not exist or the end user does not have permission, the appropriate warning message is returned to the browser and the script engine is not invoked. This option can be useful for scripts mapped to non-CGI executable files like the Perl interpreter that do not send a CGI response if the script is not accessible.</p>  <p><b>Note</b> • <i>Because the script is opened twice—once by the server and once by the script engine—there is some performance cost when this check box is selected.</i></p> <p>This setting applies to IIS 6 and earlier. IIS 7 ignores this setting.</p>

## Application Mappings Dialog Box

The Application Mappings dialog box lets you add, edit, and delete a mapping between a file name extension and the application that processes those files.

The Application Mappings dialog box is available from within the Internet Information Services view. To open this dialog box, click a Web site, application, or virtual directory in the explorer. Then click the ellipsis button (...) in the Application Mappings setting.

**Note** • *If an asterisk (\*) appears in the Verbs column, all verbs will be used for the specified extension.*

**Table 6** • Application Mappings Dialog Box Settings

Setting	Description
<b>Add</b>	To add an entry for mapping a file name extension and the program or interpreter that processes those files, click this button. This opens the <a href="#">Application Extension Mapping dialog box</a> .
<b>Edit</b>	To edit an existing application mapping, select the mapping and click this button.
<b>Remove</b>	To delete an existing application mapping, select the extension and click this button.

## Associate Components Dialog Box

The Associate Components dialog box enables you to associate components with features in the Setup Design view. Select the component or components that you want to associate with the current feature and click OK.

**Note** ▪ Components that are not associated with a feature are displayed with the orphaned component icon.

For more information on component-feature relationships, see [Associating New Components with Features](#).

## Associate DIMs Dialog Box

The Associate DIMs dialog box enables you to associate DIMs with features in the Setup Design view. Select the DIM or DIMs that you want to associate with the current feature and click OK.

**Note** ▪ DIMs that are not associated with a feature are displayed with the orphaned component icon.

For more information on DIM-feature relationships, see [Associating a DIM Reference with a Feature](#).

## Batch Build Dialog Box

This dialog displays a tree control containing all the product configurations and releases you have defined in the current project. Select the releases that you want to include in your batch build.

### Dialog Options

#### Tree Control

Select the releases that you would like to build by checking the appropriate boxes. Selecting a product configuration icon selects all the releases associated with that product configuration.

#### Select All

Click this button to select all the releases in the tree.

#### Unselect All

Click this button to deselect all the releases in the tree.

#### Build

Click this button to build all the selected releases.

## Browse for Directory Dialog Box

Use the Browse for Directory dialog box to browse to a directory, create a new directory, rename a directory, or delete a directory.

## Dialog Box Options

### Destination Directories

This field lists all of the currently available destination directories. You can select, create, rename, or delete directories in this field.

#### Selecting a Directory

#### Task

##### To select a directory:

1. Click on a directory to select it.
2. Click **OK**.

#### Creating a New Directory

#### Task

##### To create a new directory:

1. Select a directory or the Destination Computer and press the **Insert** key, or right-click and select **New** from the context menu. This creates a directory beneath the selected folder or beneath the Destination Computer.
2. Type the directory name.
3. Provide a directory identifier, if necessary.

#### Renaming a Directory

#### Task

##### To rename a directory:

1. Select a directory or the Destination Computer and press F2, or right-click and select **Rename** from the context menu.
2. Type the new directory name. Note that you cannot rename predefined directories.
3. Rename the directory identifier, if necessary, to be consistent with the directory's new name.

#### Deleting a Directory

#### Task

##### To delete a directory:

Select a directory and press the **Delete** key, or right-click and select **Delete** from the context menu.

Note that you cannot delete predefined directories.

**Note** - When you delete a directory, any subdirectories beneath the selected directory are also deleted.

## Directory Identifier

You can use the **Directory Identifier** field to provide a user-friendly name for a directory. For example, if you have a directory—ProgramFilesFolder\MyProgram\Graphics\Jpg—you can use just JPG to identify the directory path. The **Component Destination** field in the IDE displays the path as {JPG}[ProgramFilesFolder]MyProgram\Graphics\Jpg.

**Note** ▪ The directory identifier must be a valid Windows Installer identifier. For features, the directory identifier must contain all capital letters.

# Browse for Directory/Shortcut Target Dialog Box

Use the Browse for Directory dialog box to browse to a directory, create a new directory, rename a directory, or delete a directory. Use the Browse for Shortcut Target dialog box to browse to a directory or file, create a new directory, rename a directory, delete a directory.

## Dialog Box Options

### Destination Directories

This field lists all of the currently available destination directories. You can select, create, rename, or delete directories in this field.

### Selecting a Directory

#### Task

#### To select a directory:

1. Click on a directory to select it.
2. Click **OK**.

### Creating a New Directory

#### Task

#### To create a new directory:

1. Select a directory or the Destination Computer and press the Insert key, or right-click and select **New** from the context menu. This creates a directory beneath the selected folder or beneath the Destination Computer.
2. Type the directory name.
3. Provide a directory identifier, if necessary.

## Renaming a Directory

### Task

#### To rename a directory:

1. Select a directory or the Destination Computer and press F2, or right-click and select **Rename** from the context menu.
2. Type the new directory name. Note that you cannot rename predefined directories.
3. Rename the directory identifier, if necessary, to be consistent with the directory's new name.

## Deleting a Directory

### Task

#### To delete a directory:

Select a directory and press the **Delete** key, or right-click and select **Delete** from the context menu. Note that you cannot delete predefined directories.

**Note** ▪ When you delete a directory, any subdirectories beneath the selected directory are also deleted.

## Hard-Coding a Shortcut

### Task

#### To hard code a shortcut to a path such as `C:\Winnt\notepad.exe`:

First create two folders — "C:" and "Winnt." Then enter "Notepad.exe" in the filename field of the **Browse for Directory** dialog or select the root node, and enter "C:\Winnt\notepad.exe" in the filename field.

### Directory Identifier

You can use the **Directory Identifier** field to provide a user-friendly name for a directory. For example, if you have a directory—`ProgramFilesFolder\MyProgram\Graphics\Jpg`—you can use just `JPG` to identify the directory path. The **Component Destination** field in the InstallShield interface displays the path as `{JPG}[ProgramFilesFolder]MyProgram\Graphics\Jpg`.

**Note** ▪ The directory identifier must be a valid MSI identifier. For features, the directory identifier must contain all uppercase letters.

You can enter the file name in the **File name** edit box, which means that you are entering the selected directory\filename as the target of the shortcut.

# Browse for File Dialog Box

The Browse for File dialog box is displayed when you click the ellipsis button (...) in the Include Patterns and Files setting or the Exclude Patterns and Files setting on the Signing tab for a release in the Releases view. The Browse for File dialog box lets you specify which static files in your project should or should not be signed. It also lets you use an asterisk (\*) as a wild-card character. This is especially helpful if you include dynamically linked files in your project and you want to sign all files that match a certain pattern.

**Table 7** • Settings on the Browse for File Dialog Box

Setting	Description
<b>Select files to sign</b>	<p>This box is displayed if you click the ellipsis button (...) in the Include Patterns and Files setting.</p> <p>This box lists all of the statically included files in your project that match the file types that are selected in the <b>Show files of type</b> list. It also lists some default file patterns, such as *.dll.</p> <p>Select the check boxes for the files and file patterns that correspond with the types of files in your project that you want InstallShield to sign at build time.</p>
<b>Select files to skip signing</b>	<p>This box is displayed if you click the ellipsis button (...) in the Exclude Patterns and Files setting.</p> <p>This box lists all of the statically included files in your project that match the file types that are selected in the <b>Show files of type</b> list. It also lists some default file patterns, such as *.dll.</p> <p>If you want to prevent certain files or file patterns from being signed by InstallShield at build time, select the check boxes for the appropriate files and file patterns.</p>
<b>Show files of type</b>	Use this list to filter the types of files that are displayed in the <b>Select files to sign</b> box or the <b>Select files to skip signing</b> box.

**Windows Logo** • All executable files (including .exe, .dll, .ocx, .sys, .cpl, .drv, and .scr files) in an installation must be digitally signed for the Windows logo program.

When you click OK on this dialog box, InstallShield adds new Include settings under the Include Patterns and Files setting or new Exclude settings under the Exclude Patterns and Files setting.

Note that the files and file patterns that should not be signed override any files and file patterns that should be signed. For example, if you specify \*.exe in an Include setting and in an Exclude setting, InstallShield does not sign any .exe files.

## Browse for File to Run Dialog Box

The Browse for File to Run dialog box opens when you click the ellipsis button (...) in the Target setting in the Scheduled Task view. This dialog box lets you specify the file name and location on the target system for the file that you want the scheduled task to run.

**Table 8** • Settings on the Browse for File to Run Dialog Box

Setting	Description
<b>Destination Directories</b>	<p>Select the directory on the target system that will contain the file that you want to be run as a scheduled task.</p> <p>To specify a new directory, right-click the location that you want to contain the new directory, and then click New Directory.</p> <p>To hide or show empty predefined directories in this box, right-click in this box and then click Show Empty Predefined Directories.</p>
<b>Directory Identifier</b>	<p>If you select a destination directory that you created in the Destination Directories box, you can use this setting to enter a user-friendly name for the directory. For example, if you have a directory such as [ProgramFilesFolder]\MyProgram\Graphics\JPG, you can use just JPG to identify the directory path. The Component Destination field in InstallShield displays the path as {JPG} [ProgramFilesFolder]MyProgram\Graphics\JPG.</p> <p>If you select a predefined directory in the Destination Directories box, this setting is read-only.</p>
<b>File Name</b>	Enter the name of the file that you want the scheduled task to launch.

## Browse for Shortcut Icon Dialog Box

**Project** • This applies to InstallScript projects.

Use the Browse for Shortcut Icon dialog box to specify to the location on the target system of the icon file (.ico) or the .exe or .dll file that contains the icon resource. This dialog box opens when you click the ellipsis button (...) in the Icon setting in the Shortcuts view.

**Table 9** • Browse for Shortcut Icon Dialog Box Settings

Setting	Description
<b>Destination Directories</b>	Select the directory on the target system that contains the icon file.
<b>Current Value</b>	This read-only setting shows the selected directory that contains the icon file.

**Table 9** ▪ Browse for Shortcut Icon Dialog Box Settings (cont.)

Setting	Description
<b>File Name</b>	Enter the name of the icon file (.ico) or the .exe or .dll file that contains the icon resource.

**Tip** ▪ To use a hard-coded path for a file, enter the path in the *Icon File* setting manually, instead of using the *Browse for Shortcut Icon* dialog box to use system variables for directories. The *Icon File* setting is under the *Icon* setting in the *Shortcuts* view.

## Browse for Tile Target Dialog Box

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

InstallShield supports configuring the appearance of a desktop app's tile on the Start screen. Use the *Browse for Tile Target* dialog box to navigate to and select the .exe file for the app whose tile appearance you want to configure.

**Table 10** ▪ Browse for Tile Target Dialog Box Settings

Setting	Description
<b>Look in</b>	Browse to the directory that contains the .exe file of the app whose tile appearance you want to configure. Selecting a folder from this list displays the contents of the folder in the primary pane. In the primary pane, click an .exe file to select it.
<b>File Name</b>	After you have selected an .exe file in the primary pane, its file name is displayed here.

## Certificate Selection Dialog Box

**Edition** ▪ This information applies to the following project types:

- Advanced UI

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *Suite/Advanced UI*
- *QuickPatch*

When you are configuring digital signature information for a release, a patch, or a QuickPatch package, use the Certificate Selection dialog box to specify which certificate you want to use to sign your files. InstallShield lets you choose between the following options:

- You can specify the .pfx certificate file on your machine that you want to use for signing.
- You can reference a certificate store that contains the certificate that you want to use for signing.

## Accessing the Certificate Selection Dialog Box

Instructions on how to access the Certificate Selection dialog box depend on whether you are specifying certificate information for a release, a patch, or a QuickPatch package.

### **Task**      **To access the Certificate Selection dialog box for a release:**

1. In the View Bar / View List under **Media**, click **Releases**.
2. In the **Releases** explorer, select the release that you want to configure.
3. Click the **Signing** tab.
4. In the **Digital Certificate Information** setting, click the ellipsis button (...).

### **Task**      **To access the Certificate Selection dialog box for a patch:**

1. In the View Bar / View List under **Media**, click **Patch Design**.
2. In the **Patch Design** explorer, select the patch configure that you want to modify.
3. Click the **Digital Signature** tab.
4. Next to the **Digital Certificate Information** setting, click the **Browse** button.

### **Task**      **To access the Certificate Selection dialog box in a QuickPatch project:**

1. In the View Bar / View List under **Patch Settings**, click **General Information**.
2. In the **General Information** explorer, click **Build Settings**.
3. Click the **Digital Signature** tab.
4. Next to the **Digital Certificate Information** setting, click the **Browse** button.

## Certificate Selection Dialog Box Settings

**Table 11** ▪ Certificate Selection Dialog Box Settings

Setting	Description
<b>Use a file (.pfx)</b>	To use a .pfx file to digitally sign your release at build time, select this option. Then specify the location of your .pfx. You can type the path to the file or use the ellipsis button (...) to browse to the file location.
<b>Use a certificate store</b>	To reference a certificate store that contains the certificate that you want to use to digitally sign your release at build time, select this option and then enter values in the subsettings under this option.
<b>Certificate Store Name</b>	<p>Select the name of the certificate store that contains the certificate that you want to use. Available options are:</p> <ul style="list-style-type: none"> <li>● Personal</li> <li>● Trusted Root Certification Authorities</li> <li>● Enterprise Trust</li> <li>● Intermediate Certification Authorities</li> </ul> <p>This setting is available if you select the <b>Use a certificate store</b> option.</p>
<b>Certificate Store Location</b>	<p>Select the location of the certificate store that contains the certificate that you want to use. Available options are:</p> <ul style="list-style-type: none"> <li>● User</li> <li>● Machine</li> </ul> <p>This setting is available if you select the <b>Use a certificate store</b> option.</p>
<b>Certificate Subject</b>	<p>Enter the subject of the certificate that you want to use, or select from the list of certificates that are available on your machine.</p> <p>This setting is available if you select the <b>Use a certificate store</b> option.</p>
<b>View Details</b>	The details of the certificate like the general information of the certificate, security details and certification path is listed on the <b>View Details</b> option.
<b>Signature Digest</b>	<p>Choose the signature digest hashing algorithm (or choose to let InstallShield specify it automatically based on the certificate hash). Available options are:</p> <ul style="list-style-type: none"> <li>● Based on certificate hash</li> <li>● SHA-1</li> <li>● SHA-256</li> <li>● Dual (SHA-1 &amp; SHA-256)</li> </ul>

## Check In Dialog Box

When you check an InstallShield project in to your source code control application through InstallShield, the Check In dialog box opens.

**Table 12** • Check In Dialog Box Settings

Setting	Description
<b>Comments</b>	Enter comments that describe the changes that you made to the file. These comments are stored in your source code control application.
<b>Keep checked out</b>	To check in the changed version of the .isv file, but keep it checked out in your working directory, select this option.
<b>Differences</b>	To view a line-by-line comparison between the .ism file (in text format) that you are checking in with the previous version of the file, click this button.

## Check Out Dialog Box

If you select the **Use dialog for checkout** check box on the Source Control tab of the Options dialog box, the Check Out dialog box opens when you check out an InstallShield project from your source code control application through InstallShield.

**Table 13** • Check Out Dialog Box Options

Option	Description
<b>Comments</b>	Type comments about your reasons for checking out the .ism file.
<b>Advanced</b>	To configure all of your source code control application's settings for checking out the project file, click this button.

## Component Properties Dialog Box

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database
- Transform

The Component Properties dialog box lets you set some component properties—including dynamic file link settings and associated features—from the Files and Folders view.

### Task

#### To launch the dialog box:

1. In the View Bar / View List under **Application Data**, click **Files and Folders**.
2. Ensure that components are displayed in the **Destination computer's folders** pane.  
  
If components are not displayed: In the **Destination computer's folders** pane, right-click **Destination Computer** and click **Show Components** (in Windows Installer-based projects) or **Show Components and Subfolders** (in InstallScript projects).
3. Right-click a component and then click **Properties**. The **Component Properties** dialog box opens.

The following tabs are available on this dialog box:

- **General tab**
- **File Linking tab**
- **Features tab**

## General Tab

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The General tab on the Component Properties dialog box is where you set the properties for the selected component.

**Table 14** ▪ Settings on the General Tab of the Component Properties Dialog Box

Setting	Project Type	Description
<b>Shared</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, MSI Database, MSM Database, Transform	<p>If the files that are contained within this component are shared files, select this check box.</p> <p>To learn more, see <a href="#">Managing Reference Counts for Shared Files</a>.</p>
<b>Never Overwrite</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>If you do not want to replace an existing version of the same file that is already present on the target machine, select this check box.</p> <p>To learn more, see <a href="#">Checking File Versions Before Installing</a>.</p>
<b>Permanent</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>If the files in this component should not be removed from the system during uninstallation, select this check box. For example, validation rule ICE09 requires any component with a destination of [SystemFolder] to be marked as Permanent.</p> <p>To learn more, see <a href="#">Specifying Whether a Component's Files and Other Associated Data Are Uninstalled During Uninstallation</a>.</p>
<b>Uninstall</b>	InstallScript, InstallScript Object	<p>If the files in this component should be removed when the application is uninstalled, select this check box.</p> <p>To learn more, see <a href="#">Specifying Whether a Component's Files and Other Associated Data Are Uninstalled During Uninstallation</a>.</p>
<b>64-bit</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>To mark this component as 64 bit, select this check box. If a 64-bit component is included in your installation, the installation cannot be run on 32-bit machines.</p>

**Table 14** ▪ Settings on the General Tab of the Component Properties Dialog Box (cont.)

Setting	Project Type	Description
<b>Extract COM Info At Build</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	<p>If you want InstallShield to extract the COM information each time you build a release, select this check box. If your COM interfaces are subject to change, this option is preferable to maintaining statically acquired or provided data in the COM Registration advanced setting.</p> <p>If you have marked the component's COM server file as Self-Registering, you should not select this check box.</p>
<b>Self-register</b>	InstallScript, InstallScript Object	<p>If the component's files are self-registering, select this check box. A self-registering file is an OLE server that can place information about itself in the registry so that it is seen by other OLE applications. Such a file can also remove this information from the registry when it is uninstalled.</p> <p></p> <p><b>Project</b> ▪ <i>InstallScript and InstallScript Object projects support self-registration of .dll files, .exe files, and type libraries; that is, .tlb and .olb files. In Windows Installer-based projects, self-registration is set at the file level, rather than the component level.</i></p>

## File Linking Tab

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The File Linking tab on the Component Properties dialog box shows all of the settings for your dynamic link.

**Table 15** ▪ Settings on the File Linking Tab of the Component Properties Dialog Box

Setting	Description
<b>Source</b>	This column shows where the source files are stored. A path variable is typically used.

**Table 15** ▪ Settings on the File Linking Tab of the Component Properties Dialog Box (cont.)

Setting	Description
<b>Include Subfolders</b>	<p>This column indicates whether InstallShield should dynamically link the files in each subfolder.</p> <p>For information on how InstallShield creates components for the dynamically linked files in subfolders, see <a href="#">Determining the Appropriate Component Creation Method for Dynamically Linked Files</a>.</p>
<b>Self-Register</b>	<p>This column indicates whether you want InstallShield to self-register every file in the dynamic link.</p> <p>If the file are part of a 64-bit component and the Self-Register column indicates Yes for a dynamic link, the installation performs 64-bit self-registration on the target system. For more information, see <a href="#">Targeting 64-Bit Operating Systems</a>.</p>
<b>Create Components</b>	<p>This column indicates how you want InstallShield to create the components when it adds the dynamic files to your release at build time. The valid options are:</p> <ul style="list-style-type: none"> <li>● <b>Best Practice</b>—InstallShield adheres to best practices when creating components for the dynamically linked files.</li> <li>● <b>By Directory</b>—InstallShield creates one component for each folder and subfolder.</li> </ul> <p>To learn about these two methods, see <a href="#">Determining the Appropriate Component Creation Method for Dynamically Linked Files</a>.</p>
<b>Details</b>	<p>This column indicates the filter criteria for including files in and excluding files from the dynamic link.</p>

**Tip** ▪ Note the following guidelines for working with the File Linking tab:

- To add a new dynamic link, click the New Link button. InstallShield displays the [Dynamic File Link Settings dialog box](#).
- To modify the settings for an existing link, select the link and then click the Modify button. InstallShield displays the [Dynamic File Link Settings dialog box](#).
- To remove a link and its associated dynamically linked files, select the link and then click the Delete button.

## Features Tab

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript Object

- *MSI Database*
- *Transform*

The Features tab on the Component Properties dialog box is where you specify the features with which the component is associated. Select the check box next to the feature or features with which you want the component to be associated.

## Condition Builder Dialog Box

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Condition Builder dialog box simplifies the process of creating a condition for a component, a dialog, a custom action, a SQL script, a system search, or other installation element by providing a selection of valid Windows Installer properties and conditional expression operators.

The Condition Builder dialog box contains the following settings.

**Table 16** ▪ Condition Builder Dialog Box Settings

Setting	Description
<b>Conditions</b>	<p>This box is where you define the condition for your component, dialog, custom action, or other installation element. You can type a condition directly in this box, or you can use the Properties list, the Operators list, and the Add buttons to build a condition statement.</p>  <p><b>Important</b> ▪ When you click the OK button on this dialog box, InstallShield performs basic condition validation; however, you should still double-check that your condition statements evaluate to the expected outcome. For more information and example conditions, see <a href="#">Building Conditional Statements</a>.</p>
<b>Properties</b>	<p>This list contains common Windows Installer properties, as well as any properties that have been added in the Property Manager view. Select the property that you want to evaluate, and then click the <b>Add</b> button next to this list.</p> <p>If the list does not contain the property that you want to evaluate, you can type the appropriate property name in the Conditions box.</p>

**Table 16** ▪ Condition Builder Dialog Box Settings (cont.)

Setting	Description
<b>Operators</b>	<p>This list contains all of the valid operators that are recognized by the Windows Installer.</p> <p>If your conditional statement should contain an operator, select the operator that you want to use and then click the <b>Add</b> button. InstallShield adds the operator to the conditional statement. If you add an operator, type the appropriate value after the operator.</p>

## Content Source Path Dialog Box

The Content Source Path dialog box opens when you click the UNC button in the Content Source Path (Local or UNC) setting for a Web site in the Internet Information Services view. This dialog box contains the following setting.

**Table 17** ▪ Content Source Path Dialog Box Setting

Setting	Description
<b>Universal Naming Convention content source path</b>	<p>Specify the UNC path for the IIS Web site's files. For example:</p> <p><b>\\server\share</b></p>

## Convert InstallScript MSI Dialog Box

The Convert InstallScript MSI dialog box lets you convert an InstallScript MSI project to an InstallScript project. An InstallScript project offers the advantages of InstallScript MSI—such as dialog box skins, a flexible end-user interface, and a powerful scripting model—without any of the limitations or overhead of Windows Installer.

This dialog box is displayed when you select the Project menu's Convert to InstallScript Project command.

If you click Yes, most project elements are converted, many with no change. The following changes take place (the conversion process issues many messages to let you know what is happening):

- INSTALLDIR is changed to TARGETDIR in the following IDE elements:
  - Component destinations
  - Path specifications in the Files and Folders view
  - Target specifications in the Shortcuts view

Note that the value of TARGETDIR must be set in your script, as it is in the following default code in the OnFirstUIBefore event handler function:

```
if ( ALLUSERS ) then
    TARGETDIR = PROGRAMFILES ^ IFX_COMPANY_NAME ^ IFX_PRODUCT_NAME;
else
    TARGETDIR = FOLDER_APPDATA ^ IFX_COMPANY_NAME ^ IFX_PRODUCT_NAME;
endif;
```

- A new product code is generated.
- A registry set is created for each component that had registry data associated with it.
- Each component with multiple dynamic file links is split into multiple components with one dynamic file link in each.
- The script file Setup.rul is renamed OldSetup.rul and is displayed in the InstallScript view. Note that no changes are made to this script file.
- Warnings are issued for the following unsupported items:
  - Unsupported folder specifiers in path specifications in the Files and Folders view, or destinations or target specifications in the Shortcuts view
  - Win32 assemblies that are associated with components
  - Global assembly caches that are associated with components
  - Registry value names that contain a hyphen (-) or asterisk (\*)
  - Advertised shortcuts
  - Folders under the Support Files view's Disk1 folder
  - Merge modules (you can re-include these in the converted project from the Objects view)
  - Unsupported MSI tables that contain data

Releases and your scripts are not converted. At a minimum, you need to modify your scripts to set TARGETDIR, as mentioned above, change all INSTALLDIR references to TARGETDIR, and remove calls to Windows Installer API functions (whose names begin with Msi). Furthermore, the obsolete string entry PRODUCT\_NAME is not converted; IFX\_PRODUCT\_NAME can be used instead.

Note that setting SHELL\_OBJECT\_FOLDER in OnFirstUIBefore is not necessary and the default script line SHELL\_OBJECT\_FOLDER = @PRODUCT\_NAME; should be deleted.

The following Windows Installer folder specifiers are not supported in InstallScript projects:

- ALLUSERSPROFILE
- AdminToolsFolder
- AppDataFolder
- CommonAppDataFolder
- CommonFiles64Folder
- FavoritesFolder
- FontsFolder
- GlobalAssemblyCache
- LocalAppDataFolder
- MyPicturesFolder
- PersonalFolder
- PrimaryVolumePath

- ProgramFiles64Folder
- SendToFolder
- System16Folder
- System64Folder
- TempFolder
- TemplateFolder
- USERPROFILE
- WindowsVolume

In addition, the following folder specifiers are not supported for shortcut destinations:

- ProgramFilesFolder
- CommonFilesFolder
- WindowsFolder
- SystemFolder

## Create a New Component Dialog Box

Some aspects of your installation project must be associated with a component. For example, if no component exists when a shortcut or an .ini file change is created, InstallShield prompts you to create a new component.

### Dialog Options

#### New component name

InstallShield provides a default name for the component. Type a meaningful name into this field. The name you provide is for your reference only and is never displayed to end users.

#### Select the features to associate this component with

---

**Project** ▪ This property applies to the following project types:

- Basic MSI
- InstallScript

Select from the list the feature or features with which you want to associate the new component. If no features appear in this field, you can add one by clicking New Feature. You are not required to associate your new component with a feature; however, if you do not, this component will not be installed.

#### New Feature

---

**Project** ▪ This property applies to the following project types:

- Basic MSI

- *InstallScript*

Click New Feature to add a feature to your setup project. When you have created a feature, you can associate your new component with it by clicking the box next to the feature name.

**Do not show this dialog again**

Select this option if you want InstallShield to automatically create any necessary components in the future.

## Create a New Feature Dialog Box

Some aspects of your installation project must be associated with a feature. For example, if no feature exists when a merge module is added, or an ODBC resource is configured, InstallShield prompts you to create a feature.

### Dialog Options

**New feature name**

InstallShield creates a default feature name for you. Provide a meaningful name for the feature. The name you enter here is for your reference only and is never displayed to end users.

**Do not show this dialog again**

Select this check box if you want InstallShield to automatically create components and features when required.

## Custom Error Handling Dialog Box

Specify how to handle specific SQL errors in the Custom Error Handling dialog box. Any error you define will override the script's default error handling. You can define how to handle an error for all scripts in your project or simply for this script.

### Error Number

Enter the SQL error number for which you want to customize error handling.

### Behavior

Override the default behavior by choosing one of the following options:

- On Error, Abort Installation
- On Error, Go to Next Script
- On Error, Go to Next Statement

### Project Wide

To apply the customized error handling to all scripts in your project, select Yes. To apply it to only this script, select No.

## Custom Errors Dialog Box

The Custom Errors dialog box lists all of the HTTP errors that can be customized for a Web site, application, or virtual directory. A custom error can be a URL or a pointer to a file on the server.

### Task

#### To configure error messages:

1. In the **Custom Errors** dialog box, select one or more errors.
2. Click **Edit**. The **Error Mapping Properties** dialog box opens.
3. Select a message type and specify a file or URL as appropriate.
4. Click **OK**.

You can click the Set to Default button to restore default settings for the selected error.

## Customize Validation Settings Dialog Box

The Customize Validation Settings dialog box lets you specify which internal consistency evaluators (ICEs) should be used for a specific validation suite. This dialog box opens when you click Customize on the Validation tab of the Options dialog box.

To customize the list of ICEs that are performed during a particular type of validation, select the validation suite in the CUB file list. Then select the check boxes for each of the ICEs that should be performed, and clear the check boxes for each of the ICEs that should be ignored.

To learn about specific ICEs, see [ICE Reference](#) in the Windows Installer Help Library.

For information about each of the InstallShield ICEs that were added to the InstallShield validation suites, see [ISICEs](#).

## Data Languages Dialog Box

**Edition** - This information applies to the following project types:

- Basic MSI
- InstallScript MSI
- Merge Module

The Data Languages dialog box lets you include certain components and exclude others based on the language that is selected for each component. If the language specified for a component does not match one of the languages that is selected in this dialog box, InstallShield does not include the component in the release.

To open the Data Languages dialog box, open the Releases view and select a release. Then click the ellipsis button (...) in the Data Languages setting on the Build tab.

By default, releases are language independent; that is, none of the project's components are excluded from the release.

## Delete Property Dialog Box

The Delete Property dialog box is displayed when you delete a system search associated with a property in your installation project. The goal of the dialog box is to determine whether or not you want to delete that property along with the search.

**Note** ▪ *Deleting the property may affect other areas of your setup.*

Select Yes if you are certain that your project will not be affected in the absence of that property. Select No if you are uncertain whether it will affect your installation.

## Dependencies Dialog Box

The Dependencies dialog box displays the list of dependencies for a selected file. To access this dialog box, right-click a file in the **Destination computer's files** pane of the Files and Folders view, and then click **Dependencies from scan at build**.

The dialog box provides results for assembly DLLs. If you launch the dialog box from Microsoft Visual Studio, the dialog box shows results for project outputs. If launched from InstallShield outside of Visual Studio, scan at build dependencies is disabled for project outputs.

**Note** ▪ *This is enabled only for key files and when the .NET Scan at Build property is set to Dependencies and Properties. If the dependency or one of its dependencies cannot be located, a red icon is displayed.*

### Dialog Box Options

#### Dependency

This section lists all of the dependencies with a check box next to each. To exclude a dependency from the build, clear the check box next to the dependency. To close the dialog, click OK.

**Note** ▪ *Any new dependencies detected at build time—for files added after closing the Dependencies dialog box—are added to the build.*

## Dialog Images Dialog Box

Use the Dialog Images dialog box to add an image (.bmp, .gif, .jpg, .jpeg, or .ibd) that you want to display on your installation's dialogs.

### Full Screen Image

Browse to a graphic file that will serve as the full-screen background for your *exterior* dialogs. Exterior dialogs are dialogs that appear at the beginning or end of the installation, including InstallWelcome and SetupCompleteSuccess (the final dialog upon successful installation). The full-screen image should measure 499 by 312 pixels.

## Banner Image

Browse to a graphic file that will run across the top of interior dialogs. Interior dialogs, which appear between the first and last installation dialogs, include the LicenseAgreement and CustomSetup dialogs. The banner image should be 499 by 58 pixels.

## Digitally Sign Setup Dialog Box

The Digitally Sign Setup dialog box is displayed when you click Digitally Sign Setup on the Build Installation page of the Project Assistant. This dialog box enables you to assure your end users that the code within your application has not been modified or corrupted since publication.

**Table 18** • Digitally Sign Setup Dialog Box Settings

Setting	Description
<b>Digitally sign setup</b>	To digitally sign your installation, select this check box  The other settings on this dialog box are enabled when you select this check box.
<b>Certificate URL</b>	Type a fully qualified URL—for example, <b>http://www.mydomain.com</b> . This URL is used in your digital signature to link to a site that you would like end users to visit to learn more about your product, organization, or company.
<b>Digital certificate information</b>	To specify the digital certificate that you want to use to sign your release, click the ellipsis button (...) next to this setting. The Certificate Selection dialog box opens, enabling you to specify either the location of the .pfx file or information about the certificate store that contains the certificate.  To learn more, see <a href="#">Certificate Selection Dialog Box</a> .
<b>Password</b>	If the .pfx file that you are using has a password, enter it. InstallShield encrypts the password and stores it in your project file (.ism).  At build time, InstallShield uses the password to sign files with a .pfx file. If your certificate is protected by a password but you do not enter it in this setting, signing with a .pfx file fails.  Note that if you configure your project to use a certificate that was imported with password protection into a store, Windows prompts for the password at build time when InstallShield is attempting to sign your project's files. The strong key protection that Windows uses does not permit InstallShield to provide the password to the cryptographic provider.

**Tip** • The Signing tab in the Releases view lets you specify which portions of your installation should be digitally signed at build time. InstallShield enables you to sign any and all of the following files in a release, depending on what type of project you are using:

- Windows Installer package (.msi file) for Basic MSI and InstallScript MSI projects
- Merge module package (.msm file) for Merge Module projects

- Setup.exe file for Basic MSI and InstallScript MSI projects
- Media header file for InstallScript projects
- Package (self-extracting single-executable file) for InstallScript projects
- Any files in your release, including your application files

To learn more, see [Digitally Signing a Release and Its Files at Build Time](#).

**Windows Logo** - All executable files (including .exe, .dll, .ocx, .sys, .cpl, .drv, and .scr files) in an installation must be digitally signed for the Windows logo program.

## Differences Dialog Box

The Differences dialog box is displayed when you click the Show Differences command, which is available from the Project menu's Source Control menu. The dialog box has a list that contains all of the Windows Installer tables in your installation project.

### Task

**To view the table's differences in your source control program:**

Select a table from the list and click **OK**.

## Dynamic File Link Settings Dialog Box

The Dynamic File Link Settings dialog box enables you to specify the source folder for your dynamic link. You can then choose to include all the files in that folder or only specified file types.

The Dynamic Link Settings dialog box is available from the [File Linking tab](#) of the Component Properties dialog box, as well as the [Modify Dynamic Links dialog box](#).

**Table 19** - Settings on the Dynamic File Link Settings Dialog Box

Setting	Description
<b>Source folder</b>	<p>Enter the full path to the folder that you want to have dynamically linked, or click the Browse button to navigate to it. You can identify the source folder with any of the following methods:</p> <ul style="list-style-type: none"> <li>• Enter an absolute path to the folder, such as C:\Build\MySourceFolder\Bitmaps.</li> <li>• Enter a path variable. Follow the path variable with a backslash to specify a subfolder—for example, &lt;CommonFilesFolder&gt;\InstallShield\IScript.</li> <li>• Click the Browse button to navigate to a folder.</li> </ul>

**Table 19** ■ Settings on the Dynamic File Link Settings Dialog Box (cont.)

Setting	Description
<b>Include subfolders</b>	<p>To dynamically link the files in each subfolder, select this check box.</p> <p>For information on how InstallShield creates components for the dynamically linked files in subfolders, see <a href="#">Determining the Appropriate Component Creation Method for Dynamically Linked Files</a>.</p>
<b>Self-register all files</b>	<p>To self-register every file in the dynamic link, select this check box.</p> <p>If the files are part of a 64-bit component and you select this check box, the installation performs 64-bit self-registration on the target system. For more information, see <a href="#">Targeting 64-Bit Operating Systems</a>.</p>
<b>Create best practice components</b>	<p>To specify that InstallShield should adhere to best practices when creating the components for dynamically linked files, select this check box. When best practices for component creation are followed, InstallShield performs the following tasks at build time for all of the files that meet the include and exclude filter criteria:</p> <ul style="list-style-type: none"> <li>● InstallShield creates a separate component for each portable executable (PE) file in the dynamically linked folder. Each PE file is the key file of its component.</li> <li>● InstallShield adds all non-PE files at the root level of the dynamic link to the component that contains the link.</li> <li>● If the dynamic link includes a subfolder, InstallShield creates a new component for all of the non-PE files in that subfolder. If the dynamic link includes more than one subfolder, InstallShield creates a separate component for all of the non-PE files in each subfolder.</li> </ul> <p>To specify that InstallShield should not follow best practices when creating the components for dynamically linked files, clear this check box. For this component creation method, InstallShield performs the following tasks at build time for all of the files that meet the include and exclude filter criteria:</p> <ul style="list-style-type: none"> <li>● InstallShield creates one component for all of the files that are in the root-level dynamically linked folder, regardless of the file types.</li> <li>● If the dynamic link includes one or more subfolders, InstallShield creates a separate component for all of the files in each subfolder, regardless of the file types. The first dynamically linked file in a subfolder's component is the key file of that component.</li> </ul> <p>This check box is selected by default for all new dynamic links.</p> <p>For more information, see <a href="#">Determining the Appropriate Component Creation Method for Dynamically Linked Files</a>.</p>
<b>Include all files</b>	<p>To include the entire contents of your linked directory in your installation, select this option.</p>

**Table 19** ▪ Settings on the Dynamic File Link Settings Dialog Box (cont.)

Setting	Description
<b>Include/exclude files based on the following wild-card patterns</b>	<p>To include or exclude file types, select this option. Enter the file extension in the include or exclude field, preceded by an asterisk (*). Separate multiple entries with a comma.</p> <p>For example, if all of your image files are in one folder along with sound files and you want to dynamically link only the image files, you could specify that you would like to include only .bmp and .ico files in the dynamically linked folder. To do so, you would use an asterisk (*) in your include pattern, as in the following example:</p> <p><b>*.bmp, *.ico</b></p> <p>To include or exclude a specific file, you would enter the full file name in the include or exclude pattern box.</p>

## Edit Data Dialog Box

The Edit Data dialog is available from within the Application Registry panel in the [Project Assistant](#). To access the dialog, double-click on a registry value in the Destination computer's registry data pane. The Multi-Line String Value dialog box is displayed for multi-string values.

### Dialog Options

#### Value name

The name of the registry value as it appears in the Destination computer's registry data pane. To change the value name, right-click on the value and select Rename.

#### Value data

Contains the information that should be stored in the registry value. To change or edit the data, type in the edit field.

## Edit IIS Metabase Value Dialog Box

InstallShield displays the Edit IIS Metabase Value dialog box if you click the Change Value button on the Other IIS Properties dialog box. The Other IIS Properties dialog box is displayed if you click the ellipsis button (...) in the Other IIS Properties setting for a selected Web site, application, or virtual directory in the Internet Information Services view.

The Edit IIS Metabase Value dialog box is where you specify the value for an IIS setting that is not displayed in the other areas of the Internet Information Services view.

If you change the default value for any advanced property, InstallShield adds the property, the value that you specify, and the additional required information to the ISIISProperty table.

**Table 20** ▪ Edit IIS Metabase Value Dialog Box Settings

Setting	Description
<b>Property Name</b>	This read-only setting shows the property that you selected to configure.
<b>Value</b>	Specify the value that you want to use for the selected IIS property.

## Edit List Options Dialog Box

The Edit List Options dialog box

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

Use the Edit List Options dialog box to define the list of options that you want to display in a combo box control or the list box control of your installation's user interface. To learn more, see [Populating Combo Box and List Box Controls in the Wizard Interface](#).

### Task

**To access the Edit List Options dialog box:**

1. In the View Bar / View List under **User Interface**, click **Wizard Interface**.
2. In the **Wizard Interface** explorer, expand the wizard page or secondary window that contains the combo box control or list box control that you want to configure.
3. In the **Content Property** setting, click the ellipsis button (...).

**Table 21** ▪ Settings on the Edit List Options Dialog Box

Setting	Description
<b>New</b>	To add a new row to the table, click this button.
<b>Delete</b>	To remove one or more selected rows, click this button.

**Table 21** ▪ Settings on the Edit List Options Dialog Box (cont.)

Setting	Description
<b>Up</b>	<p>To move one or more selected rows up, click this button.</p> <p>The installation displays the list options in the order that you list them on this dialog box.</p> <p>To select multiple consecutive rows, click the first row, press and hold Shift, and then click the last row. To select multiple non-consecutive rows, click one of the rows, press and hold down CTRL, and then click each additional row.</p>
<b>Down</b>	<p>To move one or more selected rows down, click this button.</p> <p>The installation displays the list options in the order that you list them on this dialog box.</p> <p>To select multiple consecutive rows, click the first row, press and hold Shift, and then click the last row. To select multiple non-consecutive rows, click one of the rows, press and hold down CTRL, and then click each additional row.</p>
<b>Text</b>	<p>This column contains the list of options that you want to display in the control.</p> <p>When you type a value for this column, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Value</b>	<p>Each row in this column contains a value that corresponds with a list option for the selected wizard interface control. This is the property value that is stored in the property that is specified in the Property setting for the selected control.</p>

## Edit Registry Data Dialog Box

The Edit Registry dialog box enables you to edit the registry data within your project. To launch this dialog box, right-click a value in the Registry view and click Modify.

**Table 22** ▪ Edit Registry Data Dialog Box Settings

Setting	Description
<b>Value name</b>	<p>This read-only setting shows the name of the registry value.</p> <p>To change the name of a value, close the Edit Registry Data dialog box, select the value that you want to rename, press F2, and type the new name.</p>

**Table 22** ▪ Edit Registry Data Dialog Box Settings (cont.)

Setting	Description
<b>Value data</b>	Enter the data for this registry value as you would like it to appear on the target system.
	 <p><b>Tip</b> ▪ To write the value of a Windows Installer property called <i>PropertyName</i> to the registry, use the expression “[<i>PropertyName</i>]” in the value data.</p>

## Edit Virtual Machine Configurations Dialog Box

**Edition** ▪ Support for distributing releases to virtual machines is available in the Premier edition of InstallShield.

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- Suite/Advanced UI

Use the Edit Virtual Machine Configurations dialog box to configure virtual machine (VM) settings that you want to use when distributing successfully built releases to VMs at build time or on demand.

**Tip** ▪ When you specify VM configuration settings in the Edit Virtual Machine Configurations dialog box, InstallShield writes the data that you specify to a file called `VMConfigurations.xml`. This `VMConfigurations.xml` file is a machine-wide file that you can configure once and then use it in other InstallShield projects, as well as share it with other team members. You can also use this file on your build machine. To learn more, see [Sharing Virtual Machine Settings for Distribution of Releases](#).

When you configure VM details in the subsettings under the Configuration setting on the Events tab in the Releases view, you overriding some of the machine-wide values that were entered on the Edit Virtual Machine Configurations dialog box.

### Task

**To access the Edit Virtual Machine Configurations dialog box:**

1. In the View Bar / View List under **Media**, click **Releases**.
2. In the **Releases** explorer, select the release that you want to configure.
3. Click the **Events** tab, and then find the **Virtual Machine** area.
4. In the **Configuration** setting, click the ellipsis button (...).

The Edit Virtual Machine Configurations dialog box opens. The left part of this dialog box is where you manage the list of VM configurations that you want to available for selection. To add a new configuration, click the New button. To delete an existing configuration, select it and then click the Delete button.

When you select a specific configuration in the Configurations box, you can configure its settings on the right. The settings are organized into the following main categories:

- [General](#)
- [Server](#)
- [Virtual Machine](#)

## General Settings

Use the General area to specify the name of the selected VM configuration.

**Table 23** ▪ General Settings on the Edit Virtual Machine Configurations Dialog Box

Setting	Description
<b>Name</b>	Enter a name for the group of VM configuration settings that you want to use when distributing the selected release to a VM.

## Server Settings

Use the Server area to specify details about the server that hosts the VM to which you want to distribute releases.

**Table 24** ▪ Server Settings on the Edit Virtual Machine Configurations Dialog Box

Setting	Description
<b>Server Type</b>	<p>Select the type of server that hosts the VM to which you want to distribute releases. Available options are:</p> <ul style="list-style-type: none"> <li>● Microsoft Hyper-V Server</li> <li>● VMware ESX or ESXi Server</li> <li>● VMware Workstation</li> </ul>
<b>Server Name</b>	<p>This setting is available for the following server types: Microsoft Hyper-V Server and VMware ESX or ESXi Server.</p> <p>Specify the name of the server that hosts the VM to which you want to distribute releases.</p>
<b>Authentication</b>	<p>This setting is available for the following server types: Microsoft Hyper-V Server and VMware ESX or ESXi Server.</p> <p>Select the type of authentication that you want to use to connect to the server that hosts the VM to which you want to distribute releases.</p>

**Table 24** • Server Settings on the Edit Virtual Machine Configurations Dialog Box (cont.)

Setting	Description
<b>User Name</b>	<p>This setting is available for the following server types: Microsoft Hyper-V Server and VMware ESX or ESXi Server; it is applicable to server authentication.</p> <p>Enter the user name for the account that you want to use to connect to the server that hosts the VM to which you want to distribute releases.</p>
<b>Password</b>	<p>This setting is available for the following server types: Microsoft Hyper-V Server and VMware ESX or ESXi Server; it is applicable to server authentication.</p> <p>Enter the password for the account that you want to use to connect to the server that hosts the VM to which you want to distribute releases.</p>

## Virtual Machine Settings

Use the Virtual Machine area to specify details about the server that hosts the VM to which you want to distribute releases.

**Table 25** • Virtual Machine Settings on the Edit Virtual Machine Configurations Dialog Box

Setting	Description
<b>Machine Name</b>	Specify the name of the VM to which you want to distribute releases.
<b>Snapshot</b>	<p>Optionally specify the name of the snapshot that you want to use for distributing releases. Note that you can override the snapshot for an individual release.</p> <p>If no snapshot is specified for the VM configuration, InstallShield does not revert to a specific snapshot. InstallShield powers on the VM without reverting it to a specific snapshot, and copies your installation to the VM.</p>
<b>Authentication</b>	Optionally select the type of authentication that you want to use to connect to the VM to which you want to distribute releases. Note that you can override the authentication for an individual release.
<b>User Name</b>	<p>This setting is applicable to server authentication.</p> <p>Optionally enter the user name for the account that you want to use to connect to the VM to which you want to distribute releases. Note that you can override the user name for an individual release.</p>
<b>Password</b>	<p>This setting is applicable to server authentication.</p> <p>Optionally enter the password for the account that you want to use to connect to the VM to which you want to distribute releases. Note that you can override the password for an individual release.</p>

**Table 25** • Virtual Machine Settings on the Edit Virtual Machine Configurations Dialog Box (cont.)

Setting	Description
<b>Destination Path</b>	<p>Optionally specify the path on the VM to which you want InstallShield to stage the built release. The last subfolder in the path can be a path that InstallShield creates on the VM; the other folders in the path must already exist.</p> <p>Note that you can override the destination path for an individual release.</p>

## Error Mapping Properties Dialog Box

The Error Mapping Properties dialog box displays an IIS error code and its default properties. Use the Message Type list to set the message to a URL or a pointer to a file on the server. When you set the error message to a URL, you must specify the full URL. When you set the error message to a file pointer, you can browse for the file that you want to use as the error message or you can type the full path of the file to be used. This can include files that are not in your project but are pre-existing on the system.

## Exclusion Languages Dialog Box

**Project** • This information applies to the following project types:

- Merge Module
- MSM Database

The Exclusion Languages dialog box opens when you click the ellipsis button (...) in the Language setting for a merge module exclusion in the General Information view. This dialog box lets you specify the language requirements for the merge module that is not compatible with the merge module that you are creating.

To specify language requirements for the merge module exclusion, do one of the following:

- To exclude a merge module if its language is a particular language, select the language in the language list, and then select the **matches** option.
- To exclude a merge module if its language is not a particular language, select the language in the language list, and then select the **does not match** option.
- If the language should not be used to exclude a merge module, select Language Independent in the language list.

## Export Tables Dialog Box

The Export Tables dialog box provides a way to export one or more tables through the Direct Editor as .idt files.

**Table 26** • Export Tables Dialog Box Settings

Setting	Description
<b>Output Directory</b>	Specify the directory where the tables are to be exported. You can also click Browse to navigate to the directory.
<b>Tables</b>	This box lists check boxes for all of the tables in your project. Select the check boxes of the tables that you want to export.
<b>Select All</b>	Selects all tables for export.
<b>Clear All</b>	Deselects all tables.
<b>Invert</b>	Simultaneously deselects any selected tables and selects any deselected tables.

## Feature Condition Builder Dialog Box

The Feature Condition Builder dialog box simplifies the process of creating feature conditions by providing a selection of valid Windows Installer properties and conditional expression operators.

You can create as many conditions as required for a feature. For information on creating the conditions, see [Setting Feature Conditions](#).

The Feature Condition Builder dialog box contains the following settings.

**Table 27** • Feature Condition Builder Dialog Box Settings

Setting	Description
<b>Conditions</b>	<p>This box displays a grid with the following columns:</p> <ul style="list-style-type: none"> <li>● <b>Level</b>—This column is where you assign the install level that should be used for the feature if the condition evaluates as true.</li> <li>● <b>Condition</b>—This column is where you define the condition. You can type a condition directly in this column, or you can use the Properties list, the Operators list, and the Add buttons to build a condition statement.</li> </ul> <p>To add a new condition to this box, click the New Condition button, and then enter the appropriate information in the Level and Condition columns.</p> <p>To delete a condition in this box, select the condition, and then click the Delete Conditions button.</p>  <p><b>Important</b> • When you click the OK button on this dialog box, InstallShield performs basic condition validation; however, you should still double-check that your condition statements evaluate to the expected outcome. For more information and example conditions, see <a href="#">Building Conditional Statements</a>.</p>
<b>Properties</b>	<p>This list contains common Windows Installer properties, as well as any properties that have been added in the Property Manager view. Select the property that you want to evaluate, and then click the <b>Add</b> button next to this list.</p> <p>If the list does not contain the property that you want to evaluate, you can type the appropriate property name in the Condition column.</p>
<b>Operators</b>	<p>This list contains all of the valid operators that are recognized by the Windows Installer.</p> <p>If your conditional statement should contain an operator, select the operator that you want to use and then click the <b>Add</b> button. InstallShield adds the operator to the conditional statement.</p>

## File Details Dialog Box

Access this dialog by clicking the Details button in the [System Search Wizard](#). This button becomes active after you define a search method and specify the file you are locating. In this dialog, you have the ability to enhance a search by specifying the following details:

**Table 28** • File Details Dialog Box Settings

Setting	Description
<b>Minimum Version</b>	The search is successful if the file exists on the target system and the version is equal to or higher than the version entered.
<b>Maximum Version</b>	The search is successful if the file exists on the target system and the version is equal to or lower than what is entered.
<b>Minimum Date</b>	Select the check box to search by a minimum date. The search is successful if the file exists on the target system and the date is equal to or later than the date entered.
<b>Maximum Date</b>	Select the check box to search by a maximum date. The search is successful if the file exists on the target system and the date is earlier or equal to the date entered.
<b>Minimum Size</b>	The search is successful if the file exists on the target system and is equal to or larger than the size indicated (in bytes).
<b>Maximum Size</b>	The search is successful if the file exists on the target system and is smaller than or equal to the size indicated (in bytes).
<b>Languages</b>	Click the Browse (...) button to display the Languages dialog. You can select multiple languages as a condition of your search. The search is successful if at least one of the languages listed is a match.

**Note** • The information you provide in the edit fields is optional. You can leave any field blank.

## File Properties Dialog Box

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database

- *MSM Database*
- *Transform*

The Properties dialog box lets you override various properties for a file when it is installed on the target system.

#### Task

#### To open the File Properties dialog box:

1. In the View Bar / View List under **Application Data**, click **Files and Folders**.
2. Right-click a file and click **Properties**.

**Important** ▪ *File properties cannot be set for dynamically linked files.*

**Table 29** ▪ Properties Dialog Box Settings

Setting	Description
<b>Location</b>	<p>This read-only setting displays the directory in which this file will be installed on a target system, based on the destination of the component that contains the file.</p> <p>To modify the destination, change the destination of the component that contains the file.</p>
<b>Font title</b>	<p>If you are installing a font, you can specify the font title in this box using the format <b>FontTitle (FontType)</b>—for example, <b>Roman (All res)</b>. InstallShield provides the name of the font if it is registered on your system.</p> <p>You should not specify a font title for .ttf or .ttc fonts because Windows Installer reads the embedded font name and registers it for you. Thus, for .ttf or .ttc files, InstallShield sets the value of this setting to <b>[Title read from file]</b>.</p> <p>For more information, see <a href="#">ICE07</a> in the Windows Installer Help Library.</p>
<b>Self Register</b>	<p>To self-register the file during installation, select this check box. The Self Register setting is valid for .dll, .ocx, .exe, .tlb, and .olb files.</p> <p>If the file is part of a 64-bit component, the installation performs 64-bit self-registration on the target system. For more information, see <a href="#">Targeting 64-Bit Operating Systems</a>.</p>
	<p><b>Note</b> ▪ <i>It is recommended that you extract COM information from your self-registering files, instead of using self-registration. For more information, see <a href="#">Registering COM Servers</a>.</i></p>

**Table 29** ▪ Properties Dialog Box Settings (cont.)

Setting	Description
<b>Override system attributes</b>	<p>To install this file using the same system properties that are currently set for this file on the development system, clear this check box.</p> <p>To override one or more of the file's properties, select the <b>Override system attributes</b> check box and then select one or more of the following check boxes.</p> <ul style="list-style-type: none"> <li>● <b>Read-only</b>—If you want the file to be read-only when Windows Installer installs it, select this check box.</li> <li>● <b>Hidden</b>—If you want the file to be hidden when Windows Installer installs it, select this check box.</li> <li>● <b>Use File Hash</b>—This option is applicable for unversioned files only. Windows Installer can use file hashing to detect and avoid unnecessary copying of unversioned files. If you want Windows Installer to compare the hash of the file in your installation with the hash of the corresponding file on the target system when deciding whether to upgrade an existing file, select this check box.</li> <li>● <b>System</b>—If you want Windows Installer to install the file as a system file, select this check box.</li> <li>● <b>Vital</b>—To indicate that this file is vital to the operation of its component, select this check box. A vital file's component is not installed if the file cannot be installed for any reason. If a vital file cannot be installed, the end user sees an error message with Retry and Cancel buttons, instead of the usual Abort, Retry, and Ignore buttons (which enable the end user to complete the installation successfully without installing that file).</li> </ul> <p></p> <p><b>Note</b> ▪ If No is selected for the Generate File Hash Values setting on the Build tab for a release in the Releases view, no file hash entries are created for any files, regardless of whether an individual file's Use File Hash check box is selected.</p>
<b>Override system size</b>	<p>The Size setting shows the file's size when the <b>Override system size</b> setting is cleared.</p> <p>If you want Windows Installer to ignore the actual size of the selected file when it is calculating the required disk space requirements for your installation, and instead consider the size to be a value that you specify, select this check box and enter the appropriate value (in bytes) in the Size setting.</p>

**Table 29** • Properties Dialog Box Settings (cont.)

Setting	Description
<b>Always Overwrite</b>	<p>If you want Windows Installer to ignore the actual version number of the selected file, and instead always try to overwrite the file if it is already present on the target system, select this check box. At run time, if this file has the same name and target location as one on the target system, Windows Installer considers the version of the file in your installation to be 65535.0.0.0 when it is determining whether to update the target system's file with the version in your current installation, or to leave the file as is.</p> <p>For more details about how Windows Installer determines whether to overwrite an existing file, see <a href="#">Overwriting Files and Components on the Target System</a>.</p> <p>The maximum version number for a file is 65535.65535.65535.65535.</p>
<b>Override system version</b>	<p>If the file is a versioned file, the Version setting shows the file's version when the <b>Override system version</b> setting is cleared.</p> <p>If you want Windows Installer to ignore the actual version number of the selected file, and instead consider the version to be a number that you specify, select this check box and enter the appropriate version number in the Version setting. At run time, if this file has the same name and target location as one on the target system, Windows Installer uses the version number that you specify when it is determining whether to update the target system's file with the version in your current installation, or to leave the file as is.</p> <p>For example, if the file in your project is version 2.0.0.0, and you enter an override version of 3.0.0.0, Windows Installer may replace the file on the target system if it is version 3.0.0.1 or later, but not if it is earlier than 3.0.0.0.</p> <p>For more details about how Windows Installer determines whether to overwrite an existing file, see <a href="#">Overwriting Files and Components on the Target System</a>.</p> <p>The maximum version number for a file is 65535.65535.65535.65535.</p>
<b>Override system language</b>	<p>If you want Windows Installer to ignore the language of the selected file and instead consider the language to be one that you specify, select this check box and type the decimal value for the <a href="#">language identifier code</a> in the Language box. At run time, if this file has the same name and target location as one on the target system, Windows Installer considers the language of the file in your installation to be the one that you specified when it is determining whether to update the file with the version in your current installation, or to leave the file as is.</p> <p>For more details about how Windows Installer determines whether to overwrite an existing file, see <a href="#">Overwriting Files and Components on the Target System</a>.</p> <p>Font files should not be authored with a language ID because fonts do not have an embedded language ID resource. Leave this entry blank for font files.</p>
<b>Permissions</b>	To set permissions for the file, click this button.

# File Properties Dialog Box (InstallScript Installation Projects)

**Project** • This information applies to the following project types:

- *InstallScript*
- *InstallScript Object*

This dialog box displays the properties that are set for a file when it is installed on the target system.

## Task

### To open the File Properties dialog box:

Right-click a file and click **Properties**. This option is disabled for files in components whose Link Type property is set to **Dynamic**.

In InstallScript projects, the File Properties dialog box displays information about the selected file. The information in the dialog box is taken directly from the file system and the dialog box is read only except for the following controls:

### Register Font File

If this box is checked, the file is marked internally to be registered on the target machine if you have enabled global font registration. If this box is unchecked, the file is not registered on the target machine.

### Font title

For an .fon file, this text specifies the font title that the installation registers for the font. By default, the InstallShield user interface reads the font title from the registry of the source system and enters that font title in this edit box. For a TrueType file (.ttf or .ttc file), by default no text is displayed in this edit box and the installation reads the font title from the file at run time. For all three types of files, if you enter non-default text in this edit box, the installation registers that text as the font title.

# File Removal Properties Dialog Box

**Project** • This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The file removal Properties dialog box indicates information about a selected file or folder that you want to be removed from target systems. This file and folder removal capability is useful for scenarios such as removing application-created files that your installation does not otherwise track.

You can access the file removal Properties dialog box from within the Files and Folders view, or within the Setup Design view (for installation projects) or the Components view.

#### Task

**To access the file removal Properties dialog box from within the Files and Folders view:**

1. In the View Bar / View List under **Application Data**, click **Files and Folders**.
2. In the **Destination computer's folders** pane, click the folder that contains the file removal item that you want to configure.
3. In the **Designation computer's files** pane, right-click the file removal item that you want to configure, and then click **Properties**.

InstallShield uses an icon that has a red X through it for identifying files and folders that are configured to be removed.

#### Task

**To access the file removal Properties dialog box from within the Setup Design view (for installation projects) or the Components view:**

1. In the View List under **Organization**, click **Setup Design** (in Basic MSI, InstallScript MSI, or MSI Database projects only) or **Components**.
2. In the explorer, expand the component that contains the file removal item that you want to configure, and then click its **Files** node. In **Files** pane on the right, InstallShield displays the files and removal items that are associated with the selected component.
3. In the **Files** pane, right-click the file removal item that you want to configure, and then click **Properties**.

InstallShield uses an icon that has a red X through it for identifying files and folders that are configured to be removed.

To learn how to add file and folder removal items to your project, see [Removing Files and Folders from Target Systems](#).

**Table 30** ■ Settings in the Properties Dialog Box

Setting	Description
<b>Location</b>	This setting indicates the location of the selected item that is configured to be removed.
<b>Remove the folder if it is empty</b>	If the selected removal item is a folder that you want to be removed from target systems when it is empty, select this option.
<b>Remove files from the folder</b>	If the selected removal item is a file in the folder that is identified in the Location setting and that you want to be removed from target systems, select this option.

**Table 30** ▪ Settings in the Properties Dialog Box (cont.)

Setting	Description
<b>File Name</b>	<p>This setting is available if you select the <b>Remove files from the folder</b> option.</p> <p>Enter the name of the file that you want to be removed.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Removal Scheduling</b>	<p>Specify when you want the selected file or folder to be removed from target systems. Removals occur when the file or folder's associated component is processed in one of the following ways:</p> <ul style="list-style-type: none"> <li>• <b>Component installation</b>—The selected item is removed if its component is being installed and if—for folder removal items—the folder is empty.</li> <li>• <b>Component uninstallation</b>—The selected item is removed if its component is being uninstalled and if—for folder removal items—the folder is empty.</li> <li>• <b>Component installation and uninstallation</b>—The selected item is removed if its component is being installed or uninstalled and if—for folder removal items—the folder is empty.</li> </ul>

## Find and Replace Dialog Box

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

The Find and Replace dialog box lets you search for strings in your SQL script file and replace them with different strings at run time. The Find and Replace dialog box opens when you click the Add button on the Text Replacement tab for a SQL script that is selected in the SQL Scripts view.

In Basic MSI, DIM, and InstallScript MSI projects, you can replace a string with a Windows Installer property; at run time, Windows Installer writes the value of the property in your SQL script file.

In InstallScript projects, you can use text substitution to replace a string variable with the appropriate value.

**Caution** ▪ You should only replace text that is unique and will not cause script syntax errors.

The following settings are available on the Find and Replace dialog box.

**Table 31** • Find and Replace Dialog Box Settings

Setting	Description
<b>Find What</b>	<p>Enter the string that you want to replace in your SQL script at run time.</p>  <p><b>Project</b> ▪ In Basic MSI, DIM, and InstallScript MSI projects—You can use Windows Installer public properties to specify the replacement strings. To learn more, see <a href="#">Using Windows Installer Properties to Dynamically Replace Strings in SQL Scripts</a>.</p> <p>In InstallScript projects—You can use InstallScript text substitution to specify the replacement strings. To learn more, see <a href="#">Using InstallScript Text Substitution to Dynamically Replace Strings in SQL Scripts</a>.</p> <p>Specifying Windows Installer properties or InstallScript text substitution enables you to use data that end users enter in dialogs, or other configuration information that is determined at run time, when your product's SQL script is modified.</p>
<b>Replace With</b>	<p>Enter the new string that should replace the existing string that is found in your SQL script at run time.</p>  <p><b>Project</b> ▪ In Basic MSI, DIM, and InstallScript MSI projects—You can use Windows Installer public properties to specify the replacement strings. To learn more, see <a href="#">Using Windows Installer Properties to Dynamically Replace Strings in SQL Scripts</a>.</p> <p>In InstallScript projects—You can use InstallScript text substitution to specify the replacement strings. To learn more, see <a href="#">Using InstallScript Text Substitution to Dynamically Replace Strings in SQL Scripts</a>.</p> <p>Specifying Windows Installer properties or InstallScript text substitution enables you to use data that end users enter in dialogs, or other configuration information that is determined at run time, when your product's SQL script is modified.</p>
<b>Match case</b>	<p>This check box lets you indicate whether you want to restrict your search to strings with the same capitalization that you use in the Find What setting.</p> <p>For example, if you select this check box and enter <code>install</code> for the Find What setting, the installation searches only for all-lowercase instances of that string. If you clear this check box, the installation searches for <code>install</code>, as well as <code>INSTALL</code>, <code>Install</code>, and other mixed-case instances.</p>

**Table 31** • Find and Replace Dialog Box Settings (cont.)

Setting	Description
<b>Match whole word only</b>	<p>This check box lets you indicate whether you want to find only whole-word instances of the value that you have entered for the Find What setting.</p> <p>For example, if you select this check box and enter <b>install</b> for the Find What setting, the installation searches only for instances of <i>install</i>; it does not search for other forms of the word, such as <i>installs</i>, <i>installation</i>, or <i>uninstall</i>.</p> <p>For another example, you may have something like the following line in your SQL script:</p> <pre>PASSWORD = N'%PASSWORD%'</pre> <p>If you select this check box, enter <b>%PASSWORD%</b> in the Find What setting, and enter <b>1234</b> in the Replace With setting, the installation replaces the string. The resulting SQL script shows the following:</p> <pre>PASSWORD = N'1234'</pre>
<b>Preserve case</b>	<p>This check box lets you indicate whether you want the replacement string to use the same capitalization that is used in the Find What string.</p> <p>For example, if you select this check box and enter <b>basedir</b> for the Find What setting and <b>mybasedir</b> for the Replace With setting, the installation replaces <i>basedir</i> with <i>mybasedir</i>. It also replaces <i>basedir</i> with <i>mybasedir</i>.</p>
<b>Replace once only</b>	<p>This check box lets you indicate whether you want the installation to replace only the first occurrence of the search string.</p> <p>If you clear this check box, the installation replaces all instances of the search string.</p>

## Find String ID in Project Dialog Box

The Find String ID dialog box lets you search your entire project for occurrences of a particular string entry. Select from the list the string entry you would like to find and click OK. The results of your search are displayed in the Output window at the bottom of the screen.

## Folder Properties Dialog Box

A folder's Properties dialog box determines the properties that are set for a folder when it is installed on the target system. To access this dialog box, right-click a folder in the Files and Folders view, and then click Properties.

The Properties dialog box is organized into the following tabs:

- **General**
- **Sharing**

## General Tab

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database
- Transform

The General tab on a folder's Properties dialog box lets you configure basic properties about a folder.

**Table 32** ▪ General Tab Settings

Setting	Description
<b>Directory Identifier</b>	This setting identifies the current directory identifier for the selected folder.
<b>Source Location</b>	This setting identifies from where files will be copied to the disk image folders when you build an uncompressed release.
<b>Target</b>	This setting identifies the location to which the folder will be installed on target systems.

The Permissions button lets you configure permissions for the folder. To learn more, see [Permissions Dialog Boxes for Files and Directories](#).

## Sharing Tab

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

The General tab on a folder's Properties dialog box lets you configure basic properties about a folder.

**Table 33** ▪ General Tab Settings

Setting	Description
<b>Share this folder on the network</b>	To share this folder on the network, select this check box.
<b>Share name</b>	If you are enabling sharing for this folder, specify the name that users need to use to connect to the shared folder.
<b>Limit the number of simultaneous users to</b>	<p>If you are enabling sharing for this folder, specify the maximum number of users who can connect to the shared folder at one time.</p>  <p><b>Note</b> ▪ Windows imposes limits for the maximum number of simultaneous users. These limits vary, depending on the version and edition of Windows. An installation cannot override this Windows-imposed limit. Thus, if you specify a larger number than a target system can support, the installation sets the limit at the maximum that is allowed by that target system's operating system.</p> <p>To determine the limit for a specific version and edition of Windows, use the following command-line statement on that version and edition of Windows:</p> <pre>Net Config Server</pre> <p>The Maximum Logged On Users value that the Command Prompt window displays indicates the maximum that the operating system supports.</p> <p>You can also find the maximum number in the "Device Connections" section of a Windows end-user license agreement.</p>
<b>Allow network users to change my files</b>	If you are enabling sharing for this folder and you want to allow network users to change the files in this folder, select this check box.
<b>Component</b>	Select the component in this folder that should include this network share.

## Function Signature Dialog Box

The Function Signature dialog box is where you specify the parameters for the entry-point function in your standard .dll file.

**Task****To access the Function Signature dialog box:**

1. In the View Bar / View List under **Behavior and Logic**, click **Custom Actions and Sequences** (in Basic MSI, InstallScript MSI, MSI Database, and Transform projects) or **Custom Actions** (in DIM, Merge Module, and MSM Database projects).
2. In the **Custom Actions** explorer, select the custom action whose parameters you would like to specify.
3. In the Function Signature property, click the ellipsis button (...).

## Dialog Box Options

### Name

Specify the name of the function that you want to call. The .dll file can have a single entry point for each custom action.

### Arguments

Build the list of arguments—in order—that you want to pass to the function.

First, click the last row of the Arguments list to add a new argument. Next, complete the Type, Source, and Value columns for each argument.

### Type

In this list, select the data type of the parameter. Note that there are two special cases for argument types, and these cases are identified below.

**Task****To initialize a pointer to null:**

1. In the Type list, select **POINTER**.
2. In the **Source** list, select **Constant**.
3. In the **Value** list, select **NULL**. Do not enter 0 (zero) instead of **NULL**, because it is interpreted as a pointer pointing to the number 0.

**Task****To set a handle to the .msi database or the Windows Installer window:**

1. In the **Type** list, select **HANDLE**.
2. In the **Source** list, select **Constant**.
3. In the **Value** list, select **MsiHandle** or **MsiWindowHandle**, depending whether you want a handle to the .msi database or the Windows Installer window.

## Source

Indicate how you want to pass the data to the function. The following options are available in this list.

**Table 34** • Function Signature Dialog Box Options

Option	Description
<b>Constant</b>	<p>The value that you want to pass is stored as a literal in your installation project. After you select <b>Constant</b> for the argument's source, enter its definition in the Value column.</p> <p>This constant does not require a name or identifier. Do not enclose string literals in quotation marks.</p>
<b>in Property</b>	Select <b>in Property</b> for the source to specify the name of a Windows Installer property whose value will be passed to the function. This type of argument is suitable for a ByVal parameter.
<b>inout Property</b>	This source type is similar to a ByRef parameter. Select <b>inout Property</b> for the source to specify the name of a Windows Installer property whose value will be passed to the function and can be modified by the function.
<b>out Property</b>	An <b>out property</b> serves as a placeholder for a value that can be set by the function. No value is passed to the function, but the function requires the name of a property whose value it can modify.

When you select a property for the argument's source, you must specify the name of the property in the Value column.

## Value

The value can be one of two types:

- A number or string literal that you enter when the argument's source is a constant
- A Windows Installer property when the argument's source is a property

**Note** • When you set the Type list to **HANDLE** and the Source list to **Constant**, the Value column contains two options: **MsiHandle** and **MsiWindowHandle**. These constants can be used to get a handle to either the .msi database or the Windows Installer window.

When the source is a property, the Value list provides the name of every property in the Property Manager. You can select an existing property or enter a new name, in which case the new property is added to the Property Manager.

Remember that a property is merely a container for a value. If your parameter stores its value in an in property or inout property, ensure that you specify a value for the property in the Property Manager.

### (Context Menu)

The context menu provides you with options for working with your arguments. To access the context menu, right-click an argument in the Arguments grid. The context menu options are described below.

**Table 35** ▪ Context Menu Options

Option	Description
<b>Add</b>	Click Add to add an argument to the Arguments grid.
<b>Remove</b>	Click Remove to delete the argument.
<b>Move Up</b>	The arguments must be in the precise order in which the function expects to receive them. Click Move Up to place the argument higher in the list.
<b>Move Down</b>	Click Move Down to place the argument lower in the list.

### Return Type

Select the data type of the function's return value. If you do not need to check the return value, you can accept void.

### Return Property

Select the name of a property whose value will be set to the function's return value. If you are going to check the return value elsewhere in your installation, you may want to initialize the return property's value.

**Note** ▪ The property cannot be set to the function's return value unless the action is configured for immediate execution. Thus, if the action is scheduled for deferred, rollback, or commit execution, the Return Property setting is ignored at run time.

## General Options - Advanced Dialog Box

The General Options - Advanced dialog box opens when you click the Advanced button on the General Options panel of the Release Wizard. This dialog box allows you to specify a custom location for the built files, (in installation projects only) the space that is reserved in the disk images folders, whether the installation performs MD5 checking, and (in object projects only) how InstallShield handles subobjects contained in the object project during the build of the object.

### Panel Options

#### Build the media to the custom folder location

If unchecked, the release's Disk Images, Log Files, and Report Files folders are created in the default location:

<project folder>\Media\<release name>

Check this box to specify another location by typing in the combo box, selecting and completing one of the list items, which are defined relative to path variables, or clicking the browse button and selecting a folder.

## Reserved Space

**Project** ▪ This option is available in installation projects. If you are building an object project, this setting is not displayed.

Disabled if the current release's media type produces a single disk image—which is true for Network Image. Lets you reserve (leave empty) specified amounts of space in particular disk image folders. Select a disk image folder number in the Disk list box (for example, a value of 1 specifies disk image folder Disk1) and enter the space (in kilobytes) to be reserved in that folder in the Reserved Space edit box.

## Verify MD5 signature

**Project** ▪ This option is available in installation projects. If you are building an object project, this setting is not displayed.

If this check box is checked, the setup compares each installed file's MD5 hash value to the value stored in the .cab file. This setting is stored in the CheckMD5 key of the [Startup] section in the Setup.ini file.

**Tip** ▪ MD5 checking can detect corrupted files, which is useful during Internet setups; not doing MD5 checking can make file transfer proceed faster.

## Object Inclusion - Embedded

**Project** ▪ This option is available in object projects.

If the object project includes any subobjects, the release includes those subobjects themselves rather than references to the subobjects. A release built with this option can be used by InstallShield users who do not have the subobjects registered on their systems.

## Object Inclusion - Reference

**Project** ▪ This option is available in object projects.

If the object project includes any subobjects, the release includes references to those subobjects rather than the subobjects themselves. A release built with this option cannot be used by InstallShield users who do not have the subobjects registered on their systems.

# General Options - Other Disk Files Dialog Box

The **General Options - Other Disk Files** dialog box opens when you click the Other Disk Files button on the General Options panel of the Release Wizard. This dialog box allows you to specify a location in the disk image folders for each file that is in the Other folder under Advanced Files in the Support Files/Billboards view.

## Panel Options

### File name

Select the file for which you want to specify a disk image folder number.

### Disk

Select the desired disk image folder for the selected file (for example, selecting 3 places the selected file in disk image folder Disk3).

## History Dialog Box

The History dialog is displayed when you select **Show History from the Project/Source Control** menu. The dialog contains a drop-down list box that contains all of the Windows Installer tables in your setup project.

### Task

**To display view the table's history in your source control program:**

Select a table from the list and click **OK**.

## Import Dialog Dialog Box

The Import Dialog dialog box lets you select a dialog that you want to import into your installation project. The file for the dialog (.isd file) can be stored in a repository, or it can be stored in some other location.

### Task

**To access the Import Dialog dialog box:**

1. Open the **Dialogs** view.
2. In the Dialogs explorer, right-click **All Dialogs** and then click **Import Dialog**. The **Import Dialog** dialog box opens.

## Dialog Box Options

### Repository Items

This box lists all of the dialogs that are available in the repository. Select the dialog that you want to add to your project.

If the file for the dialog box (.isd file) that you want to import is not stored in the repository, click the Browse button to select it.

## Import InstallScript Files Dialog Box

The Import InstallScript Files dialog box lets you select one or more InstallScript (.rul) or InstallScript header (.h) files that you want to import into your installation project. The files can be stored in a repository, or they can be stored in some other location.

**Task**

**To access the Import InstallScript Files dialog box:**

1. Open the **InstallScript** view.
2. In the InstallScript explorer, right-click **Files** and then click **Import Script File**. The **Import InstallScript Files** dialog box opens.

## Dialog Box Options

### Repository Items

This box lists all of the InstallScript files that are available in the repository. Select one or more InstallScript files that you want to add to your project.

If the InstallScript file that you want to import is not stored in the repository, click the Browse button to select it.

## Import SQL Script Files Dialog Box

The Import SQL Script Files dialog box lets you select one or more SQL script files that you want to import into your installation project. The SQL script (.sql) file can be stored in a repository, or it can be stored in some other location.

**Task**

**To access the Import SQL Script Files dialog box:**

1. Open the **SQL Scripts** view.
2. In the SQL Scripts explorer, right-click Files and then click **Import Script File**. The **Import SQL Script Files** dialog box opens.

## Dialog Box Options

### Repository Items

This box lists all of the SQL script files that are available in the repository. Select one or more SQL script files that you want to add to your project.

If the SQL script file that you want to import is not stored in the repository, click the Browse button to select it.

## Insert Action Dialog Box

**Project** • The Insert Action dialog box is available in the following project types:

- Basic MSI
- InstallScript MSI
- MSI Database
- Transform

The Insert Action dialog box enables you to insert a standard action, custom action, or dialog into one of your project's sequences.

---

**Task****To launch the Insert Action dialog box:**

1. In the View Bar / View List under **Behavior and Logic**, click **Custom Actions and Sequences**.
2. Right-click a sequence, dialog, custom action, or standard action, and then click **Insert**.

---

**Tip** ▪ You can also launch this dialog box from the DIM References view in a Basic MSI project: In this view, click a DIM reference, and then click the Sequences tab. Right-click a sequence, dialog, custom action, or standard action, and then click Insert.

## Dialog Options

**Table 36** ▪ Insert Action Dialog Box Options

Option	Description
<b>Action Type</b>	<p>Select the type of action to insert:</p> <ul style="list-style-type: none"> <li>● <b>Custom Actions</b>—You can create custom actions with the Custom Action Wizard.</li> <li>● <b>Dialogs</b>—You can insert dialogs into the User Interface sequence. To create custom dialogs, use the Dialogs view.</li> <li>● <b>DIM Custom Actions</b>—These custom actions are stored within one or more DIM references that you have added to your installation project. The GUID for that DIM is appended to the name of the custom action. For example, if you have a LaunchUtility action called LaunchUtility stored within a DIM, it appears as LaunchNotepad.xxxxxxxx_xxxx_xxxx_xxxx_xxxxxxxx, where x is the GUID for that DIM.</li> <li>● <b>DIM Dialogs</b>—These dialogs are stored within one or more DIM references that you have added to your installation project. The GUID for that DIM is appended to the name of the dialog. For example, if you have a dialog called CustomerInfo stored within a DIM, it appears as CustomerInfo.xxxxxxxx_xxxx_xxxx_xxxx_xxxxxxxx, where x is the GUID for that DIM.</li> <li>● <b>Merge Module Custom Actions</b>—These custom actions are stored within one or more merge modules that you have associated with your installation project. The GUID for that merge module is appended to the name of the custom action. For example, if you have a custom action called LaunchNotepad stored within a merge module, it appears as LaunchNotepad.xxxxxxxx_xxxx_xxxx_xxxx_xxxxxxxx, where x is the GUID for that module.</li> <li>● <b>Merge Module Dialogs</b>—These dialogs are stored within one or more merge modules that you have associated with your installation project. The GUID for that merge module is appended to the name of the dialog. For example, if you have a dialog called CustomerInfo stored within a merge module, it appears as CustomerInfo.xxxxxxxx_xxxx_xxxx_xxxx_xxxxxxxx, where x is the GUID for that module.</li> <li>● <b>Standard Actions</b>—These actions are built into Windows Installer.</li> </ul> <p></p> <p><b>Note</b> ▪ When you delete a merge module from your project that contains custom actions or dialogs inserted within one of your sequences, InstallShield removes those actions and dialogs automatically from the sequence. The same is true for DIM references.</p>
<b>Select an Action</b>	<p>After you have selected the action type, you need to select the specific action. To do this, highlight the action you want to insert.</p>

**Table 36** • Insert Action Dialog Box Options (cont.)

Option	Description
<b>Condition</b>	You can set a condition upon this action. If the condition does not evaluate to true, the action does not execute. For more information on conditions, see <a href="#">Conditional Statement Syntax</a> .
<b>Comments</b>	Enter comments in this field. These comments are for internal use only and are not displayed to the end user.

## InstallShield Prerequisite Properties Dialog Box

The InstallShield Prerequisites Properties dialog box opens when you right-click a selected InstallShield prerequisite in the Redistributables view or in the Prerequisites view and then click Properties. This dialog box enables you to specify a location for the selected InstallShield prerequisite. To learn more, see [Specifying the Run-Time Location for InstallShield Prerequisites at the Release Level](#).

**Project** • In Basic MSI and InstallScript MSI projects, the InstallShield Prerequisite Properties dialog box also enables you to set release flags for InstallShield prerequisites that you want to exclude from certain builds. For example, if you have an InstallShield prerequisite that should be included only in a special edition of your product

that contains a special add-on that requires the prerequisite, you can flag that prerequisite and include it only when it is needed.

**Table 37** ▪ InstallShield Prerequisite Dialog Box Settings

Setting	Description
<b>Build Location</b>	<p>When you package an installation that includes InstallShield prerequisites, you can use any one several methods for supplying the prerequisite files to end users:</p> <ul style="list-style-type: none"> <li> <b>Download From The Web</b>—Download the InstallShield prerequisite files (if necessary) from the URL that is specified for this InstallShield prerequisite .           <p>This option is recommended if your installation will be downloaded from the Internet and you want to minimize the package size and download time. An InstallShield prerequisite will not be downloaded if the correct version is already present on the target machine.</p> <p>This option is available for Basic MSI, InstallScript, and InstallScript MSI projects.</p> </li> <li> <b>Extract From Setup.exe</b>—Compress the InstallShield prerequisite files into Setup.exe, to be extracted at run time, if necessary.           <p>Select this option if the entire installation must be self-contained in Setup.exe. Note that the Download From The Web option results in smaller installations and shorter download time; however, the Extract From Setup.exe option provides for a completely self-contained installation.</p> <p>This option is available for Basic MSI and InstallScript MSI projects.</p> </li> <li> <b>Copy From Source Media</b>—Store the InstallShield prerequisite files on the source media.           <p>Use this option if the installation will be run uncompressed from fixed media—CD, DVD, or local network.</p> <p>This option is available for Basic MSI and InstallScript MSI projects.</p> </li> <li> <b>Include with Media</b>—Store the InstallShield prerequisite files on the source media.           <p>This option is available for InstallScript projects.</p> </li> </ul> <p>Note that the option that you select in the Build Location setting may be overridden in the Releases view. For more information, see <a href="#">Specifying the Run-Time Location for InstallShield Prerequisites at the Release Level</a>.</p> <div>  <p><b>Note</b> ▪ Note that if an InstallShield prerequisite is added to a project as a dependency of another prerequisite, the location for the prerequisite dependency follows the location setting of the prerequisite that requires it.</p> </div>

**Table 37** ▪ InstallShield Prerequisite Dialog Box Settings (cont.)

Setting	Description
<b>Release Flags</b>	 <p><b>Project</b> ▪ This setting is available in Basic MSI and InstallScript MSI projects.</p> <p>Type a string. The string can be any combination of letters or numbers. To have more than one flag on an InstallShield prerequisite, use a comma to separate the flags</p>

## Languages Dialog Box

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

The Languages dialog box opens when you click the ellipsis button (...) for the Languages setting in the Components view. This dialog box enables you to specify the languages for which the component is intended, for use in build-time filtering. By default, components are language independent, meaning that none of the component's data (such as files and registry entries) are specific to a particular language.

To designate that the component is intended for only certain languages, select the check boxes for the appropriate languages.

**Project** ▪ In InstallScript and InstallScript Object projects, if a language is not selected in the General Information view of a project, it is not listed as one of the available languages for the project's components.

## Link Type Dialog Box

**Project** ▪ This information applies to the following project types:

- InstallScript
- InstallScript Object

The Link Type dialog box opens when you click the browse button in the Link Type setting in the Components and Setup Design views. It also opens when you right-click a component in the **Destination computer's folders** pane in the Files and Folders view and then click File Linking.

The Link Type dialog box lets you specify whether the file links of the selected component are static or dynamic and, if the latter, how the links are determined at the time of the media build.

## Dialog Box Settings

### Static Links

The component contains file links to files specified by explicit fully qualified file names.

### Dynamic Links

The component contains file links to files whose names can be specified by wild cards (for example, \*.\* or \*.exe) and whose folder can be specified by an explicit path or by a build variable.

---

**Note** ▪ The following settings are enabled only if the Dynamic Links option is selected.

### Specify the folder which contains the files to include

This setting specifies the folder that contains the linked files. Type an explicit path, select or type a build variable, or select and optionally append to a predefined path variable.

---

**Caution** ▪ Entering a relative path (for example, .\MyFolder) will give unpredictable results.

### Browse

Clicking this button opens the Browse for Folder dialog box, in which you can specify an explicit path.

### Include subfolders

If you select this check box, InstallShield dynamically links the files that are included in any subfolders of the folder that you identified for the **Specify the folder which contains the files to include** setting.

---

**Tip** ▪ The InstallScript engine does not support the concept of subcomponents. When you include subfolders in a dynamic file link, InstallShield creates separate components for each subfolder.

### Wildcard(s)

The file list is constructed by first including all files that match the specification you enter in the Inclusion combo box, and then excluding from those files all the ones that match the specification you enter in the Exclusion combo box.

### Inclusion

Specify the names of the files to which the component contains file links. By typing an entry or selecting a path variable, you can enter the name of a single file or use wild cards in this filename specification, for example \*.\* or \*.exe. To specify multiple wild cards, separate them with semicolons and no spaces, for example,

\*.txt;\*.doc

## Exclusion

Specify the names of the files to which the component does not contain file links. By typing an entry or selecting a path variable, you can enter the name of a single file or use wild cards in this filename specification, for example \*.\* or \*.exe. To specify multiple wild cards, separate them with semicolons and no spaces, for example,

\*.exe;\*.dll

In the above example, no .exe or DLL files are included in the component.

# Logging Options for Windows Installer 4.0 and Later Dialog Box

InstallShield displays the Logging Options for Windows Installer 4.0 and Later dialog box when you click the ellipsis button (...) for the Create MSI Logs setting in the General Information view. This dialog box enables you to specify on a project-wide basis—without having to use the command line or configure log parameters through the registry—whether Windows Installer should log your installation. You can also use this dialog box to customize the types of messages that are logged.

**Table 38** • Options for the Logging Options for Windows Installer 4.0 and Later Dialog Box

Option	Description
<b>No</b>	Installations are not logged. This is the default value.
<b>Yes (MsiLogging set to default value of voicewarmup)</b>	<p>InstallShield populates the MsiLogging property with the default value of <b>voicewarmup</b>.</p> <p>If the installation is run on a target system that has Windows Installer 4.0 or later, as well as Windows Vista or later or Windows Server 2008 or later, the following occurs:</p> <ul style="list-style-type: none"> <li>• The installer creates a log file according to the default logging mode of voicewarmup.</li> <li>• The installer populates the MsiLogFileLocation property with the log file's path.</li> <li>• A <b>Show the Windows Installer log</b> check box is added to the SetupCompleteSuccess, SetupCompleteError, and SetupInterrupted dialogs. If the end user selects that check box and then clicks Finish, the log file is opened in a text file viewer or editor.</li> </ul> <p>This setting applies to installations that are run with Windows Installer 4.0 or later on Windows Vista and later systems or Windows Server 2008 and later systems. The <b>Show the Windows Installer log</b> check box is not visible in run-time dialogs that are displayed on earlier systems that are running earlier versions of Windows Installer.</p>

**Table 38** • Options for the Logging Options for Windows Installer 4.0 and Later Dialog Box (cont.)

Option	Description
<b>Custom MsiLogging value</b>	<p>InstallShield populates the MsiLogging property with the value that you specify in the box.</p> <p>If the installation is run on a target system that has Windows Installer 4.0 or later, as well as Windows Vista or later or Windows Server 2008 or later, the following occurs:</p> <ul style="list-style-type: none"> <li>• The installer creates a log file according to the custom value that you specified in the box.</li> <li>• The installer populates the MsiLogFileLocation property with the log file's path.</li> <li>• A <b>Show the Windows Installer log</b> check box is added to the SetupCompleteSuccess, SetupCompleteError, and SetupInterrupted dialogs. If the end user selects that check box and then clicks Finish, the log file is opened in a text file viewer or editor.</li> </ul> <p>This setting applies to installations that are run with Windows Installer 4.0 or later on Windows Vista and later systems and Windows Server 2008 or later systems. The <b>Show the Windows Installer log</b> check box is not visible in run-time dialogs that are displayed on earlier systems that are running earlier versions of Windows Installer.</p>

**Important** • The MsiLogFileLocation property is read-only; it cannot be used to set or change the log file location.

## Lowercase Component Directory Warning

This dialog appears when you declare a Directory Identifier in lowercase or in mixed-case letters when setting a component's destination.

Declaring a Directory Identifier in uppercase letters makes that value a public property that can be set from the user interface. Using mixed-case or lowercase letters for the Directory Identifier defines the directory entry as a private property. Private properties cannot be changed from the user interface.

**Note** • To suppress this warning, select the **Do not show this dialog again** option.

## Media File Properties Dialog Box

Opens when you click the Import or Modify button in the Release Wizard's Update panel. Lets you specify a release that is not in the current project and the method for determining its version information.

### Media Header File

Type, or select and complete, the fully qualified name of the desired release's header file (such files have extension .hdr and are typically named Data1.hdr), or click the browse button to browse for the header file.

### Read the version information ...

Specifies that the version information is automatically read from the release's header file.

### Specify the version information below

Specifies that the version information is what you type or select in the combo box.

## Merge Module Configurable Values Dialog Box

A configurable redistributable is a merge module or an object that has at least one row in the `ModuleConfiguration` table that is referenced by at least one row in the **ModuleSubstitution** table. This allows you to change a value in the redistributable.

### Displaying the Merge Modules Configurable Values Dialog Box

The Merge Module Configurable Values dialog box opens when you select a configurable merge module or object whose check box is selected in the Redistributables view. If the redistributable selected is an object, the Merge Module Configurable Values dialog box is displayed when the object wizard finishes.

You can also right-click a configurable merge module or object and select **Configure Merge Module**.

### Dialog Box Settings

The Merge Module Configurable Values dialog box contains a grid in which you can modify the configurable values. The left column contains the name of the configurable value. The right column contains the value options. You can select a new value from the drop-down menu. Refer to the redistributable vendor's documentation for information about the values.

After you specify the values that you want, click **OK** to save the new values. When you build your project, these values are used to build the .msi package.

### Restore Defaults

Click this button to restore the redistributable's default settings. All of the configurable values in the redistributable are returned to their defaults.

## Merge Module Properties Dialog Box

The Merge Module Properties dialog opens when you right-click a selected merge module or object in the Redistributables view and then click **Properties**. The following tabs are associated with this dialog box:

- **Media**
- **Destination**
- **Configurable Values**

## Media Tab

### File Location

Use the Media tab to specify the destination and format of your output.

#### On the source media (uncompressed)

Choose this option to copy the files uncompressed to the media.

#### In a new .CAB file

When you choose this option, InstallShield puts the source media in the same location as the .msi package. However, you can choose to stream the .cab into the .msi package.

#### Stream the new .CAB file into the Windows Installer Package

Choose this option to stream the .cab into the .msi package.

---

**Note** ■ For transform (\*.mst) project types, the option to stream the .cab into the .msi package is disabled because the transform project cannot store the .cab file internally. It can only add uncompressed files or files stored in an external cab.

## Destination Tab

Use the Destination tab on the Merge Module Properties dialog box to configure destination information.

### Settings

#### GUID

Displays the merge module's unique GUID.

#### Author

Displays the merge module's author.

#### Version

Displays the merge module version.

#### Destination

Specifies the destination of the merge module's files. It is recommended you use the default setting "(Use merge module's default destination)".

## Method Browser Dialog Box

The Method Browser dialog box is where you specify the class and method in your managed assembly that your custom action should invoke. The Custom Action Wizard displays this dialog box when you click the Browse button on the [Managed Method Definition panel](#). In addition, this dialog box is also displayed if you click the Browse button on the [Method Signature dialog box](#).

**Note** ▪ Only public methods of public classes are available for selection. In addition, overloaded methods cannot be selected.

The browse functionality is available only if the .NET Framework is installed. In addition, it is available only if the location of the managed assembly is set to the Binary table or installed with the product—not if the assembly's path references a property or a directory in the Directory table.

Also note that the browse functionality is available for only 32-bit assemblies and for Microsoft intermediate language (MSIL) files. It is not available for 64-bit assemblies.

## Method Signature Dialog Box

InstallShield displays the Method Signature dialog box when you click the ellipsis button (...) in the Method Signature setting for a managed custom action in the Custom Actions and Sequences view (or the Custom Actions view). This dialog box lets you specify the public class method that you want your custom action to invoke.

The Method Signature dialog box has the following settings.

**Table 39** ▪ Settings on the Method Signature Panel

Setting	Description
<b>Class</b>	<p>Enter the name of the public class—including the full namespace—with which the method is associated. Use the following format:</p> <p><b>MyNamespace.MyClass</b></p> <p>As an alternative, click the Browse button to display the <a href="#">Method Browser dialog box</a>. This dialog box lets you select the public method from the list of public classes that are available in the managed assembly that you selected on the Action Parameters panel.</p> <p></p> <p><b>Note</b> ▪ The browse functionality is available only if the .NET Framework is installed. In addition, it is available only if the location of the managed assembly is set to the Binary table or installed with the product—not if the assembly's path references a property or a directory in the Directory table.</p> <p>Also note that the browse functionality is available for only 32-bit assemblies and for Microsoft intermediate language (MSIL) files. It is not available for 64-bit assemblies.</p>

**Table 39** ■ Settings on the Method Signature Panel (cont.)

Setting	Description
<b>Method</b>	<p>Enter the public method that you want your installation to call. As an alternative, click the Browse button to display the <a href="#">Method Browser dialog box</a>. This dialog box lets you select the public method from the list of public classes that are available in the managed assembly that you selected on the Action Parameters panel.</p>  <p><b>Note</b> ■ The browse functionality is available only if the .NET Framework is installed. In addition, it is available only if the location of the managed assembly is set to the Binary table or installed with the product—not if the assembly's path references a property or a directory in the Directory table.</p> <p>Also note that the browse functionality is available for only 32-bit assemblies and for Microsoft intermediate language (MSIL) files. It is not available for 64-bit assemblies.</p>
<b>Use custom method signature</b>	<p>To use the default method signature, clear this check box. For the default method signature, the installation calls the method with an MsiHandle parameter if the signature has one or more void parameters, or if it has a single MsiHandle parameter.</p> <p>To use a custom method signature, select this check box. Then specify the arguments and return property as needed.</p> <p>If you specified a class and a method by clicking the Browse button, InstallShield automatically adds any associated parameters. Specify the value for each parameter that you want to pass to the method.</p> <p>For detailed information about specifying the method's signature, see <a href="#">Specifying the Signature for a Managed Method in an Assembly Custom Action</a>.</p>

**Table 39** ■ Settings on the Method Signature Panel (cont.)

Setting	Description
<b>Arguments</b>	<p>If you are using a custom method signature, specify the list of arguments that you want to pass to the selected method.</p> <p>If you specified a class and a method by clicking the Browse button, InstallShield automatically adds any associated parameters to the grid in this area.</p> <p>To use a property as an argument, click the value field for the parameter, and then select the property from the list. You can also use a property that is not included in the list by typing the name of the property. The property must be defined at run time.</p> <p>The context menu provides you with options for working with arguments. To access the context menu, right-click an argument in the Arguments grid. The available context menu commands are:</p> <ul style="list-style-type: none"> <li>● <b>Add</b>—Add an argument to the grid.</li> <li>● <b>Remove</b>—Delete an argument from the grid.</li> </ul> <p>This grid is available only if the <b>Use custom method signature check box</b> is selected.</p> <p>For more information about specifying the arguments, see <a href="#">Specifying the Signature for a Managed Method in an Assembly Custom Action</a>.</p>
<b>Return Property</b>	<p>Select or type the name of the property whose value will be set to the method's return value.</p> <p>This list is available only if the <b>Use custom method signature check box</b> is selected.</p> <p>For more information about specifying the return property, see <a href="#">Specifying the Signature for a Managed Method in an Assembly Custom Action</a>.</p>

## MIME Types Dialog Box

**Project** ■ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

The MIME Types dialog box lets you add, edit, and delete mappings between file name extensions and the corresponding content types that are served as static files by the Web server to a browser or mail client.

The MIME Types dialog box is available from within the Internet Information Services view. To open this dialog box, click a Web site, application, or virtual directory in the explorer. Then click the ellipsis button (...) in the MIME Types setting.

**Table 40** ▪ MIME Types Dialog Box Settings

Setting	Description
<b>Add</b>	To add an entry for mapping a file name extension and the corresponding content type that is served as a static file by the Web server to a browser or mail client, click this button. This opens the <a href="#">Add MIME Types dialog box</a> .
<b>Edit</b>	To edit an existing MIME type, select the MIME type and click this button.
<b>Delete</b>	To delete an existing MIME type, select the MIME type and click this button.

## Modify Dynamic Links Dialog Box

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The Modify Dynamic Links dialog box shows all of the settings for your dynamic link.

### Task

#### To launch the dialog box:

1. Open the **Components** view or the **Setup Design** view.
2. In the explorer, expand the component whose dynamic link you would like to modify and then click Files.
3. Right-click in the Files pane and then click **Dynamic File Linking**. The **Modify Dynamic Links** dialog box opens.

**Table 41** ▪ Settings on the File Linking Tab of the Component Properties Dialog Box

Setting	Description
<b>Source</b>	This column shows where the source files are stored. A path variable is typically used.

**Table 41** ▪ Settings on the File Linking Tab of the Component Properties Dialog Box (cont.)

Setting	Description
<b>Include SubFolders</b>	<p>This column indicates whether InstallShield should dynamically link the files in each subfolder.</p> <p>For information on how InstallShield creates components for the dynamically linked files in subfolders, see <a href="#">Determining the Appropriate Component Creation Method for Dynamically Linked Files</a>.</p>
<b>Self-Register</b>	<p>This column indicates whether you want InstallShield to self-register every file in the dynamic link.</p> <p>If the file are part of a 64-bit component and the Self-Register column indicates Yes for a dynamic link, the installation performs 64-bit self-registration on the target system. For more information, see <a href="#">Targeting 64-Bit Operating Systems</a>.</p>
<b>Create Components</b>	<p>This column indicates how you want InstallShield to create the components when it adds the dynamic files to your release at build time. The valid options are:</p> <ul style="list-style-type: none"> <li>• <b>Best Practice</b>—InstallShield adheres to best practices when creating components for the dynamically linked files.</li> <li>• <b>By Directory</b>—InstallShield creates one component for each folder and subfolder.</li> </ul> <p>To learn about these two methods, see <a href="#">Determining the Appropriate Component Creation Method for Dynamically Linked Files</a>.</p>
<b>Details</b>	<p>This column indicates the filter criteria for including files in and excluding files from the dynamic link.</p>

**Tip** ▪ Note the following guidelines for working with the File Linking tab:

- To add a new dynamic link, click the New Link button. InstallShield displays the [Dynamic File Link Settings dialog box](#).
- To modify the settings for an existing link, select the link and then click the Modify button. InstallShield displays the [Dynamic File Link Settings dialog box](#).
- To remove a link and its associated dynamically linked files, select the link and then click the Delete button.

## Modify Property Dialog Box/Release Wizard—Platforms Panel

**Project** ▪ The following information applies to InstallScript projects.

The Modify property dialog box and the Platforms panel in the Release Wizard let you specify whether a release is specific to one or more platforms. If the platform specified for a component does not match one of the platforms that is selected for the release, the component is not included in the release.

**Task**      **To access the Modify Property dialog box:**

- 1. In the View Bar / View List under **Media**, click **Releases**.
- 2. In the **Releases** explorer, click the release that you want to configure.
- 3. Click the **Build** tab.
- 4. Click the value of the **Platform(s)** setting, and then click the ellipsis button (...).

**Task**      **To access the Platforms Panel in the Release Wizard:**

- 1. In the View Bar / View List under **Media**, click **Releases**.
- 2. In the **Releases** explorer, right-click the release that you want to configure, and then click **Release Wizard**.
- 3. Complete each of the panels in the wizard until you reach the **Platforms** panel.

The following table shows the settings that are displayed on the Modify Property dialog box and the Platforms panel in the Release Wizard.

**Table 42** - Settings on the Modify Property Dialog Box and the Platforms Panel in the Release Wizard

Setting	Description
Use platforms specified by the Platform Filtering setting	If the selected release supports all of the platforms that are specified for the Platform Filtering setting in the General Information view, select this option. If you select this option, none of the components are excluded from the release at build time.

**Table 42** ▪ Settings on the Modify Property Dialog Box and the Platforms Panel in the Release Wizard (cont.)

Setting	Description
<b>Specify the platforms to support below</b>	<p>If the selected release is specific to one or more operating systems, select this option and then select the appropriate operating systems.</p> <p>If the platform specified for a component does not match one of the platforms that is selected for this setting, InstallShield does not include the component in the release.</p> <p></p> <p><b>Tip</b> ▪ To select multiple consecutive operating systems, select the first file, press and hold <b>SHIFT</b>, and select the last operating systems. To select multiple nonconsecutive operating systems, select the first operating systems, press and hold <b>CTRL</b>, and select each additional operating systems.</p> <p></p> <p><b>Project</b> ▪ For InstallScript projects, the list of operating systems that are displayed in this dialog box excludes any of the operating systems whose check box is cleared at the project level.</p>

## Module Dependencies Dialog Box

**Project** ▪ This information applies to the following project types:

- Merge Module
- MSM Database

The Module Dependencies dialog box opens when you click the ellipsis button (...) in the Module Dependencies setting of the General Information view. This dialog box lets you select the merge modules that are required for the merge module that you are creating.

**Tip** ▪ The dialog box lists the merge modules that are found in the directories that are specified on the Merge Modules tab of the [Options dialog box](#). If you want to add a dependency that is not present on your machine, you can do so by clicking the **Add a new module dependency** button in the Module Dependencies setting of the General Information view.

## Module Exclusions Dialog Box

**Project** ▪ This information applies to the following project types:

- Merge Module

- *MSM Database*

Some merge modules do not operate correctly in the presence of certain other merge modules. This may occur because an earlier version of a module might not be compatible with your new module. As a result, you need to ensure that the incompatible module is excluded from any installation that will contain your new module.

The Module Exclusions dialog box opens when you click the ellipsis button (...) in the Module Exclusions setting of the General Information view. This dialog box lets you select the merge modules that are compatible with the merge module that you are creating.

If you add a merge module that has exclusions to an installation project, and those excluded modules have already been added to your installation project, InstallShield silently removes any reference to the exclusions from your project.

**Caution** ▪ Any excluded modules that are added to the installation project after the excluding module has been added will not be removed; in addition, you will not receive any warning that they are incompatible.

**Tip** ▪ The dialog box lists the merge modules that are found in the directories that are specified on the Merge Modules tab of the [Options dialog box](#). If you want to add an exclusion that is not present on your machine, you can do so by clicking the **Add a new module dependency** button in the Module Exclusions setting of the General Information view.

## MSI Value Dialog Box

The MSI Value dialog box enables you to create or modify a primary key for an entry in the resulting Windows Installer package's Registry table. For more information, see [Specifying a Primary Key for the Registry Table](#).

## MST SIS Settings Dialog Box

This dialog allows you suppress errors and specify validation options for the transform and base MSI package. For more information, see [Database.CreateTransformSummaryInfo](#) in the Windows Installer Help Library.

### Dialog Options

#### Suppress Errors Options

Select the check boxes next to the error conditions that you want to suppress.

**Table 43** ▪ Suppress Errors Options

Condition	Description
Add existing row	Adds a row that already exists.
Add existing table	Adds a table that already exists.
Delete missing row	Deletes a row that does not exist.

**Table 43** ▪ Suppress Errors Options (cont.)

Condition	Description
<b>Delete missing table</b>	Deletes a table that does not exist.
<b>Modify missing row</b>	Updates or modifies a row that does not exist.
<b>Change codepage</b>	The transform and .msi code pages do not match and neither code page is neutral.

### Validation Options

In this section, you can indicate the information that you want the transform package to validate on the base MSI package before the transform is applied.

**Table 44** ▪ Validation Options

Validation Option	Description
<b>Match languages</b>	Validates the languages in both the base MSI and the transform. The transform is not applied if the languages do not match.
<b>Match Upgrade Code</b>	Validates the Upgrade Codes in both the base MSI and the transform. The transform is not applied if the Upgrade Codes do not match.
<b>Match Product Code</b>	Validates the Product Codes in both the base MSI and the transform. The transform is not applied if the Product Codes do not match.

### Version comparison

Select the type of comparison you want to make.

#### Version level

Select whether you want only the major versions compared or both the major and minor versions.

## Multi-Line String Value Dialog Box

The Multi-Line String Value dialog box lets you enter a multi-line registry value. This dialog box opens when you are adding or editing a multi-line string value for a registry key in the Registry view.

## (Multi-line edit field)

In the multi-line edit field, enter a line for each null-delimited string or modify it. Right-click the grid to display the context menu or press the following keys in the grid below associated with the following actions.

**Table 45** ▪ Multi-line Edit Field Actions

Action	Shortcut Keys
Add String	INSERT
Rename String	F2
Delete String	DELETE
Move Up	UP ARROW
Move Down	DOWN ARROW

Click OK when you are finished entering a line for each null-delimited string. The strings are automatically concatenated.

**Note** ▪ Strings that contain only spaces are allowed, but strings cannot be empty or “[~]”, which is the separator for the strings as they are stored in the project and displayed in the Destination computer’s registry data pane. This separator is not included when the registry value is created on the target system.

## Select how you want to modify the registry value

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

For Windows Installer–based projects, you can choose from the following options to indicate where you want to add the value.

**Table 46** ▪ Options for Modifying the Registry Value

Option	Description
Append	Add to the end of the existing registry value string.

**Table 46** ▪ Options for Modifying the Registry Value (cont.)

Option	Description
<b>Prepend</b>	Add to the front of the existing registry value string.
<b>Replace</b>	Replace the existing registry value string.

# New Dependency Dialog Box

The New Dependency dialog box opens when you click the Add or Modify button on the [Dependencies tab](#) of the InstallShield Prerequisite Editor. This dialog box lets you specify other InstallShield prerequisites (.prq files) on which this prerequisite depends.

**Table 1** • New Dependency Dialog Box Options

Dialog Option	Description
<b>File</b>	Type the path and name of the .prq file that is required for the current InstallShield prerequisite. To find the .prq file by browsing, click the ellipsis (...) button. InstallShield prerequisite files are stored in the following location by default:  <i>InstallShield Program Files Folder\SetupPrerequisites</i>  For more information about the locations where InstallShield prerequisites are stored, see <a href="#">Specifying the Directories that Contain InstallShield Prerequisites</a> .

# New File Dialog Box

The New File dialog box opens when you click the Add button on the [Files to Include tab](#) of the InstallShield Prerequisite Editor. This dialog box lets you specify a file for your InstallShield prerequisite.

**Table 2** • New File Dialog Box Options

Option	Description
<b>File</b>	Type the path and name of the file. To find the file by browsing, click the ellipsis (...) button.
<b>URL to file</b>	If end users should be able to download the file from the Web, specify the uniform resource locator (URL) in this box. This URL is the same one that InstallShield uses when installation authors use the Redistributables view to download an InstallShield prerequisite from the Internet to their local machines.  For example, if the URL for the file is <a href="http://www.mywebsite.com/Folder1/Notepad.exe">http://www.mywebsite.com/Folder1/Notepad.exe</a> , enter the following in this box: <a href="http://www.mywebsite.com/Folder1">http://www.mywebsite.com/Folder1</a>

# New Project Dialog Box

This dialog box is displayed when you create a new project in InstallShield. In the dialog box, you can select a project type, name your project, and provide a location for the project's files. After you select a project type and click OK, your project opens in InstallShield.

---

**Project** • If you select an installation project such as *InstallScript*, *Basic MSI*, *MSIX*, or *InstallScript MSI*, the *Project Assistant* launches to help you create your project.

## Dialog Box Tabs

**Table 3** • New Project Dialog Box Tabs

Tab	Description
<b>Common</b>	This tab displays some of the most-often-used project types.
<b>InstallScript</b>	This tab displays all of the project types that use the InstallShield installation engine, including the InstallScript installation project. If you previously used InstallShield Professional, you will be familiar with these project types.
<b>Windows Installer</b>	This tab includes projects that use the Microsoft Windows Installer engine, including the Basic MSI installation project.
<b>MSIX</b>	This tab includes projects that use Windows app package format that provides a modern packaging experience of the Windows apps.
<b>All Types</b>	This tab displays all of the project types available in InstallShield. It also includes any project templates that you previously saved, as well as any templates that are available in your repository.

## Dialog Box Options

**Table 4** • New Project Dialog Box Options

Option	Description
<b>Project Name</b>	Type a name for your project in this box.  <b>Project</b> • When you create a Merge Module project, the name that you specify in this box should have 35 characters or fewer. This is because the name that you enter is used with the GUID in the ModuleID field of the ModuleSignature table of your object or module file, and the limit for the name portion of the ModuleID field is a maximum of 35 characters. When you create a DIM project, the name that you specify in this box should have 35 characters or fewer.
<b>Location</b>	Type a location or click Browse to navigate to a project location. To change the default project location displayed, change the Project Location path, which is specified on the File Locations tab of the Options dialog box.
<b>Create the project in Project Name subfolder</b>	Select this check box if you want InstallShield to create a subfolder with your project's name in your Projects location.

# Operating Systems Dialog Box

This dialog lets you specify the operating systems with which a component (in an InstallScript MSI project) is associated.

## Dialog Options

### Operating Systems

Select the operating systems on which the component should be installed. Leaving all operating systems unselected causes the component to be installed regardless of the target operating system.

# Options Dialog Box

The Options dialog box enables you to specify preferences for creating projects and working in InstallShield.

## Task

### To access the Options dialog box:

On the **Tools** menu, click **Options** button.

The Options dialog box is organized into multiple task-related tabs:

- General tab
- File Locations tab
- Path Variables tab
- User Interface tab
- Preferences tab
- .NET tab
- Files View tab
- File Extensions tab
- Prerequisites tab
- Source Control tab
- Directory tab
- Resource tab
- Validation tab
- Repository tab
- SQL Scripts tab
- Merge Modules tab

## General Tab

The General tab on the Options dialog box enables you to set general project options.

**Table 5** • General Tab Settings

Setting	Project Types	Description
<b>Enforce Setup Best Practices</b>	Basic MSI, InstallScript MSI	Select this check box to indicate that you want InstallShield to monitor your installation design to help you comply with <a href="#">Setup Best Practices</a> .
<b>Help window on top</b>	All	Select this check box to have the help window remain on top of the InstallShield interface. If you want the help window to fall to the background when focus is given to InstallShield, clear this check box.
<b>Stop build process when first error is encountered</b>	Basic MSI, InstallScript, InstallScript MSI	Select this check box to abort the build process when a build error occurs.
<b>Automatically create ISetAllUsers action</b>	Basic MSI, InstallScript MSI	Select this check box to add the ISetAllUsers action to your sequences when your project contains one or more records in the Upgrade table.

## File Locations Tab

The File Locations tab on the Options dialog box enables you to set the default directories for where your project files are located and where all of your merge modules can be found.

**Table 6** • File Locations Tab Settings

Setting	Project Type	Description
<b>Project Location</b>	All	<p>The project location becomes your Favorite folder for new installation projects. All of your source and release files, such as your project (.ism) file, installation package (.msi file), and disk image files, are stored in subfolders of your Favorites location, currently [unknown]. You can enter a complete path or click the Browse button to navigate to the folder.</p> <p>By default, your project is stored in the following location:</p> <p>C:\InstallShield 2021 Projects</p>  <p><b>Tip</b> • Changing the project location does not move existing folders and files in the previous project location. You must build a release with a new name or manually move the folders to change their location.</p>

**Table 6** • File Locations Tab Settings (cont.)

Setting	Project Type	Description
<b>Dialogs Location</b>	Basic MSI	Enter the path where the Dialog Wizard should search for dialogs. Dialogs in this location appear in the list presented in the Dialog Wizard's Dialog Template panel. Separate additional paths with a comma.

## Path Variables Tab

The Path Variables tab enables you to set user-level path variables options.

**Table 7** • Path Variable Tab Settings

Setting	Project Types	Description
<b>Always recommend path variables</b>	Advanced UI, Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, QuickPatch, Suite/Advanced UI	<p>Select this option if you want InstallShield to automatically assign existing path variables to your files. For example, if you are adding a file to your installation project that is stored in your Program Files folder, InstallShield uses &lt;ProgramFilesFolder&gt; rather than a hard-coded path.</p> <p>Select the check box below this option to have InstallShield automatically create a path variable for you. When a new variable is created, it is titled &lt;MYVAR#&gt; (where # is a successive number). You can change the name of this variable in the Path Variables editor.</p>
<b>Don't recommend path variables</b>	Advanced UI, Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, QuickPatch, Suite/Advanced UI	Select this option if you want to use hard-coded paths for all of your file links. InstallShield does not suggest path variables for you if this option is selected.
<b>Always display the Path Variable Recommendation dialog to me</b>	Advanced UI, Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, QuickPatch, Suite/Advanced UI	Select this option if you want the <a href="#">Path Variable Recommendation dialog box</a> to be displayed every time you associate a file with your installation project.

## User Interface Tab

The User Interface tab on the Options dialog box sets your user interface preferences. These settings are maintained across all projects that you create on this system.

**Table 8 •** User Interface Tab Settings

Setting	Project Type	Description
<b>Always create new components and features</b>	Basic MSI, InstallScript, InstallScript MSI	If you want InstallShield to automatically create components and features when needed, select this check box. If you do not select this check box, InstallShield prompts you to create components and features when necessary.
<b>Always confirm feature, component, and release deletion</b>	Basic MSI, InstallScript, InstallScript MSI	If you want InstallShield to display a confirmation dialog box each time that you delete a feature, component, or release, select this check box.
<b>Always confirm script terminology conversion</b>	Basic MSI, InstallScript, InstallScript MSI	If you want InstallShield to display a confirmation dialog box when you open a project that was created in InstallShield Professional, select this check box. The dialog box asks if you want to convert your script to use the InstallScript lexicon.
<b>Automatically determine best feature or component</b>	Basic MSI, InstallScript, InstallScript MSI	If you want InstallShield to automatically determine the feature or component that should contain the registry data that you configure in the Registry view, select this check box. If this check box is cleared, InstallShield displays a dialog box that you can use to specify the appropriate feature or component name when you create registry data for the All Application data option or a Feature option in the View Filter.
<b>Show Welcome panel for IDE wizards</b>	Basic MSI, InstallScript, InstallScript MSI	If you want InstallShield to display a Welcome panel every time you run a wizard, select this check box.
<b>Warn about Web site deletion</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module	If you want InstallShield to display a confirmation dialog box when you delete a Web site in the Internet Information Services view and the Web site contains one or more IIS applications or virtual directories, select this check box. The confirmation dialog box alerts you that the Web site's applications and virtual directories will be deleted from your project if you proceed with deleting the Web site.
<b>Show InstallScript project types</b>	InstallScript	This check box is available in the version of InstallShield that is included with AdminStudio. By default, this check box is cleared.  If you want InstallShield to hide the InstallScript and InstallScript MSI project types on the New dialog box, select this check box.

## Preferences Tab

The Preferences tab on the Options dialog box sets your program preferences. These settings are maintained across all installation projects you create on this system.

**Table 9** • Preferences Tab Settings

Setting	Project Type	Description
<b>Self-Registration</b>	Basic MSI, InstallScript MSI	<p>This section enables you to select the self-registration method that InstallShield should use when you indicate that a file is self-registering. Changing this setting applies only to future self-registration settings and does not affect files that were previously designated as self-registering.</p> <ul style="list-style-type: none"><li>● <b>InstallShield Self-Registration Table (ISSelfReg)</b>—Select this option to use the InstallShield Self-Registration table for all files designated as self registering.</li><li>● <b>Windows Installer Self-Registration Table (SelfReg)</b>—Select this option to use the Windows Installer Self-Registration table for all files designated as self registering.</li></ul> <p>This section also enables you to select the default timing for COM extraction of self-registering files. This is the default setting used if a self-registering file is added via the Files and Folders view or through the Component Wizard.</p> <ul style="list-style-type: none"><li>● <b>COM Extraction will occur during the build</b>—Select this option to perform extraction during the build. COM information will appear in the build log file.</li><li>● <b>COM Extraction will occur immediately when the file is added</b>—Select this option to extract COM data right after you add a COM file. When you select this option, InstallShield populates the component's COM Registration Advanced Settings view.</li></ul>
<b>Run Commands</b>	Basic MSI, InstallScript MSI	<p>If you want InstallShield to automatically uninstall your product before you debug your installation or before you rerun it by relaunching it from the Build menu, select the <b>Uninstall the product automatically before installing or debugging</b> check box.</p>
<b>Referential Integrity</b>	Basic MSI, InstallScript, InstallScript MSI	<p>Select the <b>Maintain referential integrity</b> check box if you want InstallShield to automatically maintain referential integrity when you are working in the <b>Direct Editor</b>. For example, the Control table has a Dialog_ column, meaning that the column is a foreign key to the Dialog table. If you rename the key in the Dialog table, the key in the Control table is also renamed. Also, if you delete the entire dialog, all of the controls should be deleted. This is true for any tables with this type of foreign key relationship.</p>

**Table 9** ▪ Preferences Tab Settings (cont.)

Setting	Project Type	Description
<b>Project Reload</b>	All	Select the <b>Reload last opened project on startup</b> check box if you want InstallShield to automatically reload the most recently opened project when you launch InstallShield.

## .NET Tab

The .NET tab on the Options dialog box is where you specify preferences for .NET projects. It is also where you specify the location of the Regasm.exe and InstallUtilLib.dll files, which are utilities that are included with the .NET Framework. These utilities are used for COM interop and .NET custom actions.

**Table 10** ▪ .NET Tab Settings

Setting	Project Type	Description
<b>Default .NET Scan at Build Component Setting</b>	Basic MSI, InstallScript MSI	In this list, select how the .NET Scan at Build setting should be configured for new components. This applies to components that are automatically created when you add files to your project.
<b>.NET Framework File Locations</b>	Basic MSI, InstallScript MSI	<p>Regasm.exe and InstallUtilLib.dll are utilities that are included with each version of the .NET Framework. Specify the path for the directory that contains the version of these files that you want to use at build time for releases that include .NET installer classes and COM interop.</p> <ul style="list-style-type: none"> <li>● <b>32-Bit Location</b>—Type the path or browse to the location of Regasm.exe and InstallUtilLib.dll.</li> <li>● <b>64-Bit Location</b>—This option is disabled if you are using InstallShield on a 32-bit system. If you are using InstallShield on a 64-bit system, type the path or browse to the location of Regasm.exe and InstallUtilLib.dll.</li> </ul> <p></p> <p><b>Note</b> ▪ In order to configure these options, you must be running InstallShield with administrative privileges. If you do not have administrative privileges, these options are disabled. To learn more, see <a href="#">Launching InstallShield with vs. Without Administrative Privileges</a>.</p>

## Files View Tab

In the Files View tab on the Options dialog box, you can indicate preferences such as which columns you want to be displayed in several areas of InstallShield.

If you make any changes on this tab, close and reopen your project to see the changes take effect.

**Table 11** • Files View Tab Settings

Setting	Project Type	Description
<b>Size</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module	To include a Size column in the following areas of InstallShield, select this check box: <ul style="list-style-type: none"> <li>Files and Folders view</li> <li>Files subview in the Components view</li> <li>Application Files page of the Project Assistant</li> </ul>
<b>Link To</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module	To include a Link To column in the following areas of InstallShield, select this check box: <ul style="list-style-type: none"> <li>Files and Folders view</li> <li>Files subview in the Components view</li> <li>Application Files page of the Project Assistant</li> </ul>
<b>Modified Date</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module	To include a Modified Date column in the following areas of InstallShield, select this check box: <ul style="list-style-type: none"> <li>Files and Folders view</li> <li>Files subview in the Components view</li> <li>Application Files page of the Project Assistant</li> </ul>
<b>Destination</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module	To include a Destination column in the Application Files page of the Project Assistant, select this check box.
<b>Version</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module	To include a Version column in the following areas of InstallShield, select this check box: <ul style="list-style-type: none"> <li>Files and Folders view</li> <li>Files subview in the Components view</li> </ul>  <p><b>Important</b> • Selecting the Version check box will slow the performance of the aforementioned views.</p>
<b>File Key</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	To include a Key column in the Files subview in the Components view, select this check box.

**Table 11** • Files View Tab Settings (cont.)

Setting	Project Type	Description
<b>Maximum files to display</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module	<p>Specify the maximum number of files that you want to be displayed for a dynamic file link in the following areas of InstallShield:</p> <ul style="list-style-type: none"> <li>Files and Folders view</li> <li>Files subview in the Components view</li> <li>Application Files page of the Project Assistant</li> </ul> <p>The default value is 1000. If the dynamic file link includes more than the specified number of files, the top entry in the list of files is called <i>List Truncated</i>.</p>
<b>Clean up unused components</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module	<p>If you want InstallShield to remove unused components from your project automatically, select this check box.</p> <p>When this check box is selected, you delete all of the files in a component, and that component is not required elsewhere, that component is deleted automatically.</p> <p>Examples of scenarios in which a component is still required and will not be deleted from the project automatically are:</p> <ul style="list-style-type: none"> <li>The component is selected in the <b>Destination computer's folders</b> pane in the Files and Folders view.</li> <li>A folder would no longer be displayed in the Files and Folders view if the component were removed.</li> <li>The component is selected for an item in another area of the product (for example, for XML file changes that are configured in the XML File Changes view).</li> <li>In InstallScript projects, DefaultComponent under the Application Target Folder is never deleted automatically.</li> </ul>

## File Extensions Tab

**Project** • The File Extensions tab is applicable to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The File Extensions tab on the Options dialog box is where you specify preferences for Portable Executable (PE) files. InstallShield refers to this list of PE files on several different occasions. For example:

- When you add a PE file to a folder in the **Destination computer's folders** pane in the Files and Folders view, InstallShield creates a new component for it and sets it as the component's key file.
- When you create components by using the best practice option in the Component Wizard, InstallShield creates a new component for PE files and sets each PE file as the key file of its component.
- When you use the best practice method of component creation for dynamic file links, InstallShield creates at build time a separate component for each PE file in the dynamically linked folder. Each PE file is the key file of its component.

The following setting is available on this tab:

**Table 12** • File Extensions Tab Settings

Setting	Description
<b>Portable Executable File Extensions</b>	<p>In this box, type the file extensions that you would like InstallShield to consider to be PE files. Separate extensions with a comma. The default entry for this box is the following:</p> <p><b>EXE,DLL,OCX,VXD,CHM,HLP,TLB, AX</b></p>

## Prerequisites Tab

The Prerequisites tab on the Options dialog box enables you to set preferences for InstallShield prerequisites.

**Table 13** • Prerequisites Tab Settings

Setting	Project Type	Description
<b>Prerequisite File Locations (Current User) and Prerequisite File Locations (All Users)</b>	Basic MSI, InstallScript, InstallScript MSI	<p>Specify the paths for the folders where you store InstallShield prerequisite files (.prq files).</p> <p>To specify more than one location, separate each path with a comma, as in the following example:</p> <p>C:\Prerequisites,C:\My Files\Prerequisites</p> <p>Note that you can use path variables in the path, as in the following example:</p> <p>&lt;ISProductFolder&gt;\SetupPrerequisites,&lt;ISProjectFolder&gt;\My CustomPrerequisites</p> <p>The All Users option is available if you want to run a command-line build under a system account for which you cannot easily update the user settings.</p> <p>InstallShield provides additional ways for specifying the folders that contain InstallShield prerequisite files. For more information, see <a href="#">Specifying the Directories that Contain InstallShield Prerequisites</a>.</p>  <p><b>Note</b> • In order to configure the All Users option, you must be running InstallShield with administrative privileges. If you do not have administrative privileges, this option is disabled. To learn more, see <a href="#">Launching InstallShield with vs. Without Administrative Privileges</a>.</p>

## Source Control Tab

Edit the settings on the Source Control tab of the Options dialog box to control how InstallShield interacts with your source code control program. All of the settings on this tab apply to every project the current user opens on this system.

**Project** • The following options apply to both Windows Installer—based and InstallScript-based projects unless otherwise noted.

- **Use dialog for checkout**—When this check box is selected, a checkout dialog box is displayed when you check out a project through InstallShield. If this check box is cleared, InstallShield automatically checks out the file without a comment when you select the **Check out project when edited** check box or if, on the Project menu, you point to Source Control and then click Check Out.

- **Get latest version when opening the project**—Select this check box to retrieve the latest version of your project from your source control program when you open the project in InstallShield. If you do not get the latest version, you might edit an older version in your working directory—if someone else modified the project file that exists in source control in the interim.
- **Check out project when edited**—Select this check box to have InstallShield automatically check your project file out of your source control program whenever you modify it in InstallShield. If your project file is not checked out, it is likely read only and you cannot save changes to it until you check it out.
- **Add new projects to source control**—Select this check box if you want new projects automatically added to source control upon creating them in InstallShield.
- **Use XML format when creating new Windows Installer-based projects**—When this check box is selected, XML is the default file format for Windows Installer projects that you create using the New Project dialog box. If this check box is cleared, binary is the default file format setting for Windows Installer projects. You can change the project's file format at any time by changing the value for the Project File Format setting in the General Information view.

**Note** ▪ When a project file format is converted to either XML or binary format, the project file extension remains .ism.

**Project** ▪ The **Use XML Format when creating new Windows Installer-based projects** option applies only to Windows Installer-based projects.

## User name

Specify the name you use to log on to the source control project.

## Advanced

Click this button to view the source control program's Properties dialog box and make advanced modifications.

# Directory Tab

On the Directory tab of the Options dialog box, you can set various design-time directory options for Windows Installer and InstallScript MSI projects.

**Table 14** ▪ Directory Tab Settings

Setting	Project Type	Description
<b>Show INSTALLDIR</b>	Basic MSI, InstallScript MSI	Select this check box to display INSTALLDIR as a predefined folder at the root level of the folder structure. If the check box not cleared, INSTALLDIR appears in its location relative to other folders. In the Files and Folders view, it appears as a subfolder beneath the ProgramFilesFolder and the "Your Company Name" folder.

**Table 14** • Directory Tab Settings (cont.)

Setting	Project Type	Description
<b>Always show directory nodes with different IDs separately</b>	Basic MSI, InstallScript MSI	In the Files and Folders view, the default behavior for displaying two directory identifiers with the same path is to display them as a single directory. To show different directory identifiers with the same path as two separate directories in the Files and Folders view, select this check box.
<b>Clean up unused directories</b>	Basic MSI, InstallScript MSI	Select this check box to remove unused user-defined directories from your installation project. For example, if you set a component's destination to {MYDIR}[INSTALLDIR]MYDIR1 and subsequently change the destination to [INSTALLDIR], MYDIR1 is automatically deleted from your project if it is not used elsewhere in your project.

## Resource Tab

On the Resource tab of the Options dialog box, you can specify the location of the resource compiler and resource linker programs on your system. These programs are required in order to display modified dialogs in an InstallScript MSI installation project.

These fields are automatically populated with the default file locations and command-line options for each program, but you can edit them if necessary.

**Table 15** • Resource Tab Settings

Setting	Project Type	Description
<b>Resource Compiler Settings</b>	Basic MSI, InstallScript, InstallScript MSI	<p>In this section, you can specify the location of a resource compiler and provide command line options.</p> <ul style="list-style-type: none"><li>● <b>Resource compiler location</b>—The default resource compiler (rc.exe) location appears in this field. To edit the resource compiler location, type or browse to the location of a resource compiler that is currently installed on your system.</li><li>● <b>Resource compiler command line options</b>—To edit the resource compiler command line options, type over the existing command line options in the field. The default command line option string is /r "%1".</li></ul>

**Table 15** • Resource Tab Settings (cont.)

Setting	Project Type	Description
<b>Resource Linker Settings</b>	Basic MSI, InstallScript, InstallScript MSI	<p>In this section, you can specify the location of a resource linker and provide command line options.</p> <ul style="list-style-type: none"> <li>● <b>Resource linker location</b>—The default resource linker (link.exe) location appears in this field. To edit the resource linker location, type or browse to the location of a resource linker that is currently installed on your system.</li> <li>● <b>Resource linker command line option</b>—To edit the resource linker command line options, type over the existing command line options in the field. The default command line option string is "%1" /DLL /NOENTRY /NODEFAULTLIB /MACHINE:iX86 /OUT:"%2".</li> </ul>

## Validation Tab

On the Validation tab of the Options dialog box, you can specify the type of validation you want InstallShield to perform after a successful build.

**Table 16** • Validation Tab Settings

Setting	Project Type	Description
<b>Perform Patching &amp; Upgrading validation</b>	Basic MSI, InstallScript MSI	Select this check box to perform validation on both patches and upgrades.
<b>Perform validation using</b>	Basic MSI, InstallScript MSI	To perform validation every time that you build an installation project, select this check box and then select the check box of one or more validation suites. You can also browse for a new validation module (.cub file).
<b>Perform merge module validation using</b>	Merge Module	To perform validation every time that you build a merge module, select this check box and then select the check box of one or more validation suites. You can also browse for a new validation module (.cub file).

Click the Customize button to specify which internal consistency evaluators (ICEs) should be used for a specific validation suite. For more information, see [Specifying Which ICEs, ISICEs, ISVICEs and ISBPs Should Be Run During Validation](#).

## Repository Tab

**Edition** • The boxes on the Repository tab are available in the Premier edition of InstallShield only.

If you want to set up a network repository or change its location, name, or description, you can do so through the Repository tab on the Options dialog box.

**Table 17** • Repository Tab Settings

Setting	Description
<b>Network Repository XML File</b>	This is the path and file name of the .xml file that InstallShield creates for the network repository. InstallShield also automatically creates subfolders in the same directory as the .xml file; these subfolders contain items that are published to the network repository.
<b>Name</b>	This is the name of the network repository.
<b>Description</b>	This is a description of the network repository.

## SQL Scripts Tab

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI

On the SQL Scripts tab of the Options dialog box, you can set one option for SQL script support.

**Table 18** • SQL Script Tab Settings

Setting	Description
<b>Generate unique Windows Installer properties for new connections</b>	<p>To share Windows Installer properties between any new database connections that you add to your project, clear this check box.</p> <p>To use different Windows Installer properties for any new connections that you add, select this check box.</p> <p>This check box is cleared by default.</p> <p>For more information, see <a href="#">Specifying Whether New SQL Connections Should Share the Same Windows Installer Properties</a>.</p>

## Merge Modules Tab

The Merge Modules tab on the Options dialog box enables you to set preferences for merge modules and merge module projects.

**Table 19** ▪ Merge Module Tab Settings

Setting	Project Type	Description
<b>Merge Module Locations (Current User) and Merge Module Locations (All Users)</b>	Basic MSI, InstallScript, InstallScript MSI	<p>Enter the paths where you store merge modules (.msm files). Separate additional paths with a comma, as in the following example:</p> <p>C:\MergeModules,C:\My Files\MergeModules</p> <p>Note that you can use path variables in the path, as in the following example:</p> <p>&lt;ISProductFolder&gt;\Modules\i386,&lt;ISProjectFolder&gt;\MyCustom Modules</p> <p>You can also use environment variables in the path.</p> <p>The All Users option is available if you want to run a command-line build under a system account for which you cannot easily update the user settings.</p> <p>The first path that you list is where InstallShield should copy a merge module after it is built. The file is copied only if you select <b>Copy to Modules folder</b> in the Merge Module Options panel of the Release Wizard, if you select the <b>Copy to Merge Modules folder</b> option in the Publish Merge Module setting on the Events tab in the Releases view, or if you run ISCmdBld.exe with the -e command-line option. InstallShield creates the folder if it does not exist.</p> <p>InstallShield provides additional ways for specifying the folders that contain merge modules. For more information, see <a href="#">Specifying the Directories that Contain Merge Modules</a>.</p> <hr/> <p> <b>Note</b> ▪ In order to configure the All Users option, you must be running InstallShield with administrative privileges. If you do not have administrative privileges, this option is disabled. To learn more, see <a href="#">Launching InstallShield with vs. Without Administrative Privileges</a>.</p>

**Table 19** ▪ Merge Module Tab Settings (cont.)

Setting	Project Type	Description
<b>Merge Module File Search Behavior</b>	Basic MSI, InstallScript MSI	<p>When you add a file to your project via the Best Practices Component Wizard or the Files view (with Best Practices active), InstallShield searches the merge modules to see if there is a module that contains that file and notifies you of any matches.</p> <p>In this section, you can select options that InstallShield uses to determine whether the files match.</p>

## Other IIS Properties Dialog Box

When you select a Web site, application, or virtual directory in the Internet Information Services view, InstallShield displays a grid that contains many settings. The Other IIS Properties dialog box opens when you click the ellipsis button (...) in the Other IIS Properties setting in the Advanced area of the grid. This dialog box is where you specify values for IIS settings that are not displayed in the other areas of this view.

To customize the value of a property, click the property name, and then click the Change Value button. The [Edit ISIIISMetaData Value dialog box](#) opens, enabling you to set the value as needed.

**Note** ▪ The other IIS property settings apply to IIS 6 and earlier. IIS 7 ignores these settings.

For help on specific settings, see “Metabase Property Reference” on the MSDN Web site.

## Other Window Styles Dialog Box

**Project** ▪ This information applies to the following project types:

- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

The Other Window Styles dialog box provides additional window style options for the dialog or control that is in the Dialogs view. This dialog box opens when you click the ellipsis button (...) in the Other Window Styles setting. The Other Window Styles setting is displayed when you click a dialog or a certain type of control in the Dialogs view.

The options that are available depend on the type of dialog control that is active when you open the Other Windows Style dialog box.

- [Dialogs](#)
- [Bitmap, icon, and text area controls](#)
- [Button controls](#) (check box, radio button group, push button, and group box)

- [Combo box controls](#)
- [List view controls](#)
- [Edit field and list box controls](#)
- [Line controls](#)
- [Progress bar controls](#)
- [Selection tree controls](#)

For more information about the values, refer to the MSDN Library.

## Other Window Styles for Dialogs

**Project** ▪ This information applies to the following project types:

- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

The following window style options are available for a dialog. For additional information, see the MSDN Library.

**Table 20** ▪ Window Styles for Dialogs

Value	Description
<b>WS_POPUP</b>	Creates a pop-up window.
<b>DS_NOIDLEMSG</b>	Suppresses WM_ENTERIDLE messages that the system sends to the owner of a dialog box while the dialog box is displayed.
<b>DS_CONTROL</b>	Creates a dialog box that can function as a child window of another dialog box. This allows the user to tab among the control windows of a child dialog box and use its accelerator keys.
<b>DS_SYSMODAL</b>	<p>This style is obsolete and is included for compatibility with 16-bit versions of Windows. If you specify this style, the system creates the dialog box with the WS_EX_TOPMOST style.</p> <p>This style does not prevent the user from accessing other windows on the desktop. Do not combine with the DS_CONTROL style.</p>
<b>DS_3DLOOK</b>	Displays text in the dialog box in non-bold font and draws three-dimensional borders around control windows in the dialog box.
<b>DS_CENTER</b>	Centers the dialog box in the working area of the end user's screen.
<b>DS_LOCALEDIT</b>	Specifies that edit controls in the dialog box use memory in the applications data section. By default, all edit controls in dialog boxes use memory outside the applications data section.

**Table 20** ▪ Window Styles for Dialogs (cont.)

Value	Description
<b>DS_FIXEDSYS</b>	Causes the dialog box to use the SYSTEM_FIXED_FONT instead of the default SYSTEM_FONT. This is a monospaced font compatible with the System font in 16-bit versions of Windows operating systems earlier than 3.0.
<b>DS_CENTERMOUSE</b>	Centers the cursor in the dialog box.
<b>DS_SETFONT</b>	<p>Indicates that the header of the dialog box template contains additional data specifying the font to use for text in the client area and controls of the dialog box. The font data begins on the WORD boundary that follows the title array. It specifies a 16-bit point size value and a Unicode font name string.</p> <p>If this style is not specified, the dialog box template does not include the font data.</p>
<b>DS_ABSALIGN</b>	Indicates that the coordinates of the dialog box are screen coordinates.
<b>DS_CONTEXTHELP</b>	<p>Displays a question mark in the title bar of the dialog box. When the end user clicks the question mark, the cursor changes to a question mark with a pointer. If the end user then clicks a control in the dialog box, the control receives a WM_HELP message. The control should pass the message to the dialog box procedure. The help application displays a pop-up window that typically contains help for the control.</p> <p>DS_CONTEXTHELP is only a placeholder. When the dialog box is created, the system checks for DS_CONTEXTHELP and—if it is there—adds WS_EX_CONTEXTHELP to the extended style of the dialog box. WS_EX_CONTEXTHELP cannot be used with the WS_MAXIMIZEBOX or WS_MINIMIZEBOX styles.</p>
<b>DS_MODALFRAME</b>	Creates a dialog box with a modal dialog box frame that can be combined with a title bar and window menu by specifying the WS_CAPTION and WS_SYSMENU styles.
<b>DS_NOFAILCREATE</b>	Creates the dialog box even if errors occur—for example, if a child window cannot be created or if the system cannot create a special data segment for an edit control.
<b>DS_SETFOREGROUND</b>	Causes the system to use the <b>SetForegroundWindow</b> function to bring the dialog box to the foreground.

## Other Window Styles for Bitmap, Icon, and Text Area Controls

**Project** ▪ This information applies to the following project types:

- *InstallScript*

- *InstallScript MSI*
- *InstallScript Object*

The following window style options are available for bitmap, icon, and text area controls. For additional information, see the MSDN Library.

**Table 21** • Window Style Options for Bitmap, Icon, and Text Area Controls

Value	Description
<b>WS_GROUP</b>	Specifies the first control in a group of controls. All controls defined with this style after the first control belong to the same group.
<b>SS_CENTERIMAGE</b>	Specifies that, if the bitmap or icon is smaller than the client area of the static control, the rest of the client area is filled with the color of the pixel in the top left corner of the bitmap or icon. If the static control contains a single line of text, the text is centered vertically in the client area of the control.
<b>SS_NOTIFY</b>	Sends the parent window STN_CLICKED, STN_DBLCLK, STN_DISABLE, and STN_ENABLE notification messages when the user clicks or double-clicks the control.
<b>SS_RIGHTJUST</b>	Specifies that the lower right corner of a static control with the SS_BITMAP or SS_ICON style is to remain fixed when the control is resized. Only the top and left sides are adjusted to accommodate a new bitmap or icon.
<b>WS_VSCROLL</b>	Creates a window with a vertical scroll bar.
<b>SS_REALSIZECONTROL</b>	Adjusts the bitmap to fit the size of the static control. Certain display settings on a target machine can affect the size of the control area used to render an image, such as the system font or DPI scaling. This style bit automatically resizes bitmaps to fit their controls. This style is recommended instead of SS_REALSIZEIMAGE to support high DPI machines. Otherwise, the image may be clipped or not fill the entire control at runtime on some machines.
<b>SS_REALSIZEIMAGE</b>	Prevents a static icon or bitmap control (that is, static controls that have the SS_ICON or SS_BITMAP style) from being resized as it is loaded or drawn. If the icon or bitmap is larger than the destination area, the image is clipped.
<b>SS_ENDELLIPSIS</b>	If the end of a string does not fit in the rectangle, it is truncated and ellipses are added. If a word that is not at the end of the string goes beyond the limits of the rectangle, it is truncated without ellipses. Compare with SS_PATHELLIPSIS and SS_WORDELLIPSIS.
	 <p><b>Note</b> • <i>SS_ENDELLIPSIS, SS_PATHELLIPSIS, and SS_WORDELLIPSIS are mutually exclusive.</i></p>

**Table 21** ▪ Window Style Options for Bitmap, Icon, and Text Area Controls (cont.)

Value	Description
<b>SS_PATHELLIPSIS</b>	Replaces characters in the middle of the string with ellipses so that the result fits in the specified rectangle. If the string contains backslash (\) characters, SS_PATHELLIPSIS preserves as much as possible of the text after the last backslash. Compare with SS_ENDELLIPSIS and SS_WORDELLIPSIS.  
<b>Note</b> ▪ SS_ENDELLIPSIS, SS_PATHELLIPSIS, and SS_WORDELLIPSIS are mutually exclusive.	
<b>SS_WORDELLIPSIS</b>	Truncates any word that does not fit in the rectangle and adds ellipses. Compare with SS_ENDELLIPSIS and SS_PATHELLIPSIS.  
<b>Note</b> ▪ SS_ENDELLIPSIS, SS_PATHELLIPSIS, and SS_WORDELLIPSIS are mutually exclusive.	

## Other Window Styles for Button Controls

**Project** ▪ This information applies to the following project types:

- InstallScript
- InstallScript MSI
- InstallScript Object

The following window style options are available for button controls (check box, radio button group, push button, and group box controls). For additional information, see the MSDN Library.

**Table 22** ▪ Window Styles for Button Controls

Value	Description
<b>WS_GROUP</b>	Specifies the first control in a group of controls. All controls defined with this style after the first control belong to the same group.
<b>BS_LEFTTEXT</b>	Places text on the left side of the radio button or check box when combined with a radio button or check box style.
<b>BS_CENTER</b>	Centers text horizontally in the button rectangle.
<b>BS_BOTTOM</b>	Places text at the bottom of the button rectangle.
<b>WS_VSCROLL</b>	Creates a window with a vertical scroll bar.
<b>BS_VCENTER</b>	Places text in the middle (vertically) of the button rectangle.

**Table 22** ▪ Window Styles for Button Controls (cont.)

Value	Description
<b>BS_PUSHLIKE</b>	Makes a button—such as a check box, three-state check box, or radio button—look and act like a push button. The button looks raised when it is not pushed or selected, and sunken when it is pushed or checked.
<b>BS_FLAT</b>	Specifies that the button is two-dimensional. It does not use the default shading to create a three-dimensional image.
<b>BS_NOTIFY</b>	<p>Enables a button to send BN_KILLFOCUS and BN_SETFOCUS notification messages to its parent window.</p> <p>Buttons send the BN_CLICKED notification message regardless of whether it has this style. To get BN_DBLCLK notification messages, the button must have the BS_RADIOBUTTON or BS_OWNERDRAW style.</p>
<b>BS_MULTILINE</b>	Wraps the button text to multiple lines if the text string is too long to fit on a single line in the button rectangle.

## Other Window Styles for Push Button Controls

The following values apply only to push button controls. They are mutually exclusive.

**Table 23** ▪ Window Styles for Push Button Controls

Value	Description
<b>BS_OWNERDRAW</b>	Creates an owner-drawn button. The owner window receives a WM_DRAWITEM message when a visual aspect of the button has changed. Do not combine the BS_OWNERDRAW style with any other button styles.
<b>BS_USERBUTTON</b>	Obsolete, but provided for compatibility with 16-bit versions of Windows. Win32-based applications should use BS_OWNERDRAW instead.

## Other Window Styles for Check Box Controls

The following values apply only to check box controls. They are mutually exclusive.

**Table 24** ▪ Window Styles for Check Box Controls

Value	Description
<b>BS_AUTOCHECKBOX</b>	Creates a button that is the same as a check box, except that the check state automatically toggles between checked and cleared each time the user selects the check box.
<b>BS_3STATE</b>	Creates a button that is the same as a check box, except that the box can be grayed as well as checked or cleared. Use the grayed state to show that the state of the check box is not determined.

**Table 24** ▪ Window Styles for Check Box Controls (cont.)

Value	Description
<b>BS_AUTO3STATE</b>	Creates a button that is the same as a three-state check box, except that the box changes its state when the user selects it. The state cycles through checked, grayed, and cleared.

## Other Window Styles for Combo Box Controls

**Project** ▪ This information applies to the following project types:

- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

The following window style options are available for combo box controls. For additional information, see the MSDN Library.

**Table 25** ▪ Window Styles for Combo Box Controls

Value	Description
<b>WS_GROUP</b>	Specifies the first control in a group of controls. All controls defined with this style after the first control belong to the same group.
<b>WS_VSCROLL</b>	Creates a window with a vertical scroll bar.
<b>CBS_SIMPLE</b>	Displays the list box at all times. The current selection in the list box is displayed in the edit control.
<b>CBS_DROPDOWN</b>	Similar to CBS_SIMPLE, except that the list box is not displayed unless the user selects an icon next to the edit control.
<b>CBS_OEMCONVERT</b>	Converts text entered in the combo box edit control from the Windows character set to the OEM character set and then back to the Windows set. This results in proper character conversion when the application calls the <b>CharToOem</b> function to convert a Windows string in the combo box to OEM characters. This style is useful for combo boxes that contain file names and applies only to combo boxes created with the CBS_SIMPLE or CBS_DROPDOWN style.
<b>CBS_HASSTRINGS</b>	Specifies that an owner-drawn combo box contains items consisting of strings. The combo box maintains the memory and address for the strings so the application can use the CB_GETLBTEXT message to retrieve the text for a particular item.
<b>CBS_UPPERCASE</b>	Converts to uppercase all text in both the selection field and the list.

**Table 25** ▪ Window Styles for Combo Box Controls (cont.)

Value	Description
<b>CBS_AUTOHSCROLL</b>	Automatically scrolls the text in an edit control to the right when the user types a character at the end of the line. If this style is not set, only text that fits within the rectangular boundary is allowed.
<b>CBS_DISABLENOSCROLL</b>	Shows a disabled vertical scroll bar in the list box when the box does not contain enough items to scroll. Without this style, the scroll bar is hidden when the list box does not contain enough items.
<b>CBS_NOINTEGRALHEIGHT</b>	Specifies that the size of the combo box is exactly the size specified by the application when it created the combo box. Normally, the system sizes a combo box so that it does not display partial items.
<b>CBS_OWNERDRAWFIXED</b>	Specifies that the owner of the list box is responsible for drawing its contents and that the items in the list box are all the same height. The owner window receives a WM_MEASUREITEM message when the combo box is created and a WM_DRAWITEM message when a visual aspect of the combo box has changed.
<b>CBS_OWNERDRAWVARIABLE</b>	Specifies that the owner of the list box is responsible for drawing its contents and that the items in the list box are variable in height. The owner window receives a WM_MEASUREITEM message for each item in the combo box when you create the combo box and a WM_DRAWITEM message when a visual aspect of the combo box has changed.

## Other Window Styles for List View Controls

**Project** ▪ This information applies to the following project types:

- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

The following window style options are available for list view controls. For additional information, see the MSDN Library.

**Table 26** ▪ Window Styles for List View Controls

Value	Description
<b>WS_GROUP</b>	Specifies the first control in a group of controls. All controls defined with this style after the first control belong to the same group.
<b>LVS_SINGLESEL</b>	Enables only one item to be selected at a time. By default, multiple items can be selected.

**Table 26** ▪ Window Styles for List View Controls (cont.)

Value	Description
<b>LVS_NOLABELWRAP</b>	Displays item text on a single line in icon view. By default, item text might wrap in icon view.
<b>LVS_AUTOARRANGE</b>	Specifies that icons automatically remain arranged in icon view and small icon view.
<b>LVS_SHOWSELALWAYS</b>	Always shows the selection highlighted, even if the control is not activated.
<b>LVS_SORTASCENDING</b>	Sorts items based on item text in ascending order.
<b>LVS_SORTDESCENDING</b>	Sorts items based on item text in descending order.
<b>LVS_EDITLABELS</b>	Enables item text to be edited in place. The parent window must process the LVN_ENDLABELEDIT notification message.
<b>LVS_OWNERDATA</b>	Creates a virtual list view control.
<b>LVS_NOSCROLL</b>	Disables scrolling, so all items must be displayed within the client area.
<b>LVS_NOSORTHEADER</b>	Specifies that column headers do not work like buttons. This style is useful if clicking a column header in report view does not carry out any action, such as sorting.
<b>LVS_OWNERDRAWFIXED</b>	Enables the owner window to paint items in report view. The list view control sends a WM_DRAWITEM message to paint each item; it does not send separate messages for each subitem. The itemData member of the DRAWITEMSTRUCT structure contains the item data for the specified list view item.
<b>LVS_NOCOLUMNHEADER</b>	Specifies that no column header is displayed in report view, which is the default view.
<b>LVS_SHAREIMAGELISTS</b>	Specifies that the control does not destroy the image lists assigned to it when it is destroyed. This style enables the same image lists to be used with multiple list view controls.

## Types

**Note** ▪ The following values are mutually exclusive.

**Table 27** ▪ Type Values

Value	Description
<b>LVS_ICON</b>	Specifies icon view.

**Table 27** ▪ Type Values (cont.)

Value	Description
<b>LVS_REPORT</b>	Specifies report view.
<b>LVS_LIST</b>	Specifies list view.
<b>LVS_SMALLICON</b>	Specifies small icon view.

## Align

**Note** ▪ The following values are mutually exclusive.

**Table 28** ▪ Alignment Values

Value	Description
<b>LVS_ALIGNTOP</b>	Specifies that items are aligned with the top of the list view control in icon view and small icon view.
<b>LVS_ALIGNLEFT</b>	Specifies that items are left-aligned in icon view and small icon view.

## Other Window Styles for Edit Field and List Box Controls

**Project** ▪ This information applies to the following project types:

- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

The following window style options are available for edit field and list box controls. For additional information, see the MSDN Library.

**Table 29** ▪ Window Styles for Edit Field and List Box Controls

Value	Description
<b>WS_GROUP</b>	Specifies the first control in a group of controls. All controls defined with this style after the first control belong to the same group.
<b>WS_VSCROLL</b>	Creates a window with a vertical scroll bar.
<b>LBS_STANDARD</b>	Creates a bordered list box.
<b>LBS_NOTIFY</b>	The parent window receives an input message whenever the end user clicks or double-clicks a string.

**Table 29** ▪ Window Styles for Edit Field and List Box Controls (cont.)

Value	Description
<b>LBS_NODATA</b>	<p>Specifies a no-data list box. Specify this style when the count of items in the list box will exceed one thousand. A no-data list box must also have the LBS_OWNERDRAWFIXED style, but must not have the LBS_SORT or LBS_HASSTRINGS style.</p> <p>A no-data list box resembles an owner-drawn list box except that it contains no string or bitmap data for an item. Commands to add, insert, or delete an item always ignore any specified item data; requests to find a string within the list box always fail. The system sends the WM_DRAWITEM message to the owner window when an item must be drawn.</p> <p>The itemID member of the DRAWITEMSTRUCT structure passed with the WM_DRAWITEM message specifies the line number of the item to be drawn. A no-data list box does not send a WM_DELETEITEM message.</p>
<b>LBS_NOINTEGRALHEIGHT</b>	Creates a list box that is precisely the size specified by the application when it created the list box.
<b>LBS_NOREDRAW</b>	List box is not updated when changes are made.
<b>LBS_MULTIPLESEL</b>	Toggles string selection each time the end user clicks or double-clicks the string.
<b>LBS_HASSTRINGS</b>	Specifies that a list box contains items consisting of strings. The list box maintains the memory and addresses for the strings so that the application can use the LB_GETTEXT message to retrieve the text for a particular item. By default, all list boxes except owner-drawn list boxes have this style. You can create an owner-drawn list box either with or without this style.
<b>LBS_USETABSTOPS</b>	Allows a list box to recognize and expand tab characters when drawing strings.
<b>LBS_MULTICOLUMN</b>	Creates a multicolumn list box that scrolls horizontally.
<b>LBS_EXTENDEDSEL</b>	Allows the end user to select multiple items using the SHIFT key and the mouse, or key combinations.
<b>LBS_DISABLENOSCROLL</b>	Displays a disabled vertical scroll bar when the list box does not contain enough items to scroll.
<b>LBS_WANTKEYBOARDINPUT</b>	Passes WM_VKEYTOITEM or WM_CHARTOITEM messages when the end user presses a key while the list box has focus. This allows an application to perform special processing on the keyboard input.
<b>LBS_OWNERDRAWFIXED</b>	Indicates that the owner of the list box is responsible for drawing the list box's contents. Items in the list box are the same height.

**Table 29** ▪ Window Styles for Edit Field and List Box Controls (cont.)

Value	Description
<b>LBS_OWNERDRAWVARIABLE</b>	Indicates that the owner of the list box is responsible for drawing the list box's contents. Items in the list box are of variable height.

## Other Window Styles for Line Controls

**Project** ▪ This information applies to the following project types:

- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

The following window style options are available for line controls. For additional information, see the MSDN Library.

**Table 30** ▪ Window Styles for Line Controls

Value	Description
<b>SS_SIMPLE</b>	Specifies a simple rectangle and displays a single line of left-aligned text in the rectangle. The text line cannot be shortened or altered in any way. Also, if the control is disabled, the control does not gray its text.
<b>SS_ETCHEDVERT</b>	Draws the left and right edges of the static control using the EDGE_ETCHED edge style. For more information, see the <b>DrawEdge</b> Windows API function in the MSDN Library.
<b>SS_ETCHEDFRAME</b>	Draws the frame of the static control using the EDGE_ETCHED edge style. For more information, see the DrawEdge Windows API function in the MSDN Library.
<b>SS_ETCHEDHORZ</b>	Draws the top and bottom edges of the static control using the EDGE_ETCHED edge style. For more information, see the DrawEdge Windows API function in the MSDN Library.
<b>SS_BLACKRECT</b>	Specifies a rectangle filled with the current window frame color. This color is black in the default color scheme.
<b>SS_BLACKFRAME</b>	Specifies a box with a frame drawn in the same color as the window frames. This color is black in the default color scheme.
<b>SS_WHITERECT</b>	Specifies a rectangle filled with the current window background color. This color is white in the default color scheme.

**Table 30** ▪ Window Styles for Line Controls (cont.)

Value	Description
<b>SS_WHITEFRAME</b>	Specifies a box with a frame drawn with the same color as the window background. This color is white in the default color scheme.
<b>SS_GRAYRECT</b>	Specifies a rectangle filled with the current screen background color. This color is gray in the default color scheme.
<b>SS_GRAYFRAME</b>	Specifies a box with a frame drawn with the same color as the screen background (desktop). This color is gray in the default color scheme.
<b>WS_GROUP</b>	Specifies the first control in a group of controls. All controls defined with this style after the first control belong to the same group.
<b>WS_VSCROLL</b>	Creates a window with a vertical scroll bar.
<b>SS_NOTIFY</b>	Sends the parent window STN_CLICKED, STN_DBLCLK, STN_DISABLE, and STN_ENABLE notification messages when the user clicks or double-clicks the control.
<b>SS_REALSIZECONTROL</b>	Adjusts the bitmap to fit the size of the static control. Certain display settings on a target machine can affect the size of the control area used to render an image, such as the system font or DPI scaling. This style bit automatically resizes bitmaps to fit their controls. This style is recommended instead of SS_REALSIZEIMAGE to support high DPI machines. Otherwise, the image may be clipped or not fill the entire control at runtime on some machines.
<b>SS_RIGHTJUST</b>	Specifies that the lower right corner of a static control with the SS_BITMAP or SS_ICON style is to remain fixed when the control is resized. Only the top and left sides are adjusted to accommodate a new bitmap or icon.
<b>SS_CENTERIMAGE</b>	Specifies that, if the bitmap or icon is smaller than the client area of the static control, the rest of the client area is filled with the color of the pixel in the top left corner of the bitmap or icon. If the static control contains a single line of text, the text is centered vertically in the client area of the control.
<b>SS_REALSIZEIMAGE</b>	Prevents a static icon or bitmap control (that is, static controls that have the SS_ICON or SS_BITMAP style) from being resized as it is loaded or drawn. If the icon or bitmap is larger than the destination area, the image is clipped.
<b>SS_ENDELLIPSIS</b>	<p>If the end of a string does not fit in the rectangle, it is truncated and ellipses are added. If a word that is not at the end of the string goes beyond the limits of the rectangle, it is truncated without ellipses. Compare with SS_PATHELLIPSIS and SS_WORDELLIPSIS.</p>  <p><b>Note</b> ▪ <i>SS_ENDELLIPSIS, SS_PATHELLIPSIS, and SS_WORDELLIPSIS are mutually exclusive.</i></p>

**Table 30** ▪ Window Styles for Line Controls (cont.)

Value	Description
<b>SS_PATHELLIPSIS</b>	Replaces characters in the middle of the string with ellipses so that the result fits in the specified rectangle. If the string contains backslash (\) characters, SS_PATHELLIPSIS preserves as much as possible of the text after the last backslash. Compare with SS_ENDELLIPSIS and SS_WORDELLIPSIS.  
<b>Note</b> ▪ SS_ENDELLIPSIS, SS_PATHELLIPSIS, and SS_WORDELLIPSIS are mutually exclusive.	
<b>SS_WORDELLIPSIS</b>	Truncates any word that does not fit in the rectangle and adds ellipses. Compare with SS_ENDELLIPSIS and SS_PATHELLIPSIS.  
<b>Note</b> ▪ SS_ENDELLIPSIS, SS_PATHELLIPSIS, and SS_WORDELLIPSIS are mutually exclusive.	

## Other Window Styles for Progress Bar Controls

**Project** ▪ This information applies to the following project types:

- InstallScript
- InstallScript MSI
- InstallScript Object

The following window style options are available for progress bar controls. For additional information, see the MSDN Library.

**Table 31** ▪ Window Styles for Progress Bar Controls

Value	Description
<b>WS_GROUP</b>	Specifies the first control in a group of controls. All controls defined with this style after the first control belong to the same group.
<b>PBS_VERTICAL</b>	The progress bar displays progress status vertically, from bottom to top.

## Other Window Styles for Selection Tree Controls

**Project** ▪ This information applies to the following project types:

- InstallScript

- *InstallScript MSI*
- *InstallScript Object*

The following window style options are available for selection tree controls. For additional information, see the MSDN Library.

**Table 32** • Window Styles for Selection Tree Controls

Value	Description
<b>WS_GROUP</b>	Specifies the first control in a group of controls. All controls defined with this style after the first control belong to the same group.
<b>TVS_EDITLABELS</b>	Enables the user to edit the labels of tree view items.
<b>TVS_HASBUTTONS</b>	Displays plus (+) and minus (-) buttons next to parent items. The user taps the buttons to expand or collapse a parent items list of child items. To include buttons with items at the root of the tree view, you must also specify the TVS_LINESATROOT style.
<b>TVS_DISABLEDRAHDROP</b>	Prevents the tree view control from sending TVN_BEGINDRAG notification messages.
<b>TVS_SHOWSELALWAYS</b>	Uses the system highlight colors to draw the selected item.
<b>TVS_FULLROWSELECT</b>	Enables full-row selection in the tree view. The entire row of the selected item is highlighted, and clicking anywhere on an item's row causes it to be selected. This style cannot be used in conjunction with the TVS_HASLINES style.
<b>TVS_HASLINES</b>	Uses lines to show the hierarchy of items.
<b>TVS_LINESATROOT</b>	Uses lines to link items at the root of the tree view control. This value is ignored if the TVS_HASLINES control is not also specified.
<b>TVS_RTLREADING</b>	Causes text to be displayed from right-to-left (RTL). Usually, windows display text left-to-right (LTR). Windows can be mirrored to display languages such as Hebrew or Arabic that read RTL. Typically, tree-view text is displayed in the same direction as the text in its parent window. If TVS_RTLREADING is set, tree-view text reads in the opposite direction from the text in the parent window.
<b>TVS_NOTOOLTIPS</b>	Disables ToolTips.
<b>TVS_CHECKBOXES</b>	Enables items in a tree view control to be displayed as check boxes. This style uses item state images to produce the check box effect.
<b>TVS_TRACKSELECT</b>	Enables hot tracking in a tree-view control.

**Table 32** ▪ Window Styles for Selection Tree Controls (cont.)

Value	Description
<b>TVS_SINGLEEXPAND</b>	Causes the item being selected to expand and the item being unselected to collapse upon selection in the tree view. If the mouse is used to single-click the selected item and that item is closed, it will be expanded. If the user holds down the Ctrl key while selecting an item, the item being unselected will not be collapsed.
<b>TVS_INFOTIP</b>	Obtains ToolTip information by sending the TVN_GETINFOTIP notification.
<b>TVS_NOScroll</b>	Disables horizontal scrolling in the control. The control will not display any horizontal scroll bars.
<b>TVS_NONEVENHEIGHT</b>	Sets the height of the items to an odd height with the TVM_SETITEMHEIGHT message. By default, the height of items must be an even value.

## Outputs Dialog Box

The Outputs dialog displays information about a project output group in the File System Editor. This dialog is available for InstallShield projects created in Microsoft Visual Studio.

### Task

**To access the Outputs dialog, do one of the following:**

1. Select the **Outputs** property in the **Properties** window when a project output group is selected in the **File System Editor**.
2. In the **Files and Folders** view, right-click an item in the **Source computer's files** pane and click **Resolve Project Output**.
3. In the **Files and Folders** view, right-click an item in the **Destination computer's files** pane and click **Resolve Project Output**.

**Note** ▪ If multiple project output groups are selected, information is displayed only for the first group selected.

## Dialog Options

### Target Name

Displays the file name for the selected project output group as it will be displayed on a target computer. This field is read only.

### Source Path

Displays the path to the project output group files on the development computer. This field is read only.

# Overwrite Dialog Box

This dialog box lets you specify whether the files of the active component (the component selected in the Setup Design or Components view) overwrite already-existing versions on the target system always, never, or conditionally based on date/time stamp or version number.

## Dialog Options

### list box

Select whether files on the target system are always overwritten, never overwritten, or conditionally overwritten based on date/time stamp or version number.

The following controls are enabled only if "Overwrite files BY VERSION" or "Overwrite files BY VERSION THEN DATE (if necessary)" is selected in the list box.

---

**Note** - If a file on the target system has a version number and the file on your distribution media does not, or vice versa, the file with no version number is treated as if it had a lower version number.

### Version: Newer

A file on the target system is overwritten if the file on your distribution media has a higher version number.

If the file on your distribution media and the file on the target system have the same version number, or if neither file has a version number, and you selected Overwrite files BY VERSION THEN DATE (if necessary) from the list box, then whether the file on the target system is overwritten is determined by which Date/Time option you select.

If neither file has a version number and you selected Overwrite files BY VERSION from the list box, then the file on the target system is not overwritten.

### Version: Newer or Same

A file on the target system is overwritten if the file on your distribution media has a higher or the same version number.

If neither file has a version number and you selected Overwrite files BY VERSION THEN DATE (if necessary) from the list box, then whether the file on the target system is overwritten is determined by which Date/Time option you select.

If neither file has a version number and you selected Overwrite files BY VERSION from the list box, then the file on the target system is not overwritten.

### Version: Older

A file on the target system is overwritten if the file on your distribution media has a lower version number.

If the file on your distribution media and the file on the target system have the same version number, or if neither file has a version number, and you selected Overwrite files BY VERSION THEN DATE (if necessary) from the list box, then whether the file on the target system is overwritten is determined by which Date/Time option you select.

If neither file has a version number and you selected Overwrite files BY VERSION from the list box, then the file on the target system is not overwritten.

The following controls are enabled only if Overwrite files BY DATE or Overwrite files BY VERSION THEN DATE (if necessary) is selected in the list box.

#### **Date/Time: Newer**

A file on the target system is overwritten if the file on your distribution media has a more recent date and time stamp.

#### **Date/Time: Newer or Same**

A file on the target system is overwritten if the file on your distribution media has a more recent or the same date and time stamp.

#### **Date/Time: Older**

A file on the target system is overwritten if the file on your distribution media has a less recent date and time stamp.

## Patch Sequence Dialog Box

The Patch Sequence dialog box opens when you are creating a patch sequence in the Patch Design view.

**Table 33** • Patch Sequence Dialog Box Options

Option	Description
<b>Family Name</b>	<p>Specify the name of the family of patches to which this patch belongs. Windows Installer 3.0 and later uses the patch family to compare small-update patches with all of the other patches within the same family and determine the order in which each of the patches should be applied to the target machine.</p> <p>To identify that a patch configuration belongs to multiple families, create a separate row on the Sequence tab for every patch family. You may want a patch to belong to multiple families, for example, if the patch can update more than one product.</p>
<b>Target</b>	<p>Type the product code GUID in this box if you want to associate the patch configuration with a specific product. Entry in this box is not required.</p> <p>To identify that a patch configuration should target multiple GUIDs, create a separate row on the Sequence tab for every GUID and family combination.</p>
<b>Sequence Number</b>	<p>Specify the sequence number for the patch configuration. This value indicates the placement of the patch configuration within sequence of patches that belong to the same patch family and the same target GUID (if identified).</p>

**Table 33** • Patch Sequence Dialog Box Options (cont.)

Option	Description
<b>Supersede previous versions</b>	If you want the patch to be used instead of all of the patches that have a lower sequence value and that are in the same patch family, select this check box. Selecting this check box does not guarantee that the patch will always supersede all earlier patches, since the earlier patches might belong to multiple patch families. Note that a small-update patch cannot supersede a minor upgrade patch or a major upgrade patch, regardless of whether this check box is selected.

## Path Variable Overrides Dialog Box

**Project** • This information applies to the following project types:

- *Advanced UI*
- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *Suite/Advanced UI*

The Path Variable Overrides dialog box opens when you click the ellipsis button (...) in the Path Variable Overrides setting. The Path Variable Overrides setting is on the Build tab for a release in the Releases view. Use this setting to override one or more path variables in your project at build time for the selected release.

The Path Variable Overrides dialog box shows a check box for the path variables, environment variables, and registry variables that are configured in the Path Variables view. Note that it does not include check boxes for any predefined path variables, or for path variables that are already overridden for the same release in the Releases view.

Select the check box for each path variable that you would like to override. Then click the OK button. Under the Path Variable Overrides setting, InstallShield adds a new setting for each path variable that you selected. Use those settings to specify the new values for the path variables.

At build time, InstallShield overrides the values that are set in the Path Variables view with the values that are configured for the release in the Releases view.

## Path Variable Recommendation Dialog Box

If you have selected the **Always display the Path Variable Recommendation dialog to me** option on the Path Variables tab of the Options dialog box, InstallShield displays the Path Variable Recommendation dialog box every time you associate a new source folder with your installation project.

The dialog box is also displayed if you selected the **Always recommend path variables** option on the Path Variables tab of the Options dialog box and one of the following is true:

- InstallShield can recommend more than one path variable for a particular source folder.
- InstallShield cannot recommend a path variable based on an existing path variable and you have not selected the auto-create check box on the Path Variables tab.

## Dialog Options

### Use the following path variable-based folder representation for the source folder

This option provides suggested path variables or path variable combinations for you to use instead of an absolute path. For example, if you have a path variable called <MyFiles> that points to C:\Work\Files and you add a file to your installation from C:\Work\Files\Images, it is recommended that you use <MyFiles>\Images rather than the full hard-coded path C:\Work\Files\Images.

This option is available only if InstallShield can recommend a path variable for the source folder.

### Create a new path variable

To create a path variable for the source folder in which your files are located, select the Create a new path variable option. Selecting this option creates a standard path variable that is mapped to the folder in which your new files are located. Enter the new variable path name in the Path Variable Name box.

---

**Caution** ▪ Do not enclose the path variable's name in angle brackets. InstallShield automatically adds the angle brackets when you click OK.

### Use the following absolute path

If you do not want to use a path variable to represent a particular link, select the **Use the following absolute path** option. The absolute path to your source folder appears below this button.

# Permissions Dialog Boxes for Files and Directories

---

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

## Permissions Dialog Box

The Permissions dialog box lets you configure settings for securing files and folders for end users who run your product in a locked-down environment. You can assign permissions for a file or folder to specific groups and users. For example, you may assign Read, Write, and Delete permissions for a particular file to the Administrators group, but only Read permissions for all of the users in a different group.

Depending on what is selected for the Locked-Down Permissions setting in the General Information view of your project, InstallShield adds permissions data to either the ISLockPermissions table or the LockPermissions table. To learn more, see [Securing Files, Folders, Registry Keys, and Windows Services in a Locked-Down Environment](#).

The following table describes the different areas on the Permissions dialog box.

**Table 34** ▪ Areas of the Permissions Dialog Box

Area	Description
<b>Name(s)</b>	<p>In this grid, you can enter any combination of domain and user names. To add an entry, right-click the grid and click New. You can modify or delete entries using the same context menu.</p> <p>To specify the current user's domain, select [%USERDOMAIN] in the Domain field. To specify the user that is currently running the installation, select [LogonUser] in the User field. To set permissions for user accounts on a local system, leave the Domain field blank. Note that you can enter in the Domain or User fields any Windows Installer property that is set at run time—for example, [MYPROPERTY].</p> <p>If the custom InstallShield handling option is selected for the Locked-Down Permissions setting in the General Information view, the User field contains a list of well-known security identifiers (SIDs). Most of the SIDs are not supported by the traditional Windows Installer handling option.</p> <p>The custom InstallShield handling option supports localized names for all of the SIDs that are listed in the User field. With the traditional option, if you try to use a localized name to set permissions on a non-English system, the installation may fail.</p>  <p><b>Tip</b> ▪ For more information on the custom InstallShield handling option and the traditional Windows Installer handling option, see <a href="#">Securing Files, Folders, Registry Keys, and Windows Services in a Locked-Down Environment</a>.</p>
<b>Permissions</b>	<p>Select a name in the Name(s) area, and then select or clear the check boxes in the Permissions box to configure the corresponding permissions for the file or folder. Once you have selected a permission, you can click the Advanced button to specify other associated permissions and advanced settings.</p>

**Table 34** ▪ Areas of the Permissions Dialog Box (cont.)

Area	Description
<b>Deny Access</b>	<p>If you want to explicitly deny the permissions that you are selecting in the Permissions box, select this check box.</p> <p>This check box is available only if the custom InstallShield handling option is selected for the Locked-Down Permissions setting in the General Information view. The traditional Windows Installer handling option does not include support for this behavior.</p>  <p><b>Tip</b> ▪ For more information on the custom InstallShield handling option and the traditional Windows Installer handling option, see <a href="#">Securing Files, Folders, Registry Keys, and Windows Services in a Locked-Down Environment</a>.</p>

## Advanced Permissions Dialog Box

If you click the Advanced button on the Permissions dialog box, the Advanced Permissions dialog box opens. The following table describes the different areas on the Advanced Permissions dialog box.

**Table 35** ▪ Areas of the Advanced Permissions Dialog Box

Area	Description
<b>Advanced Permissions</b>	<p>In this box, select the check boxes for the permissions that you want to set.</p>
<b>Apply these permissions to child objects</b>	<p>If you are configuring permissions for a folder and you want the permissions to be applied to all of the folder's subfolders and files, select this check box.</p> <p>This check box is available only if the custom InstallShield handling option is selected for the Locked-Down Permissions setting in the General Information view. The traditional Windows Installer handling option does not include support for this behavior.</p>  <p><b>Tip</b> ▪ For more information on the custom InstallShield handling option and the traditional Windows Installer handling option, see <a href="#">Securing Files, Folders, Registry Keys, and Windows Services in a Locked-Down Environment</a>.</p>

## Permissions Dialog Boxes for Registry Keys

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

## Permissions Dialog Box

The Permissions dialog box lets you configure settings for securing registry keys for end users who run your product in a locked-down environment. You can assign permissions for a registry key to specific groups and users. For example, you may assign Read, Write, and Delete permissions for a particular registry key to the Administrators group, but only Read permissions for all of the users in a different group.

Depending on what is selected for the Locked-Down Permissions setting in the General Information view of your project, InstallShield adds permissions data to either the ISLockPermissions table or the LockPermissions table. To learn more, see [Securing Files, Folders, Registry Keys, and Windows Services in a Locked-Down Environment](#).

The following table describes the different areas on the Permissions dialog box.

**Table 36** ▪ Areas of the Permissions Dialog Box

Area	Description
<b>Name(s)</b>	<p>In this grid, you can enter any combination of domain and user names. To add an entry, right-click the grid and click New. You can modify or delete entries using the same context menu.</p> <p>To specify the current user's domain, select [%USERDOMAIN] in the Domain field. To specify the user that is currently running the installation, select [LogonUser] in the User field. To set permissions for user accounts on a local system, leave the Domain field blank. Note that you can enter in the Domain or User fields any Windows Installer property that is set at run time—for example, [MYPROPERTY].</p> <p>If the custom InstallShield handling option is selected for the Locked-Down Permissions setting in the General Information view, the User field contains a list of well-known security identifiers (SIDs). Most of the SIDs are not supported by the traditional Windows Installer handling option.</p> <p>The custom InstallShield handling option supports localized names for all of the SIDs that are listed in the User field. With the traditional option, if you try to use a localized name to set permissions on a non-English system, the installation may fail.</p> <div>  <p><b>Tip</b> ▪ For more information on the custom InstallShield handling option and the traditional Windows Installer handling option, see <a href="#">Securing Files, Folders, Registry Keys, and Windows Services in a Locked-Down Environment</a>.</p> </div>

**Table 36** ▪ Areas of the Permissions Dialog Box (cont.)

Area	Description
<b>Permissions</b>	Select a name in the Name(s) area, and then select or clear the check boxes in the Permissions box to configure the corresponding permissions for the registry key. Once you have selected a permission, you can click the Advanced button to specify other associated permissions and advanced settings.
<b>Deny Access</b>	<p>If you want to explicitly deny the permissions that you are selecting in the Permissions box, select this check box.</p> <p>This check box is available only if the custom InstallShield handling option is selected for the Locked-Down Permissions setting in the General Information view. The traditional Windows Installer handling option does not include support for this behavior.</p>  <p><b>Tip</b> ▪ For more information on the custom InstallShield handling option and the traditional Windows Installer handling option, see <a href="#">Securing Files, Folders, Registry Keys, and Windows Services in a Locked-Down Environment</a>.</p>

## Advanced Permissions Dialog Box

If you click the Advanced button on the Permissions dialog box, the Advanced Permissions dialog box opens. The following table describes the different areas on the Advanced Permissions dialog box.

**Table 37** ▪ Areas of the Advanced Permissions Dialog Box

Area	Description
<b>Advanced Permissions</b>	In this box, select the check boxes for the permissions that you want to set.
<b>Apply these permissions to child objects</b>	<p>If you are configuring permissions for a registry key and you want the permissions to be applied to all of the key's subkey, select this check box.</p> <p>This check box is available only if the custom InstallShield handling option is selected for the Locked-Down Permissions setting in the General Information view. The traditional Windows Installer handling option does not include support for this behavior.</p>  <p><b>Tip</b> ▪ For more information on the custom InstallShield handling option and the traditional Windows Installer handling option, see <a href="#">Securing Files, Folders, Registry Keys, and Windows Services in a Locked-Down Environment</a>.</p>

# Platform Suites Dialog Box

**Project** ▪ This information applies to the following project types:

- InstallScript
- InstallScript Object

The Platform Suites dialog box lets you specify the platform suites with which the selected component is associated. To access this dialog box, click the ellipsis button (...) in the Platform Suite(s) setting for a component in the Components view or the Setup Design view.

**Table 38** ▪ Platform Suites Dialog Box Settings

Setting	Description
<b>Install without performing platform suite verification on the target system</b>	The installation of the component's files does not depend on the target system's suite.
<b>Install when the target system has one or more of the specified platform suite(s)</b>	<p>The installation installs the component's files only if at least one of the selected suites exists on the target system.</p> <p>If you select this option, select the check boxes of the appropriate platform suites.</p>
<b>Install only when the target system has all the specified platform suite(s)</b>	<p>The installation installs the component's files only if all of the selected suites exist on the target system.</p> <p>If you select this option, select the check boxes of the appropriate platform suites.</p>
<b>Show all platform suites</b>	<p>To see all of the available suites, select this check box. The full list are those that can be specified in the Windows API's OSVERSIONINFOEX data structure (as documented on MSDN).</p> <p>To see only the most common suites, clear this check box.</p>

## Platforms Dialog Box

**Project** ▪ Some of this information applies to InstallScript projects, and some of this information applies to InstallScript MSI projects.

Depending on how you launch the Platforms dialog box, you can specify either of the following:

- The platforms that you want to be available when you to select the operating system for components or releases in your project. This is available for InstallScript projects.
- The platform requirements for a component. This is available for InstallScript and InstallScript MSI projects.

## Platform Support at the Project Level (InstallScript Projects)

If you access the Platforms dialog box at the project level, you can specify the platforms that you want to be available when you to select the operating system for components or releases in your project.

**Note** - Specifying platforms at the project level does not create target for running the installation. To create target in an InstallScript project, you can use the SYSINFO structure to identify the operating platform of the target system.

### Task

#### To access the Platforms dialog box at the project level:

1. In the View List under **Installation Information**, click **General Information**.
2. In the **Platform Filtering** setting, click the ellipsis button (...).

The following table shows the settings that are displayed on the Platforms dialog box when you are accessing it at the project level.

**Table 39** - Platforms Dialog Box Settings for a Project

Setting	Description
<b>The project supports all platforms that InstallShield supports</b>	<p>Select this option if you want InstallShield to list all of the supported run-time platforms for the following settings:</p> <ul style="list-style-type: none"><li>• Operating Systems setting at the component level (InstallScript and InstallScript MSI projects)</li><li>• Platform(s) setting at the release level (InstallScript projects)</li></ul> <p>If you select this option, you can designate that a particular component or release in your project is targeted for any one or more supported platforms.</p>

**Table 39** ▪ Platforms Dialog Box Settings for a Project (cont.)

Setting	Description
<b>The project supports only the platforms that are selected below</b>	<p>Select this option if you want InstallShield to list only some platforms that are displayed for the following settings:</p> <ul style="list-style-type: none"><li>● Operating Systems setting at the component level (InstallScript and InstallScript MSI projects)</li><li>● Platform(s) setting at the release level (InstallScript projects)</li></ul> <p>Then select the platforms that should be displayed.</p>  <p><b>Tip</b> ▪ To select multiple consecutive operating systems, select the first file, press and hold <b>SHIFT</b>, and select the last operating systems. To select multiple nonconsecutive operating systems, select the first operating systems, press and hold <b>CTRL</b>, and select each additional operating systems.</p> <p>In general, if a platform is not listed for this setting at the project level, you cannot designate that a particular component or release in your project is targeted for that platform.</p>

## Platform Support at the Component Level (InstallScript and InstallScript MSI Projects)

If you access the Platforms dialog box at the component level, you can specify which platforms are supported by the selected component.

### Task

#### To access the Platforms dialog box at the component level:

1. In the View List under **Organization**, click **Components**.
2. In the **Components** explorer, click the component whose platform requirements you want to configure.
3. Click the value of the **Operating Systems** setting, and then click the ellipsis button (...).

The following table shows the settings that are displayed on the Platforms dialog box when you are accessing it at the component level.

**Table 40** ▪ Platforms Dialog Box Settings for a Component

Setting	Description
<b>The files in this component should be installed when the setup is running on any platform</b>	If the selected component is operating system independent—that is, if none of the component's data are specific to certain operating systems—select this option.

**Table 40** ▪ Platforms Dialog Box Settings for a Component (cont.)

Setting	Description
<b>The files in this component should be installed only when the setup is running on one of the platforms checked below</b>	<p>If the selected component is specific to one or more operating systems, select this option and then select the appropriate operating systems. If the target machine's operating system does not match one of the operating systems that are specified for this setting, the component is not installed.</p>  <p><b>Tip</b> ▪ To select multiple consecutive operating systems, select the first file, press and hold <b>SHIFT</b>, and select the last operating systems. To select multiple nonconsecutive operating systems, select the first operating systems, press and hold <b>CTRL</b>, and select each additional operating systems.</p>  <p><b>Project</b> ▪ For InstallScript projects, the list of operating systems that are displayed in this dialog box excludes any of the operating systems whose check box is cleared at the project level.</p> <p>Note that if the selected component supports platforms that are not supported by a release, InstallShield does not include the component in the release at build time.</p>

## Postbuild Event Dialog Box

**Edition** ▪ This information applies to the Premier edition of InstallShield.

The Postbuild Event dialog box opens when you click the ellipsis button (...) in the Postbuild Event setting. The Postbuild Event setting is on the Events tab for a release in the Releases view.

Use the Postbuild Event dialog box to specify one or more commands that you want to be run after InstallShield has built and signed the release.

To specify more than one command, enter each command on a separate line. At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.

When you are entering a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands.

For more information, see [Specifying Commands that Run Before, During, and After Builds](#).

# Prebuild Event Dialog Box

**Edition** - This information applies to the Premier edition of InstallShield.

The Prebuild Event dialog box opens when you click the ellipsis button (...) in the Prebuild Event setting. The Prebuild Event setting is on the Events tab for a release in the Releases view.

Use the Prebuild Event dialog box to specify one or more commands that you want to be run before InstallShield starts building the release. This event runs after InstallShield creates the release folder and log file, but before InstallShield starts building the release.

To specify more than one command, enter each command on a separate line. At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.

When you are entering a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands.

For more information, see [Specifying Commands that Run Before, During, and After Builds](#).

# Precompression Event Dialog Box

**Edition** - This information applies to the Premier edition of InstallShield.

The Precompression Event dialog box opens when you click the ellipsis button (...) in the Precompression Event setting. The Precompression Event setting is on the Events tab for a release in the Releases view.

Use the Precompression Event dialog box to specify one or more commands that you want to be run after InstallShield has built the .msi package and the .cab files (if your product's data files are to be stored in .cab files). Note that this event occurs after .cab files are streamed into the .msi package, but before the .msi package has been digitally signed and streamed into the Setup.exe file.

To specify more than one command, enter each command on a separate line. At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.

When you are entering a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands.

For more information, see [Specifying Commands that Run Before, During, and After Builds](#).

# Prerequisite Condition Dialog Box

The Prerequisite Condition dialog box opens when you click the Add button on the Conditions tab of the InstallShield Prerequisite Editor. It also opens when you select an existing condition on this tab and then click the Modify button.

The Prerequisite Condition dialog box lets you define installation conditions that determine whether an InstallShield prerequisite is already installed on the target machine. Failure to do so causes problems because the target system behaves as if the prerequisite was not properly installed. You can also create installation conditions that specify operating system, registry, or file requirements.

**Table 41** • Prerequisite Condition Dialog Box Options

Option	Description
<b>A registry key does or does not exist</b>	<p>If you select this option, type the name of the registry key and select the appropriate registry location to check on a 64-bit system: <b>32-bit</b> or <b>64-bit</b>. The <b>Default</b> radio button indicates you have not made a selection and 32-bit is used.</p> <p>If target machines that have this registry key should meet this installation condition, select <b>If the specified registry key exists</b>. If target machines that do not have this registry key should meet this installation condition, select <b>If the specified registry key does not exist</b>.</p>
<b>A registry entry has a specified value</b>	<p>If you select this option, type the name of the registry key, the name of the value, and the value data. Also, select the appropriate registry location to check on a 64-bit system: <b>32-bit</b> or <b>64-bit</b>. The <b>Default</b> radio button indicates you have not made a selection and 32-bit is used.</p> <p>In addition, select the option that should be used to compare the registry entry specified in this dialog box with the registry entry on the target machine.</p> <p>For example, if you specify <b>1.4.2</b> in the Value data box and select <b>is greater than</b>, target machines that have a value greater than 1.4.2 for this registry entry meet this installation condition.</p>
<b>A registry entry has a specified version value</b>	<p>If you select this option, type the name of the registry key, the name of the value, and the value data. The value data should be a version number.</p> <p>Note that all leading zeros for every field of the version number are ignored. For example, 3.5.3.0010 is greater than 3.5.3.009, and 3.5.3.009 is greater than 3.5.3.01.</p> <p>In addition, select the option that should be used to compare the registry entry specified in this dialog box with the registry entry on the target machine.</p> <p>Lastly, select the appropriate registry location to check on a 64-bit system: <b>32-bit</b> or <b>64-bit</b>. The <b>Default</b> radio button indicates you have not made a selection and 32-bit is used.</p>

**Table 41** ▪ Prerequisite Condition Dialog Box Options (cont.)

Option	Description
<b>A file does or does not exist</b>	<p>If you select this option, do one of the following:</p> <ul style="list-style-type: none"><li>Specify the path and name for the file. To specify a predefined folder, select the appropriate property in the list. The available properties are [CommonFiles64Folder], [CommonFilesFolder], [ProgramFiles64Folder], [ProgramFilesFolder], [System64Folder], [SystemFolder], and [WindowsFolder].</li></ul> <p>If you select one of the 64-bit folder locations, the installation checks the 64-folder location on 64-bit target systems and the 32-folder location on 32-bit target systems.</p> <ul style="list-style-type: none"><li>Specify just the file name—without the path or a property. The installation will search for the specified file in all directories defined for the PATH environment variable on the target machine.</li><li>Specify a registry key as a property. If you do this, the installation will resolve the registry key with the registry value. Note that the last element of the registry path is treated as a value name. If a backslash is the last character of the path, the value of the default registry entry for that registry key is used.</li></ul> <p>For example, if you type the following as the value, the installation checks if the path specified as the value for the HKEY_LOCAL_MACHINE\SOFTWARE\ORACLE\ORACLE_HOME registry entry contains a bin directory with a file named oci.dll:</p> <p>[HKEY_LOCAL_MACHINE\SOFTWARE\ORACLE\ORACLE_HOME]bin\oci.dll</p> <p>If target machines that have this file should meet this installation condition, select <b>If the specified file is found in the location specified above</b>. If target machines that do not have this file should meet this installation condition, select <b>If the specified file is not found in the location specified above</b>.</p>

**Table 41** ▪ Prerequisite Condition Dialog Box Options (cont.)

Option	Description
<b>A file with a certain date exists</b>	<p>If you select this option, do one of the following:</p> <ul style="list-style-type: none"><li>Specify the path and name for the file. To specify a predefined folder, select the appropriate property in the list. The available properties are [CommonFiles64Folder], [CommonFilesFolder], [ProgramFiles64Folder], [ProgramFilesFolder], [System64Folder], [SystemFolder], and [WindowsFolder].</li></ul> <p>If you select one of the 64-bit folder locations, the installation checks the 64-folder location on 64-bit target systems and the 32-folder location on 32-bit target systems.</p> <ul style="list-style-type: none"><li>Specify just the file name—without the path or a property. The installation will search for the specified file in all directories defined for the PATH environment variable on the target machine.</li><li>Specify a registry key as a property. If you do this, the installation will resolve the registry key with the registry value. Note that the last element of the registry path is treated as a value name. If a backslash is the last character of the path, the value of the default registry entry for that registry key is used.</li></ul> <p>For example, if you type the following as the value, the installation checks if the path specified as the value for the HKEY_LOCAL_MACHINE\SOFTWARE\ORACLE\ORACLE_HOME registry entry contains a bin directory with a file named oci.dll:</p> <p>[HKEY_LOCAL_MACHINE\SOFTWARE\ORACLE\ORACLE_HOME]bin\oci.dll</p> <p>In addition, type the date and—if appropriate—the time. For example:</p> <p>4/26/2004 3:57:46 PM</p> <p>Then select the appropriate match option to indicate when to run the InstallShield prerequisite.</p>

**Table 41** ▪ Prerequisite Condition Dialog Box Options (cont.)

Option	Description
<b>A file with a certain version exists</b>	<p>If you select this option, do one of the following:</p> <ul style="list-style-type: none"><li>Specify the path and name for the file. To specify a predefined folder, select the appropriate property in the list. The available properties are [CommonFiles64Folder], [CommonFilesFolder], [ProgramFiles64Folder], [ProgramFilesFolder], [System64Folder], [SystemFolder], and [WindowsFolder].</li></ul> <p>If you select one of the 64-bit folder locations, the installation checks the 64-folder location on 64-bit target systems and the 32-folder location on 32-bit target systems.</p> <ul style="list-style-type: none"><li>Specify just the file name—without the path or a property. The installation will search for the specified file in all directories defined for the PATH environment variable on the target machine.</li><li>Specify a registry key as a property. If you do this, the installation will resolve the registry key with the registry value. Note that the last element of the registry path is treated as a value name. If a backslash is the last character of the path, the value of the default registry entry for that registry key is used.</li></ul> <p>For example, if you type the following as the value, the installation checks if the path specified as the value for the HKEY_LOCAL_MACHINE\SOFTWARE\ORACLE\ORACLE_HOME registry entry contains a bin directory with a file named oci.dll:</p> <p><code>[HKEY_LOCAL_MACHINE\SOFTWARE\ORACLE\ORACLE_HOME]bin\oci.dll</code></p> <p>In addition, type the version number of the file. For example:</p> <p><b>6.7.8.9</b></p> <p>Then select the appropriate match option to indicate when to run the InstallShield prerequisite.</p>

**Table 41** ▪ Prerequisite Condition Dialog Box Options (cont.)

Option	Description
<b>An App package does or does not exist</b>	<p>If you select this option, do one of the following:</p> <p>If you select this option, do one of the following:</p> <ul style="list-style-type: none"> <li>Specify the App package identity name — for the package you want to detect in the target machine. Package identity information will be available in the package manifest file. The <b>Microsoft.DesktopAppInstaller</b> is the package identity name for the below package manifest identity. <pre>&lt;Identity ProcessorArchitecture="x86" Version="1.11.11102.0" Publisher="CN=Microsoft Corporation, O=Microsoft Corporation, L=Redmond, S=Washington, C=US" Name="Microsoft.DesktopAppInstaller"/&gt;</pre> </li> <li>Specify the App package publisher — for the package you want to detect in the target machine. Package publisher information will be available in the package manifest file. The <b>CN=Microsoft Corporation, O=Microsoft Corporation, L=Redmond, S=Washington, C=US</b> is the package publisher in the above package manifest identity.</li> <li>Specify the App package Architecture — for the package you want to detect in the target machine. Package Architecture will be available in the package manifest file. "x86" is the package Architecture in the above package manifest identity.</li> <li>Specify the App package Version- for the package you want to detect in the target machine. Package version will be available in the package manifest file. The <b>1.11.11102.0</b> is the package version in the above package manifest identity.</li> </ul> <p>Prerequisite installer is installed in the target machine only if the App package condition does not exist in the target machine, that means if the prerequisite engine failed to find the package with the identity name, publisher, and architecture in the target machine. If the package exists in the target machine, then the prerequisite engine checks the package version. If the installed version is lower than the validating package version, then also the package will be installed in the target machine.</p>

**Table 41** • Prerequisite Condition Dialog Box Options (cont.)

Option	Description
<b>Setup is running on a specified platform</b>	<p>If you select this option, click one of the predefined platforms in the <b>Select which platform the prerequisite should be run on</b> box, or select Custom to define your own platform requirements.</p> <p>To specify a range of service pack numbers for which this prerequisite condition is true, use the Service Packs boxes. For example, if target system must have service pack 2, 3, or 4, enter 2 in the first box and 4 in the second box. To target all future service packs, leave the second box blank. To target only service pack 3, enter 3 in both boxes.</p> <p>If you select Custom to define your own operating system, you can configure any one or more of the following settings in the Custom area:</p> <ul style="list-style-type: none"> <li> <b>Platform ID</b>—Select the required platform. <p>If the value that you select matches the dwPlatformId member of the OSVERSIONINFOEX structure of the target system's operating system, this part of the operating system condition evaluates as true.</p> </li> <li> <b>Major Version</b>—Specify the required major version of the operating system. <p>If the value that you specify matches the dwMajorVersion member of the OSVERSIONINFOEX structure of the target system's operating system, this part of the operating system condition evaluates as true.</p> <p>If you type 0 in this box, the operating system condition that InstallShield creates does not include any major version or minor version requirements; the behavior is the same if you leave the Major Version and Minor Version boxes blank.</p> </li> <li> <b>Minor Version</b>—Specify the required minor version of the operating system. <p>If the value that you specify matches the dwMinorVersion member of the OSVERSIONINFOEX structure of the target system's operating system, this part of the operating system condition evaluates as true.</p> <p>Note that 0 is a valid value for this box.</p> </li> </ul>

**Table 41** • Prerequisite Condition Dialog Box Options (cont.)

Option	Description
<b>Setup is running on a specified platform (cont.)</b>	<ul style="list-style-type: none"> <li> <b>Product (OS) Type</b>—Select the required operating system type.             If the value that you select matches the wProductType member of the OSVERSIONINFOEX structure of the target system's operating system, this part of the condition evaluates as true.             Note that if the InstallShield prerequisite supports both servers and domain controllers, you can select the <b>Server or Domain Controller</b> option.         </li> <li> <b>Processor Architecture</b>—Select the required processor architecture (for example, 32-bit or 64-bit Windows).             If the architecture that you select matches the architecture of the target system's operating system, this part of the operating system condition evaluates as true.         </li> <li> <b>Minimum CSD Version</b>—Specify the minimum required service pack or other version information for the operating system.             Note that this setting is provided for compatibility with InstallShield prerequisites that were created with earlier versions of InstallShield, and to enable subversions of Windows 9x platforms to be distinguished. Using this setting to specify a particular service pack is not recommended; if you need to specify a particular service pack, use the Minimum Service Pack box.             If the value that you specify is the same version as or an earlier version than the szCSDVersion member of the OSVERSIONINFOEX structure of the target system's operating system, this part of the operating system condition evaluates as true.             For example, if you specify "A" and the szCSDVersion value on the target machine is "B", this part of the operating system condition evaluates as true. It evaluates as false if you specify "B" but the value on the target machine is "A".             Similarly, if you specify "Service Pack 1" and the value on the target machine is "Service Pack 2", this part of the operating system condition evaluates as true. It evaluates as false if you specify "Service Pack 2" but the value on the target machine is "Service Pack 1".             Note that to prevent comparison problems, any leading and trailing spaces in the version that you specify and in the value of the szCSDVersion member on the target system are ignored.         </li> </ul>

**Table 41** ▪ Prerequisite Condition Dialog Box Options (cont.)

Option	Description
<b>Setup is running on a specified platform (cont.)</b>	<ul style="list-style-type: none"><li>• <b>Minimum Build No</b>—Specify the minimum required build number of the operating system.  If the value that you specify is the same version as or an earlier version than the dwBuildNumber member of the OSVERSIONINFOEX structure of the target system's operating system, this part of the operating system condition evaluates as true.</li><li>• <b>Maximum Build No</b>—Specify the maximum required build number of the operating system.  If the value that you specify is the same version as or an greater version than the dwBuildNumber member of the OSVERSIONINFOEX structure of the target system's operating system, this part of the operating system condition evaluates as true.</li></ul> <p>For more information on specifying an operating system condition, see <a href="#">Adding an Operating System Condition for an InstallShield Prerequisite</a>.</p> <p>For details about the OSVERSIONINFOEX structure, see <a href="#">OSVERSIONINFOEX structure</a> on the MSDN Web site.</p>

## Privileges Dialog Box

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The Privileges dialog box lets you specify one or more privileges that are required by the service that you are configuring. This dialog box opens in the following scenario:

- You are configuring a service in the Services view, or in the Advanced Settings area for a component in the Setup Design view (installation projects only) or the Components view.
- The **Change list of required privileges** option is selected in the Configuration Type setting for an event in the Configure Settings category of settings in the right pane, and you click the ellipsis button (...) in the Arguments setting for that event.

Select one or more check boxes.

The change takes effect the next time that the system is started.

# Product Condition Builder Dialog Box

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI
- MSI Database
- Transform

The Product Condition Builder dialog box simplifies the process of creating install conditions by providing a selection of valid Windows Installer properties and conditional expression operators.

For example, if your product requires 64 MB of RAM in order to run properly, you can use the Product Condition Builder dialog box to create a condition. At run time, the Windows Installer checks the target system to determine how much RAM is installed. If it is less than 64 MB, the Windows Installer displays an error message and exits the installation.

**Table 42** ▪ Product Condition Builder Dialog Box Settings

Setting	Description
Conditions	<p>This box displays a grid with the following columns:</p> <ul style="list-style-type: none"><li>• <b>Condition</b>—This column is where you define the conditions. You can type a condition directly in this column, or you can use the Properties list, the Operators list, and the Add buttons to build a condition statement.</li><li>• <b>Message</b>—This column is where you specify the error message that should be displayed if the condition evaluates to false.</li></ul> <p>When you type a value for this column, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p> <p>To add a new condition to this box, click the New Condition button, and then enter the appropriate information in the Condition and Message columns.</p> <p>To delete a condition in this box, select the condition, and then click the Delete Conditions button.</p> <div></div> <p><b>Important</b> ▪ When you click the OK button on this dialog box, InstallShield performs basic condition validation; however, you should still double-check that your condition statements evaluate to the expected outcome. For more information and example conditions, see <a href="#">Building Conditional Statements</a>.</p> <p>Windows Installer dialogs, which display the text that you specify in the Message column, do not recognize the escape sequences \r (carriage return), \n (new line), or \t (tab).</p>

**Table 42** ▪ Product Condition Builder Dialog Box Settings (cont.)

Setting	Description
<b>Properties</b>	<p>This list contains common Windows Installer properties, as well as any properties that have been added in the Property Manager view. Select the property that you want to evaluate, and then click the <b>Add</b> button next to this list.</p> <p>If the list does not contain the property that you want to evaluate, you can type the appropriate property name in the Condition column.</p>
<b>Operators</b>	<p>This list contains all of the valid operators that are recognized by the Windows Installer. Select the operator that you want to use and then click the Add button next to this list. InstallShield appends the operator to the conditional statement in the Conditions box.</p>

## Project Settings Dialog Box

The Project Settings dialog box lets you modify information about the open project.

This dialog box is displayed with the following tabs when you select the Project menu's Settings command. This dialog box is displayed with only the last two of the following tabs when you right-click an item in the Objects view's "InstallShield Objects/Merge Modules" pane and select Register new object or Properties. In the last case, all properties are uneditable.

- **Project Tab**
- **Application Tab (in InstallScript Projects)** (in Windows Installer-based projects)
- **Application Tab (in InstallScript Projects)** (in InstallScript and InstallScript Object projects)
- **Platforms Tab** (in InstallScript and InstallScript Object projects)
- **Languages Tab**
- **Maintenance Tab** (in InstallScript projects)
- **Language-Independent Object Properties Tab** (in InstallScript Object projects)
- **Language-Specific Object Properties Tab** (in InstallScript Object projects)

### Project Tab

The Project tab on the Settings dialog box displays basic information about the open project. This dialog box opens when you select the Project menu's Settings command.

#### Author

(Optional) Enter the name of the project author.

#### Comments

(Optional) Enter any comments about the project.

## Application Tab (in Windows Installer–Based Projects)

**Project** - This information applies to the following project types:

- Basic MSI
- InstallScript MSI

The Application tab on the Settings dialog box lets you view and modify information about the product that is installed by the open project. This dialog box opens when you click the Settings command on the Project menu.

**Table 43** - Application Tab Settings

Setting	Description
<b>Product Code</b>	<p>This setting displays a GUID that uniquely identifies this product. To have InstallShield generate a different GUID for you, click the Change button next to this setting.</p> <p>Since this code uniquely identifies your product, changing the product code after you have already distributed your release is not recommended.</p> <p>For more information, see <a href="#">Setting the Product Code in a Windows Installer–Based Project</a>.</p>
<b>Upgrade Code</b>	<p>This setting displays the GUID that can be used for your product's upgrade code. To have InstallShield generate a different GUID for you, click the <b>Generate a new GUID</b> button ({...}) in this setting.</p> <p>The upgrade code is a GUID that identifies a related set of products. The Windows Installer uses a product's upgrade code when performing major upgrades of an installed product. The upgrade code, stored in the UpgradeCode property, should remain the same for all versions of a product.</p> <p>For more information, see <a href="#">Setting the Upgrade Code</a>.</p>
<b>Product Name</b>	<p>Enter the name of the product.</p> <p>For information on how the product name is used, see <a href="#">Specifying a Product Name</a>.</p>
<b>Product Version</b>	<p>Enter the version number for your product. The version number must contain only numbers, and it must be in the format <i>aaa.bbb.ccccc</i>, where <i>aaa</i> represents the major version number, <i>bbb</i> represents the minor version number, and <i>cccccc</i> represents the build number. The maximum value for the <i>aaa</i> and <i>bbb</i> portions is 255. The maximum value for <i>cccccc</i> is 65,535.</p> <p>For more information, see <a href="#">Specifying the Product Version</a>.</p>

**Table 43** ▪ Application Tab Settings

Setting	Description
<b>Application Type</b>	Select the type of application from the list or type the name of an application type if it is not listed. This information is stored in the project file and is for your reference only. It is never displayed to the end user.

**Tip** ▪ You can also configure the aforementioned settings in the General Information view.

## Application Tab (in InstallScript Projects)

**Project** ▪ This information applies to the following project types:

- *InstallScript*
- *InstallScript Object*

The Application tab on the Settings dialog box lets you view and modify information about the project that is installed by the open project. This dialog box opens when you click the Settings command on the Project menu.

**Table 44** ▪ Application Tab Settings

Setting	Description
<b>Product Code</b>	<p>Enter a GUID that uniquely identifies this product. To have InstallShield generate a different GUID for you, click the <b>Generate a new GUID</b> button ({...}) in this setting.</p> <p>The product code is used to associate uninstallation or maintenance with the original installation. A new GUID is automatically generated for each new project that you create, including copies of existing projects. Once you have changed a project's product code, its previous GUID cannot be recovered. For these reasons, changing a project's product code is typically not necessary and should be approached with caution.</p> <p>For more information, see <a href="#">Setting the Product Code in an InstallScript-Based Project</a>.</p>

**Table 44** ▪ Application Tab Settings

Setting	Description
<b>Product Name</b>	<p>Enter the name of the product.</p> <p>For information on how the product name is used, see <a href="#">Specifying a Product Name</a>.</p>  <p><b>Tip</b> ▪ Instead of hard-coding a value, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value.</p> <p>The product name is stored in the InstallScript system variable <code>IFX_PRODUCT_NAME</code>.</p>
<b>Product Version</b>	<p>Enter the version number for your product. The version number must contain only numbers, and it must be in the format <code>aaa.bbb.ccccc</code>, where <code>aaa</code> represents the major version number, <code>bbb</code> represents the minor version number, and <code>cccc</code> represents the build number. The maximum value for the <code>aaa</code> and <code>bbb</code> portions is 255. The maximum value for <code>cccc</code> is 65,535.</p> <p>For more information, see <a href="#">Specifying the Product Version</a>.</p>  <p><b>Tip</b> ▪ Instead of hard-coding a value, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value.</p>
<b>Company Name</b>	<p>Enter the name of your company. This value is used in the default script to set <code>TARGETDIR</code> (if the string entry <code>COMPANY_NAME</code> does not exist); it can be retrieved at run time by calling the <b>MediaGetData</b> function.</p>  <p><b>Tip</b> ▪ Instead of hard-coding a value, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value.</p>
<b>Executable File</b>	<p>Enter the name of the application's main executable file. This value can be retrieved at run time by calling the <b>MediaGetData</b> function.</p>  <p><b>Tip</b> ▪ Instead of hard-coding a value, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value.</p>

**Table 44** ▪ Application Tab Settings

Setting	Description
<b>Application Type</b>	Select the type of application from the list or type the name of an application type if it is not listed. This information is stored in the project file and is for your reference only. It is never displayed to the end user.
<b>URL</b>	Enter a product URL. This information is stored in the project file and is for your reference only. It is never displayed to the end user.  <b>Tip</b> ▪ <i>Instead of hard-coding a value, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value.</i>
	<b>Tip</b> ▪ <i>You can also configure the aforementioned settings in the General Information view.</i>
	<b>Caution</b> ▪ <i>You must specify a non-null value in the Product Version box; otherwise, build error -7044 occurs.</i>

## Platforms Tab

**Project** ▪ This information applies to the following project types:

- *InstallScript*
- *InstallScript Object*

The Platforms tab on the Settings dialog box is where you specify the platforms that you want to be available when you to select the operating system for components or releases in your project.

**Note** ▪ *Specifying platforms at the project level does not create target for running the installation. To create target in an InstallScript project, you can use the SYSINFO structure to identify the operating platform of the target system.*

The following table shows the settings that are displayed in the Platforms tab.

**Table 45** ▪ Platforms Dialog Box Settings for a Project

Setting	Description
<b>The project supports all platforms that InstallShield supports</b>	<p>Select this option if you want InstallShield to list all of the supported run-time platforms for the following settings:</p> <ul style="list-style-type: none"><li>• Operating Systems setting at the component level (InstallScript and InstallScript MSI projects)</li><li>• Platform(s) setting at the release level (InstallScript projects)</li></ul> <p>If you select this option, you can designate that a particular component or release in your project is targeted for any one or more supported platforms.</p>
<b>The project supports only the platforms that are selected below</b>	<p>Select this option if you want InstallShield to list only some platforms that are displayed for the following settings:</p> <ul style="list-style-type: none"><li>• Operating Systems setting at the component level (InstallScript and InstallScript MSI projects)</li><li>• Platform(s) setting at the release level (InstallScript projects)</li></ul> <p>Then select the platforms that should be displayed.</p>  <p><b>Tip</b> ▪ To select multiple consecutive operating systems, select the first file, press and hold SHIFT, and select the last operating systems. To select multiple nonconsecutive operating systems, select the first operating systems, press and hold CTRL, and select each additional operating systems.</p> <p>In general, if a platform is not listed for this setting at the project level, you cannot designate that a particular component or release in your project is targeted for that platform.</p>

## Languages Tab

The Languages tab on the Settings dialog box lets you view and modify the list of languages included in the open project. This dialog box opens when you click the Settings command on the Project menu.

### check boxes

A checked check box next to a language indicates that the language is included in the project; an unchecked check box indicates that the language is not included. To add or remove a language from the project, click its check box to toggle it to the desired state.

Removing a language from the project also removes it from any components or releases that had been using that language.

## Maintenance Tab

---

**Project** ▪ This information applies to InstallScript projects.

The Maintenance tab on the Settings dialog box lets you select an option for the behavior of your setup when your end user reruns it. This dialog box opens when you click the Settings command on the Project menu.

The Multi-Instance option lets your end users run a setup multiple times as a first setup, rather than a maintenance setup. For more information on these options, see [Running an InstallScript Installation Multiple Times](#).

## Language-Independent Object Properties Tab

---

**Project** ▪ This information applies to InstallScript Object projects.

The Language-Independent Object Properties tab contains basic information about your object, such as the name of the object, the company that created it, and the location of the object. This dialog box opens when you select the Project menu's Settings command in an InstallScript object project. This dialog box also opens in an InstallScript project when you [register an object from within the Objects view](#), or you right-click an object in the Objects view and click Properties. In the last case, all properties are uneditable.

### Object Wizard

This option allows you to specify the type of wizard, if any, that you would like to use for your object's default language. The following wizard choices are available:

- **No Wizard**—Select this option if your object does not require a wizard.
- **Use InstallShield Object Stock Wizard**—Select this option to have InstallShield create a wizard for you based on the properties you created for your object. All read-only properties will be displayed but will not be editable. All read/write properties will be changeable by the user. Write-only properties will not be displayed.

---

**Note** ▪ The InstallShield stock wizard does not support array properties. If your object's properties require array properties, you will need to create your own wizard.

- **Use My Custom Wizard**—Select this option to use a wizard you created. InstallShield allows you to use a wizard created with either Visual C++ or Visual Basic. To use a wizard created with one of these two programs, enter the path to the DLL you created, or click the browse (...) button to navigate to that file.

The following controls are not displayed when you select the Project menu's Settings command.

### Company

Enter the name of the company responsible for creating this object.

### Version

Enter the version of this object.

## Media File

Enter the path to the object's media file (Data1.hdr file), or click the browse button to navigate to that file.

# Language-Specific Object Properties Tab

**Project** ▪ This information applies to InstallScript Object projects.

The Language-Specific Object Properties tab contains basic information about your object, such as the name of the object, the company that created it, and the location of the object. This dialog box opens when you select the Project menu's Settings command in an InstallScript object project. This dialog box also opens in an InstallScript project when you [register an object from within the Objects view](#), or you right-click an object in the Objects view and click Properties. In the last case, all properties are uneditable.

## IDE Language

Select the language for which you want to specify object information. Available options are English and Japanese.

## Use Default

Disabled if the default language, English, is selected. Check this box to specify that the object, when displayed in the selected language, use the same information that you specified for the default language.

*The following controls are enabled only if the **Use Default** check box is unchecked:*

## Display Name

Enter the name of your object as you would like it to appear in the object gallery.

## Short Name

Enter a shortened version of your object's name, if necessary. You can enter the same name as entered in the Display Name field.

## HTML Help

Enter the path to the help file for this object, or click the browse (...) button to navigate to this file. This help file must consist of a single .htm file.

## Icon File

Enter the path to the icon file for your object, or click the browse (...) button to navigate to this file. The icon you choose will be displayed next to your object in the object gallery. The icon you use for your object needs to be sized to 16x16 with a maximum of 16 colors.

# Rename Key Dialog Box

The Rename Key dialog box is displayed if you click Edit after selecting Rename on the Resolve Conflict dialog box. The Rename Key dialog box displays a setting in which you can provide a new key value for the exported dialog, component, or custom action. When you rename the exported item, you avoid the conflict, assuming that no objects with the new name exist in the target project file.

## Settings

**Table 46** • Rename Key Dialog Box Settings

Setting	Description
Key Value	Type a new key value or name for the item in this field and press OK to rename the item.

# Required Features Dialog Box

**Project** • This information applies to the following project types:

- InstallScript
- InstallScript MSI
- InstallScript Object

The Required Features dialog box lets you specify features that must be installed if the current feature is installed. This dialog box is launched when you click the ellipsis button (...) in the Required Features setting for a feature in the Setup Design view or the Features view.

The Required Features dialog box has a Required Features for *SeLectedFeatureName* box that shows all of the features in your project. Select the check box for each feature that the current feature requires.

**Project** • The check box for the current feature is automatically selected in InstallScript MSI projects. It is automatically cleared in InstallScript and InstallScript Object projects; in either case, the selection status cannot be changed, and it does not affect whether the feature is installed.

# Resolve Conflict Dialog Box

The Resolve Conflict dialog box identifies a conflict when you are exporting a dialog, component, or custom action to another project, or when you are importing a DIM into an installation project. A conflict occurs when the target project has an item with the same name as but different values in its settings than the one you are exporting. Resolve the conflict by selecting one of the options and clicking OK, or by renaming the item in a key column.

If you click Cancel, the item is not exported to another project, or the DIM is not imported into the installation project.

## Dialog Box Settings

**Table 47** ▪ Resolve Conflict Dialog Box Settings

Setting	Description
<b>Table</b>	<p>The table shows all of the data that pertains to the dialog, control, component, custom action, or other item.</p> <p>If you are exporting an item to a different project, the Source Data column shows the values of the settings for the item that you are exporting from the current project to a different project. The Target Data column shows the values of the settings of the existing item in the project to which you are exporting.</p> <p>If you are importing a DIM project into an installation project, the Source Data column shows the values of the settings for the item in the DIM project. The Target Data column shows the values of the settings of the setting for the item in the installation project.</p> <p>Key icons identify key columns in the record. If there is a conflict between the values, that row appears in red. Your selection for resolving the conflict determines whether InstallShield overwrites the existing item and its settings.</p>
<b>Resolution</b>	<p>Indicate how you want to resolve the conflict. Available options are:</p> <ul style="list-style-type: none"><li>● <b>Skip</b>—Use the value in the Source Data column. If additional conflicts remain, show the next conflict.</li><li>● <b>Skip All</b>— Use the value in the Source Data column for the current conflict as well as any remaining conflicts.</li><li>● <b>Overwrite</b>—Use the value in the Target Data column. If additional conflicts remain, show the next conflict.</li><li>● <b>Overwrite All</b>—Use the value in the Target Data column for the current conflict as well as any remaining conflicts.</li><li>● <b>Rename</b>—Use a different value for the key column so that there is no conflict for the item. To use this option, first select the row that contains the key that you want to rename, select the Rename option, and then click the Edit button. The <b>Rename Key dialog box</b> opens, letting you specify the new value for the key column.</li></ul>

## Save As Dialog Box

On the File menu, click Save As to open the Save As dialog box. This lets you save a copy of the open project as a template or as a new project with a different name and location.

## Dialog Box Settings

The Save As dialog box is a standard Windows dialog box. To display detailed help for any control except the following ones, select the control and press F1.

**Table 48** ▪ InstallShield-Specific Settings on the Save As Dialog Box

Setting	Description
<b>Save as type</b>	 <b>Project</b> ▪ The <b>Save as type</b> option is available for the following project types: <ul style="list-style-type: none"><li>• Basic MSI</li><li>• DIM</li><li>• InstallScript</li><li>• InstallScript MSI</li><li>• Merge Module</li></ul> The <b>Save as type</b> list enables you to specify the type of file that you are saving. To create a template from the current project, select InstallShield Template (.ist).
<b>Create 'Project Name' subfolder and save the project in the created folder</b>	This check box controls where the project file is located on your system. To create a <Project Name> subfolder in the location specified in the Project Location box (on the File Locations tab of the Options dialog box) and to save the project in that subfolder, select this check box. For projects that contain InstallScript, the Script Files folder is also created in this subfolder.  To save the .ism project in the location specified in the Project Location box, clear this check box.
<b>Create and assign a new project GUID to the saved project</b>	If the new project's GUID should be different than the GUID of the original project, select this check box. If the new project's GUID should be the same GUID of the original project, clear this check box.
<b>Update the project settings appropriately based on the new project name</b>	To use the name that you specified in the <b>File name</b> box as the value for the Project Name setting in the General Information view of the new project, select this check box. If the value of the new project's Name setting should be the same as that of the original project, clear this check box.

## Script Conversion Dialog Box

InstallShield uses different terminology for InstallScript function names. For example, InstallShield uses the term *feature* where InstallShield Professional uses *component*, and vice versa. See [Script Changes: Lexicon Conversion](#) for more information.

When you open an .ipr file in InstallShield, this dialog allows you to indicate whether you want InstallShield to automatically update your script (.rul) file to use the InstallShield lexicon.

**Note** ▪ The InstallShield Help Library and other documentation uses the InstallShield script terminology.

# Script Editor Properties Dialog Box

The Script Editor Properties dialog box is where you specify how script code should be displayed in various views throughout InstallShield. This dialog box is available in views that enables you to edit a script file (for example, the InstallScript, SQL Scripts, and Custom Actions and Sequences views).

To open the Script Editor Properties dialog box, right-click in a script editor pane and then click Properties.

**Tip** ▪ Note that the script editor properties are global per-user settings that affect all InstallShield script editors. For example, the same font is used for all script editors. If you change the font in the SQL Scripts view, the font is also changed in the InstallScript view the next time that the InstallScript is reloaded in that view.

The settings on the Script Editor Properties dialog box are organized into the following main categories:

- [General](#)
- [Colors](#)

## General Settings

The following settings are available in the General area on the Script Editor Properties dialog box.

**Table 49** ▪ General Settings on the Script Editor Properties Dialog Box

Setting	Description
<b>Font</b>	This setting displays the font, style, and size that is used for the content in the script editor. To change the option that is selected, click the ellipsis button in this setting. Doing so opens the Font dialog box, which enables you to view and modify the font, style, and size of script content.
<b>Syntax highlighting</b>	<p>Specify whether you want to InstallShield to use color coding for various script elements that are displayed in all of the script editors. If you select Yes, InstallShield uses color coding according to the selections that are made for the settings in the Colors area of the Script Editor Properties dialog box.</p> <p>For more information, see <a href="#">Changing Colors for Syntax Highlighting in the Script Editors</a>.</p>
<b>Auto completion</b>	<p>Specify whether you want InstallShield to display a pop-up list of alphabetically ordered functions, keywords, constants, and other script words that begin with the letters that you are typing. Auto completion also displays a list of available string identifiers when you enter the string constant operator (@) in the InstallScript view.</p> <p>The default value is Yes.</p> <p>Auto completion can increase your efficiency because it can reduce the time that you spend typing code. It can also help you avoid typographical errors in your code.</p> <p>For more information, see <a href="#">Using Auto Completion when Writing Code in the Script Editors</a>.</p>

**Table 49** ▪ General Settings on the Script Editor Properties Dialog Box (cont.)

Setting	Description
<b>Include local variables</b>	<p>Specify whether you want InstallShield to include in the pop-up list all of the local variables that are defined in the selected script. The default value is Yes.</p> <p>Note that if you select No, the Functions, Properties, and Methods folders in the center pane of the InstallScript view does not list any functions, properties, or methods from your script files.</p> <p>If Yes is selected for this setting and you notice performance issues when you are typing code in the InstallScript view, you might want to change this setting to No.</p> <p>This setting is ignored if you select No for the <b>Auto completion</b> setting.</p> <p>For more information, see <a href="#">Using Auto Completion when Writing Code in the Script Editors</a>.</p>
<b>Show function call tips</b>	<p>Specify whether you want InstallShield to display a function call tip—a type of tooltip—when you are typing a function call in your script. The function call tip shows the function's parameter information. It also shows a description of the function, as well as a description of the parameter that you are entering. The default value is Yes.</p> <p>For more information, see <a href="#">Viewing Function Call Tips for an InstallScript Function in the Script Editor</a>.</p>
<b>Line numbering</b>	<p>Specify whether you want the left margin of the script editor to contain line numbers. The default value is No.</p> <p>For more information, see <a href="#">Going to a Line Number in a Script that Is Displayed in a Script Editor</a>.</p>
<b>Syntax folding</b>	<p>Specify whether you want to use syntax folding for your script. If you select Yes, InstallShield adds a plus sign (+) or a minus sign (–) in the margin next to each line of code that starts an expandable or collapsible block of script. Click the plus sign to expand the hidden code. Click the minus sign to hide the code.</p> <p>The default value is No.</p> <p>Syntax folding can help you minimize the clutter of large scripts and focus on the code that is relevant to the work that you are currently doing. It can also help you see the overall structure of a script.</p>
<b>Automatic indentation</b>	<p>Specify whether you want InstallShield to indent new lines of code in your script. The default value is Yes.</p> <p>For more information, see <a href="#">Enabling or Disabling Automatic Indentation in the Script Editors</a>.</p>

**Table 49** ▪ General Settings on the Script Editor Properties Dialog Box (cont.)

Setting	Description
<b>Show Empty Space</b>	Specify whether you want InstallShield to display a symbol or other mark in place of each instance of white space in your script. For example, if you select Yes, InstallShield displays each space character in the script as a middle dot (·) and each tab character as an arrow. InstallShield also identifies line breaks when Empty Space is enabled.  The default value is No
<b>Tab width</b>	Specify the tab size as a multiple of the character space size. For example, setting a tab space of 5 causes the cursor to move five character spaces when you press the TAB key.
<b>Replace by space</b>	Specify the number of character space(s) to move forward/backward. For example, if you select Yes; the cursor moves backward by 1 character space and based on the tab width selection; the cursor will move forward accordingly. If you select No, based on the tab width selection; the cursor will move forward/backward accordingly.

## Colors Settings

The Colors area on the Script Editor Properties dialog box is where you view and modify the foreground color and—in some cases—the background color for various script elements.

The following settings are available in the Colors area on the Script Editor Properties dialog box.

**Table 50** ▪ Color Settings on the Script Editor Properties Dialog Box

Setting	Description
<b>Default</b>	Specify the colors for the text that is not one of the predefined types of script words.
<b>Selection</b>	Specify the colors for text that is selected in the script editor.
<b>Cursor</b>	Specify the colors for the blinking cursor.
<b>Keywords</b>	Specify the colors for script keywords such as built-in functions, data types, and constants.
<b>Identifiers</b>	Specify the colors that are used to show identifiers. This includes variables.
<b>Operators</b>	Specify the colors that are used to show operators. Examples include parentheses, brackets, and braces; arithmetic symbols like plus, minus, asterisk, and slash; and comma.
<b>Comments</b>	Specify the colors for the comments in your code; this includes the comment delimiters such as <code>/*</code> , <code>*/</code> , or <code>//</code> .

**Table 50** ▪ Color Settings on the Script Editor Properties Dialog Box (cont.)

Setting	Description
<b>Strings</b>	Specify the colors for strings; this includes the surrounding quotes.
<b>Unterminated strings</b>	Specify color overrides for strings that have not been closed with a terminating quote; this helps you find strings that could cause compilation errors.
<b>Preprocessor directives</b>	Specify the colors that are used to show preprocessor directives; this includes any lines that start with a pound sign (#).
<b>Constants</b>	Specify the colors that are used to show script constants.
<b>Labels</b>	Specify the colors that are used to show labels.
<b>Errors</b>	Specify the colors that are used to show script errors.
<b>Line numbers</b>	Specify the colors that are used to show line numbers in the left margin, if line numbering is enabled.
<b>Function call tips</b>	Specify the colors that are used to call tips for InstallScript functions.
<b>Matching braces</b>	Specify the colors that are used to show opening and corresponding closing braces—{ }. This is used whenever the insertion point is within parentheses, brackets, or braces. The syntax coloring takes into account nesting (for example, <b>Foo(array[array.GetLength() - 1])</b> ).
<b>Unmatched braces</b>	Specify the colors that are used to show an opening brace—{—that is missing its corresponding closing brace—}. This is used whenever the insertion point is after the opening parenthesis, bracket, or brace that is missing a closing mark. The syntax coloring takes into account nesting (for example, <b>Foo(array[array.GetLength() - 1])</b> ).

To learn more about changing colors in the script editors, see [Changing Colors for Syntax Highlighting in the Script Editors](#).

## SCM Pre-shutdown Delay Dialog Box

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database

- *MSM Database*
- *Transform*

The SCM Pre-shutdown Delay dialog box lets you specify the length of the time that the Service Control Manager should wait before proceeding with other shutdown tasks. This dialog box opens in the following scenario:

- You are configuring a service in the Services view, or in the Advanced Settings area for a component in the Setup Design view (installation projects only) or the Components view.
- The **Configure SCM pre-shutdown delay** option is selected in the Configuration Type setting for an event in the Configure Settings category of settings in the right pane, and you click the ellipsis button (...) in the Arguments setting for that event.

Select the appropriate option. To reset the time delay to the default of 3 minutes, select the Default option.

The Service Control Manager waits for the specified period of time after sending the SERVICE\_CONTROL\_PRESHUTDOWN notification to the service. The change takes effect the next time that the system is started.

## Security Descriptor Dialog Box

The Security Descriptor dialog box opens when you click the ellipsis button (...) in the Security Descriptor setting; this setting is displayed under the Permissions setting when you are configuring permissions for a service that you have added to the Services view, or to the Services node in the Advanced Settings area for a component in the Setup Design view (in installation projects) or the Components view.

The Security Descriptor dialog box is where you use valid security descriptor definition language (SDDL) to enter a valid SDDL string for service permissions. For more information about SDDL, see the “Access Control” section of the Microsoft Windows Software Development Kit (SDK).

**Tip** • You can use angle brackets (for example, <DomainName\UserName>) or environment variables (for example, [%UserDomain][%UserName]) to indicate the domain and user name of the user whose account SID is going to be determined at run time.

**Note** • The permission settings are supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore these settings.

An installation should not contain both the MsiLockPermissionsEx table and the LockPermissions table. If you use the Permissions setting for a service, and the settings under it, you are configuring the MsiLockPermissionsEx table of the package. If **Traditional Windows Installer handling** is selected for the Locked-Down Permissions setting in the General Information view and you have set permissions for one or more files, folders, or registry keys in your project, you are configuring the LockPermissions table of the package.

## Select File Dialog Box

Use the Select File dialog box to enter a file into the DuplicateFile table in the Direct Editor.

## Dialog Options

### Component

Select the component that contains the file you want to enter in this table.

### Files (\*.\*)

Select the file that you want to include in this table.

## Select Media Location Dialog Box

For MSI Databases, choose where you want to place the new file(s) on the source media. If you are creating a .cab file, you can choose to stream the file(s) into the package.

---

**Project** ▪ For MSM Databases, the File Location options are disabled since merge modules require you to store your files in a .cab file that is internal to the .msm database.

---

**Note** ▪ The option to extract COM information is only enabled when you drag files to a folder or when you add a single file to a component that does not already have any existing files. As a result, the COM file is the only file in the particular component.

## Select SQL Server Dialog Box

The Select SQL Server dialog box opens when you are using the Database Import Wizard and you click the Browse button for the server name on the SQL Server panel.

The Select SQL Server dialog box enables you to select the SQL Server whose database you are importing.

## Select String Dialog Box

---

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

The Select String dialog box shows the collection of language-independent identifiers and corresponding language-specific values for the default language of your project. This dialog box lets you select or create a string identifier that you can use in place of a hard-coded text string.

## Accessing the Select String Dialog Box

The Select String dialog box is available from within the script editor pane in the InstallScript view. It is also available in other places throughout InstallShield. For example, if you click the ellipsis button (...) in one of the settings that accepts localizable text, the Select String dialog box opens, enabling you to select or create a string entry that you want to use for the selected setting. The Display Name and Description settings for a feature are two examples of a setting that accepts localizable text.

## Working with the Select String Dialog Box

The Select String dialog box consists of the following elements:

- A row of buttons and other controls
- A group box area (below the row of buttons)
- A spreadsheetlike table

Each row in the table represents a string entry in your project.

The following table describes all of the buttons and other controls that are displayed in the Select String dialog box.

**Table 51** ▪ Controls on the Select String Dialog Box

Name of Control	Description
<b>New</b>	Displays the String Entry dialog box, which lets you specify a new string identifier, a value, and internal comments.
<b>Delete</b>	Deletes the selected string entry or string entries.
<b>Search Grid</b>	Filters the strings that are displayed in the Select String dialog box according to the string that you specify in this text box.
<b>Drag a column header here to group that column</b>	Use this group box area to group rows in the Select String dialog box. This dialog box supports multiple levels of grouping simply by dragging the column headings and dropping them onto the group box. InstallShield displays the rows in the dialog box hierarchically according to column arrangement in the group box.

The following table describes each of the columns in the Select String dialog box.

**Table 52** ▪ Columns in the Select String Dialog Box

Column	Description
<b>Identifier</b>	This column contains the language-independent ID for the string. Each string identifier in a project is linked to one or more values.

**Table 52** ■ Columns in the Select String Dialog Box (cont.)

Column	Description
<b>Value</b>	<p>This column shows the run-time string.</p>  <p><b>Project</b> ■ In Basic MSI, DIM, InstallScript MSI, and Merge Module projects, some of the string values contain Windows Installer properties inside square brackets—for example, <b>Install [ProductName]</b>. At run time, the property and brackets are replaced by the property value.</p> <p>String values in these same project types may also contain font information in curly brackets—for example, <b>{&amp;MSSansBold8}OK</b>. The font information indicates style details that should be used to display the strings at run time.</p>
<b>Comments</b>	<p>This column contains internal note about the string entries. The comments are not displayed at run time.</p>
<b>Modified</b>	<p>This column lists the date and time that the string entry was last modified.</p>

## Serial Number Violation Dialog Box

The Serial Number Violation dialog box opens when InstallShield detects that the serial number entered is already in use. InstallShield will not start for 20 minutes unless a unique, valid serial number is entered.

### Task

#### **To change the serial number:**

1. Click **Change**. The **Serial Number** dialog box opens.
2. In the **Serial Number** box, type a unique, valid serial number. Dashes are not required.

## Server Locations Dialog Box

**Project** ■ This information applies to Transform projects.

The Server Locations dialog box opens when you click the ellipsis button (...) in the Server Locations setting of the General Information view. The Server Locations dialog box lets you specify network and URL paths to the product's installation package and related files so that Windows Installer can find them if they are needed. For example, if an end user installs the product from a network server or Web site and one or more of the features were set to be installed on first use, Windows Installer may need access to the .msi package and related files on the server or Web site sometime after the initial installation.

InstallShield adds the paths that you specify to the SOURCELIST property. Windows Installer appends this list to the end of an end user's existing source list for the product at run time.

The validity of the server location that you specify is determined when the installation needs to access the server remotely. That is, if a server is not available, or if you added an invalid server, the entry will be ignored if the resource is needed, and errors might be generated. Each location that is specified must have the complete source for the installation. The entire directory tree at each source location must be the same and must include all of the required source files, including any .cab files. Each location must have an .msi file with the same file name and product code.

**Tip** • Server paths can contain environment variables that are identified with a percent sign (%). For example, the following path uses the Home environment variable:

```
\\Server1\%Home%\Office
```

**Table 53** • Server Locations Dialog Box Settings

Setting	Description
Source Paths	This box shows the list of paths that you have specified.
New	Click this button to add a new path to the Source Paths box.
Delete	Click this button to delete the selected path from the Source Paths box.
Move Up	Click this button to move the selected path higher in the list of paths.
Move Down	Click this button to move the selected path lower in the list of paths.

## Service Options Dialog Box for a Time Delay of an Auto-Start Service

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The Service Options dialog box lets you specify whether the Windows service that you are configuring should be started after other auto-start services plus a time delay have elapsed. This dialog box opens in the following scenario:

- You are configuring a service in the Services view, or in the Advanced Settings area for a component in the Setup Design view (installation projects only) or the Components view.

- The **Configure time delay of an auto-start** option is selected in the Configuration Type setting for an event in the Configure Settings category of settings in the right pane, and you click the ellipsis button (...) in the Arguments setting for that event.

Select the appropriate option.

The change takes effect the next time that the system is started.

## Service Options Dialog Box for Running Recovery Actions

---

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The Service Options dialog box lets you specify when the recovery actions should be run for the service that you are configuring. This dialog box opens in the following scenario:

- You are configuring a service in the Services view, or in the Advanced Settings area for a component in the Setup Design view (installation projects only) or the Components view.
- The **Configure when to run recovery actions** option is selected in the Configuration Type setting for an event in the Configure Settings category of settings in the right pane, and you click the ellipsis button (...) in the Arguments setting for that event.

Select the appropriate option.

The change takes effect the next time that the system is started.

## Service SID Dialog Box

---

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The Service SID dialog box lets you specify the appropriate service security identifier (SID) that you want to add. This dialog box opens in the following scenario:

- You are configuring a service in the Services view, or in the Advanced Settings area for a component in the Setup Design view (installation projects only) or the Components view.
- The **Add a service SID type to the process token** option is selected in the Configuration Type setting for an event in the Configure Settings category of settings in the right pane, and you click the ellipsis button (...) in the Arguments setting for that event.

Select the appropriate option.

Note that if multiple services are hosted in the same process and one service has the restricted service SID, all services must have the restricted service SID.

The change takes effect the next time that the system is started.

## Set File(s) URL Dialog Box

The **Set File(s) URL** dialog box opens when you click the **Set File(s) URL** button on the Files to Include tab of the InstallShield Prerequisite Editor. This dialog box lets you specify a file for your InstallShield prerequisite.

**Table 54** • Set File(s) URL Dialog Box Settings

Setting	Description
<b>URL to file's parent folder</b>	Type the URL for the parent directory of the selected file or files. This URL is the same one that InstallShield uses when installation authors use the Redistributables view to download an InstallShield prerequisite from the Internet to their local machines.  For example, if you selected files called Notepad.exe and Paint.exe, and the URLs for these files are http://www.mywebsite.com/Folder1/Notepad.exe and http://www.mywebsite.com/Folder1/Paint.exe, enter the following in this box: http://www.mywebsite.com/Folder1

## Settings Dialog Box

The Settings dialog box enables you to set preferences for how InstallShield builds the installation for the project that is currently open.

### Task

#### **To open the Settings dialog box:**

On the **Build** menu, click **Build Settings**.

The following tabs are associated with this Settings dialog box:

- **Compile/Link tab**

- [Run/Debug tab](#) (InstallScript projects only)
- [MSI Log File tab](#) (Windows Installer projects only)

## Compile/Link Tab

The Compile/Link tab on the Settings dialog box lets you specify settings for compiling your script. These settings apply to Setup.rul and any files included in it.

**Table 55** • Compile/Link Tab Settings

Setting	Description
<b>Preprocessor Defines</b>	<p>Specify any preprocessor definitions. Use the following format, with no spaces before or after equal signs or commas:</p> <pre>MYVARIABLE1=123,MYVARIABLE2=456</pre> <p>You can test those types of constants in your script by using <code>#if</code> and <code>#ifdef</code> statements that control the flow of the script. For example, type MYVARIABLE in this box, and the code in the following <code>#ifdef</code> loop will be executed:</p> <pre>#ifdef MYVARIABLE     // Commands #endif</pre> <p>After you add or change a preprocessor definition in this box, you must compile your script for the addition or change to take effect.</p> <div>  </div> <hr/> <p><b>Note</b> - Many Windows API functions are declared in the header file <code>ISRTWindows.h</code>, which is automatically included when you include <code>Ifx.h</code> in your script. You can prevent the automatic definition of Windows APIs by placing the preprocessor constant <code>ISINCLUDE_NO_WINAPI_H</code> in the Preprocessor Defines box on the Compile/Link tab of the <a href="#">Settings dialog box</a>.</p>

**Table 55** ▪ Compile/Link Tab Settings (cont.)

Setting	Description
<b>Include Paths</b>	<p>Specify which directories InstallShield should search for source files that have been included in the main installation's InstallScript code through #include statements.</p> <p>Use the following guidelines for this setting:</p> <ul style="list-style-type: none"> <li>• To specify multiple paths, separate each one with a comma.</li> <li>• You can use any valid path variable in a path.</li> <li>• Do not use quotation marks to specify a path.</li> <li>• Since the current directory is not necessarily constant, do not use the dot (.) operator in the paths that you specify. Instead, use an explicit path variable such as &lt;ISProjectFolder&gt; to indicate a known folder location.</li> <li>• When InstallShield passes the values that you have specified in this setting to Compile.exe, InstallShield automatically parses the specified string to determine comma-delimited paths. In addition, InstallShield handles path variable replacement, surrounds the paths with quotation marks, and then passes each path separately to Compile.exe using multiple /i switches. However, if you separate the paths with semicolons instead of commas, InstallShield considers the specified paths as a single path, and it passes the single path string to the compiler as is. In this case, no path variable substitution or quotation mark additions occurs.</li> </ul> <p></p> <p><b>Note</b> ▪ InstallShield searches any paths that you specify before it searches the standard InstallShield paths. Thus, if two include files share the same name but one include file is in one of your custom include paths and one is in a standard InstallShield include path, InstallShield links to the include file in the custom include path, not the version in the standard InstallShield include path.</p> <p>For more information, see #include.</p>
<b>Max Warnings</b>	Specifies the maximum number of warning messages that are displayed.
<b>Maximum Errors</b>	Specifies the maximum number of error messages that are displayed.
<b>Warning Level</b>	<p>Specifies the types of warnings that are displayed in the Output window.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—Displays no warning messages.</li> <li>• <b>Level 1</b>—Displays any system warning message that InstallShield is unable to handle.</li> <li>• <b>Level 2</b>—Displays Level 1 messages, plus a message if string length exceeds the limit.</li> <li>• <b>Level 3 (Default)</b>—Displays all warning messages.</li> </ul> <p>For more information, see <a href="#">Defining Constants Through the Compiler</a>.</p>

**Table 55** ▪ Compile/Link Tab Settings (cont.)

Setting	Description
<b>Compile before build</b>	<p>To compile your InstallScript automatically every time that you build a release, select this check box. Note the following behavior that occurs if you select this check box:</p> <ul style="list-style-type: none"> <li>• If you select the Refresh Build command on the Build menu, your script is recompiled only if changes have been made to it since the last compile.</li> <li>• If you select the Build <i>&lt;name of release&gt;</i> command on the Build menu, your script is recompiled, even if no changes have been made to it since the last compile.</li> </ul> <p></p> <p><b>Note</b> ▪ <i>The compiled script is not copied to the disk images folder before the build begins because the build process automatically copies the compiled script to the folder during the build. If the script fails to compile because of compiler errors, the build does not continue.</i></p>
<b>Generate inline debugging information</b>	<p>If this check box is selected, debugging information is included in the compiled script file so a debugging information file is not needed.</p> <p>If you want to debug an installation that includes an object that you have created, and you want to obtain debugging information from the object, you must have compiled the object's script with this check box selected.</p> <p></p> <p><b>Caution</b> ▪ <i>Selecting this check box makes the compiled script larger and the installation slower, and it makes it easier for others to reverse engineer your code. Therefore, in most cases, it should not be used when you are creating your final installation for distribution to end users.</i></p>
<b>Warnings as errors</b>	<p>If warnings should be treated as errors (that is, if the installation should not be run if there were any compile warnings when the InstallScript was compiled), select this check box.</p>

**Table 55** ▪ Compile/Link Tab Settings (cont.)

Setting	Description
<b>Additional Library Paths</b>	<div></div> <p><b>Project</b> ▪ For InstallScript and InstallScript Object projects, InstallShield automatically searches for script libraries in the following directories at compile time:</p> <ul style="list-style-type: none"><li>• &lt;ISProductFolder&gt;\Script\Ifx\Lib</li><li>• &lt;ISProductFolder&gt;\Script\Isrt\Lib</li></ul> <p>For Basic MSI and InstallScript MSI projects, InstallShield automatically searches for script libraries in the following directories at compile time:</p> <ul style="list-style-type: none"><li>• &lt;ISProductFolder&gt;\Script\Iswi\Lib</li><li>• &lt;ISProductFolder&gt;\Script\Isrt\Lib</li></ul> <p>The aforementioned directories contain the libraries that define the built-in InstallScript functions and that are listed in the Libraries (.obl) box by default.</p> <p>If you want InstallShield to search any additional directories that contain your own script libraries, you can specify the directory path in the Additional Library Paths box.</p> <p>Use the following guidelines for this setting:</p> <ul style="list-style-type: none"><li>• To specify multiple paths, separate each one with a comma.</li><li>• You can use any valid path variable in a path.</li><li>• Do not use quotation marks to specify a path.</li><li>• Since the current directory is not necessarily constant, do not use the dot (.) operator in the paths that you specify. Instead, use an explicit path variable such as &lt;ISProjectFolder&gt; to indicate a known folder location.</li><li>• When InstallShield passes the values that you have specified in this setting to Compile.exe, InstallShield automatically parses the specified string to determine comma-delimited paths. In addition, InstallShield handles path variable replacement, surrounds the paths with quotation marks, and then passes each path separately to Compile.exe using multiple /libpath switches. However, if you separate the paths with semicolons instead of commas, InstallShield considers the specified paths as a single path, and it passes the single path string to the compiler as is. In this case, no path variable substitution or quotation mark additions occurs.</li></ul> <div></div> <p><b>Note</b> ▪ InstallShield searches any paths that you specify before it searches the standard InstallShield paths. Thus, if two libraries share the same name but one library is in one of your custom library paths and one is in a standard InstallShield library path, InstallShield links to the library in the custom library path, not the version in the standard InstallShield library path.</p>

**Table 55** ▪ Compile/Link Tab Settings (cont.)

Setting	Description
<b>Libraries (.obl)</b>	<p>Specify the names of script libraries (compiled .obl files) to which you want the compiler to link. Separate each file with a comma.</p>  <hr/> <p><b>Note</b> ▪ It is not necessary to include the path of each library, as long as either the path is identified explicitly in the Additional Library Paths box or the path is one of the built-in library paths that InstallShield automatically searches at compile time.</p>  <hr/> <p><b>Project</b> ▪ The following built-in libraries are listed by default for InstallScript projects: ifx.obl,isrt.obl.</p> <p>The following built-in libraries are listed by default for Basic MSI and InstallScript MSI projects: iswi.obl,isrt.obl.</p> <p>The following built-in libraries are listed by default for InstallScript Object projects: ifxobject.obl,isrt.obl.</p> <p>Additional built-in libraries may also be listed, depending on which views in InstallShield you use when you are developing your project.</p>

## Run/Debug Tab

**Project** ▪ This information applies to the following project types:

- InstallScript
- InstallScript Object

The Run/Debug tab lets you configure settings relevant to the running and debugging of your installation.

**Table 56** ▪ Run/Debug Tab Settings

Settings	Description
<b>Setup Command Line Arguments</b>	Text placed in this box is written to the system variable CMDLINE when you run the installation from within InstallShield; this variable can be accessed in the script.
<b>Generate MIF File</b>	If you select this check box, the installation automatically generates a Management Information Format (.mif) file when you run the installation from within InstallShield. For information on generating .mif files in the installation that you distribute, see <a href="#">The [Mif] Section</a> .

**Table 56** ▪ Run/Debug Tab Settings (cont.)

Settings	Description
<b>MIF Filename</b>	Specifies the name of the .mif file generated by the installation when you run the installation from within InstallShield. If you leave this box blank, the .mif file is named Status.mif.
<b>Product Serial Number</b>	If you specify a serial number, the installation adds it to the .mif file it generates when you run the installation from within InstallShield.

## MSI Log File Tab

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

The MSI Log File tab on the Settings dialog box enables you to create a log file that you can use when you are running your installation from within InstallShield. In addition, this tab lets you select the type of information that you would like written to the log file.

**Table 57** ▪ MSI Log File Tab Settings

Setting	Description
<b>MSI Log File Options</b>	Select the check boxes for the types of messages that you want to be displayed in your log file. When you select a check box, the corresponding argument is added to the MsiExec.EXE Command-Line Arguments box.
<b>MsiExec.EXE Command-Line Arguments</b>	Enter the command-line arguments that you would like to pass to MsiExec.exe when your installation is run. When check boxes are selected in the MSI Log File Options area, the corresponding command-line parameters are added to this box.
<b>Log File</b>	Type the name of the log file that will be created when your installation is run.  <b>Project</b> ▪ For InstallScript MSI projects, you need to type the full path to the log file in this box.

# Setup Languages Dialog Box

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

The behavior of the Setup Languages dialog box varies, depending on whether the project type is Windows Installer based (a Basic MSI, InstallScript MSI, or Merge Module project) or InstallScript based (an InstallScript or InstallScript Object project).

The Setup Languages dialog box opens when you click the ellipsis button (...) for the Setup Languages setting in the General Information view.

In Basic MSI, InstallScript MSI, and Merge Module projects, the Setup Languages dialog box lets you specify the languages that you want to be listed in the UI Languages setting in the Releases view. Therefore, if a language is not listed in this dialog box at the project level, you cannot include that particular UI language in your project's releases.

In InstallScript and InstallScript Object projects, the Setup Languages dialog box lets you specify the languages that you want to be listed in the Languages setting in the Components and Releases views in your project. In general, if a language is not listed for this setting at the project level, you cannot designate that a particular component in your project is targeted for that language; in addition, you cannot designate that the components and UI strings for a particular language are included in your project's releases.

When you add a supported language to your project through this setting, InstallShield adds string entries for that language to your project. The string entries include the built-in user-interface string resources that are already translated.

**Table 58** ▪ Settings on the Setup Languages Dialog Box

Setting	Description
Languages	<p>If you want the strings of a particular language to be included in your project, select its check box. To exclude all of the strings for a particular language, clear its check box.</p> <div></div> <p><b>Edition</b> ▪ Language support varies, depending on the edition of InstallShield that you are using, the project type, and the language of the InstallShield interface (English or Japanese). For example, if you are using the English version of InstallShield, only one language is available for selection in this dialog box; if other language check boxes are listed, they are disabled.</p> <p>For general information about language support, see <a href="#">Run-Time Language Support in InstallShield</a>.</p>

**Table 58** ▪ Settings on the Setup Languages Dialog Box (cont.)

Setting	Description
<b>Show only selected languages</b>	If you want the languages box to list only languages whose check boxes are selected, select this check box.
<b>Show only available languages</b>	If you want the languages box to list only languages that are available to you with the edition of InstallShield that you are using, select this check box.

## SQL Server Requirement Dialog Box

Use the SQL Server Requirement dialog box to define the server requirements for your database.

### Predefined Minimum Database Server Version

Select a predefined minimum database server version that your application supports. Choose from the list of available options.

**Note** ▪ At runtime, the installation verifies that all database servers that are selected by the end user meet the specified requirements.

### Customize

Rarely, you will want to define your own database server version, but in the cases that you must, check the Customize box and any of the following options that apply:

**Table 59** ▪ Customize Options

Option	Description
<b>Major Version</b>	This is the major version returned by a SQL Server. For example, SQL Server version 7 returns 7.00
<b>Service Pack Level</b>	This is the server pack level number returned by a SQL Server. For example, SQL Server version 7 RTM returns 623.
<b>Any Greater than Major Version</b>	Check this option to support future major versions.
<b>Any Greater than Service Pack Level</b>	Check this option to support future service packs.

## Supersedence Dialog Box

**Edition** ▪ This information applies to Basic MSI projects.

The Supersedence dialog box opens when you click the ellipsis button (...) in the Supersedence setting of the General Information view. This dialog box lets you specify one or more other .msi packages that you want to be superseded by the installation that you are creating. InstallShield includes the list of .msi packages that you provide in a software identification tag, which provides data that AdminStudio includes when users import packages into the AdminStudio Application Catalog. AdminStudio makes this information available to users for review and tests before publishing to Microsoft System Center 2012 Configuration Manager.

When you are selecting superseded .msi packages, you can specify earlier versions of the current installation. You can also optionally select .msi packages of other tools. For example, if you are working on an installation for an image editing tool, you can have your installation supersede other image editing tools that your enterprise no longer supports.

To specify an .msi package that should be superseded by the current installation, click the Add Superseded .msi File button, and then select the package that you want to include in the list.

## UI Languages Dialog Box

**Edition** • This information applies to the following project types:

- Advanced UI
- Basic MSI
- InstallScript MSI
- Merge Module
- Suite/Advanced UI

The UI Languages dialog box lets you specify which user interface languages you want to include in the release that is selected in the Releases view. To open this dialog box, open the Releases view and select a release. Then click the ellipsis button (...) in the UI Languages setting on the Build tab.

Note that if a language is not selected in the Setup Languages setting in the General Information view of the project, it is not listed as one of the available languages for the UI Languages setting.

## Update Merge Module Search Path Dialog Box

The Update Merge Module Search Path dialog box opens when you use the Browse for Merge Module option to add a merge module to your installation project. It displays the path that will be added to the merge module search path.

Click OK to approve the action.

To learn more about why this dialog box appears, see [What Happens When You Browse for a Merge Module](#).

# Wizard Reference

InstallShield includes many wizards to assist you in creating your installation project.

---

**Project** ▪ *Not all wizards are available with all project types.*

The following wizards are available in InstallShield.

- [Component Wizard](#)
- [Convert Source Paths Wizard](#)
- [Create New QuickPatch Wizard](#)
- [Create Table Wizard](#)
- [Custom Action Wizard](#)
- [Database Import Wizard](#)
- [Device Driver Wizard](#)
- [Dialog Wizard](#)
- [DirectX Object Wizard](#)
- [Dynamic Scanning Wizard](#)
- [Export Components Wizard](#)
- [Function Wizard](#)
- [Import DIM Wizard](#)
- [Import REG File Wizard](#)
- [Import XML Settings Wizard](#)
- [Microsoft .NET Framework Object Wizard](#)
- [MSI to MSIX Conversion Wizard](#)
- [New Language Wizard](#)
- [Open MSI/MSM Wizard](#)
- [Open MSP Wizard](#)
- [Open Transform Wizard](#)
- [Publish Wizard](#)
- [Redistributable Downloader Wizard](#)
- [Reg-Free COM Wizard](#)
- [Release Wizard](#)
- [Setup Best Practices Wizard](#)
- [Static Scanning Wizard](#)

- [System Search Wizard](#)
- [Transform Wizard](#)
- [Upgrade Validation Wizard](#)
- [User Interface Wizard](#)
- [Visual Studio .NET Wizard for Visual Basic .NET, C# .NET, and Visual C++ .NET](#)
- [Visual Studio Deployment Project Import Wizard](#)

# Component Wizard

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

Although there are several ways to create Windows Installer components and specify advanced settings for them, the Component Wizard simplifies the process. The wizard assists you by organizing your files into components and making settings for files with advanced installation requirements—often by automatically retrieving information about the files.

**Task**

**To launch the Component Wizard, do one of the following:**

- For installation projects only: In the **Setup Design** view, right-click a feature and click **Component Wizard**.
- For Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, and MSM Database projects: In the **Components** view, right-click the **Components** explorer and click **Component Wizard**.

When you launch the Component Wizard, you are presented with the following options on the Welcome panel:

**Table 1** - Welcome Panel Settings

Setting	Description
Create components for me using Best Practices	Select this option to specify all of your application’s files and have InstallShield create all of the necessary components for you according to <a href="#">Setup Best Practices</a> .

**Table 1** • Welcome Panel Settings (cont.)

Setting	Description
<b>Let me select a type and define the component myself</b>	<p>This option creates components containing files that need special treatment upon installation and uninstallation. The wizard can create components for only one of the following file categories at a time. Run the Component Wizard again to build components for another type of file.</p> <ul style="list-style-type: none"> <li>• COM Server</li> <li>• Install Service</li> <li>• Control Service</li> <li>• Fonts</li> </ul>  <p><b>Note</b> ▪ If you want to create a component that installs, starts, stops, or deletes a service during installation or uninstallation, you can use the Services view. You can also use this view to configure extended service customization options, which are not configurable through the Component Wizard. For more information, see <a href="#">Installing, Controlling, and Configuring Windows Services</a>.</p>

## Welcome Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

Although there are several ways to create Windows Installer components and specify advanced settings for them, the Component Wizard simplifies the process. The wizard assists you by organizing your files into components and making settings for files with advanced installation requirements—often by automatically retrieving information about the files.

**Tip** ▪ The Component Wizard should not be used to modify existing components. When you have created your components, you can edit their properties, files, and advanced settings in the Setup Design view or the Components view.

**Table 2** ▪ Welcome Panel Settings

Setting	Description
<b>Create components for me using Best Practices</b>	Select this option to specify all of your application's files and have InstallShield create all of the necessary components for you according to <a href="#">Setup Best Practices</a> .
<b>Let me select a type and define the component myself</b>	<p>This option creates components containing files that need special treatment upon installation and uninstallation. The wizard can create components for only one of the following file categories at a time. Run the Component Wizard again to build components for another type of file.</p> <ul style="list-style-type: none"> <li>• COM server</li> <li>• Install Service</li> <li>• Control Service</li> <li>• Fonts</li> </ul>  <p><b>Note</b> ▪ If you want to create a component that installs, starts, stops, or deletes a service during installation or uninstallation, you can use the Services view. You can also use this view to configure extended service customization options, which are not configurable through the Component Wizard. For more information, see <a href="#">Installing, Controlling, and Configuring Windows Services</a>.</p>

## Setup Best Practices

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

This Component Wizard path is the easiest means for organizing all of your application's files into components. The wizard also handles installing files with special installation requirements, such as COM servers and fonts, if it detects them among the files that you provide. For more information on how the Component Wizard organizes your files according to Best Practices, see [Best Practice Rules for Creating Components](#).

After selecting the Best Practices option in the Component Wizard, the next panel you see is the Best Practices–Destination Panel.

## Destination Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

The first step is to specify the folder where the components' files will be installed on the target system.

**Note** ▪ The Destination setting is disabled if you launch the Component Wizard by right-clicking on a destination in the Files and Folders view. The destination that you selected before launching the Component Wizard becomes the destination for the component that you create.

**Table 3** ▪ Destination Panel Settings

Setting	Description
<b>Destination</b>	<p>The wizard uses the same destination folder for all of the components it creates. The destination you select in this field becomes the Destination Folder setting for every component that is created in this wizard session.</p> <p>Select a Windows Installer folder property, in square brackets, from the drop-down list of standard destination folders. The default value points to the root of INSTALLDIR, which is initialized in the product's Destination Folder setting.</p> <p>Select <b>Browse, create, or modify a directory entry</b> from the drop-down list to display the Browse for Directory dialog box.</p>

## Files Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI

- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*

In the Files panel, specify the files that should be grouped into components.

**Table 4** • Files Panel Settings

Setting	Description
<b>Files</b>	<p>The Files list displays information about each file associated with this component.</p> <p>Add files to the list in either of the following ways:</p> <ul style="list-style-type: none"> <li>• Drag and drop files from Windows Explorer onto the file list.</li> <li>• Click Add Files and browse to your application's files.</li> </ul>  <p><b>Note</b> • The path to each file is a hard-coded link. If the file is moved or renamed, the Link To value reads <b>*** File Not Found ***</b>, and the Release Wizard will be unable to resolve the file link when you build your setup package.</p>
<b>Extract COM Info Immediately</b>	<p>If this option is selected, the component's COM Extract at Build setting is set to No and the COM data is extracted immediately. If you clear this check box, the COM data is extracted at build time.</p>
<b>Add Files</b>	<p>Click Add Files to browse to the files you want to add to the list. In the resulting dialog you can select as many files as you want from a single folder by pressing the SHIFT or CTRL key and clicking on the files.</p> <p>You can also use the Insert key to add files.</p>
<b>Add Folder</b>	<p>Click Add Folder to browse to a folder that you would like to add to the list. All the files under this folder, including any files in subfolders, will be added to your project.</p>
<b>Remove Files</b>	<p>Select one or more files and click Remove Files to permanently delete them from the list.</p> <p>You can also use the Delete key to delete files.</p>

## Summary Panel

**Project** • This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*

The Summary panel displays the components' settings. Review the summary, and click Finish to complete the component creation process and organize the files into components.

If you launched the wizard by right-clicking a feature, the new components are associated with that feature. Otherwise, you must open the Setup Design view, right-click one or more features, and select Insert Components to associate your new components with features.

The Component Wizard provides smart defaults for most of your component settings and any necessary advanced settings. To edit them, select a component in the Components view and modify the component's settings.

---

**Note** ▪ Components that are not associated with a feature are displayed with the orphaned component icon.

## Component Type Panel

---

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*

The Component Type panel enables you to create components of a single type. Since these components all have unique installation and uninstallation requirements, subsequent panels of the Component Wizard differ, depending on the type of component that you are installing.

**Table 5** • Component Type Panel Settings

Setting	Description
<b>Component Name</b>	<p>When you click a component type, the wizard suggests a unique name for your new component in the Component Name field. To change the name, type a new name over the suggested name.</p>  <p><b>Note</b> ▪ Although you can specify a single component type for multiple font files or multiple services in one file, these are all placed into a single component and require only one component name.</p> <p>This setting is disabled if you are creating the font type of component. InstallShield uses the font file name as the name of font components.</p>
<b>Component Types</b>	<p>Select the type of component that you want to create.</p> <ul style="list-style-type: none"> <li>• <a href="#">COM Server</a></li> <li>• <a href="#">Install Service</a></li> <li>• <a href="#">Control Service</a></li> <li>• <a href="#">Fonts</a></li> </ul>  <p><b>Note</b> ▪ If you want to create a component that installs, starts, stops, or deletes a service during installation or uninstallation, you can use the Services view. You can also use this view to configure extended service customization options, which are not configurable through the Component Wizard. For more information, see <a href="#">Installing, Controlling, and Configuring Windows Services</a>.</p>

## COM Server Component Type

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*

The COM server component type in the Component Wizard accepts a single COM server (.exe, .dll, or .ocx) file and creates a component for it in your installation project.

Since these files require special registration so that they can operate on the target system, the wizard attempts to extract the information for you. If the wizard fails to extract the file's registry settings, it prompts you for the CLSID, progID, and so on.

All of the registration information that maps to the COM Registration advanced setting is written there. The wizard creates any additional entries, such as the InProcServer32 ThreadingModel value, in the component's registry data.

**Tip** ▪ If you are using InstallShield on a 64-bit system, InstallShield can extract COM data from a 64-bit COM server. In order to install the data to the correct locations, the component must be marked as 64 bit. To learn more about 64-bit support, see [Targeting 64-Bit Operating Systems](#).

Using the component's data, the installer registers the file during installation and unregisters it during uninstallation instead of calling self-registration functions, which would be a violation of Setup Best Practices.

**Note** ▪ The PATH system variable on the build machine must be set to include the directories of all of the .dll files to which the COM server links; otherwise, the file will fail to register and COM information will not be extracted.

The wizard asks if your COM server runs as a service, so you can specify installation parameters for the service.

## COM Server File Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

The COM Server File panel is where you identify basic information about your COM server's executable file.

**Table 6** ▪ COM Server File Panel Settings

Setting	Description
<b>COM Server File</b>	<p>Enter the path and file name of your COM server (.exe, .dll, or .ocx) file, or click the Browse button to navigate to the file.</p> <p>You can specify only one portable executable file per component according to Setup Best Practices. Launch the wizard again to install additional COM servers, or create the components using the Component Wizard's Best Practices option.</p>

**Table 6** • COM Server File Panel Settings (cont.)

Setting	Description
<b>Extract registration information</b>	<p>Select this check box to have the wizard scan your file to extract all of the file's registration information. If the extraction is successful, the next panel displayed is the Summary confirmation dialog.</p> <p></p> <p><b>Project</b> ▪ If you are working on a Basic MSI, InstallScript MSI, or Merge Module project, an alternative to extracting the COM information through the wizard and maintaining it in the COM Registration advanced setting is to have the data dynamically extracted at build time. If you are working in Direct Edit Mode, COM information cannot be extracted at build time; it is extracted at design time.</p> <p>If you do not select this check box or if the wizard cannot read the file's registration, the Classes panel is displayed next.</p> <p></p> <p><b>Tip</b> ▪ If you are using InstallShield on a 64-bit system, InstallShield can extract COM data from a 64-bit COM server. In order to install the data to the correct locations, the component must be marked as 64 bit. To learn more about 64-bit support, see <a href="#">Targeting 64-Bit Operating Systems</a>.</p>
<b>This file also runs as a service</b>	<p>This check box is enabled only if your COM server is an .exe file. If you select this option, the wizard displays panels that enable you to specify installation parameters for services.</p> <p>If you select this check box and specify the service information, InstallShield enters the information in the Services area under the Advanced Settings node of your component in the Components view. You do not have to launch the wizard again to create a service component for this COM server.</p>
<b>Custom EXE Command Line</b>	<p>This check box is enabled only if your COM server is an .exe file. Once it is enabled, you can enter a command line argument. The command line argument overrides the default /regserver command line to an .exe file.</p> <p>If you select the service option and specify parameters in the Custom EXE Command Line box, /service is passed as the command line. By default, the /service command line does everything that the /regserver command line does but it also adds registry values for service support.</p> <p>If you select all the options on this panel, the command line that you enter in this box is the command line that is passed to the .exe file.</p>

If the COM server is part of a 64-bit component and you are running InstallShield on a 64-bit machine, InstallShield performs 64-bit COM extraction. For more information, see [Targeting 64-Bit Operating Systems](#).

## Classes Panel

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

This panel is where you begin providing registration information for your COM server—including your file's classes, identified by their progIDs and CLSIDs.

This panel and the next few registration information panels are displayed only if you elected not to have the wizard extract the information, or if the wizard failed for any reason (for example, if the .exe, .dll, or .ocx file does not indeed contain a COM server). Otherwise, the wizard would continue with the Service Executable panel—if the COM server is a service, or the Summary panel—if the COM server is not a service.

**Table 7** - Classes Panel Settings

Setting	Description
<b>ProgID</b>	<p>Enter the COM server's programmatic identifier, or progID in this panel. Each progID corresponds to a COM class in your file. To add a new progID in the format Program.Component.N, click the Add button or press the Insert key.</p> <p>Enter the same value in both the ProgID and Version-Independent ProgID fields if the progID is version independent (in the format Program.Component).</p> <p>All of the other information in this panel corresponds to the class you named in this field with a progID. Click on each progID to set its class ID and version-independent progID and to check whether it is DCOM/COM+ enabled.</p>
<b>Add</b>	<p>Click Add to register a new class for this COM server. To rename the service, type the new name immediately after clicking the Add button, or press F2 and then type the new name.</p> <p>You can also use the Insert key to add a new service.</p>
<b>Remove</b>	<p>Click Remove to permanently delete a progID from the list. You can also use the Delete key to remove a service.</p>
<b>Class ID</b>	<p>Click on a progID to provide the corresponding class ID. Enter a string GUID for the CLSID that Windows Installer will register for this class.</p>

**Table 7** ▪ Classes Panel Settings (cont.)

Setting	Description
<b>Version-Independent ProgID</b>	<p>Click on a progID to provide the corresponding version-independent progID, if any, in the format <i>Program.Component</i>.</p> <p>If the progID itself is version independent, enter the same progID in this field.</p>
<b>This COM server is DCOM/COM+ enabled</b>	<p>If the COM class is enabled for DCOM or COM+, and therefore requires additional registry entries, check this box. The wizard prompts you for this information in the <a href="#">AppID General Information</a> and <a href="#">AppID Advanced Information</a> panels.</p>

## Context Types Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

Indicate the type of file in which your COM server resides. The available context types are:

- InprocServer—16-bit DLL or OCX
- InprocServer32—32-bit DLL or OCX
- LocalServer—16-bit EXE
- LocalServer32—32-bit EXE

## Type Library Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

Specify the type library, if any, referenced by this COM server.

**Table 8 • Type Library Panel Settings**

Setting	Description
<b>Type Library Description</b>	<p>Provide a brief description of the type library.</p> <p>This value is used in the component's COM Registration advanced setting as the type library's name in the COM Registration Explorer. The description is registered as the default value under <code>HKEY_CLASSES_ROOT\TypeLib\LibID\version</code>.</p>
<b>Type Library GUID</b>	<p>Enter the GUID (LibID) that identifies this type library. You can paste (Ctrl+V) your COM server's LibID into this field.</p>
<b>Language</b>	<p>Enter the decimal value of the type library's locale ID.</p> <p>Since type libraries are usually language neutral, 0 (zero) is the most common language of type libraries.</p>
<b>Version</b>	<p>Provide the version number of the type library. If this field is blank, Windows Installer automatically determines the version of the type library at run time.</p>

## AppID General Information Panel

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

In this panel, you provide basic information about your DCOM or COM+ file's AppID. An AppID is a GUID registered under `HKEY_CLASSES_ROOT\AppID` used for grouping all of the security and configuration options of distributed COM objects. The information you provide in this panel and in the [AppID Advanced Information panel](#) are registered under this key.

This panel is not displayed unless you selected the **This COM server is DCOM/COM+ enabled** check box on the [Classes panel](#).

**Table 9 • AppID Information Panel Settings**

Setting	Description
<b>AppID GUID</b>	<p>Enter the string GUID (AppID) for this COM+ or DCOM component. You can paste (Ctrl+V) the AppID into this field.</p>

**Table 9** ▪ AppID Information Panel Settings (cont.)

Setting	Description
<b>Remote Server Name</b>	Enter the name of the computer on which this component should run.

## AppID Advanced Information Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

In this panel, you provide more advanced information about your DCOM or COM+ file's AppID than you provided in the [AppID General Information panel](#).

This panel is not displayed unless you selected the **This COM server is DCOM/COM+ enabled** check box on the [Classes panel](#).

**Table 10** ▪ AppID Advanced Information Panel Settings

Setting	Description
<b>Activate at Storage</b>	<p>Select this check box to indicate that the distributed COM server resides on the same machine as its data.</p> <p>When a DCOM file is activated at storage, its objects are instantiated on the same machine as the data it uses, thereby reducing network traffic. Note that calling applications can override this default behavior with DCOM API functions.</p>
<b>Run as Interactive User</b>	<p>Select this check box to have the COM server run under the same account as the user currently logged onto the system. This option allows the server to be connected with the interactive desktop.</p> <p>Since COM servers that also run as services are not designed to run as the interactive user, this check box is disabled if you select the Run as a Win32 Service check box.</p>

**Table 10** ▪ AppID Advanced Information Panel Settings (cont.)

Setting	Description
<b>Run as a Win32 Service</b>	<p>Select this option if the distributed COM .exe file is intended to run as a service. When this option is selected, you should provide the name of the service and any parameters it takes.</p>  <p><b>Note</b> ▪ If you indicated—in the <i>COM Server Executable panel</i>—that this file runs as a service, the next panel displayed is the <i>Service Executable panel</i>, in which you must enter information about this file's services.</p>
<b>Service Name</b>	Enter the name of the service.
<b>Service Parameters</b>	Enter the parameters you want passed to the service when it is launched.

## Summary Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

Review the component's description and click Finish to have the wizard create the described components. Click Back if you need to change any of the information you provided.

All of the registration information that maps to the COM Registration advanced setting is written there. The wizard creates any additional entries, such as the InProcServer32 ThreadingModel value, in the component's registry data.

If the wizard lists **Please enter this information in the IDE**, go to the component's COM Registration (or Install Services for components that also run as a service) advanced setting and provide the values.

If you launched the wizard by right-clicking a feature, the new components are associated with that feature. Otherwise, you must open the Setup Design view, right-click one or more features, and select Insert Components to associate your new components with features.

**Note** ▪ Components that are not associated with a feature are displayed with the orphaned component icon.

## Control Service Component Type

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

**Note** ▪ If you want to create a component that installs, starts, stops, or deletes a service during installation or uninstallation, you can use the Services view. You can also use this view to configure extended service customization options, which are not configurable through the Component Wizard. For more information, see [Installing, Controlling, and Configuring Windows Services](#).

The Control Service component type is used start or stop a single service during installation or uninstallation. For example, you might need to delete a running service before updating it in your setup.

The wizard takes you through a series of panels prompting you for information about the service you want to control. Once you have completed the wizard, you have a new component consisting only of default properties and the advanced settings necessary for controlling a service. Later you can add data such as files, shortcuts, and registry entries to your component through the Setup Design or Components view.

### Task

#### To control another service:

Launch the wizard again or modify the component's Control Service advanced setting.

### Task

#### To install a service:

Launch the wizard again and select the Install Services component type or add the service's file to the Control Service component you have created in the wizard and edit its Services node in the Advanced Setting area of the Components view.

## Specify Service Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database

- *MSM Database*

The first step is to specify which service you want to install. Everything else you do in the wizard refers to this service.

You can use the Component Wizard to control a single service at installation and uninstallation. To control another service in a new component, launch this wizard again.

**Note** ▪ To control more than one service in the same component, you must modify the component's *Services* node under the *Advanced Settings* area of the *Components* view.

**Table 11** ▪ Specify Service Panel Settings

Setting	Description
<b>Service is present on target system</b>	Select this option to control a service that you are certain will be installed on the target system when your setup runs or that will be when your product is uninstalled.
<b>Service Name</b>	Enter the name of the service. This is the name that InstallShield, Windows Installer, and the Service Control Manager (which maintains the system's database of services and exposes an interface for controlling these services) use to identify a service—not its display name.
<b>Service is included in this setup</b>	Select this option to choose from among the services you have created in your setup project.
	 <p><b>Note</b> ▪ This option is disabled if none of your components has a service in its <i>Services</i> node under the <i>Advanced Settings</i> area in the <i>Components</i> view.</p>

## Installation Events Panel

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*

This panel offers you standard options for controlling the service during your product's installation.

**Table 12** • Installation Events Panel Settings

Setting	Description
<b>Trigger the following events when the component is installed</b>	Click this option to enable the installation control events.
<b>Start the service</b>	<p>This event starts the service when the component is installed. Specifically, it is started by the Start Services action in your setup's Installation sequence.</p> <p>Specify any command-line parameters to be used for launching the service in the Arguments field.</p>
<b>Arguments</b>	Specify any arguments that you want passed to the service when it is started. Separate each argument with a comma.
<b>Stop the service</b>	This event stops the service when the component is installed. It is stopped by the Stop Services action in your setup's Installation sequence.
<b>Delete the service</b>	This event deletes the service when the component is installed. It is deleted by the Delete Services action in your setup's Installation sequence.
<b>No event (do nothing)</b>	Select this option if you do not need to control this service during your product's setup. This option cancels any of the above events.

## Uninstallation Events Panel

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

This panel is prompting you for the same control events that were available for the product's installation, except that they will be triggered only when this component is uninstalled.

**Table 13** • Uninstallation Events Panel Settings

Setting	Description
<b>Trigger the following events when the component is uninstalled</b>	Click this option to enable the uninstallation control events.
<b>Start the service</b>	<p>This event starts the service when the component is uninstalled. Specifically, it is started by the Start Services action in your setup's Installation sequence.</p> <p>Specify any command-line parameters to be used for launching the service in the Arguments field.</p>
<b>Arguments</b>	Specify any arguments that you want passed to the service when it is started. Separate each argument with a comma.
<b>Stop the service</b>	This event stops the service when the component is uninstalled. It is stopped by the Stop Services action in your setup's Installation sequence.
<b>Delete the service</b>	This event deletes the service when the component is uninstalled. It is deleted by the Delete Services action in your setup's Installation sequence.
<b>No event (do nothing)</b>	<p>Select this option if you do not need to control this service during your product's setup. This option cancels any of the above events.</p> <p>If you selected the <b>No event (do nothing)</b> option on the <a href="#">Installation Events panel</a>, it is disabled in this panel. You must select a control event at either installation or uninstallation.</p>

## Wait Type Panel

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

In this panel, you can set the wait option for all events in your product's installation and uninstallation. Windows Installer proceeds as specified in this panel, following the control event.

Select **Wait for the service to complete the event before continuing** if the event is critical to the installation or uninstallation.

If you selected the **No event (do nothing)** option in the [Installation Events](#) or [Uninstallation Events](#) panel, the corresponding wait settings are disabled in this panel.

## Summary Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

Review the information the wizard has collected, and click Finish to create your Control Service component.

You can review and edit the new component's settings in the Components view or the Setup Design view.

If you launched the wizard by right-clicking a feature, the new components are associated with that feature. Otherwise, you must open the Setup Design view, right-click one or more features, and select Insert Components to associate your new components with features.

**Note** ▪ Components that are not associated with a feature are displayed with the orphaned component icon.

## Install Service Component Type

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

**Note** ▪ If you want to create a component that installs, starts, stops, or deletes a service during installation or uninstallation, you can use the Services view. You can also use this view to configure extended service customization options, which are not configurable through the Component Wizard. For more information, see [Installing, Controlling, and Configuring Windows Services](#).

The Install Service component type is used to create a component that contains the information necessary to install all of the Win32 services that are present in a single .exe file.

**Tip** ▪ If the file also runs as a COM server, a better way to create the component is to select the COM Server component type and specify that it contains a service. Once you have provided all the COM registration data, the Component Wizard will prompt you for the same information about the service that you must provide for the Install Services component type.

The wizard takes you through a series of panels prompting you for information about the services you want to install. Once you have completed the wizard, you have a new component consisting of your file, the default component properties, and the advanced settings necessary for installing and uninstalling the services.

You can edit the services' installation information in the Services node under the Advanced Setting area of the Components view. Windows Installer will pass these values to the Windows API function CreateService() to install each service onto the target system and register it with the Service Control Manager (which maintains the system's database of services and exposes an interface for controlling these services).

## Service Executable Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

Provide the fully qualified path for your file and list all of its services. Only .exe files are allowed. Driver services (.sys files) are not supported in the wizard.

**Table 14** ▪ Service Executable Panel Settings

Setting	Description
<b>Service Executable</b>	<p>Enter the fully qualified path to the executable file for the services in this component or click the Browse button to navigate to the service's executable file. In compliance with Setup Best Practices, the component can contain only one executable file. Launch the wizard again later to add another file to a new component.</p> <p>If you have arrived at this wizard panel as the result of having a COM Server component that contains services, the Service Executable box is disabled. The wizard uses the same executable that you entered in the <a href="#">COM Server Executable panel</a>.</p> <div>  <p><b>Caution</b> ▪ If you use the Browse button to navigate to and select a file, the new value overwrites anything that was entered in the Service Executable box.</p> </div>
<b>Services</b>	This list contains all of the services found in the file.
<b>Add</b>	<p>Click Add to add a new service. To rename the service, type the new name immediately after clicking the Add button, or press F2 and then type the new name. This is the name that InstallShield, Windows Installer, CreateService(), and the Service Control Manager (which maintains the system's database of services and exposes an interface for controlling these services) use to identify the service—not its display name.</p> <p>You can also use the Insert key to add a new service.</p>
<b>Remove</b>	Select a service and click Remove to permanently delete it from the Services list. You can also use the Delete key to remove a service.

## Service Type Information Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

Select each service in the drop-down list and provide the necessary details.

**Table 15** ▪ Service Type Information Panel Settings

Setting	Description
<b>Service</b>	Select the services that you entered in the Services list of the <b>Service Executable panel</b> and then specify the Display Name and Service Type installation properties for each.
<b>Display Name</b>	<p>Enter a display name for the service. This is the name that is displayed to users in the SCM. If you leave the Display Name field blank, the name you gave the service is used as the display name.</p>  <p><b>Note</b> ▪ Other service properties, such as the service description to display on target systems, are available in the component's advanced settings.</p>
<b>Service Type</b>	<p>Specify whether the service runs in its own process or shares a process with others. Select the <b>Service shares a process with others</b> option only if there is more than one service in the component.</p> <p>If you are familiar with the source code for the service, select <b>This service runs in its own process</b> if it is of type SERVICE_WIN32_OWN_PROCESS, and <b>Service shares a process with others</b> if it is of type SERVICE_WIN32_SHARE_PROCESS.</p>  <p><b>Note</b> ▪ You are limited to the options provided under Service Type. The Component Wizard does not support driver services.</p>
<b>Arguments</b>	Enter command-line arguments to pass to the service when it runs. Expressions of the form [PropertyName] will be expanded to the value of the Windows Installer property called PropertyName.

## Service Start Type Information Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

Select each service in the drop-down list and indicate the way in which you want the service started—or if you want the service disabled.

## Start Type

Select the service's start type from the list.

- Automatically when the system starts up
- On demand through the Service Control Manager
- Not started (Disabled)

## Service Load Order Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

Select each service in this file and enter its load-ordering group and dependency information. Having dependencies and membership in a load-ordering group means that the service requires other services to be running before it can be started. (Service load-ordering groups are listed under HKEY\_LOCAL\_MACHINE\System\CurrentControlSet\Control\ServiceGroupOrder. The service's Start Type property determines when it loads within its group.)

**Table 16** ▪ Service Load Order Panel Settings

Setting	Description
<b>Service</b>	Select each of the services that you entered in the Services list of the <a href="#">Service Executable panel</a> and then specify its load-ordering and dependency information.
<b>Load-Ordering Group</b>	Enter the name of the load-ordering group of which this service is a member. Leave this field blank if the service does not belong to a group.
<b>Dependencies</b>	<p>List the service's dependencies in the edit field. A service's dependency can be another service—in which case enter the service's name, or it can be a load-ordering group—in which case precede the name of the load-ordering group with a plus sign (+) so that the SCM can distinguish it from a service.</p> <p>Separate each dependency with a comma.</p>

## Error Control Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

Select each of the services that you entered in the Services list of the [Service Executable panel](#) and—for each service—specify which action you would like the Service Control Manager to take if it receives an error while attempting to start the service.

- Log the error and continue starting the service.
- Log the error, display a message box, and continue starting the service.
- Log the error and, if possible, restart the system with the last known good configuration.

## Service Logon Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

Select each service in the list and specify the type of account you want the service to log on as when it starts up.

**Caution** ▪ Because of potential password conflicts, Microsoft recommends that all services log on under the local system account.

**Table 17** ▪ Service Logon Panel Settings

Setting	Description
<b>Service</b>	Select each of the services that you entered in the Services list of the <a href="#">Service Executable panel</a> and then specify how the service should log on.
<b>Local system account</b>	Select this option to have the service log on under the local system account.

**Table 17** ■ Service Logon Panel Settings (cont.)

Setting	Description
<b>Allow service to interact with the desktop</b>	If the service has a user interface, click this option.
<b>This account</b>	Select this option if you want the service to impersonate a specific user when it logs on. You must enter a user name and password, or the local system account will be used.
<b>Domain/User Name</b>	Enter accounts in the form <b>DomainName\UserName</b> . You can use a dot for the built-in domain, such as <b>.\UserName</b> .
<b>Password</b>	Enter the password for this account.  The password will not be used if you do not specify a user name, and the service will log on under the local system account.

## Summary Panel

**Project** ■ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

Review the information the wizard has collected, and click Finish to create your service component.

The wizard provides smart defaults for all of your component's properties. You can review the property sheet in the Setup Design views. Of particular importance for an service is the Remote Installation setting, since Windows Installer cannot install a service that does not reside on the local system.

If you launched the wizard by right-clicking on a feature, the new component is associated with that feature. Otherwise, you must open the Setup Design view, right-click on one or more features, and select Insert Components to associate your new component with a feature.

**Note** ■ Components that are not associated with a feature are displayed with the orphaned component icon.

After the wizard finishes, you can modify any of the installation options for the component's Services node under the Advanced Setting area of the Components view.

InstallShield provides functionality for controlling this service or others on the target system. For more information, see [Installing, Controlling, and Configuring Windows Services](#).

## Font Component Type

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

Although you can create a component in one of several ways, the easiest way to install a font (a .ttf, .fon, or .ttc file) in a setup is to create a Fonts component in the Component Wizard.

Unlike the other component types offered in the wizard, there is no corresponding advanced setting for Fonts components. The setting that distinguishes a Fonts component and tells Windows Installer to install it differently is the file's Font Title property.

An alternative to creating a Fonts component is to select the Setup Best Practices option in the Component Wizard and let InstallShield create a Fonts component for you from your font files.

**Note** ▪ If you want a font to remain on the system after the application has been uninstalled, set its component's Permanent property to Yes.

## Add Installed Fonts Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

The wizard searches for all fonts that are registered on the development system. You can create a component containing any of these fonts by selecting them in the list.

**Table 18** ▪ Add Installed Fonts Panel Settings

Setting	Description
Fonts	Select the fonts you want to include in your Fonts component.

**Table 18** ▪ Add Installed Fonts Panel Settings (cont.)

Setting	Description
<b>I also want to add fonts not installed on this system</b>	Click this option to be able to browse to additional fonts in the <a href="#">Add New Fonts panel</a> .  If you do not select this option, the wizard displays the <a href="#">Summary panel</a> next.

## Add New Fonts Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

This panel lets you add any .ttf, .fon, or .ttc file to your Fonts component.

**Note** ▪ This panel is designed to allow you to add fonts to your installation that are not installed on your machine. For example, you might have a font file that is stored on a network drive. As a result, you cannot select fonts from your Fonts folder since those fonts are already installed on your local machine. If you want to add a font that is installed on your machine to your installation, click Back and select the appropriate font from the list.

**Table 19** ▪ New Fonts Panel Settings

Setting	Description
<b>Fonts</b>	Drag and drop files into the list, or click Add Fonts to browse to and add new fonts to your component.  InstallShield reads the font title from the font file. If no title is specified within the font file, click on the font title to specify a title in the format FontTitle (FontType)—for example, Marlett (TrueType).
<b>Add Fonts</b>	Click Add Fonts to browse to new font files.
<b>Remove Fonts</b>	Select a font in the list and click Remove Fonts to permanently remove the selected font from the component.

## Summary Panel

**Project** - This information applies to the following project types:

- Basic MSI
- InstallScript MSI
- DIM
- Merge Module
- MSI Database
- MSM Database

If you launched the wizard by right-clicking on a feature, the new component is associated with that feature. Otherwise, you must open the Setup Design view, right-click on one or more features, and select Insert Components to associate your new Font component with a feature.

**Note** - Components that are not associated with a feature are displayed with the orphaned component icon.

When the font's feature is selected for installation, it is automatically registered by Windows Installer.

All Font components are installed by default to the location stored in the FontsFolder property. You can edit the component's Destination Folder or set additional properties by editing the component's property sheet.

**Note** - If you would like a font to remain on the system even after the program has been uninstalled, be sure to set the Font component's Permanent property to Yes.

Unlike the other component types offered in the wizard, there is no corresponding advanced setting for Fonts components. The setting that distinguishes a Fonts component and tells Windows Installer to install it differently is the file's Font Title property.

## Component Wizard General Summary Panel

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

This panel appears at the end of the wizard's component creation process. For help with a specific component type, see the following information.

- [Setup Best Practices Option](#)

- [COM Server Component Type](#)
- [Install Services Component Type](#)
- [Control Service Component Type](#)
- [Fonts Component Type](#)

---

**Note** ▪ Components that are not associated with a feature are displayed with the orphaned component icon.

## Convert Source Paths Wizard

With the Convert Source Paths Wizard, you can convert existing hard-coded paths to path variables, thereby enhancing the portability of your setup project.

### Task

#### To launch the Convert Source Paths Wizard:

On the **Project** menu, click **Source Paths** button.

## Welcome Panel

The Convert Source Paths Wizard allows you to convert your setup's hard-coded paths to path variables. The wizard scans your project for any use of hard-coded paths and then replaces the paths with standard path variables.

If you have files that evaluate to existing path variables, the wizard automatically converts these paths without providing the option of selecting a new variable. For example, if you have a file in the Program Files folder, this path is automatically converted to the predefined path variable <ProgramFilesFolder>.

## Search Panel

The Search panel displays the search status. At this time the wizard is scanning the current project for any absolute paths. If your files evaluate to existing path variables, these files are converted automatically.

## Search Results and Recommendations Panel

The Search Results and Recommendations panel lists all the path variable options for the files and links in your project that are not located in directories that already have path variables. For example, if your file is C:\App Files\Executable\App.exe, you are given the option of creating a path variable called Executable that equates to that path.

### Panel Options

#### Path Variable Recommendation

Indicate the variables that you want to create by selecting the corresponding boxes. If you do not want to create one of the suggested variables, clear the check box next to it.

### Rename

Select the variable that you want to rename and click the Rename button. Type the new variable name in the Path Variable Recommendation column.

### Deselect All

Click the Deselect All button to clear the check boxes next to all the corresponding suggested path variables.

### Select All

Click the Select All button to select all the path variable suggestions. When you click Apply, these variables are created and added to your project.

## Updating Your Project Panel

This panel displays the wizard's progress in updating the hard-coded paths in your project to path variables.

## Update Completed Panel

This panel signifies the end of the Convert Source Paths Wizard. Click the Finish button to return to the IDE.

## Create New QuickPatch Wizard

**Project** ▪ This information applies to QuickPatch projects.

A QuickPatch project is recommended for installation authors who want to ship small, single updates to their users. QuickPatch authoring provides a simple alternative to creating a patch in the Patch Design view, even though it provides less customization. Fundamentally, both patch creation methods produce the same deliverable types: .msp and .exe files.

To create a QuickPatch project for an existing .msi file or an existing QuickPatch, use the Create New QuickPatch Wizard.

**Caution** ▪ Creating a QuickPatch project for an earlier QuickPatch without first building the earlier QuickPatch project may cause unexpected behavior.

### Task

#### To open the Create New QuickPatch Wizard:

Create a new project in InstallShield and select QuickPatch Project as the project type.

The QuickPatch you create using this method can be used to patch an existing .msi file or an existing QuickPatch.

**Tip** ▪ You can use the Create New QuickPatch Wizard to create a QuickPatch project for an existing QuickPatch. As an alternative, you can open the latest QuickPatch project in InstallShield and specify that you want to create a

QuickPatch project for the current QuickPatch. For more information, see [Creating a QuickPatch Project for an Existing QuickPatch](#).

## Welcome Panel

---

**Project** ▪ This information applies to QuickPatch projects.

A QuickPatch project is recommended for installation authors who want to ship small, single updates to their users. QuickPatch authoring provides an alternative to creating a patch in the Patch Design view, even though it provides less customization. Fundamentally, both patch creation methods produce the same deliverable types: .msp and .exe files.

To create a QuickPatch project for an existing .msi file or an existing QuickPatch, use the Create New QuickPatch Wizard.

---

**Note** ▪ If you click *Cancel* or *Exit* in the wizard, QuickPatch project creation will be incomplete, and the QuickPatch project will not open in InstallShield.

## QuickPatch Project Base Panel

---

**Project** ▪ This information applies to QuickPatch projects.

The QuickPatch Project Base panel is where you specify whether you would like to base your new QuickPatch project on an existing .msi file or on an existing QuickPatch project.

## Panel Options

**Table 20** ▪ QuickPatch Project Base Panel Options

Option	Description
<b>Based on an MSI package</b>	Select this option to build a QuickPatch project for an existing .msi file. Select this option if this is the first QuickPatch created for the application.
<b>Based on an existing QuickPatch project</b>	Select this option to build a QuickPatch project for an existing QuickPatch. This option creates a project that can patch existing QuickPatch projects as well as the original .msi file.
	 <p><b>Note</b> ▪ Attempting to create a QuickPatch of an already existing QuickPatch project without first building the existing QuickPatch causes unexpected behavior.</p>

If you select the Based on an MSI package option and click Next, the **Original Setup Package panel** opens. If you select the Based on an existing QuickPatch project option and click Next, the Location of Existing QuickPatch panel opens.

## Original Setup Package Panel

**Project** ▪ This information applies to QuickPatch projects.

If you are building a QuickPatch project for an existing Windows Installer installation, use the Original Setup Package panel to specify the location of the .msi file. The original installation is the base installation for the new patch. The Create New QuickPatch Wizard creates a patch that can update this installation.

If the original installation is compressed, InstallShield creates an uncompressed image of that installation. The Original Setup Package panel enables you to specify the path for the uncompressed base image.

**Note** ▪ Once your project has been created and opened in InstallShield, there is no way to change the path to the base installation. Therefore, if you want to patch a different installation, you must run through the Create New QuickPatch Wizard again to create a new QuickPatch project.

## Panel Options

**Table 21** ▪ Original Setup Package Panel Options

Option	Description
<b>Original Setup</b>	Specify the location of the original/base installation or click the Browse button. The Create New QuickPatch Wizard creates a project that can validate this installation.  If your original installation is uncompressed, click Finish to open your QuickPatch project in InstallShield.
<b>Decompress Path</b>	 <b>Note</b> ▪ This option is not available if the original installation is uncompressed. Specify a path that should contain the decompressed image. If you do not specify a path, the following location is used as the default: <ISProjectDataFolder>\BaseImage.

Click Finish to close the Create New QuickPatch Wizard and open your new QuickPatch project in InstallShield.

**Caution** ▪ You cannot decompress installations that span multiple disks from a local or network drive. You will need to find an alternate method of decompressing the installation.

## Location of Existing QuickPatch Panel

**Project** ▪ This information applies to QuickPatch projects.

If you are building a QuickPatch project for an existing QuickPatch, use the Location of Existing QuickPatch panel to specify its location. The QuickPatch that is created can be used to update the original installation, the existing QuickPatch project that you specified, and any selected intermediate QuickPatch projects.

**Note** ▪ Once your project has been created and opened in InstallShield, there is no way to change the path to the existing QuickPatch project. Therefore, if you want to patch a different QuickPatch project, you must run through the Create New QuickPatch Wizard again to create a new QuickPatch project.

## Panel Options

### Existing QuickPatch Project

Specify the location of the QuickPatch project (.ism file) that you would like to patch or click the Browse button.

# Create Table Wizard

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- QuickPatch
- Transform

The Create Table Wizard is launched when you are adding a table through the Direct Editor. This wizard collects information about your custom table, and then adds it to the table list.

## Task

### To launch the Create Table Wizard:

1. In the View Bar / View List under **Additional Tools**, click **Direct Editor**.
2. Right-click the **Table** explorer and click **Add Table**.

The Create Table Wizard consists of the following panels:

- [Welcome](#)
- [Column Properties](#)
- [Summary](#)

## Welcome Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- QuickPatch
- Transform

The Welcome panel provides an introduction to the Create Table Wizard.

**Task****To begin creating a table:**

1. In the table name box, enter a name.

**Windows Logo Guideline** ▪ The Windows logo program requires that you avoid naming a custom table with the **MSI** (in uppercase, lowercase, or mixed-case letters). The MSI prefix is reserved for future use in new standard properties and tables.

2. Click the **Add Column** button to proceed to next panel in the wizard.

## Column Properties Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- QuickPatch
- Transform

On the Column Properties panel, you configure information for your custom table columns. The following properties are configurable:

**Table 22** ▪ Column Properties Panel Options

Property	Description
<b>Column Name</b>	Provide a name for the column.
<b>Column Description</b>	Type a description for the column.
<b>Column Type</b>	The available types are Binary, Long, Short, and String.
<b>Nullable Check Box</b>	Select this check box if this column's values are nullable.
<b>Primary Key Check Box</b>	Select this check box to make this column the table's primary key.
<b>Localizable String Check Box</b>	Select this check box if the string is localizable.
<b>String Length</b>	Provide a maximum length for string columns. Enter 0 if the string can be any length.

**Table 22** ▪ Column Properties Panel Options (cont.)

Property	Description
<b>Min Value</b>	For numeric columns, specify a minimum value.
<b>Max Value</b>	For numeric columns, specify a maximum value.
<b>External Key Table</b>	If this column references an external table, select it from this list
<b>External Key Column</b>	Select the column referenced in an external table.

Click Add Another Column to define additional columns, or click Done with Columns to proceed to the Summary panel.

## Summary Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- QuickPatch
- Transform

In the Summary panel, you can review your new table's settings before you add it to your project. If you need to change any of the settings, click Back until you see the appropriate panel, and make the necessary changes.

Click Finish to add the custom table.

## Custom Action Wizard

**Project** ▪ The Custom Action Wizard is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The Custom Action Wizard enables you to add custom actions to your installation. These actions can call a .dll file function; launch an executable file (.exe); call a public method in a managed assembly; run VBScript, JScript, or InstallScript code; display an error message; set a directory or a property; and more.

### Task

#### To launch the Custom Action Wizard:

1. In the View Bar / View List under **Behavior and Logic**, click **Custom Actions and Sequences** (in Basic MSI, InstallScript MSI, MSI Database, and Transform projects) or **Custom Actions** (in DIM, Merge Module, and MSM Database projects).
2. Right-click the **Custom Actions** explorer and click **Custom Action Wizard**.

The Custom Action Wizard consists of the following panels:

- Welcome
- Basic Information
- Action Type
- Function Definition
- Action Parameters
- Managed Method Definition
- In-Sequence Scripts
- Additional Options
- Respond Options
- Insert into Sequence
- Summary

**Windows Logo** - If you are applying for the Windows logo, any custom actions in your installation must follow best practices guidelines for custom action creation. You can use the InstallShield validation suites and the Full MSI Validation Suite to verify whether your installation package meets most of the custom action-related logo requirements. However, some of the requirements cannot be verified through the validation suite. To learn more, see [Guidelines for Creating Custom Actions that Meet Requirements of the Windows Logo Program](#).

## Welcome Panel

**Project** - The Custom Action Wizard is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database

- *MSM Database*
- *Transform*

The Welcome panel provides a brief introduction to the Custom Action Wizard. The wizard helps you build a custom action that will perform tasks not inherently supported by Windows Installer.

**Windows Logo** - If you are applying for the Windows logo, any custom actions in your installation must follow best practices guidelines for custom action creation. You can use the InstallShield validation suites and the Full MSI Validation Suite to verify whether your installation package meets most of the custom action-related logo requirements. However, some of the requirements cannot be verified through the validation suite. To learn more, see [Guidelines for Creating Custom Actions that Meet Requirements of the Windows Logo Program](#).

## Basic Information Panel

**Project** - The Custom Action Wizard is available in the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Basic Information panel lets you enter the name of your custom action and a description. This information is used only for your reference and is not displayed to the end user. The following settings are available on this panel.

**Table 23** - Basic Information Panel Settings

Setting	Description
<b>Name</b>	Enter the name of your custom action. The name can contain only letters, numbers, underscores, or periods, and it must begin with a letter or an underscore.
<b>Comment</b>	Optionally enter comments about your action in this box. This information is for your reference only and is not displayed to the end user.

## Action Type Panel

**Project** - The Custom Action Wizard is available in the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Action Type panel lets you specify the type of custom action that you want to create and where the code for that action is stored.

## Panel Options

### Type

The Type list provides options for several different ways of executing your custom action. For example, your custom action can call an executable file, run VBScript code, or call a function from a .dll file. The following options are available in this list:

**Table 24** • Available Types of Custom Actions

Type	Project Type	Description
<b>Call a function in a standard dynamic-link library</b>	Basic MSI, InstallScript MSI	<p>This custom action calls a function in a .dll file. Specify the function name, parameters, and return value in the <a href="#">Function Definition panel</a>.</p>  <p><b>Note</b> - If you call a function in a standard .dll file that is stored in the Binary table, you cannot use deferred or rollback execution for the action's In-Script Execution setting.</p> <p>If you call a function in a standard .dll file that is installed with the product and the action is scheduled as deferred (for the In-Script Execution setting), the .dll file that you are calling must be the component's key file.</p>
<b>Call a function in a Windows Installer dynamic-link library</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>This custom action calls a function from a .dll file written specifically for Windows Installer. The .dll file's entry point must have a predefined parameter and return value.</p>

**Table 24** • Available Types of Custom Actions (cont.)

Type	Project Type	Description
<b>Call a public method in a managed assembly</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	This custom action calls a public method in a managed assembly that is written in managed code such as Visual Basic .NET or C#.  For more information, see <a href="#">Calling a Public Method in a Managed Assembly</a> .
<b>Display error message and abort</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action displays a specified error message, returns failure, and ends the installation.
<b>Launch an executable</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action launches an executable file.
<b>Launch another .msi package</b>	Basic MSI, InstallScript MSI, MSI Database, Transform	Also known as a nested installation, this type of custom action launches a second .msi package during your installation.    <b>Important</b> • <i>Nested installations is a deprecated feature of the Windows Installer. Applications installed with nested installations sometimes fail because they are difficult for end users to service correctly. Microsoft Corporation recommends that you avoid using nested installations and nested-installation custom actions to install products that are intended to be released to the public. To learn more, see <a href="#">Concurrent Installations</a> in the Windows Installer Help Library.</i>
<b>Run 64-bit JScript code</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action runs 64-bit JScript code instead of a compiled language such as C or Visual Basic.

**Table 24** • Available Types of Custom Actions (cont.)

Type	Project Type	Description
<b>Run PowerShell code</b>	Basic MSI, InstallScript MSI	This custom action runs a PowerShell script (.ps1).  For target , as well as other information about this type of custom action, see <a href="#">Calling a PowerShell Custom Action</a> .
<b>Run 64-bit VBScript code</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action runs 64-bit VBScript code instead of a compiled language such as C or Visual Basic.
<b>Run InstallScript code</b>	Basic MSI, InstallScript MSI, Merge Module	This custom action calls a function from your InstallScript code.
<b>Run JScript code</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action runs JScript code instead of a compiled language such as C or Visual Basic.
<b>Run VBScript code</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action runs VBScript code instead of a compiled language such as C or Visual Basic.
<b>Set a property</b>	Basic MSI, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action sets a property in the Property table. This is useful if you need to get information from the end user and store it so that it can be used later in your installation.

**Table 24** ▪ Available Types of Custom Actions (cont.)

Type	Project Type	Description
<b>Set a directory</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	This custom action sets a directory in the Directory table at run time. For example, if you want to create a temp directory that is a subdirectory of the installation directory selected by the end user, you can use this option to set that new temp directory for use later in the installation.
<b>Terminate a process by identifier</b>	Basic MSI, InstallScript MSI	<p>This custom action kills a process that has a specific process identifier (PID).</p>  <p><b>Important</b> ▪ When you create this type of custom action, you also need to define a property that identifies the PID that you want to stop. To learn more see <a href="#">Calling a Kill-Process Custom Action</a>.</p>
<b>Terminate a process by name</b>	Basic MSI, InstallScript MSI	<p>This custom action kills a process that has a specific executable file name.</p>  <p><b>Important</b> ▪ When you create this type of custom action, you also need to define a property that identifies the name of the process that you want to stop. To learn more see <a href="#">Calling a Kill-Process Custom Action</a>.</p>

## Location

The code that your custom action calls can be stored in one of several places. Select the location where the installer should look for that code. Note that some custom action types do not support some of the locations. In addition, the Location setting is not applicable for the error custom action.

**Table 25** ▪ Possible Locations for Storing Custom Actions

Location	Custom Action Type	Description
<b>An application that is advertised or already installed</b>	Launch another .msi package	Select this location to uninstall any Windows Installer applications that are currently installed on the target system—for example, applications that you previously installed with a custom action. You should have this custom action launch only on uninstallation of your main installation.
<b>Destination machine search path</b>	Standard DLL	When you call a function in a standard .dll file, the file can be present in the target system's search path.

**Table 25** • Possible Locations for Storing Custom Actions (cont.)

Location	Custom Action Type	Description
<b>Included within your main setup</b>	Launch another .msi package	Select this location if the .msi file that you want to launch is stored within your main installation package.
<b>Installed with the product</b>	Standard DLL, MSI DLL, Managed code, Executable file, PowerShell code, VBScript, 64-bit VBScript, JScript, 64-bit JScript	Select this location to call code from a file or executable file that is going to be installed on the target system.
<b>Stored directly in the custom action</b>	VBScript, 64-bit VBScript, JScript, 64-bit JScript	Select this location to enter code directly into the wizard, without having to associate a file.
<b>Stored in the Binary table</b>	Standard DLL, MSI DLL, Managed code, Executable file, PowerShell code, VBScript, 64-bit VBScript, JScript, 64-bit JScript	<p>Select this location to have your code base stored in the Binary table. This option is useful if you do not want the file to be installed on the target system.</p>  <p><b>Note</b> • For the managed-code type of custom action, InstallShield creates a C++ Windows Installer wrapper DLL for your .NET assembly at build time. The wrapper DLL includes your assembly, as well as the information that is required to mediate, load, and run the assembly. InstallShield stores the wrapper DLL in the Binary table.</p>
<b>Stored in the Directory table</b>	Executable file	Select this location to reference a path—without the file name—that is stored in the Directory table.
<b>Stored in the Property table</b>	Managed code, Executable file, VBScript, 64-bit VBScript, JScript, 64-bit JScript	Select this location to reference a full path to the executable that you want to launch. The path is stored in the Property table.
<b>Stored on the source media</b>	Launch another .msi package	Select this location if the .msi file that you want to launch is stored on the same media as your main installation package.

## Function Definition Panel

The Function Definition panel is where you specify the parameters for the entry-point function in your standard .dll file.

This panel is displayed only if you selected **Call a function in a standard dynamic-link library** in the **Action Type panel** of the Custom Action Wizard.

**Note** ▪ The function must use the `__stdcall` calling convention. Functions with more than one parameter will not work properly if this convention is not used.

### Panel Options

#### Name

Specify the name of the function that you want to call. The .dll file can have a single entry point for each custom action.

#### Arguments

Build the list of arguments—in order—that you want to pass to the function.

First, click the last row of the Arguments list to add a new argument. Next, complete the Type, Source, and Value columns for each argument.

#### Type

In this list, select the data type of the parameter. Note that there are two special cases for argument types, and these cases are identified below.

#### Task

##### **To initialize a pointer to null:**

1. In the **Type** list, select **POINTER**.
2. In the **Source** list, select **Constant**.
3. In the **Value** list, select **NULL**. Do not enter 0 (zero) instead of NULL, because it is interpreted as a pointer pointing to the number 0.

#### Task

##### **To set a handle to the .msi database or the Windows Installer window:**

1. In the **Type** list, select **HANDLE**.
2. In the **Source** list, select **Constant**.
3. In the **Value** list, select **MsiHandle** or **MsiWindowHandle**, depending whether you want a handle to the .msi database or the Windows Installer window.

## Source

Indicate how you want to pass the data to the function. The following options are available in this list.

**Table 26** ▪ Options for Passing Data to a Function

Option	Description
<b>Constant</b>	<p>The value that you want to pass is stored as a literal in your installation project. After you select Constant for the argument's source, enter its definition in the Value column.</p> <p>This “constant” does not require a name or identifier. Do not enclose string literals in quotation marks.</p>
<b>in Property</b>	Select in Property for the source to specify the name of a Windows Installer property whose value will be passed to the function. This type of argument is suitable for a ByVal parameter.
<b>inout Property</b>	This source type is similar to a ByRef parameter. Select inout Property for the source to specify the name of a Windows Installer property whose value will be passed to the function and can be modified by the function.
<b>out Property</b>	An out property serves as a placeholder for a value that can be set by the function. No value is passed to the function, but the function requires the name of a property whose value it can modify.

When you select a property for the argument's source, you must specify the name of the property in the Value column.

## Value

The value can be one of two types:

- A number or string literal that you enter when the argument's source is a constant
- A Windows Installer property when the argument's source is a property

**Note** ▪ When you set the Type list to HANDLE and the Source list to Constant, the Value column contains two options: MsiHandle and MsiWindowHandle. These constants can be used to get a handle to either the .msi database or the Windows Installer window.

When the source is a property, the Value list provides the name of every property in the Property Manager. You can select an existing property or enter a new name, in which case the new property is added to the Property Manager.

Remember that a property is merely a container for a value. If your parameter stores its value in an in property or inout property, ensure that you specify a value for the property in the Property Manager.

### (Context Menu)

The context menu provides you with options for working with your arguments. To access the context menu, right-click an argument in the Arguments grid. The context menu options are described below.

**Table 27** ▪ Context Menu Options

Option	Description
<b>Add</b>	Click Add to add an argument to the Arguments grid.
<b>Remove</b>	Click Remove to delete the argument.
<b>Move Up</b>	The arguments must be in the precise order in which the function expects to receive them. Click Move Up to place the argument higher in the list.
<b>Move Down</b>	Click Move Down to place the argument lower in the list.

### Return Type

Select the data type of the function's return value. If you do not need to check the return value, you can accept void.

### Return Property

Select the name of a property whose value will be set to the function's return value. If you are going to check the return value elsewhere in your installation, you may want to initialize the return property's value.

**Note** ▪ The property cannot be set to the function's return value unless the action is configured for immediate execution. Thus, if the action is scheduled for deferred, rollback, or commit execution, the Return Property setting is ignored at run time.

### Silent mode

If you want the installation to suppress a warning message whenever the custom action fails to load the .dll file and call the function, select this check box.

## Action Parameters Panel

The Action Parameters panel is where you specify the actual file that you call in your custom action. For example, if you call an executable file, you can browse to that file and add any command-line options.

This panel is not displayed if your custom action is running JScript or VBScript code that is stored directly within the action.

## Panel Options

### Source

This box behaves differently depending on the options you selected for the Type and Location lists on the [Action Type panel](#). The Source field is disabled if it does not apply to the type of custom action you are adding (such as a New Kill Process custom action). The following table shows the source values that you can use, depending on the type and location of each custom action.

**Table 28** • Source Values for Custom Actions

Custom Action Type	Instructions for Setting the Source
<b>Call a function in a standard DLL</b>	<p>Set the source for this custom action type according to its location.</p> <ul style="list-style-type: none"> <li>● <b>Destination machine search path</b>—Browse to the location of the .dll file. The wizard uses only the file name and not the path.</li> <li>● <b>Installed with the product</b>—Click Browse to open the Browse for File dialog box. In the list of destination folders, select the folder in which the .dll file is located. Then, in the list of files, select the standard .dll file.</li> <li>● <b>Stored in the Binary table</b>—Browse to the location of the .dll file.</li> </ul>
<b>Call a function in a Windows Installer DLL</b>	<p>Set the source for this custom action type according to its location.</p> <ul style="list-style-type: none"> <li>● <b>Installed with the product</b>—Click Browse to open the Browse for File dialog box. In the list of destination folders, select the folder in which the .dll file is located. Then, in the list of files, select the Windows Installer .dll file.</li> <li>● <b>Stored in the Binary table</b>—Browse to the location of the .dll file.</li> </ul>
<b>Call a public method in a managed assembly</b>	<p>Set the source for this custom action type according to its location.</p> <ul style="list-style-type: none"> <li>● <b>Installed with the product</b>—Click Browse to open the Browse for File dialog box. In the list of destination folders, select the folder in which the .NET assembly is located. Then, in the list of files, select the assembly.</li> <li>● <b>Stored in the Binary table</b>—Browse to the location of the .NET assembly.</li> <li>● <b>Path referencing a Property</b>—Select a Windows Installer property in the list, type the name of a new property, or type the name of a directory in the Directory table. The property or directory name must be enclosed within square brackets ([ ]). You can add a string after the property if appropriate. The resulting path should indicate the location of the .NET assembly.</li> </ul>
<b>Display error message and abort</b>	<p>The Source setting is disabled for the error custom action, since it is not applicable to this type of custom action.</p>

**Table 28** ▪ Source Values for Custom Actions (cont.)

Custom Action Type	Instructions for Setting the Source
<b>Launch an executable</b>	<p>Set the source for this custom action type according to its location.</p> <ul style="list-style-type: none"> <li>● <b>Installed with the product</b>—Click Browse to open the Browse for File dialog box. In the list of destination folders, select the folder in which the executable file is located. Then, in the list of files, select the executable file.</li> <li>● <b>Stored in the Binary table</b>—Browse to the location of the .exe file.</li> <li>● <b>Stored in the Property table</b>—Select a Windows Installer property in the list. If you specify the name of a new property, you must later open the Property Manager, enter the property, and specify a value that points to the .exe file.</li> <li>● <b>Stored in the Directory table</b>—Select one of the standard folders in the list, or enter the name of a new entry into the Directory table—which you can later edit in the Direct Editor. The directory that you specify is the working directory for the target that you specify in the Target box.</li> </ul>
<b>Launch another .msi package</b>	<p>Set the source for this custom action type according to its location. (For more information about custom actions that launch another .msi package, see <a href="#">Nested Installations</a>.)</p> <ul style="list-style-type: none"> <li>● <b>Included within your main setup</b>—Browse to the location of the “child” .msi file. The Custom Action Wizard automatically creates the appropriate entries in the Binary table.</li> <li>● <b>Stored on the source media</b>—Browse to the location of the “child” .msi file. The Custom Action Wizard automatically adds this file to the Disk1 folder in the Support Files view.</li> <li>● When you build a release, InstallShield copies the .msi file (but not its uncompressed application and support files) to the release location.</li> <li>● <b>An application that is advertised or already installed</b>—Browse to the location of the “child” .msi file. The Custom Action Wizard extracts the product code from the .msi package that you select.</li> </ul>
<b>Run InstallScript code</b>	<p>You cannot change the location of the InstallScript file. For an InstallScript custom action, you must select the name of the entry-point function in the list.</p>

**Table 28** ▪ Source Values for Custom Actions (cont.)

Custom Action Type	Instructions for Setting the Source
<b>Run JScript or 64-bit JScript code</b>	<p>Set the source for this custom action type according to its location.</p> <ul style="list-style-type: none"> <li>● <b>Installed with the product</b>—Click Browse to open the Browse for File dialog box. In the list of destination folders, select the folder in which the .js file is located. Then, in the list of files, select the .js file.</li> <li>● <b>Stored in the Binary table</b>—Browse to the location of the JScript source file.</li> <li>● <b>Stored in the Property table</b>—Select one of the properties in the list. If you specify a new property, you must later open the Property Manager, enter the property name, and add the JScript code as the value of the property.</li> <li>● <b>Stored directly in the custom action</b>—You can use the <a href="#">In-Sequence Scripts panel</a>, which provides a text editor for your JScript code.</li> </ul>  <p><b>Note</b> ▪ The In-Sequence Scripts panel is provided for backward compatibility only. A superior script editor is available in the Script tab of the Custom Actions and Sequences view (and the Custom Actions view).</p>
<b>Run PowerShell code</b>	<p>Set the source for this custom action type according to its location.</p> <ul style="list-style-type: none"> <li>● <b>Installed with the product</b>—Click Browse to open the Browse for File dialog box. In the list of destination folders, select the folder in which the .ps1 file is located. Then, in the list of files, select the .ps1 file.</li> <li>● <b>Stored in the Binary table</b>—Browse to the location of the PowerShell file (.ps1).</li> </ul>

**Table 28** ▪ Source Values for Custom Actions (cont.)

Custom Action Type	Instructions for Setting the Source
<b>Run VBScript or 64-bit VBScript code</b>	<p>Set the source for this custom action type according to its location.</p> <ul style="list-style-type: none"> <li>● <b>Installed with the product</b>—Click Browse to open the Browse for File dialog box. In the list of destination folders, select the folder in which the .vbs file is located. Then, in the list of files, select the .vbs file.</li> <li>● <b>Stored in the Binary table</b>—Browse to the location of the VBScript source file.</li> <li>● <b>Stored in the Property table</b>—Select one of the properties in the list. If you specify a new property, you must later open the Property Manager, enter the property name, and add the VBScript code as the value of the property.</li> <li>● <b>Stored directly in the custom action</b>—You can use the <b>In-Sequence Scripts panel</b>, which provides a text editor for your VBScript code.</li> </ul>  <p><b>Note</b> ▪ The In-Sequence Scripts panel is provided for backward compatibility only. A superior script editor is available in the Script tab of the Custom Actions and Sequences view (and the Custom Actions view).</p>
<b>Set a directory</b>	You cannot set the location when setting a Directory. You must select the name of a folder in the list, or enter a new name and specify it in the Directory table (available in the Direct Editor).
<b>Set a property</b>	You cannot set the location when setting a property. You must select the name of the property in the list, or enter a new name and specify it in the Property Manager.
<b>Set a property</b>	You cannot set the location when setting a property. You must select the name of the property in the list, or enter a new name and specify it in the Property Manager.
<b>Set a property</b>	You cannot set the location when setting a property. You must select the name of the property in the list, or enter a new name and specify it in the Property Manager.

## Target

The value for the target depends on the custom action type.

**Table 29** - Target Options

Custom Action Type	Instructions for Setting the Target
<b>Call a function in a standard DLL</b>	For the standard DLL type of custom action, the Target box is read-only. It displays the function definition that is specified on the <a href="#">Function Definition panel</a> .
<b>Call a function in a Windows Installer DLL</b>	<p>Use this box to enter the name of the function that you want to call. You do not need brackets or any other special formatting, but note that the function name is case-sensitive.</p> <p>A Windows Installer .dll function has a predefined parameter and return type. For more information, see <a href="#">Passing Parameters to a DLL File Function in a Custom Action</a>.</p>
<b>Call a public method in a managed assembly</b>	For a managed assembly type of custom action, the Target box is not applicable. The <a href="#">Managed Method Definition panel</a> , which is the next panel in the wizard for this type of custom action, is where you identify the method that you want to be invoked.
<b>Display error message and abort</b>	<p>Type the error message text that should be displayed when the custom action's conditions are met on the target system.</p> <p>As an alternative, you can type a property name whose value contains the error text. The property name must be enclosed within square brackets ([ ]).</p>
<b>Launch an executable</b>	If you are launching an executable file, you can enter command-line arguments in this box. For example, if you want to launch a readme file that is installed with you installation, you should enter Notepad.exe [INSTALLDIR]Readme.txt.
<b>Launch another .msi package</b>	Specify any public properties that you would like to pass to the .msi package.
<b>Run InstallScript code</b>	The target value is not applicable for InstallScript custom actions.
<b>Run PowerShell code</b>	The target value is not applicable for PowerShell custom actions.
<b>Run JScript/64-bit JScript or VBScript/64-bit VBScript code</b>	Enter the function name that you want to call.
<b>Set a property or directory</b>	Enter a formatted text string that evaluates to the new value of the property that you selected or created. See the Windows Installer Library for more information on formatted text strings.

**Table 29** ▪ Target Options (cont.)

Custom Action Type	Instructions for Setting the Target
<b>Terminate a process by identifier</b>	Enter the PIDs of the processes that you wish to terminate for the Kill Process custom action. To specify more than one process, use a semicolon (;) to separate each PID.
<b>Terminate a process by name</b>	Enter the executable file names of the processes that you wish to terminate that you wish to terminate for the Kill Process custom action. To specify more than one process, use a semicolon (;) to separate each file name.

## Managed Method Definition Panel

The Managed Method Definition panel is where you specify the public class method in the managed assembly. The Custom Action Wizard displays this panel only if you selected **Call a public method in a managed assembly** in the [Action Type panel](#).

The Managed Method Definition panel has the following settings.

**Table 30** ▪ Settings on the Managed Method Definition Panel

Setting	Description
<b>Class</b>	<p>Enter the public class with which the method is associated. As an alternative, click the Browse button to display the <a href="#">Method Browser dialog box</a>. This dialog box lets you select the public method from the list of public classes that are available in the managed assembly that you selected on the Action Parameters panel.</p>  <p><b>Note</b> ▪ The browse functionality is available only if the .NET Framework is installed. In addition, it is available only if the location of the managed assembly is set to the Binary table or installed with the product—not if the assembly's path references a property or a directory in the Directory table.</p> <p>Also note that the browse functionality is available for only 32-bit assemblies and for Microsoft intermediate language (MSIL) files. It is not available for 64-bit assemblies.</p>

**Table 30** ■ Settings on the Managed Method Definition Panel (cont.)

Setting	Description
<b>Method</b>	<p>Enter the public method that you want your installation to call. As an alternative, click the Browse button to display the <a href="#">Method Browser dialog box</a>. This dialog box lets you select the public method from the list of public classes that are available in the managed assembly that you selected on the Action Parameters panel.</p>  <p><b>Note</b> ■ The browse functionality is available only if the .NET Framework is installed. In addition, it is available only if the location of the managed assembly is set to the Binary table or installed with the product—not if the assembly's path references a property or a directory in the Directory table.</p> <p>Also note that the browse functionality is available for only 32-bit assemblies and for Microsoft intermediate language (MSIL) files. It is not available for 64-bit assemblies.</p>
<b>Use custom method signature</b>	<p>To use the default method signature, clear this check box. For the default method signature, the installation calls the method with an MsiHandle parameter if the signature has one or more void parameters, or if it has a single MsiHandle parameter.</p> <p>To use a custom method signature, select this check box. Then specify the arguments and return property as needed.</p> <p>If you specified a class and a method by clicking the Browse button, InstallShield automatically adds any associated parameters. Specify the value for each parameter that you want to pass to the method.</p> <p>For detailed information about specifying the method's signature, see <a href="#">Specifying the Signature for a Managed Method in an Assembly Custom Action</a>.</p>

**Table 30** ■ Settings on the Managed Method Definition Panel (cont.)

Setting	Description
<b>Arguments</b>	<p>If you are using a custom method signature, specify the list of arguments that you want to pass to the selected method.</p> <p>If you specified a class and a method by clicking the Browse button, InstallShield automatically adds any associated parameters to the grid in this area.</p> <p>To use a property as an argument, click the value field for the parameter, and then select the property from the list.</p> <p>The context menu provides you with options for working with arguments. To access the context menu, right-click an argument in the Arguments grid. The available context menu commands are:</p> <ul style="list-style-type: none"> <li>● <b>Add</b>—Add an argument to the grid.</li> <li>● <b>Remove</b>—Delete an argument from the grid.</li> </ul> <p>This grid is available only if the <b>Use custom method signature check box</b> is selected.</p> <p>For more information about specifying the arguments, see <a href="#">Specifying the Signature for a Managed Method in an Assembly Custom Action</a>.</p>
<b>Return Property</b>	<p>Select the name of the property whose value will be set to the method's return value.</p> <p>This list is available only if the <b>Use custom method signature check box</b> is selected.</p> <p>For more information about specifying the return property, see <a href="#">Specifying the Signature for a Managed Method in an Assembly Custom Action</a>.</p>

## In-Sequence Scripts Panel

**Note** ■ The In-Sequence Scripts panel is provided for backward compatibility only. A superior script editor is available in the Script tab of the Custom Action and Sequences view (and the Custom Actions view).

If your custom action calls JScript or VBScript code that is stored directly in the custom action, you can enter the script in the box that is displayed. Type your code into the text box and click Next to continue. No validation is performed on your code to check syntax.

## Additional Options Panel

The Additional Options panel lets you specify how the custom action thread should be processed and whether the custom action should be run only during patch uninstallation.

The Additional Options panel has the following settings.

**Table 31** ▪ Settings on the Additional Options Panel

Setting	Description
<b>Return Processing</b>	<p>Specify how the custom action thread should be processed. Valid options for the Return Processing list are:</p> <ul style="list-style-type: none"> <li>• Asynchronous (No wait for completion)</li> <li>• Asynchronous (Wait for exit code)</li> <li>• Synchronous (Check exit code)</li> <li>• Synchronous (Ignores exit code)</li> </ul> <p>These flags are used to specify that the main and custom action threads run synchronously (the installer waits for the custom action thread to complete before resuming the main installation thread) or asynchronously (the installer runs the custom action simultaneously as the main installation continues).</p> <p>Note that some options are not applicable to some types of custom actions. Only options that pertain to the selected type of custom action are available in this list.</p>

#### Run During Patch Uninstall

**Project** ▪ If you are working on a project in Direct Edit mode, this setting is not applicable unless the database schema is a minimum of 405 (for Windows Installer 4.5 or later).

This check box lets you specify whether Windows Installer should run the custom action only when a patch is being uninstalled. You can select this check box for a custom action in an .msi package. You can also select this check box for a new custom action that is added by a patch. However, this check box should not be selected for a custom action that is being added or removed by a patch to an existing custom action. This check box is cleared by default.

When Windows Installer 4.5 runs the patch uninstall custom action, it uses the custom action in the patch that is being uninstalled.

**Note** ▪ Windows Installer 4.5 includes support for this setting, but Windows Installer 4.0 and earlier do not. Therefore, if you select Yes for this setting and some target systems may have Windows Installer 4.0 or earlier, add a condition to this custom action to prevent Windows Installer 4.0 and earlier from running it. Otherwise, Windows Installer 4.0 and earlier would call the custom action during the installation, repair, or update of the package.

For the condition, use the MSIPATCHREMOVE property. For more information, see [MSIPATCHREMOVE](#) in the Windows Installer Help Library.

## Respond Options Panel

The Respond Options panel lets you specify how your custom action will respond to the rest of the installation.

**Table 32** • Respond Options Panel Options

Option	Description
<b>In-Script Execution</b>	<p>Specify when you would like your action to execute.</p> <ul style="list-style-type: none"> <li>● <b>Immediate execution</b>—Select this option to have the action execute when it is encountered in the sequence.</li> <li>● <b>Immediate execution (Terminal Server Aware)</b>—Select this option to have the action execute when it is encountered in the sequence. The custom action impersonates the user during per-machine installations on terminal server machines.</li> <li>● <b>Deferred execution</b>—Select this option to have your action wait until the script begins to run.</li> <li>● <b>Rollback execution</b>—Select this option to set your action to execute only during rollback. If you changed something to the system during the execute sequence using a custom action, you need to undo that change with a rollback custom action.</li> <li>● <b>Rollback execution (Terminal Server Aware)</b>—Select this option to set your action to execute only during rollback. If you changed something to the system during the execute sequence using a custom action, you need to undo that change with a rollback custom action. The custom action impersonates the user during per-machine installations on terminal server machines.</li> <li>● <b>Commit execution</b>—Select this option to have your action delayed until the installation has successfully completed the installation script.</li> <li>● <b>Commit execution (Terminal Server Aware)</b>—Select this option to have your action delayed until the installation has successfully completed the installation script. The custom action impersonates the user during per-machine installations on terminal server machines.</li> <li>● <b>Deferred execution in system context</b>—Select this option if your action needs elevated system privileges for performing tasks such as editing the registry. The action is deferred until the script begins to run. When the action does run, it runs with elevated system privileges. For more information on this property, see <a href="#">In-Script Execution</a>.</li> </ul>

**Note** • If you are calling a function in a standard dynamic-link library that is stored in the Binary table, you cannot use deferred or rollback execution for the action's In-Script Execution property.

**Table 32** • Respond Options Panel Options (cont.)

Option	Description
<b>Execution Scheduling</b>	<p>Specify how many times you want the action to run. For example, if an action is listed in both the user interface and execute sequences, it can be set to run both times, or it can run only once. Available options are:</p> <ul style="list-style-type: none"> <li>• <b>Always execute</b>—The action runs every time it is encountered. Therefore, it could run in the user interface sequence and again in the execute sequence.</li> <li>• <b>Execute only once</b>—The action runs only once—even if it exists in both the user interface and Execute sequences. The action is skipped in the execute sequence if the user interface sequence has run.</li> </ul> <p></p> <p><b>Note</b> • The <b>Execute only once</b> option does not work for InstallScript MSI projects. If your custom action exists in both the user interface and execute sequences, it is executed twice. This is because—in an InstallScript MSI project—the InstallScript engine executes the user interface sequence and Windows Installer executes the execute sequence.</p> <ul style="list-style-type: none"> <li>• <b>Execute only once per process</b>—The user interface sequence and the execute sequence run in separate processes. Select this option to force your custom action to launch at least once in the user interface sequence and once in the execute sequence.</li> <li>• <b>Always execute at least once on the client</b>—This action executes at least one time on the client.</li> </ul> <p>If you selected anything other than Immediate execution in the In-Script Execution setting, the Execution Scheduling setting is not available and is set to Always execute.</p>

## Insert into Sequence Panel

In the Insert into Sequence panel, you specify where in the installation sequence you want to insert the custom action that the wizard is creating. You can insert your custom action into one sequence or into multiple sequences.

### Panel Options

#### Sequences

Select where in the Installation User Interface or Installation Execute sequence you want to insert your custom action.

#### Conditions

Click the Browse button to launch the Condition Builder dialog box, where you can create a condition that will be used to determine whether your custom action is launched.

## Summary Panel

In the Summary panel, you can review your custom action's settings before you add it to your installation. If you need to change any of the settings, click Back until you see the appropriate panel, and make the necessary changes.

When your action is complete, click Finish.

You can now insert this custom action into a sequence or specify it as the argument for a dialog's control event.

## Database Import Wizard

**Note** ▪ The import database functionality applies to the Microsoft SQL Server Database. Oracle users should refer to the Oracle Web page on [Oracle Database Utilities](#) for information on utilities that may work in conjunction with InstallShield.

The Database Import Wizard helps you import your Microsoft SQL Server Database and generate a SQL script file from the database based on options you, the installation author, determine. The wizard can be launched from the following nodes of the SQL Scripts explorer when you right-click in the SQL Scripts view:

- SQL Servers
- New Connection
- New Script

**Note** ▪ InstallShield supports SQL Server 7.0 and later.

The following wizard panels are associated with the Database Import Wizard:

- [Welcome](#)
- [SQL Server](#)
- [SQL Database](#)
- [Database Tables](#)
- [Objects to Script](#)
- [Scripting Options](#)
- [Advanced Scripting Options](#)
- [Summary](#)

## Welcome Panel

**Note** ▪ The import database functionality applies to the Microsoft SQL Server Database.

The Database Import Wizard helps you import your Microsoft SQL Server Database and generate a SQL script file from the database based on options you, the installation author, determine.

The second paragraph of this wizard panel indicates what the wizard will create.

## SQL Server Panel

---

**Note** ▪ The import database functionality applies to the Microsoft SQL Server Database.

### Server Name

Specify a SQL Server from the list of servers below or click Browse to select the location of a server on your network.

---

**Note** ▪ InstallShield supports SQL Server 7.0 and later.

Importing a database and browsing for a SQL Server requires ODBC driver version 3.80 or later.

### With Windows NT authentication using the network login ID

This is the recommended authentication method. SQL Servers must be set up to work with this method. The currently logged in user and the user's credentials will be used.

### With Server authentication using the login ID and password below

If you select this option, you will have to enter the login ID and set the password for a particular SQL Server.

## SQL Database Panel

---

**Note** ▪ The import database functionality applies to the Microsoft SQL Server Database.

### Database Name

Choose a database found on the SQL Server you selected in the SQL Server panel. A script file will be generated for the database you select in the Database Name drop down list.

### Script Display Name

Type a valid identifier for the script file which will be generated from the SQL database you selected in the Database Name drop down list. The script display name is what is displayed in the explorer in the SQL Scripts view.

---

**Note** ▪ When the generated script is executed on a target machine, this database will be automatically created if not found on the target server.

## Database Tables Panel

**Note** ▪ The import database functionality applies to the Microsoft SQL Server Database.

In this panel, determine which tables in the database you want to include or exclude in the generated script file. If you choose to include or exclude certain tables, then from the Available Tables list, click the table(s) you want, and then click the “>” button to mark the tables.

**Note** ▪ Selecting the Include All Tables option guarantees that new tables added to the database are imported every time you reimport the database.

## Objects to Script Panel

**Note** ▪ The import database functionality applies to the Microsoft SQL Server Database.

The Objects to Script panel is where you select the objects that you want to import from the database.

### Objects

Determine which objects to import from your SQL Database. Many of these objects represent and expose attributes of a single Microsoft SQL Server database object.

**Note** ▪ The Records option is unavailable if no tables are selected to be imported in the [Database Tables wizard panel](#).

## Scripting Options Panel

**Note** ▪ The import database functionality applies to the Microsoft SQL Server Database.

The Scripting Options panel in the Database Import Wizard is where you specify whether your script should be compatible with Microsoft SQL Server version 7.0. Other options on this panel let you specify whether descriptive headers, extended properties, and other information should be included in your script. Transact-SQL statements are generated as needed.

## General Options

**Table 33** • General Options

Option	Description
<b>Create Only If Missing</b>	<p>To generate a Transact-SQL statement that creates a component prefixed by a check for existence, select this check box. When the script is executed, a component is created only if a copy of the named component does not exist.</p>  <p><b>Note</b> • Currently, this option applies only to tables.</p>
<b>Drop First If Exists</b>	<p>To generate a Transact-SQL statement that removes a referenced component, select this check box. The script tests for the existence of the component prior to an attempt to remove the component.</p>
<b>Include Descriptive Headers</b>	<p>To include explanatory header text before each Transact-SQL statement in the script, select this check box.</p>
<b>Include Extended Properties</b>	<p>To include extended stored procedures in the SQL scripts that are created, select this check box.</p>
<b>Only Script 7.0 Compatible</b>	<p>To generate a script that is compatible with Microsoft SQL Server version 7.0, select this check box.</p> <p>If you select this check box, the following SQL Server 2000 options are ignored:</p> <ul style="list-style-type: none"> <li>• Column level collation</li> <li>• User-defined functions</li> <li>• Extended property</li> <li>• INSTEAD OF trigger on tables and views</li> <li>• Indexes on views (indexed views)</li> <li>• Indexes on computed columns</li> <li>• Reference permissions on views</li> <li>• Descending indexes</li> </ul>

## Table Scripting Options

**Table 34** • Table Scripting Options

Setting	Description
<b>Script Indexes</b>	<p>To generate a Transact-SQL statement that creates indexes that currently exist for any selected tables, select this check box.</p>  <p><b>Note</b> • Selecting this check box is useful only if one or more tables are selected on the Database Tables panel.</p>
<b>Script Full-Text Indexes</b>	<p>To generate a Transact-SQL statement that creates full-text indexes, select this check box.</p> <p>Selecting this check box is useful only if one or more tables are selected on the Database Tables panel.</p>
<b>Script Triggers</b>	<p>To generate a Transact-SQL statement that creates triggers that exist for any selected tables, select this check box.</p>  <p><b>Note</b> • Selecting this check box is useful only if one or more tables are selected on the Database Tables panel.</p>
<b>Script Check Constraints</b>	<p>To generate a Transact-SQL statement that creates check constraints that exist for any selected tables, select this check box.</p>  <p><b>Note</b> • Selecting this check box is useful only if one or more tables are selected on the Database Tables panel.</p>
<b>Script Foreign Keys</b>	<p>To generate a Transact-SQL statement that creates FOREIGN keys that exist for any selected tables, select this check box.</p>  <p><b>Note</b> • Selecting this check box is useful only if one or more tables are selected on the Database Tables panel.</p>
<b>Script Primary Keys</b>	<p>To generate a Transact-SQL statement that creates PRIMARY keys that exist for any selected tables, select this check box.</p>  <p><b>Note</b> • Selecting this check box is useful only if one or more tables are selected on the Database Tables panel.</p>

**Table 34** ▪ Table Scripting Options (cont.)

Setting	Description
<b>Script Defaults</b>	<p>To generate a Transact-SQL statement that creates defaults that exist for any selected tables, select this check box.</p>  <p><b>Note</b> ▪ <i>Selecting this check box is useful only if one or more tables are selected on the Database Tables panel.</i></p>

## Advanced Scripting Options Panel

**Note** ▪ *The import database functionality applies to the Microsoft SQL Server Database.*

The Advanced Scripting Options panel lets you specify security scripting options, as well as the file format.

## Security Scripting Options

**Table 35** ▪ Security Scripting Options

Setting	Description
<b>Script database</b>	Generate a Transact-SQL statement to create a script of the existing database schema.
<b>Script database users and database roles</b>	Generate a Transact-SQL statement to create all users and roles that have access to the database.
<b>Script SQL Server logins (Windows NT and SQL Server logins)</b>	Generate a Transact-SQL statement to create all logins that currently have access to the server.
<b>Script object-level permissions</b>	Generate a Transact-SQL statement to create all grant, revoke, and deny permissions that currently exist for each object selected on the Objects to Script panel.

## File Format

**Table 36** ▪ File Format Options

Option	Description
<b>Windows Text (ANSI)</b>	This is the default option. If you want the script to be in ANSI format, select this option.
<b>International Text (Unicode)</b>	International databases can use the Unicode file format for the script, if necessary. If you select this option, Unicode BOM encoding for your SQL script.

**Note** ▪ Consult your SQL-DMO help reference for more detailed information about script formatting and file formats.

## Summary Panel

**Note** ▪ The import database functionality applies to the Microsoft SQL Server Database.

The Summary panel provides a summary of all the wizard settings.

Check the Regenerate Script at Build option if you want to regenerate the script file each time you build your installation project.

**Note** ▪ The Regenerate Script at Build option will slow down your build since a connection to the server needs to be established, and the database needs to be reimported every time you rebuild your project.

Click Finish to generate the script file (.sql). Once the script is generated, you can edit it from the script's Script tab in the SQL Scripts view.

## Device Driver Wizard

**Project** ▪ The Device Driver Wizard is available in the following project types:

- Basic MSI
- InstallScript MSI
- MSI Database

The Device Driver Wizard simplifies the process of installing device drivers from a Windows Installer-based installation using the Driver Installation Frameworks for Applications (DIFxApp) from Microsoft. The wizard creates the necessary table and entries, custom actions, feature, and components.

For the latest available information on the Driver Installation Frameworks, visit Windows Hardware and Driver Central at <http://www.microsoft.com/whdc/>.

### Task

**To open the Device Driver Wizard, do one of the following:**

- In the **Setup Design** view, right-click a feature and then click **Device Driver Wizard**. The feature that the wizard creates will be a subfeature of the selected feature.
- On the **Project** menu, click **Device Driver Wizard**. The feature that the wizard creates will be a root-level feature.

The following panels are associated with the Device Driver Wizard:

- [Welcome](#)
- [Device Driver Package](#)
- [Device Driver Files](#)
- [Device Driver Information](#)
- [Project-Wide Device Driver Information](#)
- [Summary](#)

## Welcome Panel

The Device Driver Wizard simplifies the process of installing device drivers from a Windows Installer-based installation using Microsoft's Driver Install Frameworks for Applications (DIFxApp). The wizard creates the necessary table and entries, custom actions, feature, and components.

**Tip** • You can disable the Welcome panel by choosing the Tools menu's Options command and clearing the Options dialog box's **User Interface tab's Show Welcome panel in IDE wizards** option.

## Device Driver Package Panel

In the Device Driver Package panel, specify the package file (.inf file) for the device driver that you want to add. Type the fully qualified file name of the package, or click the Browse button to navigate to the file.

**Note** • Clicking Next displays a warning message if the specified package file does not specify a security catalog, if the specified security catalog is missing, or if the package file has been modified or corrupted since it was signed. For more information, visit <http://www.microsoft.com/whdc/winlogo/drvsign/drvsign.mspx>.

## Device Driver Files Panel

The Device Driver Files panel displays the files that the wizard has detected as belonging to the device driver.

## Device Driver Information Panel

In the Device Driver Information panel, you can view the **device driver type** that is specified in your .inf file, and optionally select any of the following runtime options:

### Always overwrite any existing device driver

Replace any existing driver for the device with this driver. If this check box is cleared and a driver already exists for the device, your driver is not installed.

### Do not show Connect Device to Computer dialog

To prevent the Connect Device to Computer dialog from being displayed during the installation of a device driver if a device matching the driver is not connected to a computer, select this option.

### Do not create Add or Remove Programs entry for device driver

If you select this check box, the installation does not create an Add or Remove Programs entry for the device driver. If you clear this check box, the installation does create an Add or Remove Programs entry.

DIFxApp does not support this feature on Windows Vista and later.

### Install unsigned driver files and drivers with missing files

By default, DIFxApp does not install unsigned driver packages or driver packages that have missing files. To override this default behavior, select this check box. Selecting this check box enables you to fully test drivers more easily before shipping final signed versions.

## Remove binary files associated with driver during uninstall

By default, when DIFxApp uninstalls a driver package, DIFxApp does not remove the binary files that were copied to the system when it installed the driver. To override this default behavior, select this check box.

If you select this check box, DIFxApp removes a binary file from the system only if the binary file is identical to the corresponding binary file in the driver store.

**Caution** ▪ Select the **Remove binary files associated with driver during uninstall** check box only if you can verify that the driver's binary files are not required by any other driver package or application.

## Device Driver Type

The **Device Driver Information panel** displays a device driver type, which is determined in the following way:

- If the [Version] section of the package file (.inf file) has a DriverPackageType entry whose value is one of those in the following table, the corresponding driver type is displayed.
- Otherwise, the displayed device driver type is Plug and Play driver.

**Table 37** ▪ DriverPackageType Values and Corresponding Driver Types

DriverPackageType Value	Corresponding Driver Type
<b>ClassFilter</b>	Class filter driver
<b>FileSystem</b>	File system driver
<b>FileSystemFilter</b>	File-system filter driver
<b>KernelModule</b>	Export driver
<b>KernelService</b>	Kernel service driver
<b>Network</b>	Network driver
<b>PlugAndPlay</b>	Plug and Play driver

InstallShield uses Microsoft Windows Driver Install Framework (DIFx) to install drivers. When your device driver is installed, DIFx treats it as being a device driver of the type that is displayed in the Device Driver Information panel.

To change the device driver type, change the value of the DriverPackageType entry in the package file's [Version] section to the desired value from the preceding table, and then re-sign the package file. (For more information on signing package files, visit <http://www.microsoft.com/whdc/winlogo/drvsign/drvsign.mspx>.)

## Project-Wide Device Driver Information Panel

The settings that you configure on the Device Driver Information panel are applied to all device drivers in this project. The settings are:

## Include all localized installation runtime dialogs

When this check box is selected, the installation uses a custom action runtime .dll that includes dialogs and text for the following languages:

- Arabic (Saudi Arabia)
- Chinese (People's ROC)
- Chinese (Taiwan)
- Czech (Czech Republic)
- Danish (Denmark)
- Dutch (Netherlands)
- English (United States)
- Finnish (Finland)
- French (France)
- German (Germany)
- Greek (Greece)
- Hebrew (Israel)
- Hungarian (Hungary)
- Italian (Italy)
- Japanese (Japan)
- Korean (Korea)
- Norwegian (Bokmål) (Norway)
- Polish (Poland)
- Portuguese (Brazil)
- Portuguese (Portugal)
- Russian (Russia)
- Spanish - Modern Sort (Spain)
- Swedish (Sweden)
- Turkish (Turkey)

If you clear this check box, the installation uses runtime dialogs for English only. The English runtime .dll file is smaller than the localized .dll file, so if space is an issue and you do not need the extra language runtime dialogs, clear this check box.

## Device driver machine architecture

This area has several options. Select the appropriate option.

- Device driver targets 32 bit machines

- Device driver targets Itanium 64 bit machines
- Device driver targets AMD 64 bit machines

## Summary Panel

The Summary panel displays the options that you have specified in the wizard. Click the Finish button to complete the wizard.

# Dialog Wizard

InstallShield provides a Dialog Wizard that enables you to add a new dialog to your installation and configure it by stepping through the wizard panels.

### Task

#### *To launch the Dialog Wizard:*

1. Open the **Dialogs** view.
2. In the **Dialogs** explorer, right-click **All Dialogs** and then click **New Dialog**. The Dialog Wizard launches.
3. Follow the wizard panels.

The following panels are associated with the Dialog Wizard:

- [Welcome d](#)
- [Dialog Template](#)
- [User Interface Sequence](#)
- [Dialog Position and Condition](#)

## Welcome Panel

The Welcome panel welcomes you to the wizard and briefly describes the Dialog Wizard's function. Click Next to begin using the wizard.

## Dialog Template Panel

Use the Dialog Template panel to select a default template or an existing dialog on which to base your new dialog.

## Panel Options

### List of Dialogs

The box in the Dialog Template panel lists dialogs that are in the directory specified in the Dialog Location box on the File Locations tab of the Options dialog box. It may also include dialogs that are stored in a repository. In addition, several default dialog templates are listed:

**Table 38** - Dialog Template Options

Dialog Template	Description
<b>Blank Dialog</b>	<p>Creates a blank dialog with no dialog controls.</p>  <p><b>Project</b> - In InstallScript and InstallScript MSI projects, this dialog template does not have a hidden control that has a Control Identifier value of 2; the NewScriptBasedDialog and NewSkinnableDialog templates do include this control. To enable end users to cancel the installation by clicking the close button in the upper-right corner of the InstallScript dialog, a custom dialog must have a button control whose Control Identifier property is set to this value. For more information, see <a href="#">Using InstallScript to Implement Custom Dialogs</a>.</p>
<b>Exterior Wizard Panel</b>	 <p><b>Project</b> - This dialog template is available for Basic MSI projects.</p> <p>Creates a dialog with a large bitmap along the left side of the dialog—similar to the formatting of the Welcome dialog.</p>
<b>Interior Wizard Panel</b>	 <p><b>Project</b> - This dialog template is available for Basic MSI projects.</p> <p>Creates a dialog with a small bitmap at the top of the dialog.</p>
<b>Logon Information Panel and Associated Child Dialogs</b>	 <p><b>Project</b> - This dialog template is available for Basic MSI projects.</p> <p>For information on adding the Login Information dialogs to Basic MSI, InstallScript, or InstallScript MSI projects, see <a href="#">Adding the Ability to Create or Set an Existing User Account</a>.</p> <p>Creates a set of dialogs that enable the end user to create or browse for an existing user account in order to access resources that are restricted to others.</p>

**Table 38** • Dialog Template Options (cont.)

Dialog Template	Description
<b>NewScriptBasedDialog</b>	 <p><b>Project</b> • This dialog template is available for the following project types:</p> <ul style="list-style-type: none"> <li>• InstallScript</li> <li>• InstallScript MSI</li> </ul> <p>Creates a new script-based dialog that contains the same controls as those contained in an internal dialog. This dialog contains basic controls, including Back, Next, Cancel, Title, and Subtitle.</p>
<b>NewSkinnableDialog</b>	 <p><b>Project</b> • This dialog template is available for the following project types:</p> <ul style="list-style-type: none"> <li>• InstallScript</li> <li>• InstallScript MSI</li> </ul> <p>Creates a new script-based, <i>skinnable</i> dialog that contains some of the same controls as those contained in an internal dialog. This dialog contains basic controls—including Back, Next, and Cancel. You should select this option if you plan to use <a href="#">dialog skins</a>.</p> <p></p> <p><b>Caution</b> • If you add any controls to this dialog, do not set the control ID to 52. If you do, the dialog skins will not work.</p>

## Show Dialogs in Repository

To display dialogs that are stored in a repository, select the Show Dialogs in Repository check box.

## Browse

Click the Browse button if you want to select to a dialog (.isd) file that is not listed.

## Let me Insert this dialog into a sequence

Select this check box to automatically insert the new dialog in a user interface sequence. This check box is available only for Basic MSI projects and only for Interior and Exterior dialogs. In InstallScript MSI projects, you need to use InstallScript to schedule the dialog's appearance in the user interface and to process the dialog's controls.

**Note** • If this option is not selected in a Basic MSI project, the wizard process ends and the new dialog is added to your project. You need to [manually add the dialog](#) to a sequence to display it during installation.

## Basic MSI Projects

If you selected an exterior, interior, or login dialog, click Next to move to the next panel. If you selected a blank dialog, a dialog in your repository, or a dialog in a different location, click Finish to add the dialog to your project.

**Note** ▪ You need to manually *insert a blank dialog* into a sequence in order to display it during installation.

## InstallScript and InstallScript MSI Projects

Click Finish to add the new dialog. In order for the new dialog to appear in the user interface, you need to add it to your script and use InstallScript to process the dialog controls. You can edit the dialog controls if necessary.

## User Interface Sequence Panel

The User Interface panel lets you select the user interface sequence into which you want to insert the new dialog. You can also see which dialogs are currently in the selected sequence and insert the new dialog after a particular existing dialog.

### Panel Options

**Table 39** ▪ User Interface Sequence Panel Options

Option	Description
<b>User Interface Sequence</b>	From the menu, select the sequence into which you want to insert the new dialog.
<b>Dialogs currently in this sequence</b>	Displays the dialogs that occur in the selected sequence. Select the dialog that you want to appear immediately before your new dialog in the sequence.

## Dialog Position and Condition Panel

Use the Dialog Position and Condition panel to indicate where you want the dialog to appear in the sequence. This panel also lets you specify any conditions that you want placed on the dialog.

## Panel Options

**Table 40** ▪ Dialog Position and Condition Panel Options

Option	Description
<b>Dialog Position</b>	This pane displays the new dialog's place in the sequence selected in the <a href="#">User Interface Sequence panel</a> . To move the new dialog within the sequence, select it and click Move Up or Move Down.
<b>Condition</b>	Set a condition for the new dialog in this field. Click Build to launch the <a href="#">Condition Builder dialog box</a> .

Click Finish to exit the wizard. InstallShield adds the new dialog to your project and inserts it in the specified sequence.

## DirectX Object Wizard

**Project** ▪ The DirectX Object Wizard is available in the following project types:

- Basic MSI
- InstallScript MSI

The DirectX Object Wizard enables you to include the Microsoft DirectX 9c redistributable files in your installation project and to set several options.

**Note** ▪ For information about which files are included with the DirectX object, see [Including the DirectX 9.0 Object](#).

The optional ManagedDX component of DirectX 9c requires that the .NET Framework version 1.1 or later be installed on the system.

The following wizard panels are associated with the DirectX Object Wizard:

- [Welcome](#)
- [Object Settings](#)
- [Summary](#)

For more information about DirectX, visit [MSDN](#).

## Welcome Panel

**Project** ▪ The DirectX Object Wizard is available in the following project types:

- Basic MSI

- *InstallScript MSI*

The DirectX Object Wizard enables you to include the Microsoft DirectX 9c redistributable files in your installation project and to set several options.

**Note** ■ For information about which files are included with the DirectX object, see [Including the DirectX 9.0 Object](#).

The optional ManagedDX component of DirectX 9c requires that the .NET Framework version 1.1 or later be installed on the system.

For more information about DirectX, visit [MSDN](#).

## Object Settings Panel

**Project** ■ The DirectX Object Wizard is available in the following project types:

- *Basic MSI*
- *InstallScript MSI*

The Object Settings panel enables you to set the following options:

**Table 41** ■ Object Settings Panel Options

Option	Description
<b>Place DirectX files in a folder in Disk1</b>	<p>If you select this check box, InstallShield creates a DirectX folder for your installation at build time and places it in the Disk1 folder of your release.</p> <p>If you clear this check box, InstallShield streams the DirectX redistributable files into the .msi file. If you are creating a single-file executable installation, clear this check box so that the files are included in the .msi file.</p> <p>For information on the DirectX files that are included in the object, see <a href="#">Including the DirectX 9.0 Object</a>.</p>
<b>Show the Microsoft DirectX EULA before starting the DirectX 9 installation</b>	<p>By default, the Microsoft DirectX EULA is displayed to the end user before the DirectX 9 installation begins. To prevent the EULA from being displayed, clear this check box.</p>

For more information about DirectX, visit [MSDN](#).

## Summary Panel

**Project** ■ The DirectX Object Wizard is available in the following project types:

- *Basic MSI*

- *InstallScript MSI*

The Summary panel enables you to review the options that you configured on the [Object Settings panel](#). Click Finish to accept the settings and add the DirectX 9 redistributable files to your project.

## Dynamic Scanning Wizard

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The Dynamic Scanning Wizard is an easy-to-use tool that monitors your system while an executable file runs. The wizard displays a list of .dll and .ocx files that may be required by the executable file, and it lets you specify whether you want to include each one in your project. The wizard can scan for an executable file that is already included in your project, or you can use the [Specify the Executable panel](#) in the wizard to select a new executable file that you want to scan and add to your project prior to the scanning process.

### Task

**To launch the Dynamic Scanning Wizard:**

1. In the View Bar / View List under **Additional Tools**, click **Dependency Scanners**.
2. Click the **Perform Dynamic Scanning** button.

The following panels are associated with the Dynamic Scanning Wizard:

- [Welcome](#)
- [Filter Files](#)
- [Specify the Executable](#)
- [Specify Application File](#)
- [Launch the Application](#)
- [Your Application is Running](#)
- [File Selection](#)
- [Scan Results](#)
- [Completing the Dynamic Scanning Wizard](#)

## Welcome Panel

**Project** ▪ This information applies to the following project types:

- *Basic MSI*

- *InstallScript*
- *InstallScript MSI*

The Dynamic Scanning Wizard provides you with an easy path to add your application's dependency files to your project. Before you begin using the scanner, it is recommended that you add the target executable file to your project.

Click Next to begin using this wizard.

## Filter Files Panel

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The Dynamic Scanning Wizard may list as dependencies certain files that you do not want to add to your installation. For example, common system files that are already present on target machines usually do not need to be reinstalled. To avoid having these files added to your project when you run the scanner, select the **Filter files** check box on the Filter Files panel.

To learn how to customize the list of files that are excluded from scans, see [Filtering Files in Dependency Scanners](#).

## Specify the Executable Panel

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The Specify the Executable panel is where you specify whether you want to scan an executable file that is already included in your project, or one that has not yet been added.

**Table 42** ▪ Specify the Executable Panel Settings

Setting	Description
<b>I would like to select an executable file from my project (recommended)</b>	If the executable file that you would like to scan has already been added to your project, select this option.
<b>I would like to select a new executable</b>	If the executable you want to scan is not currently included in your project, select this option.

## Specify Application File Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

The Specify Application File panel is where you to select the specific executable file (.exe) that you would like to scan. Additionally, you can specify command-line parameters for the file and a working folder.

**Table 43** ▪ Specify Application File Panel Settings

Setting	Description
<b>Application</b>	Specify which executable file you would like to scan. If you choose to scan a file that is already included in your project, select it from the list of executable files that present in your project. If you choose to scan a file that is not yet a part of your project, enter the path to that file or click the Browse button to navigate to it.
<b>Command Line</b>	Enter the command-line parameters that you would like to pass to the executable file. These parameters are used only during the scanning process; they are not used after the wizard has been dismissed.
<b>Working Folder</b>	Enter the path to the working folder for this application, or click the Browse button to navigate to the directory. By default, this directory is set to the same folder in which the application you choose to scan resides.

## Launch the Application

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

Before the Dynamic Scanning Wizard begins scanning your application, it must launch the application. After your application is launched by the wizard, you should use as many of the application's menu items and features as you can. This helps to identify where dependency files are located so that they can be added to your project.

Click Next to launch your application and begin scanning for dependencies.

## Your Application is Running Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

The Your Application is Running panel is displayed while your application is running. When you have finished using your application, click the Done button to view the results of the scan. No files are added until you have confirmed the findings of the scan.

## File Selection Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

The File Selection panel displays a list of possible files and merge modules that you may need to add to your project. Use this panel to select the ones that you want to include in your installation. For more information, see [Reviewing Dependency Scanner Results](#).

**Table 44** ▪ File Selection Panel Settings

Setting	Description
<b>File</b>	Indicate which files and merge modules you want to add to your project by selecting the appropriate check boxes.
<b>Deselect All</b>	If you want to clear all of the check boxes, click this button. You can then manually select each check box that corresponds with a file or merge module that you would like to add to your project.
<b>Select All</b>	If you want to select all of the check boxes, click this button. You can then manually clear each check box that corresponds with a file or merge module that you do not want to add to your project.

## Scan Results Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript

- *InstallScript MSI*

The Scan Results panel shows the dependencies that the wizard identified and that you selected to be added to your project.

To add these dependencies to your project, click the Next button. To exit the wizard without adding the dependencies, click the Cancel button. To review the list of potential dependencies again and add or remove any of them, click the Back button.

## Completing the Dynamic Scanning Wizard Panel

---

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

When the Dynamic Scanning Wizard shows the Completing the Dynamic Scanning Wizard panel, the wizard has added the executable file's dependencies to your project. If you chose to scan an executable file that was not already included in your project, that .exe file has been added as well.

Click Finish to close the wizard and return to InstallShield.

## Export Components Wizard

---

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Export Components Wizard simplifies the process of exporting a component from certain file types (.ism, .msi, .msm) to any existing project or a new one altogether. A common use of this wizard includes exporting components to merge modules.

---

**Note** ▪ The Export Components Wizard does not let you export components from an .msi or .msm file to an .ism file. It also does not let you export from an .ism file to an .msi or .msm file.

When you export components to other projects, a copy of this component is added to the specified project file, along with all of the component's data, such as its files, shortcuts, registry entries, and advanced settings.

**Task****To launch the Export Components Wizard:**

1. In the View Bar / View List under **Organization**, click **Setup Design** (in installation projects only) or **Components**.
2. Do one of the following:
  - To export a specific component, right-click the component that you want to export, and then click **Export Component Wizard**.
  - To export more than one component, right-click the main node in this view, and then click **Export Component Wizard**.

**Note** ▪ You can also launch the Export Components Wizard from the Project menu.

The following panels are associated with the Export Components Wizard:

- Welcome
- Select Components
- Select Target File Info
- Summary

## Welcome Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The Export Components Wizard simplifies the process of exporting components from a file type (.ism, .msi, .msm) to any existing project or a new one altogether. A common use of this wizard includes exporting components to merge modules.

**Note** ▪ The Export Components Wizard does not let you export components from an .msi or .msm file to an .ism file. It also does not let you export from an .ism file to an .msi or .msm file.

## Select Components Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The Select Components panel lists all of the components in your open project. Select the components that you want to export. You can filter the components list in this panel by feature or component destination.

If you launch the Export Components Wizard by right-clicking a specific component and then clicking Export Components Wizard, the wizard skips the Select Components panel.

**Note** ▪ When you are exporting from a merge module, the feature filter is not available because there are no features in merge modules.

## Select Target File Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

On the Select Target File panel, specify whether you want to export the component to an existing or new project. In either case, browse for the file location.

**Note** ▪ When the wizard is exporting the component to the target project, the wizard checks for conflicts. If the target project already has a component of the same name with different settings, the Resolve Conflict dialog box opens to offer you options for resolving the conflicts.

There is also an option to export as a Merge Module project. Select this option to export the component to this specific project type.

## Target File Info Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

On the Target File panel, specify information, including the product name, version, and language, for the new project. Indicate whether you want to replace exported components in the current project with the generated merge module. Replacing the component with the exported merge module option removes the component from the currently open project.

## Summary Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The Summary panel displays the results of the export process. The summary also lists any errors from exporting. Click Finish to complete the process.

**Note** ▪ After you have arrived at the Summary panel, you cannot click Back to return to previous panels.

## Function Wizard

The Function Wizard automates the process of adding function calls to your scripts. After you complete two brief wizard panels, your function call is inserted into your script at the caret location.

## Launching the Function Wizard

### Task

**To launch the Function Wizard, do one of the following:**

- On the **Edit** menu, click **Insert InstallScript Function**.

## Function Name Panel

Lets you select an InstallScript function to paste into the active script editor window.

The Function Wizard lets you select from an alphabetic list of all functions or from lists of specific function categories. You can view the description for each function you highlight. Press the Help button to see the complete function description for any highlighted function.

### Panel Options

#### Function Category (list box)

Select a function category. The InstallScript functions belonging to the selected category are displayed in the Function Name list box. Select “All” to display the names of all available InstallScript functions.

#### Function Name (list box)

Select a function name to display the function parameters and a brief description of the selected function in the bottom portion of this panel.

Click Next to display the [Function Parameters panel](#) of the Function Wizard.

## Function Parameters Panel

Displays the name of the function selected in the [Function Name panel](#) and the parameters for that function. Next to each parameter is either an edit box in which you can enter a variable name or a value, or a drop-down menu from which you can select a parameter value.

### Task

**To specify function parameters and insert the function into your script:**

- Complete the arguments for each function. When you place the cursor in an edit field, the parameter description appears at the bottom of the panel. If there are predefined options available for a parameter, the edit field contains a drop-down menu. Note that you can select only one option from a drop-down menu, even when the options are not exclusive.

**Note** ▪ You can enter strings (or string identifiers) and numbers directly in the edit fields, but you must pay careful attention to the purpose of the parameters. One clue is the InstallScript Hungarian notation in the variable name.

You must declare all variable names that you use in all function calls. The Function Wizard does not declare them for you.

2. Click **Finish** to insert the function call into your setup script. If you need further help, place the cursor in the function name and press the **F1** key.

## Import DIM Wizard

**Project** ▪ This information applies to Basic MSI projects.

Use the Import DIM Wizard to identify a DIM that you want to statically import into a Basic MSI project. When you complete the wizard, InstallShield incorporates the project data of the DIM into the open Basic MSI project.

Note that statically importing a DIM is a design-time task. If you statically import a DIM into a project, its data becomes part of the Basic MSI project at the time of the import. If you later update the DIM project, the Basic MSI project is not updated with the latest changes in the DIM. In order to remove a statically imported DIM from a Basic MSI project, it would be necessary to identify each file, component, and other element from the DIM and manually remove it from the Basic MSI project.

### Task

#### To launch the Import DIM Wizard:

1. In the View Bar / View List under **Organization**, click **Setup Design**.
2. In the **Setup Design** explorer, right-click the feature that you want to contain the DIM, and then click **Import DIM Wizard**.

The Import DIM Wizard consists of the following panels:

- **Welcome**
- **Select Source File**
- **Import**

## Welcome Panel

**Project** ▪ This information applies to Basic MSI projects.

Use the Import DIM Wizard to identify a DIM that you want to statically import into a Basic MSI project. When you complete the wizard, InstallShield incorporates the project data of the DIM into the open Basic MSI project.

## Select Source File Panel

**Project** ▪ This information applies to Basic MSI projects.

On the Select Source File panel, specify the path and file name for the DIM that you want to statically import into your Basic MSI project. To navigate to the file without having to manually enter the path and file name, click the Browse button.

If you want to back up your Basic MSI project file (.ism) before statically importing the DIM, specify the path and file name for the backup project file. If you specify a path and file name, the wizard saves the backup file when you click the Next button on this panel.

## Import Panel

**Project** ▪ This information applies to Basic MSI projects.

The Import panel shows the location and name of the DIM project file that you are importing. If you specified to create a backup copy of your Basic MSI project file (.ism) before statically importing the DIM, the path and file name are also displayed.

To complete the import process, click the Finish button.

## Import REG File Wizard

InstallShield enables you to import existing registry (.reg) files that you have created in other installation projects or outside InstallShield.

### Task

#### To launch the Import REG File Wizard:

1. In the View Bar / View List under **System Configuration**, click **Registry**.
2. *Windows Installer projects only:* In the **View Filter** list, click the component that should have the .reg file that you are importing.

**Note** ▪ If All Application Data is selected, the Registry view is read-only. *InstallScript projects only:* In the Destination computer's Registry view pane, open the registry set that should have the .reg file that you are importing.

3. In the **Destination computer's Registry** view pane, right-click the registry key to which you would like your registry data added, and then click **Import REG File**. The Import Reg File Wizard opens.

When you import an .reg file into a component or registry set, that registry data is added to the component's or registry set's registry data and written to the end user's system if the component or registry set is installed.

The Import REG File Wizard consists of the following panels:

- **Welcome**
- **Import Registry File**
- **Import Conflict Options**
- **Progress**

## Welcome Panel

The Import REG File Wizard allows you to import existing registry data (.reg) into your InstallShield project. This registry data is added to the target system's registry during the setup project.

Click Next to continue to the next wizard panel to begin importing your REG file.

---

**Note** - Before you begin importing REG data be sure that you selected the proper feature to which you would like this data added. To specify a feature, cancel the wizard and select the appropriate feature from the Feature list at the top of the Registry view.

## Import Registry File Panel

In this panel you can specify the REG file you would like to import.

### Panel Options

#### Registry File

Enter the path to the REG file you would like to import, or click the Browse button to navigate to this file.

## Import Conflict Options Panel

Because your setup may already contain registry data that could conflict with information stored within the REG file you are importing, you can select how you would like to handle any conflicts.

### Panel Options

#### Overwrite the registry data

Select this option if you would like data stored within the REG file you are importing to overwrite any conflicting data already present in your setup project.

#### Do not overwrite the registry data

Select this option if you would like to retain the data already present in your setup project when a conflict arises during the import progress. All nonconflicting registry data are still imported.

#### Log all registry conflicts to a file

Select this option if you want to keep a record of all registry conflicts found by the wizard. You can type a path and folder name in the field or click the folder button to browse to a file.

## Import Progress Panel

This panel displays the import progress of the REG file. Click Cancel to stop the import or wait until the wizard finishes importing your REG file and click Finish to return to the IDE.

# Import XML Settings Wizard

The Import XML Settings Wizard enables you to add a reference for an XML file to the XML File Changes view, where you can configure the changes that you want to be made to the XML file at run time.

**Important** • The XML File Changes view is not designed to list a node for every node in an XML file. To improve performance, the XML File Changes view should show only the settings that differ from the base XML file:

- If the XML file that you are modifying is part of your installation, the XML File Changes view should list only the nodes and node sets that should be added, changed, or deleted after the XML file is installed at run time.
- If the XML file that you are modifying is a file that is already present on the target system, the XML File Changes view should list only the nodes that need to be added, changed, or deleted at run time.

Therefore, when you use the Import XML Settings Wizard, import only the nodes in the XML file that you want to modify at run time.

Note that the XML File Changes view does not enable you to specify the order in which new elements should be listed in the XML file. Therefore, importing only the nodes that you want to modify at run time helps to avoid issues that may occur if your product requires that the elements be listed in a particular order.

The wizard consists of the following panels:

- Welcome
- XML File
- XML Element
- XML Import Progress
- XML Import Results

## Welcome Panel

The Import XML Settings Wizard enables you to add a reference for an XML file to the XML File Changes view, where you can configure the changes that you want to be made to the XML file at run time.

The Welcome panel is the first panel of the Import XML Settings Wizard.

**Important** • The XML File Changes view is not designed to list a node for every node in an XML file. To improve performance, the XML File Changes view should show only the settings that differ from the base XML file:

- If the XML file that you are modifying is part of your installation, the XML File Changes view should list only the nodes and node sets that should be added, changed, or deleted after the XML file is installed at run time.
- If the XML file that you are modifying is a file that is already present on the target system, the XML File Changes view should list only the nodes that need to be added, changed, or deleted at run time.

Therefore, when you use the Import XML Settings Wizard, import only the nodes in the XML file that you want to modify at run time.

*Note that the XML File Changes view does not enable you to specify the order in which new elements should be listed in the XML file. Therefore, importing only the nodes that you want to modify at run time helps to avoid issues that may occur if your product requires that the elements be listed in a particular order.*

## XML File Panel

On the XML File panel, specify the XML file that you want to import by clicking Browse to locate it and populate the field. Then click Next to continue.

## XML Element Panel

On the XML Element panel, specify which elements in the XML file should be imported into the XML File Changes view. Then click Import to begin the process or click Back to return to the previous panel.

**Important** - The XML File Changes view is not designed to list a node for every node in an XML file. To improve performance, the XML File Changes view should show only the settings that differ from the base XML file:

- If the XML file that you are modifying is part of your installation, the XML File Changes view should list only the nodes and node sets that should be added, changed, or deleted after the XML file is installed at run time.
- If the XML file that you are modifying is a file that is already present on the target system, the XML File Changes view should list only the nodes that need to be added, changed, or deleted at run time.

Therefore, on the XML Element panel of the Import XML Settings Wizard, select only the nodes in the XML file that you want to modify at run time.

*Note that the XML File Changes view does not enable you to specify the order in which new elements should be listed in the XML file. Therefore, importing only the nodes that you want to modify at run time helps to avoid issues that may occur if your product requires that the elements be listed in a particular order.*

## XML Progress Panel

The XML Progress panel appears after you click Import in the Import XML Element panel. It displays the progress of the file import.

## XML Results Panel

The XML Results panel displays a summary of the imported .xml file and all of its elements. Click Finish to complete the import process and exit the wizard.

Once you click Finish, InstallShield adds a new node for the XML file that you imported. The XML file node contains each of the nodes that you selected in the wizard. Each node represents an XPath query that occurs at run time. InstallShield also adds a new component for the XML file that you have imported through the XML File Changes view. Once you are done importing, you can use the XML File Changes view to configure the XML file's settings and specify any element, attribute, and content changes for it.

For examples of how to create some basic XPath expressions, see [Using XPath Expressions to Find XML Data in an XML File](#).

# Microsoft .NET Framework Object Wizard

**Project** ▪ The Microsoft .NET Framework Object Wizard is available in InstallScript projects.

The Microsoft .NET Framework Object Wizard opens when you add the Microsoft .NET Framework Object to a feature in the Objects view of an InstallScript project. This wizard lets you specify which versions of the .NET Framework and language packs should be included in your project. The language packs contain translated text, such as error messages, for languages other than English.

The Microsoft .NET Framework Object Wizard consists of the following panels:

- [Step 1](#)
- [Step 2](#)

**Tip** ▪ This object is not installed with InstallShield; you need to download it. For more information, see [Obtaining Updates for InstallShield](#).

## Step 1 Panel

**Project** ▪ The Microsoft .NET Framework Object Wizard is available in InstallScript projects.

The Step 1 panel of the Microsoft .NET Framework Object Wizard lets you specify which versions of the .NET Framework and language packs should be included in your project.

**Table 45** ▪ Step 1 Panel Settings

Setting	Description
<b>Select the version of .NET to include and install</b>	Select which versions of the .NET Framework should be included in the object.
<b>Use Web downloader version of .NET redistributable</b>	<p>If a Web downloader redistributable and a full package redistributable are available for the selected version of .NET, this check box is enabled. Select this check box if you want to use the Web downloader redistributable.</p> <p>The Web downloader redistributable is smaller than the full package redistributable, but it requires that the target system have an Internet connection at run time.</p>
<b>Platforms</b>	Select which platform-specific versions of the .NET Framework should be included in the object.

**Table 45** ▪ Step 1 Panel Settings (cont.)

Setting	Description
<b>Languages</b>	Specify whether the object should include language packs. <ul style="list-style-type: none"> <li>● <b>Don't include any language packs</b>—If no language packs should be included, select this option.</li> <li>● <b>Include all appropriate language packs</b>—If the object should include all of the available language packs that are supported by the project, select this option.</li> </ul>

For more information about this object, see the help pane that is displayed when you click the Microsoft .NET Framework Object in the Objects view.

**Tip** ▪ This object is not installed with InstallShield; you need to download it. For more information, see [Obtaining Updates for InstallShield](#).

## Step 2 Panel

**Project** ▪ The Microsoft .NET Framework Object Wizard is available in InstallScript projects.

If you select the **Include multiple versions of the .NET Framework** option on the Step 1 panel of the Microsoft .NET Framework Object Wizard, the Step 2 panel is displayed.

**Table 46** ▪ Step 2 Panel Settings

Setting	Description
<b>Select the .NET redists to include in the object</b>	Select the check box for each version of the .NET Framework that should be included in the project. Note that the object can install only one version of the .NET Framework at run time.
<b>Allow the object to install a .NET language pack without installing the corresponding .NET Framework.</b>	<p>To allow a language pack to be installed without first installing the corresponding version of the .NET Framework, select this check box.</p> <p>InstallShield uses this setting to configure the <code>InstallLangPackOnly</code> property for the object. This read-write numeric property indicates whether the object should allow the installation of the language pack without first installing the corresponding version of the .NET Framework, which may occur if the framework is not being included in the object.</p> <p>By default, if the object is set to install a particular version of the framework and that version of the framework is not included in the object, the object sets a status of <code>DOTNET_STATUS_VERSION_NOT_IN_MEDIA</code>. However, if the <code>InstallLangPackOnly</code> property is set, the object does not set the failure status, which allows the object to install the language pack, if appropriate, without first installing the framework. This property is typically set in the object wizard.</p>

For more information about this object, see the help pane that is displayed when you click the Microsoft .NET Framework Object in the Objects view.

**Tip** ▪ This object is not installed with InstallShield; you need to download it. For more information, see [Obtaining Updates for InstallShield](#).

## MSI to MSIX Conversion Wizard

**Project** ▪ This information applies to Basic MSI projects.

The MSI to MSIX Conversion Wizard helps you convert existing Windows Installer files (.msi files) to MSIX package through Basic MSI project.

### Task

#### To launch the MSI to MSIX Conversion Wizard:

1. On the **Home** menu, click **New** button. The **New Project** dialog box opens.
2. On the **Windows Installer** tab, click **MSI to MSIX Conversion Wizard**.
3. Click **OK**. The MSI to MSIX Conversion Wizard opens.

## Welcome Panel

The MSI to MSIX Conversion Wizard helps you to convert a MSI to MSIX package.

### Task

#### To convert from MSI to MSIX:

1. On the **Welcome** panel, click **Next**.
2. Click **Browse** and locate to specify the location of the MSI file.
3. Click **Next**.
4. Enter the Project Name.
5. Click **Browse** and to store the Data File to a location.
6. Click **Finish**. The Basic MSI project type opens.

**Note** ▪ The MSI file is built automatically through the Basic MSI project type.

# New Language Wizard

**Edition** ▪ The New Language Wizard is available in the Premier edition of InstallShield.

**Project** ▪ The New Language Wizard is available in the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- Suite/Advanced UI

The InstallShield Premier edition lets you add unsupported languages, beyond the built-in 35 languages, to projects through the New Language Wizard. An unsupported language is one in which none of the default run-time strings are translated. When you add an unsupported language to a project, that language is made available in various language-related settings throughout InstallShield. In addition, InstallShield uses the strings from your project's default language as placeholders for the strings in that newly added unsupported language; you can use the String Editor view to provide translated strings for the unsupported languages.

When you use the New Language Wizard to add an unsupported language, InstallShield adds to your machine several files that contain English strings as placeholders:

- *LanguageID.ini*

*LanguageID* is the language identifier for the new language. InstallShield adds this file to the following directory:

*InstallShield Program Files Folder\Support*

- *\_isres\_LanguageID.dll*

*LanguageID* is the language identifier for the new language. InstallShield adds this file to the following directories:

*InstallShield Program Files Folder\Redist\Language Independent\i386*

*InstallShield Program Files Folder\Redist\Language Independent\i386\Skins*

If you want to add the unsupported language in InstallScript or InstallScript MSI projects, you will need to translate the strings in those files. You can open the .dll file in a resource editor to replace the English strings with the appropriate translated strings.

## Task

### To launch the New Language Wizard:

On the **Tools** menu, click **Add New Language**.

## Welcome Panel

**Edition** ▪ The New Language Wizard is available in the Premier edition of InstallShield.

---

**Project** ▪ The New Language Wizard is available in the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- Suite/Advanced UI

The InstallShield Premier edition lets you add unsupported languages, beyond the built-in 35 languages, to projects through the New Language Wizard. An unsupported language is one in which none of the default run-time strings are translated. When you add an unsupported language to a project, that language is made available in various language-related settings throughout InstallShield. In addition, InstallShield uses the strings from your project's default language as placeholders for the strings in that newly added unsupported language; you can use the String Editor view to provide translated strings for the unsupported languages.

## Project Language Panel

---

**Edition** ▪ The New Language Wizard is available in the Premier edition of InstallShield.

---

**Project** ▪ The New Language Wizard is available in the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- Suite/Advanced UI

The Project Language panel lets you specify the languages that you would like to add to your project. Select the box next to each language that you want to add.

## Project Files Panel

---

**Edition** ▪ The New Language Wizard is available in the Premier edition of InstallShield.

---

**Project** ▪ The New Language Wizard is available in the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- Suite/Advanced UI

The Project Files panel is where you specify which existing projects should contain the ability to add the new languages. (That is, InstallShield will add the new languages to the list of languages that you can select for the Setup Languages setting in the General Information view.)

This panel also enables you to specify whether you want to be able to include the languages in every new project that you create.

For information on adding a language to a project, see [Selecting the Installation Languages](#).

## Panel Settings

**Table 1** • Project Files Panel Settings

Setting	Description
<b>Project Name</b>	Select the projects that should enable you to select the new languages for the Setup Languages setting in the General Information view. If your project is not stored in the default project location, navigate to it by clicking the Browse button.
<b>Update InstallShield</b>	Select this check box if you would like any new project that you create to have optional support for these languages. Selecting this check box does not automatically include the new languages in future projects. Instead, it adds the new languages to the list of languages that you can select for the Setup Languages setting in the General Information view.

## Summary Panel

**Edition** • The New Language Wizard is available in the Premier edition of InstallShield.

**Project** • The New Language Wizard is available in the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- Suite/Advanced UI

The Summary panel lists the new languages that will be added to the specified projects. It also indicates whether you want InstallShield to add the new languages to all new projects that you create. Click the Finish button to accept the settings and begin updating projects with the new languages.

When you use the New Language Wizard to add an unsupported language, InstallShield adds to your machine several files that contain English strings as placeholders:

- *LanguageID.ini*

*LanguageID* is the language identifier for the new language. InstallShield adds this file to the following directory:

*InstallShield Program Files Folder\Support*

- *\_isres\_LanguageID.dll*

*LanguageID* is the language identifier for the new language. InstallShield adds this file to the following directories:

*InstallShield Program Files Folder\Redist\Language Independent\i386*

*InstallShield Program Files Folder\Redist\Language Independent\i386\Skins*

If you want to add the unsupported language in InstallScript or InstallScript MSI projects, you will need to translate the strings in those files. You can open the .dll file in a resource editor to replace the English strings with the appropriate translated strings.

## Open MSI/MSM Wizard

The Open MSI/MSM Wizard is a tool that converts existing installation projects (.msi files) and merge modules (.msm files) to InstallShield installation projects (.ism files) that you can modify and build in the InstallShield user interface.

### Task

#### To launch the Open MSI/MSM Wizard:

1. On the **Home** menu, click **Open** button. The **Open** dialog box opens.
2. In the file type list, select either **Windows Installer Packages (\*.msi)** or **Windows Installer Modules (\*.msm)**.
3. Browse to the Windows Installer package or merge module that you want to convert.
4. On the **Open** button, click the arrow, and then click **Open with Wizard**.

The Open MSI/MSM Wizard opens.

**Note** - If the wizard encounters errors while opening the package, the errors are displayed in the Output window when the converted project is opened. To solve any problems, see [MSI/MSM Conversion Errors](#).

## Welcome Panel

The Open MSI/MSM Wizard allows you to import setup packages (.msi) and merge modules (.msm) into InstallShield. This functionality is useful for network administrators who need to build custom setups for their users.

### Panel Options

#### Open MSI/MSM in Direct Edit Mode

Select this option to view and edit the database directly, without creating a project file. If you select this option, the selected database will open in the IDE, where you can view and edit its contents with the Direct Editor.

Click Next to open the database in the Direct Editor.

#### Convert MSI/MSM to an InstallShield Project

Select this option to convert the selected database into an InstallShield project, which you can then edit within the IDE.

Click Next to continue using the wizard for this option.

## File Locations Panel

In the File Locations panel, specify the name of the project that the wizard will create and the location of its data files.

### Panel Options

#### Project Name

Type a name for the setup project that will be created when the wizard converts the existing .msi or .msm project to an InstallShield (.ism) project. The .ism project is saved in the default location.

---

**Note** ▪ Because the project name determines the name of the .ism file and the root for the project's folder structure, use only legal characters for a Windows file name.

#### Data File Location

If the imported application's files are stored in .cab files, those files are automatically extracted and stored in the location specified here.

After specifying the project name and data file location, click Finish to convert the project and open it in the InstallShield IDE.

---

**Note** ▪ The wizard alerts you of any errors it encountered while creating the project. To resolve any problems, see [MSI/MSM Conversion Errors](#).

## Open MSP Wizard

Before InstallShield can open a patch or MSP file for editing or create a new patch project, it needs the base MSI to which the MSP should be applied. When you first open a patch (.msp) project in InstallShield, the Open MSP Wizard appears.

The Open MSP Wizard gathers the necessary file information, applies the patch to the base MSI, and opens the patch project in the IDE in Direct MSP mode (which is similar to the Direct Edit mode). The data you specify in the Open MSP Wizard is saved so the next time you open the MSP file, the patch project opens in the IDE.

## Welcome Panel

This panel welcomes you to the wizard and briefly describes the Open MSP Wizard's function. Click Next to begin using the wizard.

## Base MSI Package Panel

In the Base MSI Package panel, you specify the base MSI file to which you want to apply this patch.

## Panel Options

### MSP File Name

Read-only field that provides the path and file name of the MSP file.

### Base MSI File Name

Specify the name of the base MSI file to which this patch (indicated in the MSP File Name edit box) will be applied. Click the browse (ellipsis) button to browse to an .msi file.

Click Finish to close the Open MSP Wizard and create your patch project. The patch is applied to the MSI project that is specified in the Base MSI File Name edit box, and the patch project (.msp file) opens in Direct MSP mode in the IDE.

## Open Transform Wizard

Before InstallShield can open a transform (.mst) file for editing or create a new Transform project, it needs the base .msi file to which the .mst should be applied and any additional .mst files that should be applied to the base .msi file.

The first time that you open an .mst file in InstallShield, the Open Transform Wizard launches. This wizard enables you to specify the .mst file, the base .msi file, and any additional transforms to apply before editing. The last panel of this wizard—the Create a Response Transform panel—lets you specify whether or not your transform should be a response transform. A response transform includes default responses for the user interface portion of the installation. If you specify that you want to create a response transform, the user interface elements of the installation are executed, enabling you to customize the options available in each panel of the installation wizard.

When the Open Transform Wizard is finished, the transforms are applied and the .mst file opens in the InstallShield in Direct MST mode (which is similar to Direct Edit mode). The data specified in the wizard is saved so that the next time that you open the .mst file, the transform project opens directly in InstallShield.

### Task

#### *To launch the Open Transform Wizard when opening a transform for editing:*

1. On the **Home** menu, click **Open** button. The **Open** dialog box opens.
2. Select the .mst file that you would like to open.
3. In the **Open as** box, select **Wizard**.
4. Click **Open**. The Open Transform Wizard opens.

### Task

#### *To launch the Open Transform Wizard when creating a new transform:*

1. On the **Home** menu, click **New** button. The **New Project** dialog box opens.
2. On the **Windows Installer** tab, click **Transform**.
3. In the **Project Name** box, type a name for your transform project.
4. In the **Location** box, type the path where your transform project should be stored or click the browse button to find the location.

5. Click **OK**. The Open Transform Wizard opens.

The following panels are associated with the Open Transform Wizard:

- [Welcome](#)
- [Transform Information](#)
- [Additional Transforms](#)
- [Create a Response Transform](#)

## Welcome Panel

This panel welcomes you to the Open Transform Wizard and briefly describes the wizard's function. Click Next to begin using the wizard.

## Transform Information Panel

In the Transform Information panel, you specify the base .msi file to which you want to apply this transform.

### Panel Options

#### MST File Name

Read-only field that provides the path and file name of the .mst file.

#### Base MSI File Name

Specify the name of the base .msi file to which this transform (indicated in the MST File Name box) will be applied. Click the ellipsis (...) button to browse to an .msi file.

Click Next to move to the next panel.

## Additional Transforms Panel

In this panel, you can supply the names of one or more additional transforms that you want applied prior to applying the transform that the Open Transform Wizard is currently creating. For example, you may want to include previous customization or transforms containing language-specific information. The transforms are applied in the order in which they are listed.

### Adding a Transform

---

#### Task

#### *To add a transform to the list:*

1. Click New (Insert) or press Insert.
2. Type the full path and name of the .mst file or click the ellipsis (...) button to browse to it.

## Deleting a Transform from the List

### Task

#### **To delete a transform from the list:**

1. Select the transform in the list that you would like to remove.
2. Click Delete or press Delete.

## Changing the Transform Order

### Task

#### **To change the order in which the transforms are applied:**

Select a transform in the list and click the move up button or the move down button.

The transform that the Open Transform Wizard is creating is applied last.

**Caution** ▪ When you are using multiple transforms, keep in mind that the order in which they are applied is critical. For example, if you create a transform for a Windows Installer package that creates a new value for a property, and then you create a second transform that changes the value created in the first transform, everything works correctly. However, if you apply the second transform first, that transform is attempting to modify the property's value, instead of creating it. That will result in an error.

One simple example of where this may be a problem is with the default company name. If the value is not set by default, and you set it in the first transform, a new value for the property is created. If you create a second transform that modifies the combined original package and first transform, and the second transform changes the default company name, it is only changing the property. However, if you try to apply the second transform without the first one, Windows Installer interprets this as trying to change a null value to another value, which will result in an error.

Click Next to move to the next panel.

## Create a Response Transform Panel

In this panel, you can specify that you want to create a response transform.

## Panel Options

**Table 2** • Create a Response Transform Panel Options

Option	Description
<b>Create response transform</b>	<p>If you want to create a response transform, select this check box.</p> <p>If you select this option, the user interface elements of the installation are executed when you click Finish. No file transfer takes place, and no changes to your machine occur. Complete this simulated installation, customizing the options available in each panel of the installation wizard as needed. When you reach the end of the installation sequence and click Install, the simulated installation exits. InstallShield saves all of the changes that you made during the simulated installation as default installation values in the response transform.</p>
<b>Command line properties (optional)</b>	<p>If you are using a response transform, you can specify additional command-line properties (in property name/value pairs separated by semicolons) to pass to the response transform. These must be public properties, and they control only how the dialog boxes are displayed during creation of the response transform. They are not persisted outside of the user interface sequence during creation. For example, you can pass the property/value pair <code>ARPHelpTelephone=1-111-111-1111</code> to set the value of the Help Telephone field of Add or Remove Programs in Control Panel.</p> <p>You might pass a property/value pair during the creation of a response transform to display all dialog boxes during an installation that may not be displayed based on your system configuration (for example, to show Windows 9x-only dialog boxes on a Windows NT platform). You can then make appropriate responses and have them included in your transform.</p>

Click Finish to exit the Open Transform Wizard and create your transform project. The transforms are applied to the .msi file specified in the [Transform Information panel](#), and the transform project (.mst file) opens in Direct MST mode in InstallShield.

## Publish Wizard

Use the Publish Wizard to save the selected installation element to a repository.

The following panels are associated with the Publish Wizard:

- [Welcome](#)
- [Repository](#)

- [Publishing Information](#)
- [Summary](#)

## Welcome Panel

This panel welcomes you to the Publish Wizard. Click Next to begin using the wizard.

## Repository Panel

The Repository panel of the Publish Wizard is where you specify the repository to which your installation element should be published.

## Publishing Information Panel

The Publishing Information panel of the Publish Wizard is where you specify information that identifies the item that you are publishing to the repository. If you are publishing a dialog to the repository, for example, the information that you provide in the Publishing Information panel will be displayed for your dialog when you or other users browse the repository of dialogs.

### Panel Options

#### Name

Specify a name for the dialog, template, script file, or other installation element that you are publishing.

#### Publisher

Type your name.

#### Description

Type the description that should be displayed for this installation element.

## Summary Panel

Use the Summary panel of the Publish Wizard to review the settings for the item that you are publishing to the repository. If you need to change anything, click Back until you reach the appropriate panel, and then make the necessary changes.

When you are done, click Finish. The Output window opens to inform you whether the installation element was successfully published to the selected repository.

## Redistributable Downloader Wizard

---

**Project** • This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

The Redistributable Downloader Wizard allows you to quickly download third-party redistributables, merge modules, prerequisites, and other files to your local machine. You can launch the Redistributable Downloader Wizard from the Release Wizard's **.NET Run-Time Options panel** and from the Releases view (.NET 1.1/2.0 Core Language and .NET 1.1/2.0 Language Packs settings).

#### Task

#### To use the Redistributable Downloader Wizard:

1. In the **Select Files to Download** panel, select the redistributables\prerequisites that you want to download and click **Next** to move to the **Progress** panel.
2. When the progress bars complete, click **Next**.
3. The final panel displays the list of redistributables\prerequisites that the wizard downloaded to your machine. Click **Finish** to exit the wizard.

## Reg-Free COM Wizard

Use the Reg-Free COM Wizard to create and modify Reg-Free COM manifest files to be included in your installation.

**Note** - Before you use the Reg-Free COM Wizard, you should add the COM libraries (.dll and .ocx files) and the executable file that uses them to your InstallShield project. Note that the Reg-Free COM manifest file, the executable file, and the COM libraries should all be installed to the same folder on the target machine.

#### Task

#### To launch the Reg-Free COM Wizard:

On the **Project** menu, click **Reg-Free COM Wizard**.

The following panels are associated with the Reg-Free COM Wizard:

- **Welcome**
- **Select an EXE File**
- **Select the Manifest File**
- **Select Files**
- **Summary**

## Welcome Panel

The Welcome panel provides a brief introduction to the Reg-Free COM Wizard. Click Next to begin using the wizard.

**Note** - Select the **Don't show the welcome panel again** check box if you do not want this panel to appear the next time you open the wizard.

## Select an EXE File Panel

The Select an EXE File panel is where you specify the executable file that uses the manifest file that you are creating or modifying.

### Panel Options

#### Executable FileKey

Select an executable file from the Executable FileKey list and click Next. Note that the file must already be included in your installation project.

## Select the Manifest File Panel

The Select the Manifest File panel is where you either specify that you are creating a new manifest (.manifest) file or that you are modifying an existing one. If you are modifying a manifest file, you need to specify where it is located.

### Panel Options

#### Create a new manifest file that will be added to the project

To create a new manifest file, select this option.

#### Pre-existing file that will be added to the project

To specify a manifest file that already exists but has not been included in the project yet, select this option, and then click the Browse button to locate the file.

#### A manifest file that already exists in the project

To specify a manifest file that has already been added to the project, select this option and then select the file from the list.

## Select Files Panel

The Select Files panel is where you specify the required COM library files (.dll or .ocx) that are used by the executable file. You can additionally specify to extract the COM information during each build by selecting the **Refresh COM Info during Build** check box. If you clear this check box, the COM information is injected into the manifest only once, when you have completed the wizard.

## Summary Panel

Use the Summary panel of the Reg-Free COM Wizard to review the options that you selected. If you need to change anything, click Back until you reach the appropriate panel, and then make the necessary changes.

When you are done, click Finish. The wizard creates a new component with the manifest file set as the key file. The manifest component has the same destination and condition as the associated executable-file component. The following file naming convention is used for manifest files:

ExecutableFileName.exe.manifest

For example, **MyFile.exe**.manifest is created for an executable file called **MyFile.exe**.

You can specify additional COM servers by running the wizard again and specifying the existing manifest file.

## Release Wizard

The Release Wizard provides an easy way for you to build a release for your product and specify the settings particular to that release.

### Task

*To launch the Release Wizard and build your setup package, do one of the following:*

- On the **Build** menu, click the **Release Wizard** button.
- Double-click the **Release Wizard** item in the **Release** view.
- Right-click on a product name or a release name in the tree control in the **Release** view, and select **Release Wizard**.

### Task

*You can launch an abbreviated version of the Release Wizard by doing one of the following:*

- Click the **Build** button on the toolbar.
- Select **Build** from the **Build** menu.
- Right-click on a release name in the Release explorer, and select **Build**.

The Build option rebuilds the release that has focus in the Release view or builds the product's first release with default settings. The build feedback—and any build errors—appears in the Output window.

Another alternative to the Release Wizard is building a release at the command line.

## Welcome Panel

This panel provides a brief introduction to the Release Wizard. This wizard walks you through all the necessary steps required to build a distributable release of your product.

Click Next to begin using the wizard.

## Product Configuration Panel

---

**Project** - This topic does not apply to InstallScript projects.

A product configuration is the highest level of organization in the Release view. By grouping related releases together under a common product configuration, you can change specific settings for each release by editing the properties of the product configuration.

### Panel Options

#### New product configuration

Select this option if you want to build this release under a new product configuration. Specify a name for the new configuration.

#### Existing product configuration

Select this option to build this release under an existing product configuration. Choosing this option overwrites any existing release.

## Specify a Release Panel

This panel gives you the option of creating a new release or rebuilding an existing release.

### Panel Options

#### New Release Name

If you would like to build a new release, select the New Release Name option and then enter a new name in the field.

#### Existing Release Name

If you choose to build an existing release, click the Existing Release Name option and then select a release name from the drop-down list.

## Filtering Settings Panel

---

**Project** - The Filtering Settings panel is available in the following project types:

- Basic MSI
- InstallScript MSI
- Merge Module

The Filtering Settings panel prompts you to select which features, components, InstallShield prerequisites, and chained .msi packages to include in your release.

**Table 3** • Filtering Settings Panel Options

Setting	Description
<b>Release Flags</b>	<p>To filter features, InstallShield prerequisites, and chained .msi packages, enter the release flags that you would like to include in this release. If you are including more than one flag, separate them with commas.</p> <p>You have the option of including a subfeature but not its parent feature. In such a case, the subfeature is built into the release as a top-level feature, and its parent is excluded from the release.</p> <p>The release flags that you enter here are combined with the product configuration flags. For more information on the relationship between the two, see <a href="#">Product Configuration Flags vs. Release Flags</a>.</p>  <p><b>Project</b> • The Release Flags option is not available for merge module projects.</p>
<b>Filter application data based on the following languages</b>	<p>To filter application data based on each component's language, select this option, and then select or clear the appropriate language check boxes.</p> <p>If you select one or more language check boxes, InstallShield includes in the release all of the components that are marked with a matching language, as well as all of the components that are marked as language independent; InstallShield excludes any components whose languages do not match.</p>

## Merge Module Options Panel

The Merge Module Options panel provides the option to make your new module immediately available to other InstallShield packages by copying it to your local merge module gallery.

### Panel Options

#### Add to local merge module catalog

Select this option if you would like your new module to be immediately available to other projects. The Merge Modules Locations field is located on the Merge Modules tab of the Options dialog.

## Setup Languages Panel

**Project** • The functionality for the Setup Languages panel varies, depending on which project type you are using.

The Setup Languages panel lets you specify language-related settings for your installation's run time.

**Table 4 •** Setup Languages Panel Settings

Setting	Description
<b>Included Release Languages</b>	<p>The functionality for this box varies, depending on which project type you are using:</p> <ul style="list-style-type: none"><li>• In a Basic MSI or InstallScript MSI project, this setting lets you specify which user interface languages you want to include in a release.</li></ul> <p>Note that if a language is not selected in the Setup Languages setting in the General Information view of the project, it is not listed as one of the available languages in this box.</p> <ul style="list-style-type: none"><li>• In an InstallScript or InstallScript Object project, use this setting if you want to include certain components and exclude others based on the language that is selected for each component. This setting also lets you specify which user interface languages you want to include in a release. If the language specified for a component does not match one of the languages that is selected in this box, InstallShield does not include the component in the release. In addition, if a UI language that is included in the project does not match one of the languages that is selected in this box, InstallShield does not include the UI strings in the release.</li></ul> <p>By default, releases are language independent; that is, none of the project's components or UI strings are excluded from the release.</p> <p>Note that if a language is not selected in the General Information view of a project, it is not listed as one of the available languages in this box.</p>
<b>Make Default</b>	<p>To override the release's default project language that is configured in the General Information view or the String Editor view, select the appropriate default user interface language for your installation, and then click this button.</p> <p>For more information, see <a href="#">Setting the Default Project Language</a>.</p>
<b>Display the Setup Languages Dialog</b>	<p>If you want your installation to display the Choose Setup Languages dialog when it is run with a full user interface, select this check box.</p> <div></div> <p><b>Tip •</b> A Setup.exe <i>setup launcher</i> is required if you want the language selection dialog to be displayed. To learn more, see <a href="#">Creating a Setup Launcher</a>.</p>

**Project** • In Basic MSI and InstallScript MSI projects, the Setup Languages panel affects only the user interface elements that you include in your project. To include components based on the language of the application data, see the [Release Filtering panel](#).

For information on adding a language to a project, see [Selecting the Installation Languages](#).

## Media Type Panel

This panel prompts you to select the type of distribution media for which you want to create a release.

### Panel Options

#### Media type

Choose the type of media on which you will be distributing your setup program. You can select from the following options:

**Table 5** • Media Type Panel Options

Option	Description
<b>CD-ROM</b>	Select this option if you will be distributing your setup on a CD. The maximum size for this type of media is 650 MB.
<b>Custom</b>	Select this option if the media that you are distributing is not in the list of media types. For example, you may be distributing your setup on floppy disks or Zip disks. You will need to set the format size and cluster size for this media, as it will change depending on the media type you are using.
<b>DVD-5</b>	This option allows you to ship your release on a 4.38 GB DVD-ROM.
<b>DVD-9</b>	Choose this option if you plan on shipping your setup on a 7.95 GB DVD-ROM.
<b>DVD-10</b>	This option allows you to ship your release on an 8.75 GB DVD-ROM.
<b>DVD-18</b>	If you have an enormous setup, you can ship your release on 15.83 GB DVD-ROM media.
<b>Network image</b>	If your setup is going to be placed on a network, you can choose this option. There is no size limit for this media type.
<b>Web</b>	(Windows Installer based projects only) If you want to distribute your release over the Web, choose this option. There is no size limit for this media type.

**Project** • If your installation requires more than one disk, InstallShield automatically splits it across as many disks as needed. In a Windows Installer-based project, the wizard prompts you for more information about disk spanning later in the sequence.

## Format size

If you chose the Custom media type, you will need to specify the capacity of the media in this field. For example, if you are shipping your installation program on a Zip disk, you will want to set the media size to 100 MB. If you chose any other media type, the maximum size allowed for that media is displayed in this field.

## Cluster size in bytes (Windows Installer based projects only)

This option defines the minimum amount of space that each file requires. For bigger disks, the cluster size will be larger due to the formatting constraints.

# Disk Spanning Options Panel

---

**Project** ▪ This panel is not available for InstallScript projects.

If your setup is larger than one disk, you have the option to split the setup into pieces so it can be distributed on multiple disks.

## Panel Options

### Automatic

Select this option to have the wizard automatically split your setup across as many disks as are necessary. This option is the recommended way to span your setup across disks.

### Custom

Select this option to manually define how many disks your setup requires, and set the breakpoints yourself. This option requires you to specify which features will be stored on each disk in the [Disk Spanning Advanced Settings panel](#).

---

**Caution** ▪ Multi-disk setups cannot be run from a non-removable media (for example, from a hard drive). If you want to run test a setup that spans disks, you need to put the setup on your target media. If you do not, the setup will fail due to a limitation of the Windows Installer service.

### Enforce disk size

Select this option if you want the wizard to verify that none of your disk images exceeds the media size that you selected. If any of the disks exceeds the specified size limit, Build Error [-1531](#) appears when you try to build the project.

# Disk Spanning Advanced Settings Panel

---

**Project** ▪ This panel is not available for InstallScript projects.

This panel prompts you to specify the number of disks that your setup requires. In addition, you can choose which features are on each disk. This panel is displayed only if you selected the Custom Disk Spanning option on the [Disk Spanning Options panel](#).

## Panel Options

### Disk Mapping

This dialog lists all the features included in the release when it was first built. Because a release is designed to be a snapshot of your build settings, features created after a release will not be available for disk mapping nor built into the current release. You must start a new release in order to map the new features.

All features are on Disk 1 by default. To change the name of this disk, click the Rename Disk button and type in the new name of the disk. To add a new disk, click the New Disk button.

#### Task

##### ***To transfer some of your features from one disk to another:***

1. Select the feature that you want to move.
2. Click the **Move Up** or **Move Down** button. The feature will move through the hierarchy of the current disk until there is nowhere left to go, at which time it will skip to the next disk, provided there is another disk for it to move to.

##### **Tip** - *Note the following when spanning your setup across multiple disks:*

- *A single feature cannot be spanned across multiple disks. If you have a feature that is too big to fit on one disk, you need to divide it into smaller features or subfeatures.*
- *Any merge modules that are included in your setup must be on the first disk, because these files must be available when Windows Installer first processes the database (.msi file).*

If you add features to your setup after you have defined how you would like your setup to span across multiple disks, those features are automatically added to the last disk of your setup. You can add new disks to your setup at any time by using the Release Wizard.

### Disk Prompt

#### Task

##### ***To indicate the prompt you want displayed to end users when the next disk needs to be inserted:***

1. Select a disk in the **Disk Mapping** section.
2. Do one of the following in the **Disk Prompt** field.
  - Type the prompt that you want to display to end users.
  - Click the ellipsis button (...) to display the Select String dialog and select a string to use as the prompt.

Repeat for each disk except the last. The Release Wizard automatically creates a string-table entry for the Disk Prompt value, so you can provide a translated string for each language your setup program supports.

The string that is displayed comes from a number of sources throughout your project, as described below:

1. The complete prompt originates in the Error table (exposed in the Direct Editor) as Error record 1302.
2. This value in turn comes from your project's string entries, and the default value for English reads "Please insert the disk: [2]."
3. Windows Installer resolves [2] with the value of the property DiskPrompt, which is set to [1] in the Property Manager.
4. Finally, Windows Installer evaluates [1] to the string you enter into the Disk Prompt field.

In most cases you should enter the same name as the disk volume (below). For example, assuming the defaults are unchanged, a Disk Prompt entry of *Disk8* would cause the user to be prompted with "Please enter the disk: Disk8."

### Disk Volume

Select a disk and then enter the name for the resulting disk image folder. Repeat for each disk.

When you are building your release image for removable media (such as CD-ROM), be sure to create the media with the same volume names specified here.

If you leave the names as DISK?, the Release Wizard numbers the disks sequentially (for example, DISK1, DISK2, and so on).

---

**Tip** ▪ Notice that the default name of the volume is in all uppercase letters. It is a good idea to keep the names as uppercase to accommodate media types, such as CD-ROM, which require volume names in that format.

## Web Type Panel

---

**Project** ▪ This panel is not available for InstallScript projects.

The Web Type panel prompts you to select the configuration of your Web installation package.

### Panel Options

#### One Executable

Select this option if you want to build this release as a single self-extracting Setup.exe. This Web type is ideal for a package that is to be downloaded from multiple Web or FTP sites, since the installation package is self-contained, and it does not contain any configuration information that ties it to a specific location.

Note, however, that the entire installation package will be downloaded, so the download size and time will be greater than the Install from the Web type described below.

#### Downloader

Select this option to build this release as a combination of Setup.exe and your .msi database. With this option, you can specify where your product's data files should be stored: they can be streamed into the .msi database or stored externally in cabinet (.cab) files. Any .mst and .ini files are embedded in the Setup.exe file.

With the Downloader option, the end user downloads and runs Setup.exe, which in turn downloads and runs the .msi database. If the .cab files are stored externally, only the .cab files that are required, based on the end user's setup type and feature selections, are downloaded and installed. This minimizes download size and time.

The URL that you specify in the [Downloader Options panel](#) of the Release Wizard is used during product maintenance and repair mode.

### Install from the Web

Select this option to build this release as a combination of Setup.exe, your .msi database, and external cabinet (.cab) files. Any .mst and .ini files are embedded in the Setup.exe file.

With the Install from the Web option, the end user downloads and runs Setup.exe, which in turn downloads and runs the .msi database; based on the end user's setup type and feature selections, only the requested .cab files are downloaded and installed, which minimizes download size and time.

The URL that you specify in the [Install from the Web Options panel](#) of the Release Wizard is used during product maintenance and repair mode.

## Downloader Options Panel

**Project** ▪ This panel is not available for InstallScript projects.

The Downloader Options panel is where you specify the URL for your installation package. It is also where you specify the location for your product's data files.

**Table 6** ▪ Downloader Options Panel Settings

Setting	Description
<b>URL for your package</b>	Type the URL for your installation package—for example, <b>http://www.yourcompany.com/downloads</b> . (The file name is not necessary.)
<b>Create external .cab files</b>	<p>To stream your product's data files into the .msi package, clear this check box.</p> <p>To store your product's data files outside the .msi package (in external .cab files), select this check box and then select the appropriate <b>.cab Files</b> option.</p>

**Table 6** • Downloader Options Panel Settings (cont.)

Setting	Description
<b>.cab Files</b>	<p>If you select the <b>Create external .cab files</b> check box, specify how the (.cab files should be created. Available options are:</p> <ul style="list-style-type: none"><li>● <b>One .cab per component</b>—Builds a separate cabinet file for each component. At run time, only the cabinet files that are required by the end user's setup type and feature selections are downloaded.</li><li>● <b>One .cab per feature</b>—Builds a separate cabinet file for each feature. At run time, only the cabinet files that are required by the end user's setup type and feature selections are downloaded.</li><li>● <b>Multiple .cab files based on size</b>—Enter a specific size, in kilobytes, for each cabinet file.</li></ul>

## Install From The Web Options Panel

**Project** ▪ This panel is not available for InstallScript projects.

The Install From The Web Options panel is where you specify the URL for your installation package. It is also where you specify how the .cab files should be created.

**Table 7** • Install From The Web Options Panel Settings

Setting	Description
<b>URL to install files from the Web</b>	Type the URL for your installation package—for example, <b>http://www.yourcompany.com/downloads</b> . The URL must begin with <b>http://</b> .
<b>.cab Files</b>	<p>Specify how the (.cab files should be created. Available options are:</p> <ul style="list-style-type: none"><li>● <b>One .cab per component</b>—Builds a separate cabinet file for each component. At run time, only the cabinet files that are required by the end user's setup type and feature selections are downloaded.</li><li>● <b>One .cab per feature</b>—Builds a separate cabinet file for each feature. At run time, only the cabinet files that are required by the end user's setup type and feature selections are downloaded.</li><li>● <b>Multiple .cab files based on size</b>—Enter a specific size, in kilobytes, for each cabinet file.</li></ul>

## One-Click Install Panel

**Project** ▪ This panel is not available for InstallScript projects.

The One-Click Install panel is where you specify whether to generate an HTML page and cabinet file from which an end user can begin installing your project.

## Panel Options

### Generate a One-Click Install

Select this option if you would like to create a One-Click Install, which is an installation program whose initial user interface is an HTML page. When an end user visits your Web page and clicks a button on it, the installation files are downloaded to the target system and then launched. The files that are downloaded to the user's system depends on your setting for the Web Type property for the current release.

#### HTML base file name

Type in the base name of the HTML file to generate, as in *install*. The “.htm” extension will be added to the base name you specify.

#### CAB base file name

Type in the base name of the cabinet (.cab) file to generate, as in *install*.

## Local Machine Panel

---

**Project** - This panel is not available for InstallScript projects.

The Local Machine panel prompts you to specify whether and where your installation files should be cached on the target system.

## Panel Options

### Cache installation on local machine

Check this box if you would like your installation files to be cached on the target system. When the user performs maintenance operations on your product, the cached location you specify here will be used as the default installation source.

---

**Note** - Files cached on the target system using this option will not be automatically removed when the user uninstalls your product.

### Path

Specify the directory in which files should be cached on the target system. You can enter a hard-coded path, as in C:\Cached Files, but it is recommended you include a destination variable from the drop-down list in the path, as in [LocalAppDataFolder]Downloaded Installations.

---

**Note** - Only the destination variables included in the Path list are available for use as download locations.

## Release Configuration Panel

**Project** ▪ This panel is not available for InstallScript projects.

The Release Configuration panel enables you to specify the type of compression, if any, that you would like to use in your release.

If you are rebuilding an existing release, the wizard remembers your previous build settings.

**Table 8** ▪ Settings on the Release Configuration Panel

Setting	Description
<b>Compress all files</b>	Select this option to compress all of your product's files into either a single executable file (Setup.exe) or a single Windows Installer package (.msi file).
<b>Leave files uncompressed and separate from the installation package</b>	Select this option if your product's files should not be compressed, and if they should be in a subfolder of the folder that contains your installation package.
<b>Custom</b>	<p>Specify whether the release should be compressed:</p> <ul style="list-style-type: none"><li>● <b>Compress all files</b>—Select this option to compress all of your product's files into either a single executable file (Setup.exe) or a single Windows Installer package (.msi file).</li><li>● <b>Leave files uncompressed and separate from the installation package</b>—Select this option if your product's files should not be compressed, and if they should be separate from your installation package.</li><li>● <b>Custom</b>—Select this option to compress only the files that are associated with one or more features into .cab files. If you select this option, the Release Wizard displays the <b>Custom Compression Settings panel</b> when you click Next to enable you to configure how the compression should be done.</li></ul>

**Tip** ▪ The output of the build process depends on your media type, compression, and spanning settings.

**Note** ▪ The output of the build process depends on your media type, compression, and spanning settings.

- If you choose a Network Image media type and the **Compress all files** option, all your data files are compressed into Setup.exe or your .msi database, depending on whether you include the Setup.exe installation launcher.
- If you choose a CD-ROM, DVD-ROM, or Custom media type, along with the **Compress all files** option, each disk image contains a DataN.cab file that contains your data files.
- If you choose a CD-ROM, DVD-ROM, or Custom media type, along with the Custom option compression, the data files that you choose to compress are placed in cabinet files named ComponentName.cab.

- If you choose a Web media type, the build output is described on the [Web Type](#) panel of the Release Wizard.

## Custom Compression Settings Panel

---

**Project** ▪ This panel is not available for InstallScript projects.

This panel prompts you to choose which features you would like to compress.

### Panel Options

#### Features to Compress

All of the features included in this release are displayed here. Select the features that you would like to compress by selecting the check box next to each one.

A component or merge module can be associated with more than one feature. In such a case, the Release Wizard applies the compression settings of the *first* feature with which the component or module is associated. For example, if ComponentA belongs to both Feature1 (whose files are compressed) and Feature2 (whose files are uncompressed), the compression settings are applied as follows. If Feature1 is the first feature to be built into the release, ComponentA's files will be compressed into the Windows Installer package or Setup.exe.

#### Select All

Click this button to select all features for compression.

#### Clear All

Click this button to deselect all features, meaning that none of the features will be compressed into the installation.

## Setup Launcher Panel

---

**Project** ▪ The Setup Launcher panel is available for the following project types:

- Basic MSI
- InstallScript MSI

The Setup Launcher panel lets you specify whether you want to create a Setup.exe setup launcher. It also lets you specify whether you want to include the redistributable for Windows Installer 3.1 or earlier with your installation. For information about Windows Installer redistributables, see [Adding Windows Installer Redistributables to Projects](#).

**Table 9** • Settings on the Setup Launcher Panel

Setting	Description
<b>Create installation launcher (Setup.exe)</b>	<p>Use this option to specify whether to create a Setup.exe setup launcher for the current release.</p> <p>The Setup.exe setup launcher is required in some cases. For example, if you want to install the Windows Installer engine on a target system, your release must include a setup launcher. It is also required if you selected the option to display the Language dialog in the <a href="#">Setup Languages panel</a>. To learn more about scenarios that require a setup launcher, see <a href="#">Creating a Setup Launcher</a>.</p> <p>The entire setup package and all of your application's files are compressed into Setup.exe if you selected the <b>Compressed and included within the installation package</b> option on the <a href="#">Release Configuration panel</a> for a Network Image or Web—One Executable media type.</p>
<b>Include MSI 3.1 Engine</b>	<p>If you want to include the Windows Installer engine installation so that it can be installed or upgraded on a target system if necessary, select this check box.</p> <p>As an alternative, you can add an InstallShield prerequisite for the Windows Installer to your project. For more information, see <a href="#">Adding Windows Installer Redistributables to Projects</a>.</p>
<b>Suppress warning if the Windows Installer service cannot be upgraded</b>	To suppress the warning dialog that is displayed if the Windows Installer service cannot be installed or upgraded on the target system, select this check box.
<b>Delay engine reboot until after your setup installation completes</b>	Select the <b>Delay engine reboot until after your setup installation completes</b> option to delay any reboot that may be required by the Windows Installer engine installation until your setup program has completed. Clear this option to allow the system to reboot immediately after installing or updating the Windows Installer engine, if necessary.

## Windows Installer Location Panel

**Project** • This panel is not available for InstallScript projects.

This panel specifies where the Windows Installer engine installers (InstMsiA.exe and InstMsiW.exe) are located.

## Panel Options

### Download engine from the Web

Select this option to download the Windows Installer engine installers (if necessary) from the URL that is specified on the Setup Launcher panel.

---

**Tip** ▪ This option is recommended if your installation will be downloaded from the Internet and you want to minimize the package size and download time. The engine will not be downloaded if the correct version is already present on the target machine.

### Extract engine from Setup.exe

Select this option to compress the selected Windows Installer engine installers into Setup.exe, to be extracted at run time, if necessary.

---

**Tip** ▪ Use this option if the entire installation must be self-contained in Setup.exe. Note that the Download engine from the Web option results in smaller installations and shorter download time; however, this option provides for a completely self-contained installation.

### Copy from source media

Select this option to leave the Windows Installer engine installers on the root of the source media. This option is not available for Web media types or Network Image media types with all of your files compressed into Setup.exe.

---

**Tip** ▪ Use this option if the installation will be run uncompressed from fixed media—CD, DVD, or local network.

## InstallShield Prerequisites Panel

The InstallShield Prerequisites panel is displayed if your project contains one or more InstallShield prerequisites.

Use this panel to specify where the InstallShield prerequisites are located. Available options are as follows.

---

**Tip** ▪ If you want to use the locations that are specified for each individual InstallShield prerequisite, you must select the Following Individual Selections option for the InstallShield Prerequisites Locations setting on the

Setup.exe tab in the Releases view. For more information, see [Specifying a Run-Time Location for a Specific InstallShield Prerequisite](#).

**Table 10** ■ Available Options on the InstallShield Prerequisites Panel

Option	Description
<b>Download prerequisites from the Web</b>	<p>Download all of the InstallShield prerequisite files included in your project (if necessary) from the URL specified in the InstallShield prerequisite (.prq) file for each prerequisite.</p>  <p><b>Tip</b> ■ This option is recommended if your installation will be downloaded from the Internet and you want to minimize the package size and download time. An InstallShield prerequisite will not be downloaded if the correct version is already present on the target machine.</p>
<b>Extract prerequisites from Setup.exe</b>	<p>Compress the InstallShield prerequisite files into Setup.exe, to be extracted at run time, if necessary.</p>  <p><b>Tip</b> ■ Select this option if the entire installation must be self-contained in Setup.exe. Note that the <b>Download prerequisites from the Web</b> option results in smaller installations and shorter download time; however, the <b>Extract engine from Setup.exe</b> option provides for a completely self-contained installation.</p>
<b>Copy prerequisites from source media</b>	<p>Store the InstallShield prerequisite files on the source media.</p>  <p><b>Tip</b> ■ Use this option if the installation will be run uncompressed from fixed media—CD, DVD, or local network.</p>
<b>Follow individual selections</b>	<p>Use the locations that are specified for each individual setup prerequisite's properties in the Redistributables or Prerequisites view. For more information, see <a href="#">Specifying a Run-Time Location for a Specific InstallShield Prerequisite</a>.</p>

**Note** ■ If an InstallShield prerequisite is added to a project as a dependency of another prerequisite, the location for the prerequisite dependency follows the location setting of the prerequisite that requires it.

## Digital Signature Panel

The Digital Signature panel enables you to specify digital signature information for your package and the files in your package. Digitally signing your application assures your end users that the code within your application has not been modified or corrupted since publication.

**Table 11** • Settings on the Digital Signature Panel

Setting	Description
<b>Certificate URL</b>	Type a fully qualified URL—for example, <a href="http://www.mydomain.com">http://www.mydomain.com</a> . This URL is used in your digital signature to link to a site that you would like end users to visit to learn more about your product, organization, or company.
<b>Digital certificate information</b>	<p>To specify the digital certificate that you want to use to sign your release, click the Browse button next to this setting. The Certificate Selection dialog box opens, enabling you to specify either the location of the .pfx file or information about the certificate store that contains the certificate.</p> <p>To learn more, see <a href="#">Certificate Selection Dialog Box</a>.</p>
<b>Certificate password</b>	<p>If the .pfx file that you are using has a password, enter it. InstallShield encrypts the password and stores it in your project file (.ism).</p> <p>At build time, InstallShield uses the password to sign files with a .pfx file. If your certificate is protected by a password but you do not enter it in this setting, signing with a .pfx file fails.</p> <p>Note that if you configure your project to use a certificate that was imported with password protection into a store, Windows prompts for the password at build time when InstallShield is attempting to sign your project's files. The strong key protection that Windows uses does not permit InstallShield to provide the password to the cryptographic provider.</p>

## Digital Signature Options Panel

The Release Wizard includes the Digital Signature Options panel if you enter digital signature information on the [Digital Signature panel](#).

Use the Digital Signature Options panel to specify which files in your installation should be digitally signed at build time.

**Tip** ▪ You can also configure digital signature information for a release on the *Signing* tab in the *Releases* view.

**Table 12** ▪ Settings on the Digital Signature Options Dialog Box

Setting	Project Type	Description
<b>Sign Windows Installer Package</b>	Basic MSI, InstallScript MSI, Merge Module	<p>If you want to sign your Windows Installer package (.msi file), select this check box.</p>  <p><b>Note</b> ▪ You can sign the Windows Installer package only if version 2.0 or later is selected for the <i>MSI Engine Version</i> setting on the <i>Setup.exe</i> tab.</p>
<b>Sign Media</b>	InstallScript	<p>If you want to digitally sign the media header file (Data1.hdr), select this check box.</p>
<b>Sign Setup.exe</b>	Basic MSI, InstallScript, InstallScript MSI	<p>If you want to sign your Setup.exe file, select this check box.</p> <p>This setting is applicable only to releases that meet the following criteria:</p> <ul style="list-style-type: none"><li>• Single-file Setup.exe</li><li>• Compressed files</li><li>• Network image media type</li></ul>
<b>Sign files in package</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>If you want to sign any of the files in your release, select this check box and then use the <b>Include patterns and files</b> and <b>Exclude patterns and files</b> boxes to indicate which files should be signed.</p>  <p><b>Windows Logo</b> ▪ All executable files (including .exe, .dll, .ocx, .sys, .cpl, .drv, and .scr files) in an installation must be digitally signed for the Windows logo program.</p>

**Table 12** ▪ Settings on the Digital Signature Options Dialog Box (cont.)

Setting	Project Type	Description
<b>Include patterns and files</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>Specify the files and file patterns that you want to be digitally signed at build time.</p> <p>Note the following guidelines:</p> <ul style="list-style-type: none"><li>• You can type directly in the box. As an alternative, you can click the Files button, which launches the <a href="#">Browse for file dialog box</a>. This dialog box lists all of the static files that are currently in your project. It also lists file patterns such as *.dll, which you can select.</li><li>• To indicate a wild-card character, use an asterisk (*).</li></ul> <p>For example, if you want to sign all .exe files, specify the following: <b>*.exe</b></p> <p>Using wild-card characters is especially helpful if you include dynamically linked files in your project and you want to sign all files that match a certain pattern.</p> <ul style="list-style-type: none"><li>• Put each file and each file pattern on its own line, with each separated by a carriage return.</li><li>• Note that the files and file patterns that should not be signed override any files and file patterns that should be signed. For example, if you specify *.exe in the <b>Include patterns and files</b> box and in the <b>Exclude patterns and files</b> box, InstallShield does not sign any .exe files.</li></ul>

**Table 12** ▪ Settings on the Digital Signature Options Dialog Box (cont.)

Setting	Project Type	Description
<b>Exclude patterns and files</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>Specify any files and file patterns that you do not want to be digitally signed at build time.</p> <p>Note the following guidelines:</p> <ul style="list-style-type: none"> <li>You can type directly in the box. As an alternative, you can click the Files button, which launches the <a href="#">Browse for file dialog box</a>. This dialog box lists all of the static files that are currently in your project. It also lists file patterns such as *.dll, which you can select.</li> <li>To indicate a wild-card character, use an asterisk (*).  For example, if you do not want to sign any .drv files, specify the following: <b>*.drv</b>  Using wild-card characters is especially helpful if you include dynamically linked files in your project and you want to avoid signing any files that match a certain pattern.</li> <li>Put each file and each file pattern on its own line, with each separated by a carriage return.</li> <li>Note that the files and file patterns that should not be signed override any files and file patterns that should be signed. For example, if you specify *.exe in the <b>Include patterns and files</b> box and in the <b>Exclude patterns and files</b> box, InstallShield does not sign any .exe files.</li> </ul>
<b>Sign files that are already signed</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>If any of the files in your project are already digitally signed, determine whether you want InstallShield to replace those existing digital signatures with the digital signature that you specify on the Digital Signature panel. Note that this affects only files that meet the requirements that are specified in the <b>Include patterns and files</b> and <b>Exclude patterns and files</b> boxes.</p> <ul style="list-style-type: none"> <li>To use the digital signature information that you provided on the Digital Signature panel to sign a file instead of any existing digital signature information that is already included with the file, select this check box.</li> <li>To leave the existing digital signature information intact for any files that are already signed, clear this check box.</li> </ul> <p>This check box is cleared by default.</p>

**Table 12** ▪ Settings on the Digital Signature Options Dialog Box (cont.)

Setting	Project Type	Description
<b>Sign files in their original location</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>Determine whether you want InstallShield to sign your original files or just the files that are built into the release:</p> <ul style="list-style-type: none"><li>• If you want InstallShield to sign a temporary copy of each file and then use that signed temporary copy to build a release, clear this check box. Note that if you clear this check box, InstallShield will not modify or sign your original files.</li><li>• If you want InstallShield to sign your original files, select this check box.</li></ul> <p>This check box is cleared by default.</p>  <p><b>Tip</b> ▪ The benefit of selecting this check box for a Basic MSI or InstallScript MSI project is that it helps create one patch that updates both compressed and uncompressed versions of a release that contains originally unsigned files.</p>

## Password & Copyright Panel

The Password & Copyright panel prompts you to activate password protection for your installation. It also lets you specify whether you want to use default information or custom information for the Version tab on the Properties dialog box, which is displayed when end users right-click Setup.exe and then click Properties.

**Table 13** ▪ Password & Copyright Panel Settings

Setting	Description
<b>Password Protect Setup.exe</b>	If you want to require that end users enter a password in order for Setup.exe to run, select this check box, and then enter the password in the Password box.
<b>Password</b>	Enter the password that end users must enter in order to run the installation.
<b>Show Password Dialog Box During Setup Initialization</b>	 <p><b>Project</b> ▪ This setting is available in InstallScript projects.</p> <p>If you want to launch the password-checking code in the <b>OnCheckMediaPassword</b> event handler function's default code, select this check box.</p> <p>If you clear this check box, you must enter your own code in the script to request the password from end users and check it by calling <b>FeatureValidate</b>.</p>

**Table 13** • Password & Copyright Panel Settings

Setting	Description
<b>Use Custom Version Properties</b>	 <p><b>Project</b> ▪ This setting is available in the following project types:</p> <ul style="list-style-type: none"> <li>• Basic MSI</li> <li>• InstallScript MSI</li> </ul> <p>To override the default information and display your company's copyright information, as well as other information, select this check box.</p> <p>The information is shown on the Properties dialog box, which is displayed when end users right-click Setup.exe and then click Properties.</p>
<b>Copyright Notice</b>	 <p><b>Project</b> ▪ This setting is available in the following project types:</p> <ul style="list-style-type: none"> <li>• Basic MSI</li> <li>• InstallScript MSI</li> </ul> <p>Enter the copyright information that you want to be displayed on the Properties dialog box, which is displayed when end users right-click Setup.exe and then click Properties.</p>

## .NET Framework Panel

**Project** ▪ This panel is available in the following project types.

- Basic MSI
- InstallScript MSI

To include one or more versions of the .NET Framework in an InstallScript or InstallScript Object project, use the Objects view to add the Microsoft .NET Framework object to your installation.

The .NET Framework panel is where you add support for the 32-bit versions of the .NET Framework 1.0, 1.1, or 2.0.

**Note** ▪ To include .NET Framework 3.5, 3.0 SP1, 3.0, 2.0 SP1 (x86, x64, IA64), or 2.0 (only x64, IA64) redistributables in your project, use the Redistributables view to add the appropriate InstallShield prerequisite for the Microsoft .NET Framework to your project.

For more information, see [Adding .NET Framework Redistributables to Projects](#).

**Table 14** ▪ .NET Framework Panel Settings

Setting	Description
<b>Include or set up .NET Framework</b>	Select this check box to include the .NET Framework with your installation. If it is not available on the target system, you can indicate the location where to find it and specify installation details.
<b>.NET Version</b>	<p>Select the version of .NET Framework that you want to install to the target system.</p>  <p><b>Note</b> ▪ To include .NET Framework 3.5, 3.0 SP1, 3.0, 2.0 SP1 (x86, x64, IA64), or 2.0 (only x64, IA64) redistributables in your project, use the Redistributables view to add the appropriate InstallShield prerequisite for the Microsoft .NET Framework to your project.</p> <p>For more information, see <a href="#">Adding .NET Framework Redistributables to Projects</a>.</p>
<b>Download from the Web</b>	Select this option to download .NET Framework support from the URL that is specified in the Release property sheet's .NET and J# Framework URL property.
<b>Extract from Setup.exe</b>	Select this option to extract the .NET Framework from Setup.exe and install it to the target system.
<b>Copy from source media</b>	Select this option to leave the .NET Framework on the root of the source media. This option is not available for Web media types or Network Image media types with all of your files compressed into Setup.exe.
<b>Show full user interface when installing .NET Framework</b>	<p>If you select this check box, the Microsoft .NET Framework (English) Setup wizard appears when dotnetfx.exe installs the .NET Framework on the target system. This wizard shows the progress of the .NET Framework installation.</p> <p>If you clear this check box, the InstallShield Wizard appears when dotnetfx.exe installs the .NET Framework on the target system. This InstallShield Wizard shows the progress of the .NET Framework installation.</p>
<b>Delay requested .NET reboots until after your installation</b>	Select this check box to delay any prompts to reboot until after the installation is finished. The .NET Framework may not function until after this reboot. Therefore, it is strongly recommended that you not select this check box if the .NET Framework is used during the installation.

## .NET Run-Time Options Panel

**Project** ▪ This panel is not available for InstallScript projects.

Use this panel to specify additional command line parameters to DotNetFx.exe and select the .NET core language.

### Panel Options

#### Command line to pass to DotNetFx.exe

In the edit field, type a command line that you want to pass to DotNetFx.exe.

#### .NET Core Language

If you selected .NET version 1.1 in the [.NET Framework panel](#), you can specify one .NET core language you want to distribute. This is the language that is used while the .NET 1.1 core redistributable is installed. If you selected version 2.0, the language options are disabled since they are all included with this version of the redistributable. To launch the [Redistributable Downloader Wizard](#), click **Download more Languages**.

## .NET Language Pack Run-Time Options Panel

**Project** ▪ This panel is not available for InstallScript projects.

Use this panel to select the .NET language packs you want to include with your setup. In addition, you can provide a command line to be used with LangPack.exe.

### Panel Options

#### Command line to pass to LangPack.exe

Type a command line to pass to LangPack.exe.

#### .NET 1.1 Language Packs to Distribute

Select the check boxes next to the language packs that you want to distribute with your setup. The options available depend on the Microsoft language pack redistributables you have on your system. To download more, click **Download more languages** to launch the [Redistributable Downloader Wizard](#).

## Visual J# Run-Time Options Panel

**Project** ▪ This panel is not available for InstallScript projects.

Use this panel to select Visual J# options that will be used if the Visual J# run-time components are not installed on the target system.

**Note** ▪ The version of Visual J# installed at runtime aligns with the version of the .NET Framework you selected in the .NET Framework panel.

## Panel Options

### Include Visual J# run-time components

Select this option to include the Visual J# run-time components you select below

### Download from the Web

Select this option to have the setup download the components from the URL that is specified in the Release property sheet's .NET and J# Framework URL property.

### Extract from Setup.exe

Select this option to extract the J# run-time components from Setup.exe during the installation process.

### Copy from source media

The components are copied from the installation's source media.

### Command line to pass to redistrib

Type a command line to pass to the J# redistributable. Consult Microsoft for valid command-line parameters.

### Make the installation of J# optional

Presents the option to the end user while the installation is running—via a dialog.

### If it is optional, and the setup is silent, install J#

If you elect to make J# installation optional and the installation is run silently, the option cannot be presented to the end user. In this case, the J# run-time components are installed without requiring the end user to make a choice.

## Advanced Settings Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI
- Merge Module

The Advanced Settings panel enables you to set the release location and file name format. For installation projects, you can also specify whether you want to create Autorun and package definition files along with your release. You can optionally specify an earlier release build to optimize patch creation.

If you are rebuilding an existing release, the wizard remembers the build settings you last specified.

## Panel Options

### Release Settings

**Table 15** ▪ Release Settings Area on the Advanced Settings Panel

Setting	Description
<b>Location</b>	<p>Enter the directory where you would like your release to be saved. You may navigate to this directory by clicking the Browse button.</p> <p>Alternatively, you may enter a path variable for your release location. To use a path variable in this field, you can either navigate to the directory your path variable points to, or you can enter the name of the path variable you would like to use, enclosed in angle brackets—for example, &lt;MyVariable&gt;.</p>
<b>Use long file names</b>	<p>If your release will be stored on media that supports long file names, select this check box. If long file names are not supported, or if you are uncertain what file name format your media supports, clear this check box.</p>
<b>Optimize size</b>	<p>If you want InstallShield to use the LZX method of compression when building this release's cabinet files, select this check box. To use MSZIP compression, clear this check box.</p> <p>The Cab Optimization Type setting on the Build tab for a release in the Releases view also lets you select LZX or MSZIP compression for the .cab files; in addition, this setting also lets you specify that you do not want to use any compression for the .cab files.</p> <div></div> <p><b>Important</b> ▪ <i>Using compression generally decreases the size of your compressed files, but the build process may take more time to complete. Depending on the number and size of the files being compressed, the LZX compression and the build may take hours to complete. Therefore, if you select this check box, it is recommended that your build machine have the latest hardware to minimize the time that it takes for the build to complete.</i></p> <p>This setting is used only if your release is configured to compress some or all of its files into .cab files.</p>
<b>Use path variable test values</b>	<p>If you used test values for any of your path variables, you can set those variables to their actual values at this time.</p>

**Table 15** ▪ Release Settings Area on the Advanced Settings Panel (cont.)

Setting	Description
<b>Generate Autorun.inf</b>	<p>Choose this option if you are distributing your installation on a CD-ROM and want to support the AutoPlay feature, a Windows logo requirement. A text file called Autorun.inf containing the instructions to autoplay your installation will be created in the root of your disk images folder.</p> <p>You can edit this file to add additional AutoPlay options or to pass command-line parameters to MsiExec.exe or Setup.exe.</p> <p>AutoPlay will not work in the disk image folders on your development system, because it is enabled only in root drives. Note also that users can turn off AutoPlay on their own systems.</p>
<b>Generate Package Definition File</b>	<p>To create a package definition file (.pdf) that enables end users to run your installation as an SMS job, select this check box. If you select this check box, InstallShield creates a version 2.0 .pdf.</p>
<b>Build UTF-8 Database</b>	<p>If you want the Windows Installer database, along with any instance or language transforms, to be built using the UTF-8 encoding, select this check box.</p> <p>The UTF-8 encoding supports characters from all languages simultaneously, enabling you to mix and match, for example, Japanese and German, or Russian and Polish, both in text shown to end users and in file names and registry keys. These mixed languages work correctly regardless of the current language of the target system. However, some scenarios result in user interface issues. For example, if an end user specifies the /qb command-line option or uninstalls the product from Add or Remove Programs, Windows Installer uses very small fonts to display the user interface text in a UTF-8 database.</p> <p>If you clear this check box, InstallShield creates an ANSI database when you build your release. This option does not let you mix characters from languages in different code pages.</p> <p>This check box is cleared by default.</p>

### Patch optimization (Optional) Area

To make the smallest possible patches, file keys in the File table should be identical in the earlier and later .msi databases. The patch-creation process uses the File table keys to determine if two files are the same file. (The actual file names cannot reliably be used, since a package might contain more than one file with the same name, installed under different conditions.) If the previous package is specified here, InstallShield uses identical File table keys for identical files.

For more information, see [Upgrade Considerations](#).

### Previous Windows Installer package

Browse for the earlier release version of the .msi file.

## Release Settings Summary Panel

If you want to change any settings, click the Back button until you come to the panel that you would like to change. You can then return to the Release Settings Summary panel and start your build.

### Panel Options

#### Build the Release

Select this option to build this release when you click Finish. Progress information for the build is displayed in the Output window.

---

**Note** • The Build your Release option does not appear on the Summary panel if the Release Wizard was launched from Microsoft Visual Studio.

## General Options Panel

---

**Project** • The General Options panel is available in the following project types:

- InstallScript
- InstallScript Object

The General Options panel enables you to do the following:

- Create a self-extracting executable file for distributing your installation.
- Pass command-line options to Setup.exe.
- Pass preprocessor variable definitions to the compiler.
- Select whether to place the compiled script file (.inx file) in a cabinet file.

---

**Project** • In an InstallScript object project, the Compiler Preprocessor Defines list and the Advanced button are available; none of the other options on this panel are available.

#### Create a single file executable

Select this check box to create a self-extracting executable file. The File Name and Icon lists are enabled only if this check box is selected.

#### File Name

Type a file name for the self-extracting executable file or select a path variable whose value defines the password.

## Icon

Optionally specify the fully qualified name of the file from which the executable file's icon is taken at build time; if no file is specified, a default icon is used. To specify a file, type an explicit path, select and append to a path variable, or click the browse button to open the Change Icon dialog box, in which you can click the Browse button to select a file. By default, the icon with index 0 is used; to specify a different icon, either select an icon in the Change Icon dialog box or append the icon's index or resource ID (preceded by a minus sign) to the file name. For example, **C:\Temp\MyLibrary.dll,2** indicates the icon with an index of 2, and **C:\Temp\MyLibrary.dll,-100** indicates the icon with a resource ID of 100.

## Compress compiled script (.inx) file into media

If the compiled script file (.inx file) should be placed in a cabinet file, select this check box. If the file should be placed uncompressed in the Disk1 disk image folder, clear this check box.

## Setup Command Line

Optionally specify any command-line parameters you want to pass to Setup.exe when the installation is launched; type a command line or select a path variable.

## Compiler Preprocessor Defines

Optionally specify any preprocessor variable definitions; type the definitions or select a user-created build variable. Preprocessor variable definitions that are specified here apply only to the current release; they are not used when compiling the script for other releases. Use the following format, with no spaces before or after equals signs or commas:

```
MYVARIABLE1=123,MYVARIABLE2
```

Such variables can be tested in the script by #if and #ifdef statements that control the flow of the script. When you are creating an InstallScript object, enter IFX\_OBJECTS.

Entering the name of a preprocessor variable in this box defines the variable. For example, if you enter MYVARIABLE in this box, the script commands in the following #ifdef loop are executed:

```
#ifdef MYVARIABLE
    // Commands
#endif
```

After you add or change a preprocessor variable definition in this box, you must compile your installation project for the addition or change to take effect. To learn how, see [Compiling Scripts](#).

## Other Disk Files

This button is enabled only if there are files in the Other folder under Advanced Files in the Support Files/ Billboards view and you selected a media format that produces multiple disk images—which is true for all formats other than Network Image.

When you click this button, the General Options - Other Disk Files dialog box opens. This dialog box lets you specify a location in the disk image folders for each file that is in the Other folder.

## Advanced

When you click this button, the General Options - Advanced dialog box opens. This dialog box lets you specify a custom location for the built files, the space that is reserved in the disk images folders, and whether the installation performs MD5 checking.

## Features Panel

**Project** • This panel is not available for the following project types:

- Basic MSI
- InstallScript MSI

The Features panel allows you to specify which features are included in the built release.

### Panel Options

#### Use the "Include in Build" property

If this option is selected, each feature whose Include in Build property is set to Yes is included in the built release and each feature whose "Include in Build" property is set to No is not included.

#### Specify the features

Lets you specify for each feature whether the feature is included in the built release. To toggle a feature's inclusion, click the check box next to the feature. A checked box indicates that a feature is included in the built release; an unchecked box indicates that a feature is not included.

You cannot toggle the inclusion status of InstallScript objects. Objects will always have the same inclusion status as their parent feature.

A disabled checked box indicates that the feature cannot be excluded because it is required by a feature that is included.

If you toggle a feature to included, all its parent, child, and required features will also become included, as well as all child features of its required features. If you toggle the feature to excluded, then its child features will become excluded as well. If this feature's parent has no more included features, then the parent will become excluded as well; a parent feature must have at least one child feature included for it to be included. If you exclude all but one of the visible child features of a required feature, the remaining visible child feature of the required feature is automatically included and disabled so that at least one child feature remains included.

Visible features (features whose Visible property is set to Yes) are displayed with a filled icon (●); invisible features are displayed with an unfilled icon (○).

## Media Layout Panel

**Project** • This panel is not available for Windows Installer-based or InstallScript MSI projects.

This panel allows you to specify, for individual features or for all features, whether the features' files are stored in cabinet files or placed uncompressed in the disk image.

### Panel Options

#### Cabinet File(s)

Store all features' files in cabinet files.

**Note** ▪ You can specify in a component's *Compressed* property whether the component's files are compressed or uncompressed when stored in a cabinet file.

### CD-ROM Folder(s)

Place all features' files uncompressed in the disk image. Files associated with a given feature are placed in the disk image in the folder specified in the feature's CD-ROM Folder property. If no folder is specified, that feature's files are placed in the root of the disk image.

### Custom

If this option is selected, clicking the panel's Next button displays the Custom Media Layout panel, which lets you specify for individual features whether the feature's files are stored in cabinet files or placed uncompressed in the disk image.

## Custom Media Layout Panel

**Project** ▪ This panel is not available for the following project types:

- Basic MSI
- InstallScript MSI

This panel allows you to specify, for individual features or for all features, whether the features' files are stored in cabinet files or placed uncompressed in the disk image.

### Panel Options

#### Features in cabinets

Lets you specify for individual components whether the component's files are stored in cabinet files or placed uncompressed in the disk image. To toggle a component's storage mode, click the check box next to the component. A checked box signifies that a component's files are stored in cabinet files. An unchecked box signifies that a component's files are placed in the disk image in the folder specified by the component's CD-ROM Folder property. If no folder is specified, that component's files are placed in the root of the disk image.

#### Select All

Selects all features in the **Features in cabinets** box.

#### Clear All

Deselects all features in the **Features in cabinets** box.

## User Interface Panel

**Project** ▪ This panel is not available for the following project types:

- *Basic MSI*
- *InstallScript MSI*

This panel allows you to specify the look and feel of your setup's end user dialog boxes.

## Panel Options

### Use project's default

If this option is selected, the end user dialog boxes are displayed with the skin that is selected in the Dialogs view's Skins folder, as shown in the Dialog Preview graphic.

### Do not use any skin

If this option is selected, the end user dialog boxes are displayed in standard Windows style, as shown in the Dialog Preview graphic.

### Use skin specified below

If this option is selected, the end user dialog boxes are displayed with the skin that you select in the list box, as shown in the Dialog Preview graphic. Note that the BlueTC skin uses GIF files and so under a 16-bit color setting does not look as good as the Blue skin, which uses bitmaps (and so is much larger).

### Dialog Preview

Displays a sample of how the end user dialog boxes will appear as a result of the selections you made with the option buttons and list box.

---

**Note** ■ The dialog boxes that are displayed by the following functions cannot be displayed with a skin; they appear the same regardless of whether you have specified a skin.

- *AskYesNo*
- *EnterDisk*
- *MessageBox*
- *MessageBoxEx*
- *RebootDialog*
- *SdComponentDialog*—the Available Disk Space dialog box
- *SdComponentDialog2*—the Select Subcomponents dialog box
- *SdComponentDialogAdv*—the Available Disk Space dialog box
- *SdConfirmNewDir*
- *SdConfirmRegistration*
- *SdExceptions*
- *SdShowMsg*
- *SelectDir*
- *SelectDirEx*
- *SprintfBox*

## Display small initialization dialog

If checked, the setup initialization dialog box is the small box that was shown by setups created with InstallShield Professional version 6.31 and earlier—unless the setup displays a security, Save And/or Run Setup, Choose Setup Language, or Qualifying Product(s) Detected dialog box, in which case the setup initialization dialog box is larger and is consistent with the rest of the end user dialog boxes, regardless of the state of this check box. If unchecked, the setup initialization dialog box is larger and is consistent with the rest of the end user dialog boxes.

If this check box is unchecked, the setup initialization dialog box (and the Choose Setup Language dialog box, if any) are not displayed until the startup graphic closes. To specify the length of time for which the startup graphic displays, set Setup.ini's [Startup] section's SplashTime value.

## Internet Options Panel

**Project** ▪ This panel is available in InstallScript projects.

The Internet Options panel enables you to specify various Internet-related options.

**Note** ▪ Any release can be run over the Internet, regardless of its media type.

**Table 16** ▪ Settings on the Internet Options Panel

Setting	Description
<b>Generate One-Click Install</b>	<p>To create a One-Click Install installation that end users can download from the Internet and install, select this check box. If you select this check box, InstallShield includes with your installation an external setup player (Setup.ocx file) that downloads and then launches the Setup.exe file with the appropriate command line.</p> <p>If you select this check box, the other settings on this panel are enabled.</p> <p>To learn more, see <a href="#">One-Click Install Installations in InstallScript Projects</a>.</p>
<b>Create a default Web page for the setup</b>	<p>Select this check box to indicate that you want InstallShield to create a default Web page (.htm file) in the Disk1 folder.</p>

**Table 16** ▪ Settings on the Internet Options Panel (cont.)

Setting	Description
<b>Enter the URL to launch</b>	<p>Do one of the following to indicate what URL should be launched if you click the Run From Web command on the Build menu:</p> <ul style="list-style-type: none"><li>● To launch the Setup.htm file that InstallShield creates at build time and places in the Disk1 folder, leave this box blank.</li><li>● To launch a different Web page, type the URL in this box or click the browse button to select the Web file.</li></ul>  <p><b>Tip</b> ▪ If you enter a URL, do not include the name of the page, and do not include an ending forward slash. For example, if the full URL for the Setup.htm file is <b>http://www.mypages.com/setup/Setup.htm</b>, enter the following as the URL to launch: <b>http://www.mypages.com/setup</b>.</p> <p>When you click the Run from Web command on the Build menu, InstallShield launches the appropriate URL (<b>http://www.mypages.com/setup/Setup.htm</b>, in the aforementioned example).</p>

## Update Panel

**Project** ▪ This panel is not available for the following project types:

- Basic MSI
- InstallScript MSI

This panel allows you to specify the release format and the existing releases for which the current release can be run as an update.

**Tip** ▪ To create a setup that can be run on a system on which no version of your product is currently installed, select the Full option and the Non-version specific option.

### Panel Options

#### Full

Specifies that the current release is a full release.

#### Non-version specific

Enabled only if the Full option button is selected. Specifies that the current release can update any existing version of your application (as long as it was installed by a setup that was created with InstallShield Professional version 6.0 or later), or can install your application on a system on which no version of your product is currently installed.

## Version specific

Enabled only if the Full option button is selected. Specifies that the current release can update only the versions of your application that are specified in the combo box.

## combo box

Enabled only if the Version specific option is selected. Lets you specify the versions of your product to which the update can be applied. Type a semicolon-delimited list of version numbers (for example, 1.2.3;1.2.4) or select a list of version numbers from the list box. If you leave this field blank, the update can be applied to all earlier versions of your product.

## Differential

Specifies that the current release is a differential release.

## list box

Enabled only if the Differential option button is selected. Displays the existing releases to which the current project is compared when creating the new differential release. A file in the current project is excluded from the differential release if the same file (with the same date and time, size, and attributes) exists in each of the specified releases; otherwise the file is included in the differential release. (Files in a component whose Difference property is set to No are always included in the differential release.) You specify these releases by clicking the Import and Add buttons.

Also displays the version information for each release.

---

**Note** - If the setup is unable to determine a specified release's version information, that version of your product cannot be updated by the setup. If no version information is displayed for a release, select the release, click the Modify button, then select the **Specify the version information below** option and type or select a version number.

## Add

Enabled only if the Differential option is selected. Opens the Existing Media dialog box, in which you can specify a release that is in the current project.

## Import

Enabled only if the Differential option is selected. Opens the Media File Properties dialog box, in which you can specify a release that is not in the current project.

## Modify

Enabled only if the Differential option is selected and a single release is selected in the list box. Opens the Media File Properties dialog box, in which you can change the release selection and the version information that is associated with the release.

## Remove

Enabled only if the Differential option is selected and one or more releases are selected in the list box. Removes the selected release from the list.

## Objects

Enabled only if the Differential option is selected. Opens the Object Difference dialog box, in which you select the conditions for including InstallScript objects in your differential release.

## Object Difference Dialog Box

This dialog box opens when you click the Objects button in the Release Wizard's Update panel. This dialog box allows you to you specify the conditions for including InstallScript objects in your differential media.

### Dialog Options

#### Include All

Specifies that the differential build will include all objects that would have been included in a full (non-differential) build. (This excludes, for example, objects that are associated with a feature whose Include In Build property is set to No or that is deselected in the Release Wizard's Features panel.)

#### Include If Changed

Specifies that the differential build will include only those objects that would have been included in a full build and are absent from, or have an earlier version number in, all the specified comparison media.

---

**Note** ▪ If the current project and all specified comparison media include the InstallShield Object Installer object, the media builder compares the files packaged by the InstallShield Object Installer in the current project to the packaged files in the specified media. The media builder includes in the InstallShield Object Installer only those files that are absent from—or have an earlier date and time, different size, or different attributes in—all the specified comparison media.

#### Exclude All

Specifies that the differential build will include no objects.

## Postbuild Options Panel

---

**Project** ▪ The Postbuild Options panel is not available for the following project types:

- Basic MSI
- InstallScript MSI

The Postbuild Options panel enables you to copy disk image folders to a folder or FTP site, or execute a batch file, after the release build is complete.

**Table 17** ■ Settings on the Postbuild Options Panel

Setting	Description
<b>Upload release files to the FTP site specified below</b>	<p>To automatically distribute your release to an FTP site, select this check box and enter the FTP location. Also enter the user name and password, if applicable.</p> <ul style="list-style-type: none"><li>● <b>FTP Location</b>—Specify the FTP URL for the location.  If you need to distribute your release to a path outside the FTP default folder, use a double slash (/). For example, to distribute your release to a root-level folder called <b>myproduct</b>, where the URL of the FTP server is <b>ftp://ftp.mydomain.com</b>, enter <b>ftp://ftp.mydomain.com//myproduct</b> for the FTP location.</li><li>● <b>User Name</b>—If a user name is required to upload to the FTP location, enter the user name.</li><li>● <b>Password</b>—If a password is required to upload to the FTP location, enter the password.</li></ul>
<b>Copy the built media files to the folder specified below</b>	<p>If you want to be able to automatically distribute your release to a folder, select this check box and specify the FTP URL for the location. Existing folders with the same names as copied folders are overwritten, but no folders are deleted. Specify the folder path by typing the path in the box, or click the browse button to browse to the location.</p> <p>If the media format of the selected release is a network image, which creates only one disk image folder, the contents of the disk image folder, rather than the folder itself, are copied. If you chose to create a self-extracting executable file, the executable file, rather than the disk image folders, is copied.</p>
<b>Execute the batch or executable file specified below after building the media files</b>	<p>To launch a batch file (.bat) or executable file (.exe) after the release has been built, select this check box and specify the path in the box. You can either type the path or click the browse button to browse to the file. In addition, you can select a path variable in the list and then type the rest of the path.</p> <p>If you select this check box, InstallShield sets environment variables with the same names (including the angle brackets) and values as the project's build variables. InstallShield also sets the environment variable &lt;ISMEDIAIDIR&gt;, whose value is the path to the folder in which the release's Disk Images, Log Files, and Report Files folders are created. You can refer to the value of an environment variable in a batch file by surrounding the variable name with percent signs (%); for example:</p> <pre>set PATH = %&lt;ISPROJECTDIR&gt;%;%PATH%</pre> <p>When the file is finished, InstallShield deletes the environment variables that it set.</p>

# Setup Best Practices Wizard

This wizard is invoked whenever you violate Setup Best Practices while adding files to a component. The wizard tells you which Best Practices you are not following and gives you the option to correct the action.

The wizard appears only if you have enabled active monitoring of Best Practices in the Options dialog.

## Welcome Panel

The wizard is informing you that by adding files to a component you have violated one of the following Setup Best Practices:

**Table 18** • Setup Best Practices Violations

Best Practice	Description
<b>Components Should Not Contain Multiple EXEs, DLLs, OCXs, CHMs, or HLPs</b>	Each component should contain only one “portable executable” file (an EXE, DLL, or OCX) or help file (CHM or HLP). Windows Installer components are designed such that all of the advanced settings and component properties, such as the code GUID, refer ideally to a single portable executable or help file. Place other EXEs, DLLs, OCXs, CHMs, or HLPs into new components.
<b>A File Cannot Be Associated with More than One Component</b>	This Best Practice is extremely important for shipping reusable components and facilitating resiliency. Microsoft recommends that no file be shipped in more than one component, “even across products, product versions, and companies.”
<b>Use Merge Modules</b>	<p>Merge modules contain all of the files, registry entries, and logic necessary to install a distinct piece of functionality. You should not distribute a file for which a merge module is available. Using merge modules also helps you comply with two related requirements—the Best Practice to avoid associating a file with more than one component and the Windows logo guideline not to ship any core components.</p> <p>If the Best Practices monitoring option is enabled, the Setup Best Practices Wizard alerts you whenever you try adding to a component any file that is part of the merge modules that InstallShield provides.</p>

## Panel Options

### Please do not warn me of other Setup Best Practice conflicts

Selecting this option if you do not want the Setup Best Practices Wizard to notify you of Best Practices violations. You can reverse this action later in the Tools | Options panel.

## Compliance Panel

This panel tells you which files violate the Setup Best Practices listed in the [Welcome panel](#) by placing a warning icon next to the file and citing the specific Best Practice rule violated.

## Panel Options

### Files

The list contains all of the files you added to the component and tells you which of them violates Best Practices. You can ignore the wizard's recommendations by clicking Finish (or Cancel to exit the wizard altogether), or you can correct the Best Practices conflict by clicking the Remove button.

### Remove

Select a file and click the Remove button to prevent the file from being added to this component.

# Static Scanning Wizard

**Project** - This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

In Basic MSI and InstallScript MSI projects, the value that is selected for a component's *NET Scan at Build* setting affects how the Static Scanning Wizard scans the files in that component. To learn more, see [Static Scanning](#).

The Static Scanning Wizard enables you to scan the files that are in your project for potential dependencies that they may require. This wizard scans all .exe, .dll, .ocx, .sys, .com, .drv, .scr, and .cpl files in your project and lets you add any detected dependencies to your installation.

The new files that added to your project are added to the same feature as the file that depends on them, thereby ensuring they get installed when needed.

### Task

#### To launch the Static Scanning Wizard:

1. In the View List under **Additional Tools**, click **Dependency Scanners**.
2. Click the **Perform Static Scanning** button.

The following panels are associated with the Static Scanning Wizard:

- [Welcome](#)
- [Filter Files](#)
- [Scanning Progress](#)
- [File Selection](#)
- [Scan Results](#)
- [Completing the Static Scanning Wizard](#)

## Welcome Panel

---

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

The Static Scanning Wizard enables you to scan the files that are in your project for potential dependencies that they may require. This wizard scans all .exe, .dll, .ocx, .sys, .com, .drv, .scr, and .cpl files in your project and lets you add any detected dependencies to your installation.

Click the Next button to begin scanning your project's files for dependencies.

## Filter Files Panel

---

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

The Static Scanning Wizard may list as dependencies certain files that you do not want added to your installation. For example, common system files that are already present on target machines usually do not need to be reinstalled. To avoid having these files added to your installation when you run the scanner, select the **Filter files** check box on the Filter Files panel.

To learn how to customize the list of files that are excluded from scans, see [Filtering Files in Dependency Scanners](#).

## Scanning Progress Panel

---

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

The Scanning Progress panel is displayed when the Static Scanning Wizard is scanning all .exe, .dll, .ocx, .sys, .com, .drv, .scr, and .cpl files in your project for dependencies. No files are added until you have confirmed the findings of the scan.

## File Selection Panel

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

The File Selection panel displays a list of possible files and merge modules that you may need to add to your project. Use this panel to select the ones that you want to include in your installation. For more information, see [Reviewing Dependency Scanner Results](#).

**Table 19** ▪ File Selection Panel Settings

Setting	Description
<b>File</b>	<p>Indicate which files you want added to your installation by selecting the appropriate check boxes. The meaning of each type of icon is as follows:</p> <ul style="list-style-type: none"><li>• : This icon indicates that the file is a system or driver files. They are normally not redistributed as part of an installation, and they can potentially cause target systems to become inoperable. Ensure that these files are necessary before including them.</li><li>• : This icon indicates a non-system file. To include the file in your project, select the corresponding check box.</li><li>• : This icon indicates a merge module. To include the merge module in your project, select the corresponding check box.</li><li>• : This is the icon for a .NET assembly in your project.</li><li>• : This icon indicates a file that the Static Scanning Wizard has detected but is already in the project.</li></ul>
<b>Deselect All</b>	<p>If you want to clear all of the check boxes, click this button. You can then manually select each check box that corresponds with a file or merge module that you would like to add to your project.</p>
<b>Select All</b>	<p>If you want to select all of the check boxes, click this button. You can then manually clear each check box that corresponds with a file or merge module that you do not want to add to your project.</p>

## Scan Results Panel

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

The Scan Results panel shows the dependencies that the wizard identified and that you selected to be added to your project.

To add these dependencies to your project, click the Next button. To exit the wizard without adding the dependencies, click the Cancel button. To review the list of potential dependencies again and add or remove any of them, click the Back button.

## Completing the Static Scanning Wizard Panel

**Project** ▪ *This information applies to the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

When the Static Scanning Wizard shows the Completing the Static Scanning Wizard panel, the wizard has added the selected dependencies to your project.

Click Finish to close the wizard and return to InstallShield.

## System Search Wizard

**Project** ▪ *The System Search Wizard is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The System Search Wizard provides the Windows Installer capability to search for a particular file, folder, registry key, .xml file or .ini value on a target system prior to installation.

### Task

#### **To launch the System Search Wizard:**

1. In the View Bar / View List under **Behavior and Logic**, click **System Search**.
2. Do one of the following:
  - To create a new system search: Right-click in the grid and click **Add**.

- To edit an existing system search: Right-click the item that you want to edit and then click **Modify**.

The System Search Wizard consists of the following panels:

- **Welcome**
- **What do you want to find?**
- **How do you want to look for it?**
- **What do you want to do with the value?**

## Welcome Panel

---

**Project** - The System Search Wizard is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The Welcome panel in the System Search Wizard. This wizard enables you to add or modify a system search in your project. Click Next to add or modify a system search.

## What do you want to find? Panel

---

**Project** - The System Search Wizard is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The **What do you want to find?** panel of the System Search Wizard is where you specify the type of item you are searching for and where to conduct that search on the target system. Available options are:

- File path, by searching folders
- Folder path, by searching all drives
- Folder path, by searching in a specific folder
- Folder path, by searching for a specific file

- File path, as specified by a registry entry
- Folder path, as specified by a registry entry
- Registry entry
- File path, as specified by an .ini file value
- Folder path, as specified by an .ini file value
- .ini file value
- File path, as specified by a component's key file
- Folder path, as specified by a component's key path
- XML file value

If you are searching for a registry entry that contains a file path or folder, the file or folder must exist on the target system in order for the search to be successful. Otherwise, the value from the search is not set to a property.

If you are searching for a file or folder, the full path to that item is stored in the property. If you are searching for a registry value, the data of that value is stored in the property. The same holds true for .ini files. For components, the key path to the component is in the property.

To get the property using script, see [MsiGetProperty](#) in the Windows Installer Help Library.

## How do you want to look for it? Panel (Defining Your System Search Method)

**Project** • The System Search Wizard is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The **How do you want to look for it?** panel contains settings that let you customize your search. The settings in this panel vary, depending on the type of search that you selected in the previous panel.

**Table 20** • Customizing Your Search

Type of Search	Corresponding Settings That Need to Be Configured
<b>File path, by searching folders</b>	Specify file details and where to search for the file.  To learn more, see <a href="#">Specify the file details Panel (File Search Options)</a> .

**Table 20** ▪ Customizing Your Search (cont.)

Type of Search	Corresponding Settings That Need to Be Configured
<b>Folder path, by searching all drives</b>	<p>Specify the name of the folder and how many subfolder levels you want to be searched.</p> <p>To learn more, see <a href="#">How do you want to look for it? Panel (Folder Search Options)</a>.</p>
<b>Folder path, by searching in a specific folder</b>	<p>Specify the name of the folder and where on target systems to look.</p> <p>To learn more, see <a href="#">How do you want to look for it? Panel (Specific Folder Options)</a>.</p>
<b>Folder path, by searching for a specific file</b>	<p>Specify file details and where to search for the file.</p> <p>To learn more, see <a href="#">Specify the file details Panel (File Search Options)</a>.</p>
<b>File path, as specified by a registry entry</b>	<p>Specify details about the registry entry.</p> <p>To learn more, see <a href="#">How do you want to look for it? Panel (Registry Search Options)</a>.</p>
<b>Folder path, as specified by a registry entry</b>	<p>Specify details about the registry entry.</p> <p>To learn more, see <a href="#">How do you want to look for it? Panel (Registry Search Options)</a>.</p>
<b>Registry entry</b>	<p>Specify details about the registry entry.</p> <p>To learn more, see <a href="#">How do you want to look for it? Panel (Registry Search Options)</a>.</p>
<b>File path, as specified by an .ini file value</b>	<p>Specify details about the .ini file value.</p> <p>To learn more, see <a href="#">How do you want to look for it? Panel (.ini File Search Options)</a>.</p>
<b>Folder path, as specified by an .ini file value</b>	<p>Specify details about the .ini file value.</p> <p>To learn more, see <a href="#">How do you want to look for it? Panel (.ini File Search Options)</a>.</p>
<b>.ini file value</b>	<p>Specify details about the .ini file value.</p> <p>To learn more, see <a href="#">How do you want to look for it? Panel (.ini File Search Options)</a>.</p>
<b>File path, as specified by a component's key file</b>	<p>Specify the component identifier.</p> <p>To learn more, see <a href="#">How do you want to look for it? Panel (Component Search Option)</a>.</p>

**Table 20** ▪ Customizing Your Search (cont.)

Type of Search	Corresponding Settings That Need to Be Configured
<b>Folder path, as specified by a component's key path</b>	Specify the component identifier.  To learn more, see <a href="#">How do you want to look for it? Panel (Component Search Option)</a> .
<b>XML file value</b>	Specify file details and where to search for the XML file.  To learn more, see <a href="#">Specify the file details Panel (File Search Options)</a> .

## Specify the file details Panel (File Search Options)

**Project** ▪ The System Search Wizard is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

If you are configuring the **File path, by searching folders** type of system search, the **Folder path, by searching for a specific file** type of search, or the **XML file value** type of search, the following settings are available on the **Specify the file details and specifically where to search for the file** panel:

**Table 21** ▪ Specify the file details and specifically where to search for the file Panel Settings

Option	Description
<b>File Name</b>	Enter the full name and extension of the file or application that you want to locate.   <b>Note</b> ▪ When you enter a file name, the wizard enables the Details button. To modify your search to include any particular version, date, size, or language, click this button. To learn more, see <a href="#">File Details Dialog Box</a> .
<b>Look In</b>	Specify where on target systems you want Windows Installer to search.
<b>Maximum number of subfolders to search</b>	Specify the maximum number of subfolders that you want Windows Installer to search for the file on the target system.

## How do you want to look for it? Panel (Folder Search Options)

**Project** ▪ The System Search Wizard is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

If you are configuring the **Folder path, by searching all drives** type of system search, the following settings are available on the **How do you want to look for it?** panel:

**Table 22** ▪ How do you want to look for it? Panel Settings

Option	Description
<b>Folder Name</b>	Enter the full name and extension of the folder that you want Windows Installer to find.
<b>Look In</b>	Specify where on target systems you want Windows Installer to search.
<b>Number of subfolder levels to search</b>	Specify the number of subfolder levels that you want Windows Installer to search on target systems.

## How do you want to look for it? Panel (Specific Folder Options)

**Project** ▪ The System Search Wizard is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

If you are configuring the **Folder path, by searching in a specific folder** type of system search, the following settings are available on the **How do you want to look for it?** panel:

**Table 23** ▪ How do you want to look for it? Panel Settings

Option	Description
<b>Folder Name</b>	Enter the full name and extension of the folder you want to locate.
<b>Look In</b>	<p>Specify where on target systems you want Windows Installer to search. You can either specify a full path or select a path from a previous search.</p> <p>If you want to specify a full path, you can click the Browse button to select an existing directory or create a new one.</p> <p>If you want to specify a path from a previous search, select it from the drop-down list. Note that the list is empty if your project does not contain any other searches.</p>
<b>Number of subfolder levels to search</b>	Specify the number of subfolder levels that you want Windows Installer to search on target systems.

## How do you want to look for it? Panel (Registry Search Options)

**Project** ▪ The System Search Wizard is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

If you are configuring the **Folder path, as specified by a registry entry** type of system search, the **Folder path, as specified by a registry entry** type of system search, or the registry entry type of system search, the following settings are available on the **How do you want to look for it?** panel:

**Table 24** ▪ How do you want to look for it? Panel Settings

Setting	Description
<b>Registry Root</b>	Select the registry root where you want Windows Installer to search on target systems.

**Table 24** ▪ How do you want to look for it? Panel Settings (cont.)

Setting	Description
<b>Registry Key</b>	<p>Enter the exact registry key that is associated with the item that you are locating. For example, to locate HKEY_LOCAL_MACHINE\SOFTWARE\Adobe\Acrobat on the target system, you would enter <b>SOFTWARE\Adobe\Acrobat</b> in this setting.</p>  <p><b>Tip</b> ▪ Ensure that the syntax is correct by copying the correct key name from the Windows Registry Editor.</p>
<b>Registry Value (Optional)</b>	<p>To search for a specific registry value, enter the registry value exactly as it appears in the Windows Registry Editor.</p>  <p><b>Note</b> ▪ If this setting is blank, the system search looks for the registry key's default value.</p>
<b>Search the 64-Bit Portion of the Registry</b>	<p>A 64-bit target system typically has two HKEY_LOCAL_MACHINE\Software keys:</p> <ul style="list-style-type: none"><li>● HKLM\Software, which is for 64-bit applications</li><li>● HKLM\Software\Wow6432Node, which is for 32-bit applications</li></ul> <p>If you want Windows Installer to check the 64-bit portion of the registry (HKLM\Software) on 64-bit target systems, select this check box.</p>

## How do you want to look for it? Panel (.ini File Search Options)

**Project** ▪ The System Search Wizard is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

If you are configuring the **File path, as specified by an .ini file value** type of system search, the **Folder path, as specified by an .ini file value** type of system search, or the **.ini file value** type of system search, the following settings are available on the **How do you want to look for it?** panel:

**Table 25** ▪ How do you want to look for it? Panel Settings

Option	Description
<b>INI File Name</b>	Specify the .ini file name as it should appear on target systems. The file must exist in the Windows folder.
<b>INI Section Name</b>	Specify the name of the section in the .ini file that contains the value that you want Windows Installer to find.
<b>INI Key Name</b>	Specify the name of the key that contains the value that you want Windows Installer to find..
<b>Read entire line</b>	If you want Windows Installer to read the entire line in the .ini file, select this check box.

## How do you want to look for it? Panel (Component Search Option)

**Project** ▪ The System Search Wizard is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

If you are configuring the **File path, as specified by a component's key file** type of system search or the **Folder path, as specified by a component's key path** type of system search, the System Search Wizard displays the **How do you want to look for it?** panel. This panel is where you specify the identifier of the component whose key path or key file is to be used for the search. The component ID must be enclosed in curly braces {}.

## Specify the data that you wish to find in the XML file Panel (XML File Options)

**Project** ▪ The System Search Wizard is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

- *MSI Database*
- *MSM Database*
- *Transform*

If you are configuring the **XML file value** type of system search, the System Search Wizard displays the **Specify the data that you wish to find in the XML file** panel. This panel is where you specify which .xml element you want to search for in the .xml file on the target system.

**Table 26** • Specify the data that you wish to find in the XML file Panel Settings

Option	Description
<b>XPath to XML Element (Example: Element/ SubElement)</b>	Specify an XPath expression to identify the data in the XML file that you want to find.  For examples of XPath expressions, see <a href="#">Using XPath Expressions to Find XML Data in an XML File</a> .
<b>Look For</b>	Select the type of XML data that you want to find. You can search for the value of an attribute in the element that you specify, the contents of the element, or the existence of the element.

## What do you want to do with the value? Panel

**Project** • The System Search Wizard is available in the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

In the **What do you want to do with the value?** panel, specify where you want to store the results of the search. If the search fails, the property is undefined. Available options are:

**Table 27** ▪ What do you want to do with the value? Panel Settings

Setting	Description
<b>Store the value in this property</b>	<p>Select the public property that you want to use to store the location that the system search finds on target systems. To store the value in a non-predefined public property, enter the name of the property in this setting. The property must be a public property and therefore have an identifier that consists of uppercase letters.</p>  <hr/> <p><b>Note</b> ▪ You can add a new property to your project through the Property Manager view. Any new properties that you create must be public properties and have an identifier that consists of all uppercase letters.</p>
<b>Additional Options</b>	<p>Select the appropriate option:</p> <ul style="list-style-type: none"><li>● <b>Just store the value in the property</b>—Store the value in the public property that you identify on this wizard panel.</li><li>● <b>Use the property in an Install Condition</b>—Store the value in the public property that you identify in this wizard panel and use it in an install condition.</li></ul> <p>If you select this option and then click the Finish button, InstallShield displays the Condition Builder, which enables you to specify the conditions that the installation must meet.</p>

## What do you want to do with the value? Panel

**Project** ▪ The System Search Wizard is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

In the **What do you want to do with the value?** panel, specify where you want to store the results of the search. If the search fails, the property is undefined. Available options are:

**Table 28** • What do you want to do with the value? Panel Settings

Setting	Description
<b>Store the value in this property</b>	<p>Select the public property that you want to use to store the location that the system search finds on target systems. To store the value in a non-predefined public property, enter the name of the property in this setting. The property must be a public property and therefore have an identifier that consists of uppercase letters.</p>  <hr/> <p><b>Note</b> • You can add a new property to your project through the Property Manager view. Any new properties that you create must be public properties and have an identifier that consists of all uppercase letters.</p>
<b>Additional Options</b>	<p>Select the appropriate option:</p> <ul style="list-style-type: none"><li>● <b>Just store the value in the property</b>—Store the value in the public property that you identify on this wizard panel.</li><li>● <b>Use the property in an Install Condition</b>—Store the value in the public property that you identify in this wizard panel and use it in an install condition.<p>If you select this option and then click the Finish button, InstallShield displays the Condition Builder, which enables you to specify the conditions that the installation must meet.</p></li><li>● <b>Use the property as the destination for a component</b>—Store the value in the public property that you identify in this wizard panel and use it as the destination for a component that you identify.<p>This option is available only when you are searching for a folder path, a registry entry that contains a folder, an .ini file that contains a folder, a component whose key path is a folder, or an XML file.</p></li></ul>

## Transform Wizard

The Transform Wizard walks you through the steps of creating and applying transforms for your installation projects. Transforms represent the difference between two similar installation projects. When you apply a transform to one project, you are updating or changing it to incorporate the changes between the two projects.

### Task

#### To launch the Transform Wizard:

On the **Tools** menu, click **Transform Wizard** button. It is not necessary to have a project open in InstallShield.

The following panels are associated with the Transform Wizard:

- **Welcome**

- [Specify Files](#)
- [Validation Settings](#)
- [Suppress Error Conditions](#)
- [Specify Output File Name](#)
- [Summary](#)
- [Completing the Transform Wizard](#)

## Welcome Panel

The Transform Wizard walks you through the steps of creating and applying transforms to your setup project. A transform represents the differences between two setup projects. For example, network administrators may want to distribute different configurations of a product to the various departments in the company. As a result, you can create a transform for every configuration of the product, then apply the appropriate transform as needed.

### Panel Options

#### Create a transform

Select this option to compare two similar setup projects and create a transform that represents the differences between them. This transform can then be applied at run time or before the final setup is built.

#### Apply a transform

Select this option to apply a transform to an existing Windows Installer setup. This may be useful for network administrators who will be customizing a product for everyone.

## Specify Files Panel

If you are creating a transform, select the two MSI files that you would like to compare. If you are applying a transform, select the MSI file that you would like the transform applied to and the transform that will be applied.

### Panel Options

#### Base package

This field will contains the path to the project that is currently open. If you want to change this value, enter the path to a different project or click the Browse button to navigate to one. If you are applying a transform, this field should contain the path to the file that you would like the transform applied to.

#### Target Package

This option is only available if you are creating a transform. Enter the path to the MSI file that you would like to compare to your base file, or click the Browse button to navigate to this file. The differences between these two files will be compared and a transform will be created that will update the base package to the target package.

## Transform

This option is only available if you chose to apply a transform. Enter the path to the transform (\*.mst) file that you would like to apply, or click the Browse button to navigate to that file.

## Validation Settings Panel

The Validation Settings panel is displayed if you selected the Create a transform option on the [Welcome panel](#) of this wizard.

The Validation Settings panel prompts you for information on how you would like to validate your transform. These validation items must be met in order for the transform to execute.

### Panel Options

#### Do not perform validation prior to applying the transform to the base package

Select this option if you do not want to perform any validation prior to applying the transform.

#### Validate the following prior to applying the transform to the base package

Select this option to check for certain conditions before the transform is applied. If these conditions are not met, the transform will not be applied.

**Table 29** - Conditions for Applying a Transform to a Base Package

Option	Description
<b>Default language must match base package</b>	Select this option if the language of the transform should match the language of the package to which the transform is being applied.
<b>Product must match base package</b>	Select this option if you want your transform to be applied only to .msi files that have the same product code as the base package.
<b>Platform must match base package</b>	Select this option if the platform for which the base package is intended should match the target platform of the transform.
<b>Upgrade Code must match base package</b>	Select this option if you want the transform to be applied only if the upgrade code of the .msi file matches that of the transform.
<b>Product Version</b>	Select the version type that you would like to validate against. You can choose between a combination of major version, minor version, or upgrade version. You can also choose to not validate against the product version.

**Table 29** ▪ Conditions for Applying a Transform to a Base Package (cont.)

Option	Description
<b>Version Relationship</b>	<p>Specify how you would like to validate the product version. The choices are outlined below:</p> <ul style="list-style-type: none"><li>• <b>None</b>—Do not validate against the product version.</li><li>• <b>Applied Version &lt; Base Version</b>—Apply the transform only if the product version of the .msi file to which the transform is being applied is less than the version number of the base .msi file.</li><li>• <b>Applied Version &lt;= Base Version</b>—Apply the transform if the product version of the .msi file to which the transform is being applied is less than or equal to the version number of the base .msi file.</li><li>• <b>Applied Version = Base Version</b>—Apply the transform only if the product version of the .msi file to which the transform is being applied is equal to the version number of the base .msi file.</li><li>• <b>Applied Version &gt;= Base Version</b>—Apply the transform only if the product version of the .msi file to which the transform is being applied is greater than or equal to the version number of the base .msi file.</li><li>• <b>Applied Version &gt; Base Version</b>—Apply the transform only if the product version of the .msi file to which the transform is being applied is greater than the version number of the base .msi file.</li></ul>

## Suppress Error Conditions Panel

As your transform is being applied to the target MSI file, certain error codes may be generated. This panel gives you the option of suppressing those error codes so the end user will not see them.

### Panel Options

#### **Do not suppress error conditions when the transform is applied to the base package**

Select this option if you do not want to hide the errors reported during the application of the transform.

#### **Suppress the following error conditions when the transform is applied to the base package**

Select this option to hide certain error codes from your end users. You can choose to suppress the following errors:

**Table 30** ▪ Suppressible Error Conditions

Error	Description
<b>Adding an existing row</b>	If your transform tries to add a row to the MSI database that already exists, an error is generated. Select this option to suppress that error.

**Table 30** ▪ Suppressible Error Conditions (cont.)

Error	Description
<b>Deleting a row that does not exist</b>	Select this option to suppress any errors that occur as a result of your transform trying to delete a row from the MSI database that does not exist.
<b>Adding an existing table</b>	Select this option to suppress errors caused by your transform trying to add a table to the MSI database that already exists.
<b>Deleting a table that does not exist</b>	Select this option to suppress any errors that occur as a result of your transform trying to delete a table from the MSI database that does not exist.
<b>Updating a row that does not exist</b>	If your transform tries to update a row to the MSI database that does not exist, an error will be generated. Select this option to suppress that error.
<b>Transform and database code pages do not match</b>	Select this option to suppress error codes caused by code pages in the transform not matching those in the target database.

## Specify Output File Name Panel

This panel prompts you for the location and name of the transform (\*.mst) file that will be created as a result of the comparison of your two MSI files.

### Panel Options

#### Folder location and file name

If you are creating a transform, enter the path and file name of the transform file that you would like to create. If you are applying a transform, enter the path and file name of the new MSI package that you are creating as a result of applying the transform.

## Summary Panel

The Summary panel displays all of the settings you selected throughout the Transform Wizard. If you need to change any of these settings, click the Back button until you reach the appropriate panel.

## Completing the Transform Wizard Panel

The last panel of the Transform Wizard notifies you of the wizard's success. When you click the Finish button, you will be taken back to the IDE.

For more information on transforms, see [Creating Transforms](#). This page provides an overview of transforms and links to pages that discuss how to create a transform and the different ways that transforms can be applied.

**Tip** ▪ For more information about the errors that can occur when a transform is being applied to an .msi database, see the [MsiDatabaseApplyTransform](#) topic in the Windows Installer Help Library.

## Upgrade Validation Wizard

The Upgrade Validation Wizard performs a set of tests to determine if your installation will properly upgrade older versions of your installation.

**Project** ▪ This wizard does not apply to the following project types:

- *InstallScript*
- *InstallScript Object*

### Task

**To launch the Upgrade Validation Wizard:**

On the **Build** menu, click the **Validate** drop-down list, and then click **Upgrade Validation Wizard**.

The following panels are associated with this wizard:

- [Welcome](#)
- [Settings](#)
- [Summary](#)

## Welcome Panel

The Upgrade Validation Wizard performs a set of tests to determine if your setup will properly upgrade older versions of your setup.

Click Next to continue.

## Settings Panel

Specify the following basic configurations for the upgrade validation:

**Table 31** ▪ Settings Panel

Configuration	Description
<b>Specify the latest version of your setup</b>	<p>Click the browse button to locate the file.</p>  <p><b>Tip</b> ▪ Think of the latest setup as the new image or version that you want to place on the target machine, and think of the previous setup as the existing image or version on the target machine before an upgrade.</p>
<b>Specify any previous versions of your setup you want to validate against</b>	<p>Click Add to append to the existing list. You can add *.msi or *.exe Windows Installer Setup files. You can also specify multiple previous versions of your setup. To remove an item from the previous versions list, you must first select it in the list control and then click Remove.</p>

When you click Next, validation begins.

## Summary Panel

The Summary panel allows you to view the results from validation. You can also view the results externally by opening the corresponding log file stored in <ISProjectDataFolder>\Upgrade Validation Log\Results.log.

**Note** ▪ You can run validation again with different settings by clicking the Back button and changing your settings.

The following table describes the icons next to each log file entry.

**Table 32** ▪ Icons

Button	Description
	This is the information notice icon.
	This is the error notice icon.
	This is the warning notice icon.

# User Interface Wizard

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The User Interface Wizard enables you to add various predefined wizard pages to your Advanced UI or Suite/Advanced UI project. Examples include:

- A page that allows end users choose the installation directory for an .msi package
- A page that lets end users enter customer information and serial numbers
- A page that shows a feature tree, as well as feature descriptions and sizes, and allows end users to select which features to install

## Task

### To launch the User Interface Wizard:

1. In the View Bar / View List, under **User Interface**, click **Wizard Interface**.
2. In the **Wizard Interface** explorer, right-click **Wizard Pages** and then click **Add Predefined Page**.

The User Interface Wizard consists of the following panels:

- [Predefined Task Pages Panel](#)
- [Task Configuration Panel](#)

## Predefined Task Pages Panel

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The Predefined Task Pages panel is where you select the type of predefined wizard page that you want to add to your Advanced UI or Suite/Advanced UI project. This panel also lets you specify where in the sequence of wizard pages you want to schedule the new predefined page. You can resequence the wizard page later after adding it to your project.

The following table describes each of the types of available predefined wizard pages:

**Table 33** ▪ Types of Predefined Task Pages

Type of Wizard Page	Description
<b>Browse for installation folder</b>	<p>This BrowseFolder wizard page lets end users select the installation directory for an .msi package. The Advanced UI or Suite/Advanced UI installation passes the path to the .msi package through the Windows Installer property INSTALLDIR when launching the package.</p> <p>This type of page is usually sequenced before an InstallationType or InstallationProgress wizard page.</p>
<b>Enter customer information for a Web Deploy package</b>	 <p><b>Edition</b> ▪ Support for Web Deploy packages is available in the Premier edition of InstallShield.</p> <p>This CustomerInformation wizard page lets end users enter information to publish a Web Deploy package, and pass the values to the package as COMPUTERNAME, USERNAME, PASSWORD, and SITE.</p> <p>This type of page is usually sequenced after the LicenseAgreement wizard page.</p>
<b>Enter customer information for an MSI package</b>	<p>This CustomerInformation wizard page lets end users enter customer information and serial numbers for an .msi package, and pass the values to the package through the Windows Installer properties USERNAME, COMPANYNAME, and SERIALNUMBER.</p> <p>This type of page is usually sequenced after the LicenseAgreement wizard page.</p>
<b>Enter installation's password</b>	<p>This Password wizard page is where end users enter the installation's password. If an end user does not enter the correct password, the installation exits.</p> <p>This type of page is usually sequenced at the beginning of an installation.</p>  <p><b>Note</b> ▪ When you add this type of wizard page to your project, InstallShield adds a placeholder image control to it so that you can add a lock image to the page. Ensure that you either configure the control's Resource setting to indicate the file that you want to display with this control, or, to exclude an image, delete the image control.</p>

**Table 33** • Types of Predefined Task Pages (cont.)

Type of Wizard Page	Description
<b>Enter login information for a database server</b>	 <p><b>Edition</b> • SQL Support for suites is available in the Premier edition of InstallShield.</p> <p>This SQLLogin wizard page lets end users enter database server login information (database server name, authentication credentials, database catalog name, etc.) in order to establish a connection to the database server that is referenced by one or more .msi packages in the suite.</p> <p>Values entered through these dialogs (or provided on a Suite command line) are passed to a selected .msi package command line with passwords marked as hidden.</p>  <p><b>Note</b> • When you add this type of wizard page to your project, you specify the database technology, driver, and the underlying Windows Installer properties and select the .msi package that receives these properties (because a suite may have multiple packages that need different SQL servers or else may need to share the same SQL server.)</p>
<b>Maintenance welcome with update</b>	<p>The MaintenanceUpdateWelcome wizard page includes an update option to enable end users to download and install the latest available Advanced UI or Suite/Advanced UI update.</p> <p>To learn more, see <a href="#">Supporting Downloadable Updates for an Advanced UI or Suite/Advanced UI Installation</a>.</p>
<b>View and accept supplemental license agreement</b>	<p>This LicenseAgreement wizard page requires end users to accept a supplemental end-user license agreement (EULA).</p> <p>The name of each EULA file must be unique; otherwise, the text and properties are linked.</p> <p>This type of page is usually sequenced after another LicenseAgreement wizard page.</p>
<b>View and accept supplemental license agreement (Scrolling required)</b>	<p>This LicenseAgreement wizard page requires end users to scroll through and accept a supplemental end-user license agreement (EULA).</p> <p>The name of each EULA file must be unique; otherwise, the text and properties are linked.</p> <p>This type of page is usually sequenced after another LicenseAgreement wizard page.</p>

**Table 33** ▪ Types of Predefined Task Pages (cont.)

Type of Wizard Page	Description
<b>View features and their size</b>	<p>This wizard page shows a feature tree, as well as feature descriptions and sizes that you have specified in your project. It allows end users to select which features to install.</p> <p>Note that this wizard page requires that you enter values in the Description and Cost settings of each feature in your Advanced UI or Suite/Advanced UI project.</p> <p>This type of page usually replaces the built-in InstallationFeatures wizard page.</p>

## Task Configuration Panel

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** ▪ The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The Task Configuration panel in the User Interface Wizard is where you specify additional information for the predefined wizard page that you are adding to your project. This panel is displayed for only some of the predefined wizard page types.

**Table 34** ▪ Required Information for the Task Configuration Panel

Type of Wizard Page	Description of the Required Information
<b>Browse for installation folder</b>	Select the package in the Advanced UI or Suite/Advanced UI project for which you want to allow end users to specify the path.
<b>Enter customer information for an MSI package</b>	Select the package in the Advanced UI or Suite/Advanced UI project for which you want to allow end users to specify customer information.
<b>Enter installation's password</b>	If you add this type of wizard page to your Advanced UI or Suite/Advanced UI project, the Task Configuration panel is not displayed.
<b>View and accept supplemental license agreement</b>	Specify the EULA file (.rtf) that you want to be displayed on the supplemental LicenseAgreement wizard page.

**Table 34** • Required Information for the Task Configuration Panel (cont.)

Type of Wizard Page	Description of the Required Information
<b>View and accept supplemental license agreement (Scrolling required)</b>	Specify the EULA file (.rtf) that you want to be displayed on the supplemental LicenseAgreement wizard page.
<b>View features and their size</b>	If you add this type of wizard page to your Advanced UI or Suite/Advanced UI project, the Task Configuration panel is not displayed.

## Visual Studio .NET Wizard for Visual Basic .NET, C# .NET, and Visual C++ .NET

The Visual Studio .NET Wizard for Visual Basic .NET, C# .NET, and Visual C++ .NET creates a new InstallShield installation project and adds it to a Microsoft Visual Studio solution.

**Note** • The Visual Studio .NET Wizard is available only if Microsoft Visual Studio is installed on your system.

When you are creating the InstallShield installation project, the Visual Studio .NET Wizard does the following:

- Creates a new InstallShield project (with the file name specified on the New Project dialog box) and adds it to the solution (.sln file).
- If you have the Scan at Build option set to Dependencies and Properties (on the .NET tab of the Options dialog box), the wizard adds all dependencies to your project at build time.
- Adds the primary outputs from every project in the solution to the InstallShield project.
- Updates the release settings to deploy the appropriate version of the .NET Framework via download.

To launch the wizard, select the appropriate project type in the New Project dialog box.

The following panels are associated with this wizard:

- [Welcome Panel](#)
- [Solution Panel](#)

### Welcome Panel

The Visual Studio .NET Wizard enables you to add an InstallShield installation project to a Microsoft Visual Studio .NET solution.

**Note** • The Visual Studio .NET Wizard is available only if Microsoft Visual Studio is installed on your system.

Click Next to select a solution.

## Solution Panel

In this panel, type the path or browse to the Visual Studio solution to which you want to add the InstallShield installation project.

Click Finish to create a new InstallShield project and add it to the selected solution.

## Visual Studio Deployment Project Import Wizard

The Visual Studio Deployment Project Import Wizard enables you to import a Visual Studio setup or merge module project (.vdproj) into an InstallShield project (.ism). You can reuse this wizard if you want to import multiple Visual Studio projects into your InstallShield project.

**Important** - If the Visual Studio setup or merge module project that you want to import into an InstallShield project contains one or more project outputs, the InstallShield project must be in the same Visual Studio solution that contains the Visual Studio setup or merge module project and all of its project dependencies.

### Task

**To launch the Visual Studio Deployment Project Import Wizard, do one of the following:**

- If you are using InstallShield by itself (without integration with Visual Studio): On the **Project** menu, click **VS Deployment Project Import** button.
- If you are using InstallShield from within Visual Studio: On InstallShield toolbar, click the **Visual Studio Deployment Project Import Wizard** button.

This wizard consists of the following panels:

- **Welcome**
- **Project File**
- **Options**
- **Summary**

## Welcome Panel

The Visual Studio Deployment Project Import Wizard enables you to import a Visual Studio setup or merge module project (.vdproj) into an InstallShield project (.ism). You can reuse this wizard if you want to import multiple Visual Studio projects into your InstallShield project.

**Important** - If the Visual Studio setup or merge module project that you want to import into an InstallShield project contains one or more project outputs, the InstallShield project must be in the same Visual Studio solution that contains the Visual Studio setup or merge module project and all of its project dependencies.

Click Next to begin using the wizard.

# Project File Panel

The Project File panel is where you specify the Visual Studio project (.vdproj) that you want to import. The project can be a setup project or a merge module project.

# Options Panel

The Visual Studio Deployment Project Import Wizard imports the project outputs, files, registry keys, file extensions, custom actions, target system searches, launch conditions, and prerequisites from your Visual Studio project into your InstallShield project. The Options panel is where you select which, if any, properties you also want InstallShield to import from the Visual Studio project into your InstallShield project.

**Note** ▪ If you select the check box for an option, InstallShield overwrites the existing value in your InstallShield project with the value that is configured in the Visual Studio project. For example, if you select the Product Name check box, InstallShield overwrites the value of the Product Name setting of your InstallShield project with the value that is set in the Visual Studio project.

**Table 35** ▪ Available Options for Importing

Option	Description
Product Name	<p>If you want your InstallShield project to use the ProductName property that is configured in the Visual Studio project that you are importing, select this check box.</p> <p>The product name is configured in the General Information view of InstallShield.</p> <div></div> <p><b>Project</b> ▪ This option does not apply to merge module projects.</p>
Product Version	<p>If you want your InstallShield project to use the value of the ProductVersion property that is configured in the Visual Studio project that you are importing, select this check box.</p> <p>The product version is configured in the General Information view of InstallShield.</p>

**Table 35** ▪ Available Options for Importing (cont.)

Option	Description
<b>INSTALLDIR</b>	<p>If you want your InstallShield project to use the value of the DefaultLocation property that is configured for the application folder in the Visual Studio project that you are importing, select this check box.</p> <p>If you select this check box, InstallShield updates the value of the INSTALLDIR setting in the General Information view with the path that is configured in the Visual Studio project.</p>  <hr/> <p><b>Note</b> ▪ Visual Studio lets you specify a directory path that contains multiple formatted properties, such as [ProgramFilesFolder][Manufacturer]\[ProductName], for the application folder. Visual Studio projects use a directory custom action to resolve the path at run time. However, InstallShield does not support this type of directory path. Therefore, InstallShield resolves the path during the conversion process and uses the INSTALLDIR property for the path.</p>
<b>Add or Remove Programs Properties</b>	<p>If you want your InstallShield project to use the Add or Remove Program properties (AddRemoveProgramsIcon, Manufacturer, Description, ManufacturerUrl, Author, SupportUrl, and SupportPhone) that are configured in the Visual Studio project that you are importing, select this check box.</p> <p>If you select this check box, InstallShield updates the values of the following settings in the General Information view with the values that are configured in the Visual Studio project:</p> <ul style="list-style-type: none"> <li>• Display Icon (In the Visual Studio project, this is the AddRemoveProgramsIcon property.)</li> <li>• Publisher (In the Visual Studio project, this is the Manufacturer property.)</li> <li>• Add or Remove Programs Comments (In the Visual Studio project, this is the Description property.)</li> <li>• Publisher/Product URL (In the Visual Studio project, this is the ManufacturerUrl property.)</li> <li>• Support Contact (In the Visual Studio project, this is the Author property.)</li> <li>• Support URL</li> <li>• Support Phone Number</li> </ul>  <hr/> <p><b>Project</b> ▪ This option does not apply to merge module projects.</p>

**Table 35** ▪ Available Options for Importing (cont.)

Option	Description
<b>Summary Information Stream Properties</b>	<p>If you want your InstallShield project to use the Summary Information Stream properties (Title, Subject, Keywords, and TargetPlatform) that are configured in the Visual Studio project that you are importing, select this check box.</p> <p>If you select this check box, InstallShield updates the values of the following settings in the General Information view with the values that are configured in the Visual Studio project:</p> <ul style="list-style-type: none"><li>• Title</li><li>• Subject</li><li>• Keywords</li><li>• Processor type in the Template Summary setting (In the Visual Studio project, this is the TargetPlatform property.)</li></ul>  <hr/> <p><b>Project</b> ▪ This option does not apply to merge module projects.</p>
<b>Product Code</b>	<p>If you want your InstallShield project to use the value of the ProductCode property that is configured in the Visual Studio project that you are importing, select this check box.</p> <p>The product code is configured in the General Information view of InstallShield.</p>  <hr/> <p><b>Project</b> ▪ This option does not apply to merge module projects.</p>
<b>Upgrade Code</b>	<p>If you want your InstallShield project to use the value of the UpgradeCode property that is configured in the Visual Studio project that you are importing, select this check box.</p> <p>The upgrade code is configured in the General Information view of InstallShield.</p>  <hr/> <p><b>Project</b> ▪ This option does not apply to merge module projects.</p>

**Table 35** ▪ Available Options for Importing (cont.)

Option	Description
<b>All Users</b>	<p>If you want your InstallShield project to use the value of the InstallAllUsers property that is configured in the Visual Studio project that you are importing, select this check box.</p> <p>If you select this check box, InstallShield updates the value of the ALLUSERS property in the Property Manager view based on the value that is set in the InstallAllUsers property in the Visual Studio project.</p> <div></div> <p><b>Project</b> ▪ This option does not apply to merge module projects.</p>

**Table 35** ▪ Available Options for Importing (cont.)

Option	Description
<b>Project Language</b>	<p>If you want your InstallShield project to use the language that is selected in the Localization property of the Visual Studio project that you are importing, select this check box.</p> <p>If you are importing a Visual Studio project into an InstallShield project and the following conditions exist, InstallShield replaces the existing string entry values in your project with default string entry values for the language of your Visual Studio project:</p> <ul style="list-style-type: none"><li>• You select this Project Language check box in the Visual Studio Deployment Project Wizard.</li><li>• The language of your Visual Studio project does not match the default language in your InstallShield project. (In Visual Studio, the Localization property indicates the project's language. In InstallShield, the Default Language setting in the String Editor view indicates the project's default language.)</li><li>• InstallShield has support for the language that is used in your Visual Studio project. (If you are using the InstallShield, you may not have support for the language that is used in your Visual Studio project.)</li></ul> <p>For example, if you select this Project Language check box, if the language of your InstallShield project is Spanish, if the language of your Visual Studio project is German, and if you are using the Premier edition of InstallShield, InstallShield replaces the Spanish run-time strings in your project with the default German translations. Thus, if you edit a string entry value by revising a setting such as the Publisher setting in the General Information view, and then you indicate in the wizard that you want to import the language of a Visual Studio project, InstallShield overwrites the value of the Publisher setting—as well as values for other settings—with the default German string entry values.</p> <p>Therefore, if the project language is changed while you are importing your Visual Studio project, review the settings in the General Information view and the String Editor view after the import, and modify the string entry values if appropriate.</p>  <p><b>Project</b> ▪ This option does not apply to merge module projects.</p>

## Summary Panel

The Summary panel lets you review the settings that you specified in the Visual Studio Deployment Project Import Wizard. To change any of the settings, click the Back button until you reach the appropriate panel. To import the project, click the Finish button.

# View Reference

The InstallShield installation development environment (IDE) is organized into views that incorporate various areas of functionality. The View Reference section describes each of those views in the InstallShield interface.

## Installation Information View

---

**Project** • The Installation Information view is available in the following project types:

- Advanced UI
- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database
- Suite/Advanced UI
- Transform
- MSIX

The Installation Information view contains links to other views that you can use to configure general settings about your installation.

### General Information

---

**Project** • The General Information view is available in the following project types:

- Advanced UI
- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database
- Suite/Advanced UI
- Transform

The General Information view contains basic information about your project, your company, and your product. Some of the information that you enter in this view is for your reference only, some (in Basic MSI, DIM, InstallScript MSI, and Merge Module projects) is necessary to comply with Windows logo requirements, and the rest is for setting basic project settings.

## General Information View

**Project** • The General Information view is available in the following project types:

- Advanced UI
- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database
- Suite/Advanced UI
- Transform

The General Information view contains basic information about your project, your company, and your product. Some of the information that you enter in this view is for your reference only, some is necessary to comply with Windows logo requirements, and the rest is for setting basic project settings.

When you create a new installation project, you must configure its General Information view settings. InstallShield creates new projects with default settings, but you should set your own values so that your project includes data that is specific to your needs.

The General Information view consists of the following elements:

- A row of buttons
- A grid of settings

The following table describes the buttons that are displayed in the General Information view.

**Table 1** • Controls in the General Information View

Name of Control	Icon	Description
<b>Categorized</b>		Sorts the settings according to categories.
<b>Alphabetical</b>		Sorts the settings alphabetically.

For descriptions of each of the settings in the General Information view, see [General Information View Settings](#).

## General Information View Settings

**Project** ▪ The General Information view is available in the following project types:

- Advanced UI
- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database
- Suite/Advanced UI
- Transform

The General Information view settings are organized into the following main categories:

- [General Settings](#)
- [Summary Information Stream](#)
- [Add or Remove Programs](#)
- [Software Identification Tag](#)

### General Settings

Use the General area of the General Information view to specify details such as product name and product version. The following settings are available in this area.

**Table 2** ▪ General Settings

Setting	Project Type	Description
<b>Project File Name</b>	Advanced UI, Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI, MSIX	<p>This read-only setting displays the path and name of the InstallShield project file. It also shows the type of project.</p> <p>The extension of the project file varies, depending on the project type:</p> <ul style="list-style-type: none"> <li>• <b>.ism project file</b>—InstallShield uses this extension for most project types, including Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSIX, and Merge Module.</li> <li>• <b>.dim project file</b>—InstallShield uses this extension for DIM projects.</li> <li>• <b>.issuite project file</b>—InstallShield uses this extension for Advanced UI and Suite/Advanced UI projects.</li> </ul> <p>To learn more, see <a href="#">Project Types</a>.</p>

**Table 2** ▪ General Settings (cont.)

Setting	Project Type	Description
<b>Project File Format</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, MSIX, Merge Module	<p>Select the file format that you want to use for your project file (.ism or .dim). Available options are:</p> <ul style="list-style-type: none"> <li> <b>Binary</b>—To save the .ism file as a database file, select this option. This format is best for the speed of opening and saving the project file.           <p>This is the default format for Basic MSI, DIM, InstallScript MSI, MSIX, and Merge Module projects. If you select this project file format for these project types, you can modify the .ism file in a Windows Installer database editor. You can also modify the .ism file by using the Windows Installer API or its automation interface.</p> </li> <li> <b>XML</b>—To save the .ism file as a hierarchical text-based format, select this option. This project file format is best for use with source code control systems. It enables you to modify the project file using XML tools.           <p>This is the default format for InstallScript and InstallScript Object projects.</p> </li> </ul>  <p><b>Note</b> ▪ Both project file formats let you build releases from the command line.</p>
<b>Suite GUID</b>	Advanced UI, Suite/Advanced UI	<p>Enter a GUID that uniquely identifies the Advanced UI or Suite/Advanced UI installation. To have InstallShield generate a different GUID for you, click the <b>Generate a new GUID</b> button ({...}) in this setting.</p> <p>Since this code uniquely identifies your Advanced UI or Suite/Advanced UI installation, changing the Suite GUID after you have already distributed your release is not recommended.</p>

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>Setup Languages</b>	Advanced UI, Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI	 <p><b>Project</b> ▪ <i>The behavior of this setting varies, depending on the project type.</i></p> <p>In Basic MSI, InstallScript MSI, Merge Module, and Suite/Advanced UI projects, the Setup Languages setting lets you specify the languages that you want to be listed in the UI Languages setting in the Releases view. If a language is not listed for this Setup Languages setting at the project level, you cannot include that particular UI language in your project's releases.</p> <p>Advanced UI projects, which are available in the InstallShield, have support for only one language. Therefore, the Setup Languages setting in this project type is read-only.</p> <p>In InstallScript and InstallScript Object projects, the Setup Languages setting lets you specify the languages that you want to be listed in the Languages setting in the Components and Releases views in your project. In general, if a language is not listed for this setting at the project level, you cannot designate that a particular component in your project is targeted for that language; in addition, you cannot designate that the components and UI strings for a particular language are included in your project's releases.</p> <p>When you add a supported language to an Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, or Suite/Advanced UI project through this setting, InstallShield adds string entries for that language to your project. The string entries include the built-in user-interface string resources that are already translated.</p> <p>In DIM projects, the Setup Languages setting lets you specify the languages that you want the project to support. When you add a language to your project through this setting, InstallShield adds string entries for that language to your project. The string entries include string resources that you would need to have translated.</p> <p>For more information, see <a href="#">Selecting the Installation Languages</a>.</p>

**Table 2** ▪ General Settings (cont.)

Setting	Project Type	Description
<b>Default Language</b>	Advanced UI, Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI, MSIX	<p>To override the default project language that is configured in the General Information view or the String Editor view, select the appropriate default user interface language for the selected release.</p> <p>For more information, see <a href="#">Setting the Default Project Language</a>.</p>
<b>Platform Filtering</b>	InstallScript, InstallScript Object	<p>This setting lets you specify the platforms that you want to be available when you select operating for components or releases in your project. In general, if a platform is not listed for this setting at the project level, you cannot designate that a particular component or release in your project is targeted for that platform.</p> <p>To change the platforms for your project, click the ellipsis button (...) in this setting. The Platforms dialog box opens, enabling you to select the platforms for your project.</p>  <p><b>Note</b> ▪ <i>Specifying platforms at the project level does not create target for running the installation. If you want to create target in an InstallScript or InstallScript Object project, use the SYSINFO structure to identify the operating platform of the target system.</i></p>

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>Maintenance Experience</b>	InstallScript	<p>Select the behavior that occurs when a target machine already has your product installed and the end user reruns your installation. Valid options are:</p> <ul style="list-style-type: none"> <li>● <b>Standard</b>—If the maintenance user interface should be displayed when a target machine already has your product installed and the end user reruns your installation, select this option. Only one entry for the product is listed in Add or Remove Programs.</li> <li>● <b>Multi-Instance</b>—If end users should be able to rerun an installation multiple times as a first-time installation rather than as a maintenance installation, select this option. Each time that an end user runs the installation, a separate entry is added to Add or Remove Programs. By default, this option lets end users install the product to a different location each time that they run the installation. This is useful for a product that an end user may want to install to different locations in order to experiment with different product configurations and then later remove only specific instances. The maintenance user interface is displayed only if an end user reruns the installation from Add or Remove Programs.</li> <li>● <b>No uninstall or maintenance</b>—If end users should not be able to uninstall the product or run it in maintenance mode, select this option. No entry is created for the product in Add or Remove Programs.</li> </ul> <p>To learn more, see <a href="#">Running an InstallScript Installation Multiple Times</a>.</p>
<b>Enable Maintenance</b>	InstallScript MSI	<p>Indicate whether you want to display the full maintenance user interface (UI) or the uninstallation UI when end users rerun the installation on a system on which the product is already present. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—Unless the <code>/removeonly</code> command-line parameter is passed to <code>Setup.exe</code>, the system variable <code>REMOVEONLY</code> is set to <code>FALSE</code> when an end user reruns the installation, and the standard maintenance UI is displayed.</li> <li>● <b>No</b>—The system variable <code>REMOVEONLY</code> is set to <code>TRUE</code> when an end user reruns the installation, and the uninstallation UI is displayed.</li> </ul> <p>To learn more, see <a href="#">Configuring the Enable Maintenance Setting</a>.</p>

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>InstallScript User Interface Type</b>	InstallScript MSI	<p>Specify the type of InstallScript user interface (UI) that you want to use for your installation. Valid options are:</p> <ul style="list-style-type: none"> <li>● <b>Traditional Style (Requires Setup.exe)</b>—If you want to use the InstallScript engine as an external UI handler for your InstallScript MSI installation, select this option. With this style, your installation must include a Setup.exe setup launcher. The setup launcher serves as a bootstrap application that initiates the InstallScript engine to display the UI and run the InstallScript code, and the Windows Installer to run the Execute sequence of the .msi package.  This is the default option for this setting.</li> <li>● <b>New Style (Requires Windows Installer 4.5)</b>—If you want to use the InstallScript engine as an embedded UI handler for your InstallScript MSI installation, select this option. With this style, InstallShield embeds the InstallScript engine within the .msi package. The Windows Installer calls the InstallScript engine to display the UI. The Windows Installer also runs the Execute sequence of the .msi package.  This option requires Windows Installer 4.5 on the target machine. This option also has some limitations that require careful planning if you decide to use this style.</li> </ul> <p>For detailed information about these two styles, see <a href="#">Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations</a>.</p>

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>Product Name</b>	Advanced UI, Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, MSI Database, MSM Database, Suite/ Advanced UI, Transform	<p>Enter the name of the product, DIM, merge module, or object.</p> <p>For information on how the product name is used, see <a href="#">Specifying a Product Name</a>.</p>  <hr/> <p><b>Project</b> ▪ For InstallScript and InstallScript Object projects— Instead of hard-coding a value, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value. (To use a path variable: On the Project menu, click Settings. Then select the appropriate path variable on the Application tab.)</p> <p>The product name is stored in the InstallScript system variable IFX_PRODUCT_NAME.</p> <p>For DIM projects—The value in this setting is not displayed or used at run time. You can use this setting in DIM projects as a reference for internally identifying different versions of the project.</p>

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>Product Version</b>	Advanced UI, Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, MSI Database, MSM Database, Suite/ Advanced UI, Transform	<p>Enter the version number for your product. The version must contain only numbers. It is typically in the format <i>aaa.bbb.ccccc</i> or <i>aaa.bbb.ccccc.ddddd</i>, where <i>aaa</i> represents the major version number, <i>bbb</i> represents the minor version number, <i>cccc</i> represents the build number, and <i>dddd</i> represents the revision number. The maximum value for the <i>aaa</i> and <i>bbb</i> portions is 255. The maximum value for <i>cccc</i> and <i>dddd</i> is 65,535.</p> <p>Note that although you can include the fourth field (<i>dddd</i>), the installation does not use this part of the product version to distinguish between different product versions. To learn more, see <a href="#">Specifying the Product Version</a>.</p> <div>  <p><b>Project</b> • For Basic MSI, InstallScript, and InstallScript MSI projects—If your release includes a Setup.exe file, the product version that you specify is displayed on the Properties dialog box for Setup.exe. For more information, see <a href="#">Customizing File Properties for the Setup Launcher</a>.</p> <p>For InstallScript and InstallScript Object projects—Instead of hard-coding a value, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value. (To use a path variable: On the Project menu, click Settings. Then select the appropriate path variable on the Application tab.)</p> <p>For DIM projects—The value in this setting is not displayed or used at run time. You can use this setting in DIM projects as a reference for internally identifying different versions of the project. The value that you enter is displayed in the DIM References view of the project that contains this DIM.</p> </div>
<b>Product Code</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Transform	<p>Enter a GUID that uniquely identifies this product. To have InstallShield generate a different GUID for you, click the <b>Generate a new GUID</b> button ({...}) in this setting.</p> <p>Since this code uniquely identifies your product, changing the product code after you have already distributed your release is not recommended.</p> <p>For more information, see <a href="#">Setting the Product Code in a Windows Installer-Based Project</a> or <a href="#">Setting the Product Code in an InstallScript-Based Project</a>.</p>

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>Upgrade Code</b>	Basic MSI, InstallScript MSI, MSI Database, Transform	<p>Enter a GUID that can be used for your product's upgrade code. To have InstallShield generate a different GUID for you, click the <b>Generate a new GUID</b> button ({...}) in this setting.</p> <p>The upgrade code is a GUID that uniquely identifies the product family to which the product belongs. The upgrade code should be consistent across different versions and languages of a family of related products so that Windows Installer can use it to search for related versions of the product that are already installed.</p> <p>For more information, see <a href="#">Setting the Upgrade Code</a>.</p>
<b>Install Condition</b>	Basic MSI, InstallScript MSI, MSI Database, Transform	<p>This setting lets you specify one or more conditions that must be true in order for your installation to run. For example, you can test for a specific operating system or minimum . If the conditions do not evaluate to True at run time, an error message is displayed and the product is not installed.</p> <p>To specify one or more conditions, click the ellipsis button (...) in this setting. For more information, see <a href="#">Setting Product Conditions</a>.</p> <p>When you add a condition, InstallShield adds two new settings under the Install Condition setting:</p> <ul style="list-style-type: none"> <li>● <b>Condition</b>—This setting displays the conditional statement that you added. To edit the conditional statement, click the ellipsis button (...) in this setting. To delete the condition and its message, click the <b>Delete this condition</b> button in this setting.</li> <li>● <b>Message</b>—This setting displays the run-time error message that is configured to be displayed at run time if the corresponding condition is not met on the target system.</li> </ul> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>Exit Conditions</b>	Advanced UI, Suite/Advanced UI	<p>This setting lets you specify one or more exit error messages that you want the Advanced UI or Suite/Advanced UI installation to display under various conditions before ending the installation. For example, if your Advanced UI or Suite/Advanced UI installation requires Windows Vista or later, you could use the Exit Condition setting and its subsettings to specify an error message that you want to be displayed when end users launch your Advanced UI or Suite/Advanced UI installation on earlier versions of Windows. When end users dismiss the error message, the Advanced UI or Suite/Advanced UI installation ends.</p> <p>To specify an error message and one or more conditions, click the ellipsis button (...) in this setting.</p>
<b>Exit Conditions (continued)</b>		<p>When you add a condition, InstallShield adds two new settings under the Exit Conditions setting:</p> <ul style="list-style-type: none"> <li> <b>Exit Message</b>—Use this setting to enter the error message that you want the Advanced UI or Suite/Advanced UI installation to display at run time if the conditions that are defined under this message are true. To delete the message and its conditions, click the <b>Delete this condition</b> button in this setting. </li> </ul> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p> <p>When you type a value for this setting, you can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p> <ul style="list-style-type: none"> <li> <b>Any/All/None</b>—This setting displays the conditional statement that you are defining. </li> </ul> <p>For more information, see <a href="#">Defining Exit Conditions for an Advanced UI or Suite/Advanced UI Installation</a>.</p>
<b>Module Language</b>	DIM, Merge Module, MSM Database	Select the language of the DIM or merge module, or select Language Independent.

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>INSTALLDIR</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Specify the value of the Windows Installer property <code>INSTALLDIR</code>, which indicates the destination directory where most of the files of the product, DIM, or merge module will be installed at run time.</p> <p>Instead of hard-coding a path, you can enter a directory property as part of the path. To select a directory property, click the ellipsis button (...) in this setting. This enables you to select the appropriate directory from a list, or to create a new directory within a predefined directory. Separate further levels of subdirectories with a backslash—for example, <code>[ProgramFilesFolder]MyApp\Bin</code>.</p> <p></p> <hr/> <p><b>Windows Logo</b> • To comply with the Windows logo program, your product's default destination should be a subfolder of the Program Files folder (<code>[ProgramFilesFolder]</code>), which can vary depending on the system's locale and user settings.</p> <p></p> <hr/> <p><b>Project</b> • In Basic MSI, InstallScript MSI, MSI Database, and Transform projects, the default value is as follows:</p> <p><code>[ProgramFilesFolder]My Company Name\My Product Name</code></p> <p>The value that you enter in this setting is assigned to the property <code>INSTALLDIR</code>, which is the default destination folder for all of your product's features and components. For more information, see <a href="#">Setting the Default Product Destination Folder (INSTALLDIR)</a>.</p> <p>In DIM, Merge Module, and MSM Database projects, the default value is as follows:</p> <p><code>[TARGETDIR]</code></p> <p>In DIM, Merge Module, and MSM Database projects, if you would like to let the users of this DIM or module override the default destination directory, leave that default value in this setting. For more information, see <a href="#">Specifying the Default Destination Folder for a Merge Module</a>.</p>
<b>TARGETDIR</b>	InstallScript, InstallScript Object	<p>Specify the default value for the main target directory for your product. Typically this value is set to a value such as the following one:</p> <p><code>&lt;FOLDER_APPLICATIONS&gt;\&lt;IFX_COMPANY_NAME&gt;\&lt;IFX_PRODUCT_NAME&gt;</code></p> <p>For more information, see <code>TARGETDIR</code>.</p>

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>Module ID GUID</b>	Merge Module, MSM Database	<p>This read-only setting displays a GUID that uniquely identifies the merge module. Whenever you create a new merge module, InstallShield generates a new GUID for it.</p> <p>The module ID GUID is appended to all merge module GUID foreign keys. For example, if you create a component in a merge module project, that component is listed in the Direct Editor and in the built .msm file as <b>ComponentName.MergeModuleGUID</b>.</p> <p>If you want to change this GUID, you can use the Direct Editor view to edit the ModuleID field of the ModuleSignature table. Note that if you change this value, you must also update the value in all of the tables in your project; you can do this from within the Direct Editor view.</p>
<b>Module Dependencies</b>	Merge Module, MSM Database	<p>This setting lets you specify one or more merge modules that are required for your merge module.</p> <p>To add one or more dependencies that are available in your redistributables gallery, click the ellipsis button (...) in this setting. The Module Dependencies dialog box opens, enabling you to select the modules that your merge module requires.</p> <p>To add a dependency that is not present on your machine, click the <b>Add a new module dependency</b> button, and then specify its version, language, and module GUID.</p>
<b>Name</b>	Merge Module, MSM Database	<p>This read-only setting shows one of the following values:</p> <ul style="list-style-type: none"> <li>● If you selected a dependency that is available in your redistributables gallery, this setting shows the name of that dependency.</li> <li>● If you chose to add a dependency that is not present on your machine, this setting indicates <b>[Merge Module Added by Setup Author]</b>.</li> </ul> <p>This setting is displayed only if you have added a merge module dependency to your project.</p> <p>If you want to remove this dependency from your project, you can click the <b>Delete this module dependency</b> button in this setting.</p>
<b>Version</b>	Merge Module, MSM Database	<p>If the merge module that you are creating requires a particular version of the dependency, specify the version number. If any version of the dependency is acceptable, you can leave the Version setting blank.</p> <p>This setting is displayed only if you have added a merge module dependency to your project.</p>

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>Language</b>	Merge Module, MSM Database	<p>If the merge module that you are creating requires a dependency of a particular language, specify the language. If any language of the dependency is acceptable, select Language Independent.</p> <p>This setting is displayed only if you have added a merge module dependency to your project.</p>
<b>Module ID</b>	Merge Module, MSM Database	<p>If you selected a dependency that is available in your redistributables gallery, this setting indicates the module ID of that dependency.</p> <p>If you chose to add a dependency that is not present on your machine, enter the module ID of the dependency. The module ID must be in the following format:</p> <p><b>ModuleName.ModuleGUID</b></p> <p>For example, if the name of the merge module is <b>MyDependency</b> and the GUID is <b>{2560C1ED-E2F7-4FE6-A0E6-15A9DA4CE9B9}</b>, enter the following in this setting:</p> <p><b>MyDependency.2560C1ED-E2F7-4FE6-A0E6-15A9DA4CE9B9</b></p> <p>This setting is displayed only if you have added a merge module dependency to your project.</p>
<b>Module Exclusions</b>	Merge Module, MSM Database	<p>This setting lets you specify one or more merge modules that are incompatible with the merge module that you are creating. This may be necessary, for example, if an earlier version of your merge module is not compatible with your new module.</p> <p>To add one or more exclusions that are available in your redistributables gallery, click the ellipsis button (...) in this setting. The Module Exclusions dialog box opens, enabling you to select the modules that are incompatible with your merge module.</p> <p>To add an exclusion that is not present on your machine, click the <b>Add a new module exclusion</b> button, and then specify the requirements for the version, language, and module GUID.</p>

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>Name</b>	Merge Module, MSM Database	<p>This read-only setting shows one of the following values:</p> <ul style="list-style-type: none"> <li>• If you selected an exclusion that is available in your redistributables gallery, this setting shows the name of that exclusion.</li> <li>• If you chose to add an exclusion that is not present on your machine, this setting indicates <b>[Merge Module Added by Setup Author]</b>.</li> </ul> <p>This setting is displayed only if you have added a merge module exclusion to your project.</p> <p>If you want to remove this exclusion from your project, you can click the <b>Delete this module exclusion</b> button in this setting.</p>
<b>Max. Version</b>	Merge Module, MSM Database	<p>Specify the maximum version number of the merge module that should be excluded.</p> <p>If you leave this setting blank, all versions after the value that you specify in the Min. Version setting are excluded. If you leave both the Max. Version and Min. Version settings blank, there is no exclusion based on version.</p> <p>This setting is displayed only if you have added a merge module exclusion to your project.</p>
<b>Min. Version</b>	Merge Module, MSM Database	<p>Specify the minimum version number of the merge module that should be excluded.</p> <p>If you leave this setting blank, all versions before the value that you specify in the Max. Version setting are excluded. If you leave both the Max. Version and Min. Version settings blank, there is no exclusion based on version.</p> <p>This setting is displayed only if you have added a merge module exclusion to your project.</p>
<b>Language</b>	Merge Module, MSM Database	<p>If you want to exclude merge modules that have a specific language or change the current value of this setting, click the ellipsis button (...) in this setting. The Exclusion Languages dialog box opens, enabling you to specify whether you want to exclude a particular language or all of the languages except a particular language. This dialog box also lets you select Language Independent, which indicates that the language should not be used to exclude a merge module.</p> <p>This setting is displayed only if you have added a merge module exclusion to your project.</p>

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>Module ID</b>	Merge Module, MSM Database	<p>If you selected an exclusion that is available in your redistributables gallery, this setting indicates the module ID of that exclusion.</p> <p>If you chose to add an exclusion that is not present on your machine, enter the module ID of the exclusion. The module ID must be in the following format:</p> <p><b>ModuleName.ModuleGUID</b></p> <p>For example, if the name of the merge module is <b>MyExclusion</b> and the GUID is <b>{2560C1ED-E2F7-4FE6-A0E6-15A9DA4CE9B9}</b>, enter the following in this setting:</p> <p><b>MyExclusion.2560C1ED-E2F7-4FE6-A0E6-15A9DA4CE9B9</b></p> <p>This setting is displayed only if you have added a merge module exclusion to your project.</p>
<b>DIM GUID</b>	DIM	<p>This read-only setting displays a GUID that uniquely identifies the DIM. Whenever you create a new DIM, InstallShield generates a new GUID for it.</p> <p>The DIM GUID is appended to all DIM GUID foreign keys. For example, if you create a component in a DIM project, that component is listed in the Direct Editor as <b>ComponentName.DIM_GUID</b>.</p> <p>If you want to change this GUID, you can use the Direct Editor view to edit the ModuleID field of the ModuleSignature table. Note that if you change this value, you must also update the value in all of the tables in your project; you can do this from within the Direct Editor view.</p>
<b>Build Instructions</b>	DIM	<p>Enter any special instructions or comments about this project that may be helpful for the release engineers who are responsible for including this DIM in installation projects. These instructions are displayed in the DIM References view of the project that contains this DIM. The build instructions are not displayed to the end user.</p>

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>Locked-Down Permissions</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Select the type of permissions that you want to use for securing files, folders, and registry keys for end users who run your product in a locked-down environment. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Custom InstallShield handling</b>—InstallShield uses a custom ISLockPermissions table and adds custom actions to your project to set permissions on the target system. This option is the default value.</li> <li>● <b>Traditional Windows Installer handling</b>—InstallShield uses the LockPermissions table in the .msi database to store permission information for your product.</li> </ul> <p>It is often more advantageous to use the custom InstallShield handling than the traditional Windows Installer handling. For example:</p> <ul style="list-style-type: none"> <li>● The custom option includes support for many well-known security identifiers (SIDs) that are not supported by the traditional option.</li> <li>● The custom option supports the use of localized user names for many well-known SIDs, unlike the traditional option. With the traditional option, if you try to use a localized name to set permissions on a non-English system, the installation may fail.</li> <li>● The custom option lets you specify that you want to deny a user or group from having the permissions that you are specifying. The traditional handling does not allow you to do this. That is, with the traditional handling, you can only set specific permissions; you cannot deny permissions.</li> </ul> <p>This is a project-wide setting that affects all new permissions that you set for files, folders, and registry keys in your project. If you have already configured some permissions in your project and then you change the value of this setting, InstallShield lets you specify whether you want to use the alternate handling method for those already-existing permissions.</p> <p>For more information about configuring this setting, as well as information about InstallScript support for setting permissions, see <a href="#">Securing Files, Folders, Registry Keys, and Windows Services in a Locked-Down Environment</a>.</p>

**Table 2** ▪ General Settings (cont.)

Setting	Project Type	Description
<b>Show Per-User Option</b>	Basic MSI	<p>Specify whether you want to give end users the option of installing your product for all users or for only the current user. This run-time option is available only on Windows 7 and later systems, and on Windows Server 2008 R2 and later systems. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>No</b>—Do not include the buttons that let end users specify how they want to install the product.</li> <li>● <b>Yes</b>—If the target system has Windows 7 or Windows Server 2008 R2, InstallShield adds buttons to the ReadyToInstall dialog. The buttons let end users specify how they want to install the product. If elevated privileges are required, the shield icon is included on the all-users button. If an end user selects the per-user button, the ALLUSERS property is set to 2, and the MSIINSTALLPERUSER property is set to 1. If an end user selects the all-users button, the ALLUSERS property is set to 1, and the MSIINSTALLPERUSER property is not set.</li> </ul> <p>If the target system has Windows Vista or earlier, or Windows Server 2008 or earlier, the ReadyToInstall dialog does not show the buttons that let end users specify how they want to install the product.</p> <p>The default value is No.</p>  <p><b>Note</b> ▪ <i>Selecting No does not prevent end users from setting MSIINSTALLPERUSER from the command line when they run your installation. If your installation does not support this, you may want to add a launch condition or other run-time check to prevent this from occurring.</i></p> <p>To learn more, see <a href="#">Per-User vs. Per-Machine Installations</a>.</p>

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>Create MSI Logs</b>	Basic MSI, InstallScript MSI, MSI Database, Transform	<p>To specify whether Windows Installer 4.0 or later should log your installation, click the ellipsis button (...) in this setting, which launches the Logging Options for Windows Installer 4.0 and Later dialog box. This dialog box is where you specify whether Windows Installer should log your installation. You can also use this dialog box to customize the types of messages that are logged.</p> <p>There are three possible values for this setting:</p> <ul style="list-style-type: none"> <li>● <b>No</b>—Installations are not logged. This is the default value.</li> <li>● <b>Yes</b>—InstallShield populates the MsiLogging property with the default value of <b>voicewarmup</b>.</li> <li>● <b>Custom</b>—InstallShield populates the MsiLogging property with the value that you specified on the Logging Options for Windows Installer 4 and Later dialog box.</li> </ul> <p>If the value of this setting is Yes or Custom, and if the installation is run with Windows Installer 4.0 or later, as well as Windows Vista or later or Windows Server 2008 or later, the following occurs:</p> <ul style="list-style-type: none"> <li>● The installer creates a log file according to the appropriate logging mode: either <b>voicewarmup</b> (if the Create MSI Logs value is Yes) or whatever custom value you specified on the Logging Options for Windows Installer 4.0 and Later dialog box.</li> <li>● The installer populates the MsiLogFileLocation property with the log file's path.</li> <li>● A <b>Show the Windows Installer log</b> check box is added to the SetupCompleteSuccess, SetupCompleteError, and SetupInterrupted dialogs. If the end user selects that check box and then clicks Finish, the log file is opened in a text file viewer or editor.</li> </ul>

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>Create MSI Logs</b> (continued)		<p>The Create MSI Logs setting applies to installations that are run with Windows Installer 4.0 or later on Windows Vista and later systems or Windows Server 2008 and later systems. The <b>Show the Windows Installer log</b> check box is not visible in run-time dialogs that are displayed on earlier systems that are running earlier versions of Windows Installer.</p>  <p><b>Note</b> ▪ If the value of this setting is Custom and you change it to Yes, any custom parameters that you defined for the MsiLogging property in the Property Manager will be overwritten with the default value. If you change it to No, InstallShield deletes any custom parameters from the MsiLogging property.</p> <p>For more information, including details on how to customize the types of messages that are logged, see <a href="#">Specifying Whether Windows Installer Installations Should Be Logged</a>.</p>
<b>Fast Install</b>	Basic MSI, InstallScript MSI, MSI Database, Transform	<p>If you want to reduce the time that is required to install a large Windows Installer package, consider selecting the check boxes for one or more of the following options:</p> <ul style="list-style-type: none"> <li>• No system restore point is saved for this installation</li> <li>• Perform only File Costing and skip checking other costs</li> <li>• Reduce the frequency of progress messages</li> </ul> <p>This setting configures the Windows Installer property MSIFASTINSTALL, which can be set at the command line.</p> <p>Windows Installer 5 includes support for this setting. Earlier versions of Windows Installer ignore it.</p>
<b>Company Name</b>	InstallScript, InstallScript Object	<p>Enter the name of your company. This value is used in the default script to set TARGETDIR (if the string entry COMPANY_NAME does not exist); it can be retrieved at run time by calling the <b>MediaGetData</b> function.</p>  <p><b>Tip</b> ▪ Instead of hard-coding a value, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value. (To use a path variable: On the Project menu, click Settings. Then select the appropriate path variable on the Application tab.)</p>

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>Executable File</b>	InstallScript, InstallScript Object	<p>Enter the name of the application's main executable file. This value can be retrieved at run time by calling the <b>MediaGetData</b> function.</p>  <p><b>Tip</b> ▪ Instead of hard-coding a value, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value. (To use a path variable: On the Project menu, click Settings. Then select the appropriate path variable on the Application tab.)</p>
<b>URL</b>	InstallScript, InstallScript Object	<p>Enter a product URL. This information is stored in the project file and is for your reference only. It is never displayed to the end user.</p>  <p><b>Tip</b> ▪ Instead of hard-coding a value, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value. (To use a path variable: On the Project menu, click Settings. Then select the appropriate path variable on the Application tab.)</p>

**Table 2** ▪ General Settings (cont.)

Setting	Project Type	Description
<b>Server Locations</b>	Transform	<p>If you are storing the installation package and its related files for the product on a network server or Web site, click the ellipsis button (...) in this setting to specify the server or Web site locations. The locations should have the .msi package, as well as all of the files that might be required to, for example, repair the product or advertise a feature.</p> <p>The validity of the server location that you specify is determined when the installation needs to access the server remotely. That is, if a server is not available, or if you added an invalid server, the entry will be ignored if the resource is needed, and errors might be generated. Each location that is specified must have the complete source for the installation. The entire directory tree at each source location must be the same and must include all of the required source files, including any .cab files. Each location must have an .msi file with the same file name and product code.</p>  <p><b>Tip</b> ▪ Server paths can contain environment variables that are identified with a percent sign (%). For example, the following path uses the Home environment variable:</p> <pre>\\Server1\%Home%\Office</pre> <p>The paths that you specify are stored in the SOURCELIST property. Windows Installer appends this list to the end of an end user's existing source list for the product at run time.</p>
<b>Register Object</b>	InstallScript Object	<p>Specify whether you want the InstallScript object to be registered on your machine when you build a release for it. Registering an object on your development machine enables you to include the object in InstallScript projects that you create on that machine.</p>  <p><b>Tip</b> ▪ If the object is not registered when you build it, you can register it from within an InstallScript project. To learn more, see <a href="#">Registering Objects in InstallScript Projects</a>.</p>

Table 2 ■ General Settings (cont.)

Setting	Project Type	Description
<b>Object Wizard</b>	InstallScript Object	<p>Select the type of wizard, if any, that you would like to use for your object's default language. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>No Wizard</b>—If your object does not require a wizard, select this option.</li> <li>● <b>Use InstallShield Object Stock Wizard</b>—If you want InstallShield to create a wizard based on the properties that you are creating for your object, select this option. With the stock wizard, all read-only properties are displayed but are not editable. All read/write properties can be changeable by the user. Write-only properties are not displayed.</li> </ul> <p>As an alternative, you can click the ellipsis button (...) in this setting if you want to select a custom wizard that you created for your object.</p> <p>To learn more about creating a custom wizard and using the InstallShield stock wizard, see <a href="#">Designing an Object's Wizard</a>.</p>
<b>Register Custom Wizard</b>	InstallScript Object	<p>Specify whether you want InstallShield to register the custom object wizard for this object when you build a release for the object.</p>  <p><b>Note</b> ■ This setting is applicable only if you specify a custom wizard in the Object Wizard setting.</p>
<b>Font Registration</b>	InstallScript, InstallScript Object	<p>If you want all of the font files in your project to be registered on the target system at run time, select Enabled. Static file links have an individual setting for font registration as well. This setting must be used to set the behavior for dynamically linked font files.</p>
<b>DIFx Support (for 32-bit platforms)</b>	InstallScript, InstallScript Object	<p>To enable DIFx support in your project for installing device drivers on 32-bit systems, select Enabled. If you select Enabled, InstallShield adds the DIFxAPI libraries to your project when you build a release.</p> <p>For more information, see <a href="#">Installing Device Drivers</a>.</p>
<b>DIFx Support (for 64-bit Itanium platforms)</b>	InstallScript, InstallScript Object	<p>To enable DIFx support in your project for installing device drivers on 64-bit Itanium systems, select Enabled. If you select Enabled, InstallShield adds the DIFxAPI libraries to your project when you build a release.</p> <p>For more information, see <a href="#">Installing Device Drivers</a>.</p>

**Table 2** • General Settings (cont.)

Setting	Project Type	Description
<b>DIFx Support (for 64-bit AMD platforms)</b>	InstallScript, InstallScript Object	To enable DIFx support in your project for installing device drivers on 64-bit AMD systems, select Enabled. If you select Enabled, InstallShield adds the DIFxAPI libraries to your project when you build a release.  For more information, see <a href="#">Installing Device Drivers</a> .

## Summary Information Stream

Windows Installer databases are implemented as COM structured storage, and COM structured storage files usually contain a Summary Information Stream. The Summary Information Stream contains information about your company and the product that is being installed.

The following settings are available in the Summary Information Stream area in the General Information view.

**Table 3** • Summary Information Stream Settings

Setting	Project Type	Description
<b>Title</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Specify the type of database that you are creating. For a product installation, the default value is <b>Installation Database</b>, which is the recommended value.</p>  <p><b>Project</b> ▪ <i>Basic MSI, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—The value that you enter is used on the Summary tab of the Properties dialog box that is displayed if you right-click the Windows Installer database and then click Properties.</i></p> <p><i>For DIM projects—The value in this setting is not displayed or used at run time. You can use this setting in DIM projects as a reference for internally identifying the project.</i></p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

**Table 3** • Summary Information Stream Settings (cont.)

Setting	Project Type	Description
<b>Subject</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Enter the name of the product.</p>  <p><b>Project</b> ▪ In Basic MSI, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—The value that you enter is used on the Summary tab of the Properties dialog box that is displayed if you right-click the Windows Installer database and then click Properties.</p> <p>For DIM projects—The value in this setting is not displayed or used at run time. You can use this setting in DIM projects as a reference for internally identifying the project. The value that you enter is displayed in the DIM References view of the project that contains this DIM.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Author</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Specify your company name.</p>  <p><b>Project</b> ▪ In Basic MSI, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—The value that you enter is used on the Summary tab of the Properties dialog box that is displayed if you right-click the Windows Installer database and then click Properties.</p> <p>For DIM projects—The value in this setting is not displayed or used at run time. You can use this setting in DIM projects as a reference for internally identifying the project. The value that you enter is displayed in the DIM References view of the project that contains this DIM.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

**Table 3** • Summary Information Stream Settings (cont.)

Setting	Project Type	Description
<b>Keywords</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Specify keywords that describe the Windows Installer database for your product.</p>  <p><b>Project</b> ▪ In Basic MSI, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—The value that you enter is used on the Summary tab of the Properties dialog box that is displayed if you right-click the Windows Installer database and then click Properties.</p> <p>For DIM projects—The value in this setting is not displayed or used at run time. You can use this setting in DIM projects as a reference for internally identifying the project.</p>
<b>Package Code</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database	<p>This setting identifies the package code, which is the GUID for your installation package, DIM, or merge module. To have InstallShield generate a different GUID for you, click the <b>Generate a new GUID</b> button ({...}) in this setting.</p>  <p><b>Project</b> ▪ In Basic MSI, InstallScript MSI, Merge Module, MSI Database, and MSM Database projects—Because Windows Installer requires that any two .msi databases with identical package codes to have identical contents, you should change the package code before releasing a modified package. In the Releases view, you can use the Generate Package Code setting for a product configuration to specify whether you want InstallShield to generate a new package code every time that you build a release. The default value for this setting is Yes.</p> <p>For DIM projects—The value in this setting is not displayed or used at run time. You can use this setting in DIM projects as a reference for internally identifying the project. The value that you enter is displayed in the DIM References view of the project that contains this DIM.</p>

**Table 3** • Summary Information Stream Settings (cont.)

Setting	Project Type	Description
<b>Template Summary</b>	Basic MSI, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Specify the processor type and default language that your installation supports. List the processor type first, followed by your installation's default language, and separate them with a semicolon. If you have multiple entries in the language category, separate them with a comma.</p> <p>For example, if your installation runs only on Intel processors and English-based systems, enter <b>Intel;1033</b>. If your product runs on x64 processors and supports English and German, enter <b>x64;1033,1031</b>. For the language portion of this setting, use the number 0 if your installation is language neutral.</p> <p>Valid processor values include:</p> <ul style="list-style-type: none"> <li>● Intel</li> <li>● Intel64</li> <li>● x64</li> </ul> <p>Note that you can specify only one processor value.</p> <p>For more information, see <a href="#">Using the Template Summary Property</a>.</p> <p>If the target machine does not meet the requirements that you specify for this setting, an error message is displayed and the installation exits.</p>
<b>Summary Information Stream Comments</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Enter any comments about your product. A typical value for this setting is as follows:</p> <p><b>This installer database contains the logic and data required to install MyProduct.</b></p>  <hr/> <p><b>Project</b> • In Basic MSI, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—The value that you enter is used on the Summary tab of the Properties dialog box that is displayed if you right-click the Windows Installer database and then click Properties.</p> <p>For DIM projects—The value in this setting is not displayed or used at run time. You can use this setting in DIM projects as a reference for internally identifying the project.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

**Table 3** ▪ Summary Information Stream Settings (cont.)

Setting	Project Type	Description
<b>Schema</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>This setting lets you specify the integer that identifies the minimum Windows Installer version that is required for your installation package or DIM. For a minimum of Windows Installer 2.0, enter <b>200</b>. For a minimum of Windows Installer 3.0, enter <b>300</b>. For a minimum of Windows Installer 3.1, enter <b>301</b>. For a minimum of Windows Installer 4.5, enter <b>405</b>.</p> <p>If the end user's system has a Windows Installer version earlier than the minimum requirement that you specify for the Schema setting—for example, if you specify a schema value of 405 because your installation uses Windows Installer 4.5 features, but an end user has Windows Installer 3.1—the installation displays an error message and exits.</p> <p>The value that you enter for the Schema setting is used for the <b>Page Count Summary property</b> of your Windows Installer database.</p> <hr/> <p> <b>Note</b> ▪ You can override this value for all of the releases that are associated with a particular product configuration in your project by setting the Schema setting for the <b>product configuration in the Releases view</b>.</p>

**Table 3** • Summary Information Stream Settings (cont.)

Setting	Project Type	Description
<b>Require Administrative Privileges</b>	Basic MSI, MSI Database	<p>Specify whether your .msi package requires administrative privileges for the execute sequence of your installation. The default is Yes.</p> <p>If you set this to No, InstallShield sets bit 3 in the <a href="#">Word Count Summary property</a> to indicate that elevated privileges are not required to install the .msi package. Note that if you select No but your .msi package tries to perform a task for which it does not have adequate privileges, Windows Installer may display a run-time error.</p> <p>This setting applies to installations that are run with Windows Installer 4.0 or later on Windows Vista and later systems or Windows Server 2008 and later systems. Earlier versions of Windows Installer and Windows ignore this setting.</p> <p>Note that an end user's installation experience is more secure when installations are run with only the permissions that they need. Unless an application is designed to be run only by system administrators, it should be run with the least privilege.</p> <p>To learn how this setting and other InstallShield settings affect whether Windows Vista and later display a User Account Control prompt to elevate privileges, see <a href="#">Minimizing the Number of User Account Control Prompts During Installation</a>.</p>

## Add or Remove Programs

Add or Remove Programs (which is called Programs in the latest versions of Windows) in the Control Panel provides end users with technical support links and telephone numbers, product update information, and information about a product's manufacturer. Depending on how the installation is configured, the end user may have the option of removing, repairing, or changing the installation with the click of a button. You can specify this information in your project by configuring the Add or Remove Programs settings in the General Information view.

**Project** • In a Basic MSI project—To prevent your product from appearing in Add or Remove Programs, you can set the Windows Installer property ARPSYSTEMCOMPONENT to 1 in the Property Manager. Note that setting this property simply suppresses the display of your product in Add or Remove Programs. An end user can still remove your product by running the installation in maintenance mode or from the command line.

*In an InstallScript MSI project—To prevent your product from appearing in the Add or Remove Programs, select Yes for the Hide Add/Remove Panel Entry setting in the Releases view.*

**Table 4 •** Add or Remove Programs Settings

Setting	Project Type	Description
<b>Show Add or Remove Programs Entry</b>	Advanced UI, Suite/Advanced UI	<p>Indicate whether you want to show your Advanced UI or Suite/Advanced UI product's entry in Add or Remove Programs in the Control Panel. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—Your Advanced UI or Suite/Advanced UI product's entry is displayed on the target system in Add or Remove Programs. This is the default value.</li> <li>● <b>No</b>—Your Advanced UI or Suite/Advanced UI product's entry is not displayed on the target system in Add or Remove Programs. The end user cannot use Add or Remove Programs to remove the product, perform maintenance, or view support information. If you select this option, InstallShield disables the other Add or Remove Programs settings.</li> </ul>

**Table 4** • Add or Remove Programs Settings (cont.)

Setting	Project Type	Description
<b>Display Icon</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	 <p><b>Project</b> • The value that you should enter for this setting depends on what project type you are using.</p> <p><b>In Basic MSI, InstallScript MSI, MSI Database, and Transform projects:</b> Enter the path on your development system to the .ico, .exe or .dll file that contains the icon resource that you want to be used for your product's entry in Add or Remove Programs. Instead of manually typing the path and file name, you can click the ellipsis button (...) in this setting to browse to the file.</p> <p><b>For InstallScript and InstallScript Object projects:</b> Enter the path on the target system to the .ico or .exe file that contains the icon resource that you want to be used for your product's entry in Add or Remove Programs. You can specify a path relative to a system variable that is enclosed by angle brackets—for example:</p> <pre>&lt;TARGETDIR&gt;\icon.ico</pre> <p><b>In Advanced UI and Suite/Advanced UI projects:</b> Enter the path on your development system to the .ico, .exe or .dll file that contains the icon resource that you want to be used for your product's entry in Add or Remove Programs. Instead of manually typing the path and file name, you can click the ellipsis button (...) in this setting to browse to the file. If you want to use the icon in a file that is present on target systems (for example, in a file that is installed by one of the packages in the Advanced UI or Suite/Advanced UI installation), select a directory property from the list in this setting, and then enter the rest of the path for the icon file. If you leave this setting blank, InstallShield uses the icon that is specified in the Setup.exe Icon File setting on the Setup.exe tab in the Releases view.</p>
<b>Display Icon Index</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Suite/ Advanced UI	<p>If the icon file that you specify contains more than one icon resource, specify the index in this setting.</p> <ul style="list-style-type: none"> <li>• A nonnegative integer refers to the order of the icon resources in the executable file. For example, 0 refers to the first icon in the file, 1 refers to the second icon, and 2 refers to the third icon.</li> <li>• Use a negative number to refer to a specific resource ID. For example, the icon index -12 refers to the icon with a resource ID of 12.</li> </ul>

**Table 4** • Add or Remove Programs Settings (cont.)

Setting	Project Type	Description
<b>Disable Change Button</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	<p>Specify whether you want to disable the Change button for your product's entry in Add or Remove Programs. The Change button enables end users to change installation options after the product has been installed. End users can remove or add features as needed.</p>  <p><b>Project</b> • In an InstallScript project, the <b>OnMoveData</b> event handler writes the data for this setting to the target system's registry.</p> <p>Also in an InstallScript project, you can specify a combined Change/Remove button by setting the <b>Disable Change Button</b> and <b>Disable Remove Button</b> settings to Yes and setting the system variable <b>ADDREMOVE_COMBINEDBUTTON</b> to <b>TRUE</b> in your script before the <b>MaintenanceStart</b> function is called. (<b>MaintenanceStart</b> is called by the default code for the <b>OnMoveData</b> event handler.)</p>
<b>Disable Remove Button</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	<p>Specify whether you want to disable the Remove button for your product's entry in Add or Remove Programs. The Remove button enables end users to remove the product by clicking one button, which runs your uninstaller with a reduced user interface.</p>  <p><b>Project</b> • For Basic MSI, InstallScript MSI, MSI Database, and Transform projects—If the end user clicks the Remove button to remove your product, actions in the User Interface sequence of the project are executed.</p> <p>In an InstallScript project, the <b>OnMoveData</b> event handler writes the data for this setting to the target system's registry.</p>
<b>Disable Repair Button</b>	Basic MSI, MSI Database, Transform	<p>Specify whether you want to disable the Repair button for your product's entry in Add or Remove Programs. The Repair button enables end users to run the Windows Installer repair option if any files have been deleted or corrupted.</p>

**Table 4** • Add or Remove Programs Settings (cont.)

Setting	Project Type	Description
<b>Publisher</b>	Advanced UI, Basic MSI, InstallScript MSI, MSI Database, Suite/Advanced UI, Transform	<p>Specify the name of the company that created the product. This information is displayed for your product's entry in Add or Remove Programs. The value that you enter is stored in the Windows Installer <b>Manufacturer</b> property.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>  <p><b>Windows Logo</b> • If you want to meet the requirements of the Windows logo program, you must specify the publisher.</p>
<b>Publisher/Product URL</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	<p>Enter a general URL for your company or product—for example, <b><a href="http://www.installshield.com">http://www.installshield.com</a></b>.</p> <p>On some versions of Windows, the publisher name on the Support Info dialog box is a hyperlink to this URL. The Support Info dialog box is displayed when an end user clicks the support information hyperlink for your product's entry in Add or Remove Programs.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>  <p><b>Project</b> • In an InstallScript project, the <b>OnMoveData</b> event handler writes the data for this setting to the target system's registry.</p>

**Table 4** • Add or Remove Programs Settings (cont.)

Setting	Project Type	Description
<b>Support Contact</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Transform	Enter the name of the person or department that end users should contact for technical support.
		On some versions of Windows, this information is displayed on the Support Info dialog box for your product's entry in Add or Remove Programs.
		When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a> .
		 <p><b>Project</b> • In an InstallScript project, the <b>OnMoveData</b> event handler writes the data for this setting to the target system's registry.</p>
<b>Support URL</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Transform	Enter the URL that you would like end users to visit for technical support information for your product. This URL is displayed for your product's entry in Add or Remove Programs.
		When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a> .
		 <p><b>Windows Logo</b> • If you want to meet the requirements of the Windows logo program, you must enter a valid URL.</p>
		 <p><b>Project</b> • In an InstallScript project, the <b>OnMoveData</b> event handler writes the data for this setting to the target system's registry.</p>

**Table 4** • Add or Remove Programs Settings (cont.)

Setting	Project Type	Description
<b>Support Phone Number</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	<p>Enter the technical support phone number for your product.</p> <p>On some versions of Windows, this information is displayed on the Support Info dialog box for your product's entry in Add or Remove Programs.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p> <div data-bbox="769 720 812 760" data-label="Image"></div> <p><b>Project</b> • In an InstallScript project, the <b>OnMoveData</b> event handler writes the data for this setting to the target system's registry.</p>
<b>Read Me</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	<p>Enter the name or path of the Readme file for your product. As an alternative, you can link to a Readme file located on the Internet by specifying a valid URL. For more information, see <a href="#">Specifying a Readme File</a>.</p> <p>On some versions of Windows, this information is displayed on the Support Info dialog box for your product's entry in Add or Remove Programs.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p> <div data-bbox="769 1417 812 1457" data-label="Image"></div> <p><b>Project</b> • In an InstallScript project, the <b>OnMoveData</b> event handler writes the data for this setting to the target system's registry.</p>

**Table 4** • Add or Remove Programs Settings (cont.)

Setting	Project Type	Description
<b>Product Update URL</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	<p>Specify a URL where end users can get information about product updates or download the latest version.</p> <p>On some versions of Windows, this information is displayed on the Support Info dialog box for your product's entry in Add or Remove Programs.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p> <div></div> <p><b>Project</b> • In an InstallScript project, the <b>OnMoveData</b> event handler writes the data for this setting to the target system's registry.</p>
<b>Add or Remove Programs Comments</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	<p>Enter comments about your product. This information is displayed for your product's entry in Add or Remove Programs.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p> <div></div> <p><b>Project</b> • In an InstallScript project, the <b>OnMoveData</b> event handler writes the data for this setting to the target system's registry.</p>
<b>English or Japanese IDE Settings</b>	InstallScript Object	<p>These areas—English IDE Settings and Japanese IDE Settings—let you specify information that should be available to InstallShield users when they view your object in the Objects view of the English and Japanese versions of InstallShield.</p>
<b>Use Default</b>	InstallScript Object	<p>If this setting is for a language other than the default language, specify whether you want to use the default language settings' values for this language. If you select Yes, the other settings under the Use Default setting become disabled. If you select No, the other settings under the Use Default setting become enabled so that you can specify language-specific values.</p> <p>This setting is disabled for the default language.</p>

**Table 4** • Add or Remove Programs Settings (cont.)

Setting	Project Type	Description
<b>Display Name</b>	InstallScript Object	Enter the name of your object as you would like it to appear in the Objects view.
<b>Short Name</b>	InstallScript Object	Enter a shortened version of your object's name, if desired. You can enter the same name that you entered for the Display Name setting.
<b>HTML Help</b>	InstallScript Object	Specify the object's help file, which must consist of a single Web file; this file is displayed in the right pane when the object is selected in the Objects view. Type an explicit path or path variable.
<b>Icon File</b>	InstallScript Object	The icon is displayed next to your object in the Objects view. The icon must be 16 pixels by 16 pixels with a maximum of 16 colors. The icon can be loaded from a DLL, .exe, or .ico file. When the file is a DLL or .exe, the icon index or resource ID can be specified after the path and file name separated by a comma. If a resource ID is specified rather than an index, it must be preceded by a dash (-). If no index is specified, the number 0 is assumed.

## Software Identification Tag

Use the Software Identification Tag area of the General Information view to specify whether you want to include an ISO/IEC 19770-2 software identification tag in your installation. If a tag is included, this area also lets you specify the identification information that is not already specified in other areas of the General Information view. For more information, see [Including a Software Identification Tag for Your Product](#).

If you include a software identification tag, you can include application model data for Microsoft System Center Configuration Manager in the tag. For more information, see [Including Microsoft System Center Configuration Manager Application Model Data About Your Product](#).

**Table 5** • Software Identification Tag Settings

Setting	Project Type	Description
<b>Use Software Identification Tag</b>	Basic MSI	Specify whether you want to include an ISO/IEC 19770-2 software identification tag in your installation. If you select Yes, use the other tag-related settings in this area of the General Information view to specify the identification information that is not already specified in other areas of the General Information view.

**Table 5** • Software Identification Tag Settings (cont.)

Setting	Project Type	Description
<b>Require Software Entitlement</b>	Basic MSI	Specify whether you want to require your product to have a corresponding software entitlement in order for software reconciliation to be considered successful. In general, if the software must be purchased, Yes should be selected for this setting; if the software is free, No should be selected for this setting.
<b>Unique ID</b>	Basic MSI	<p>Enter a unique ID that identifies the specific version of this specific product. To have InstallShield generate a different GUID for you, click the <b>Generate a new GUID</b> button (...) in this setting.</p> <p>Note that InstallShield uses the value that you enter as part of the name of the tag file (<i>TagCreatorID_UniqueID.swidtag</i>). Therefore, the ID that you enter must not contain any characters that are invalid for file names.</p>
<b>Tag Creator</b>	Basic MSI	Enter the name of the organization that created the tag.

**Table 5** • Software Identification Tag Settings (cont.)

Setting	Project Type	Description
<b>Tag Creator ID</b>	Basic MSI	<p>Enter the registration ID of the organization that created the tag. This ID helps to differentiate between different legal organizations that have the same creator name but are in different countries.</p> <p>The convention for the registration ID is as follows:</p> <p><b>regid.YYYY-MM.ReversedDomainName,division</b></p> <p>The registration ID consists of the following parts:</p> <ul style="list-style-type: none"> <li>● <b>regid.</b>—The string <i>regid</i> indicates that the XML portion is a registration ID for a software identification tag. A period (.) must be included after this string.</li> <li>● <b>YYYY-MM.</b>—This part of the registration ID identifies the first full month (MM) and the year (YYYY) in which the domain name was owned by the tag creator. For example, if you are creating the tag and you purchased the domain name February 15, 1999, you would use <b>1999-03</b> in this part of the registration ID, since the first full month the domain name was owned was March (03), and the year was 1999. The year and month must be separated by a dash.</li> <li>● <b>ReversedDomainName</b>—This part identifies the reversed domain name of the organization that is creating the software identification tag. For example, for the <i>revera.com</i> domain name, the reversed domain name is: <b>com.revera</b></li> <li>● <b>,division</b>—This optional part starts with a comma (,), and is followed by an additional string. You can enter a string that helps to distinguish between different divisions or areas of the organization. If you do not want to use this optional distinguishing part of the registration ID, do not include the comma or an additional string in your entry.</li> </ul> <p>Note that InstallShield uses the value that you enter as part of the name of the tag file (<i>TagCreatorID_UniqueID.swidtag</i>). Therefore, the ID that you enter must not contain any characters that are invalid for file names.</p>
<b>Software Creator</b>	Basic MSI	<p>Enter the name of the organization that created the software.</p> <p>This setting is optional. If you leave this setting blank, InstallShield uses the value of the Tag Creator setting for the name of the software creator.</p>

**Table 5** • Software Identification Tag Settings (cont.)

Setting	Project Type	Description
<b>Software Creator ID</b>	Basic MSI	<p>Enter the registration ID of the organization that created the software. This ID helps to differentiate between different legal organizations that have the same creator name but are in different countries.</p> <p>This setting is optional. If you leave this setting blank, InstallShield uses the value of the Tag Creator ID setting for the software creator ID.</p> <p>The convention for the registration ID is as follows:</p> <p><b>regid.YYYY-MM.ReversedDomainName,division</b></p> <p>The registration ID consists of the following parts:</p> <ul style="list-style-type: none"> <li>● <b>regid.</b>—The string <i>regid</i> indicates that the XML portion is a registration ID for a software identification tag. A period (.) must be included after this string.</li> <li>● <b>YYYY-MM.</b>—This part of the registration ID identifies the first full month (MM) and the year (YYYY) in which the domain name was owned by the tag creator. For example, if you are creating the tag and you purchased the domain name February 15, 1999, you would use <b>1999-03</b> in this part of the registration ID, since the first full month the domain name was owned was March (03), and the year was 1999. The year and month must be separated by a dash.</li> <li>● <b>ReversedDomainName</b>—This part identifies the reversed domain name of the organization that is creating the software identification tag. For example, for the <i>revera.com</i> domain name, the reversed domain name is: <b>com.revera</b></li> <li>● <b>,division</b>—This optional part starts with a comma (,), and is followed by an additional string. You can enter a string that helps to distinguish between different divisions or areas of the organization. If you do not want to use this optional distinguishing part of the registration ID, do not include the comma or an additional string in your entry.</li> </ul>
<b>Software Licensor</b>	Basic MSI	<p>Enter the name of the organization that owns the copyright for the software.</p> <p>This setting is optional. If you leave this setting blank, InstallShield uses the value of the Tag Creator setting for the name of the software licensor.</p>

**Table 5** • Software Identification Tag Settings (cont.)

Setting	Project Type	Description
<b>Software Licensor ID</b>	Basic MSI	<p>Enter the registration ID of the organization that owns the copyright for the software. This ID helps to differentiate between different legal organizations that have the same licensor name but are in different countries.</p> <p>This setting is optional. If you leave this setting blank, InstallShield uses the value of the Tag Creator ID setting for the software licensor ID.</p> <p>The convention for the registration ID is as follows:</p> <p><b>regid.YYYY-MM.ReversedDomainName,division</b></p> <p>The registration ID consists of the following parts:</p> <ul style="list-style-type: none"> <li>● <b>regid.</b>—The string <i>regid</i> indicates that the XML portion is a registration ID for a software identification tag. A period (.) must be included after this string.</li> <li>● <b>YYYY-MM.</b>—This part of the registration ID identifies the first full month (MM) and the year (YYYY) in which the domain name was owned by the tag creator. For example, if you are creating the tag and you purchased the domain name February 15, 1999, you would use <b>1999-03</b> in this part of the registration ID, since the first full month the domain name was owned was March (03), and the year was 1999. The year and month must be separated by a dash.</li> <li>● <b>ReversedDomainName</b>—This part identifies the reversed domain name of the organization that is creating the software identification tag. For example, for the <i>revera.com</i> domain name, the reversed domain name is: <b>com.revera</b></li> <li>● <b>,division</b>—This optional part starts with a comma (,), and is followed by an additional string. You can enter a string that helps to distinguish between different divisions or areas of the organization. If you do not want to use this optional distinguishing part of the registration ID, do not include the comma or an additional string in your entry.</li> </ul>
<b>Add SCCM App Model Data</b>	Basic MSI	<p>Specify whether you want to include application model data for Microsoft System Center Configuration Manager in the software identification tag in your installation. If you select Yes, configure this setting's subsettings as needed.</p> <p>For more information, see <a href="#">Including Microsoft System Center Configuration Manager Application Model Data About Your Product</a>.</p>

**Table 5** • Software Identification Tag Settings (cont.)

Setting	Project Type	Description
<b>Application Type</b>	Basic MSI	Select the type of application that your installation installs.
<b>Supersedence</b>	Basic MSI	If you want the installation that you are creating to supersede other installations, click the ellipsis button (...) in this setting. The <a href="#">Supersedence dialog box</a> opens, enabling you to browse to the Windows Installer packages (.msi) that you want to be superseded.
<b>Uninstall Superseded Applications</b>	Basic MSI	Specify whether the applications that are being superseded should be uninstalled before installing the application via the current installation.

## Package Information View

**Project** • The Package Information view is available in the following project types:

- MSIX

The Package Information view contains links to other views that you can use to configure general settings about your installation.

- [General Information View](#)
- [Visual Assets View](#)
- [Capabilities View](#)
- [Declarations View](#)
- [Content URIs View](#)

## General Information View

**Project** • The General Information view is available in the following project types:

- MSIX

The General Information view contains basic information about your project, your company, and your product. Some of the information that you enter in this view is for your reference only, some is necessary to comply with Windows logo requirements, and the rest is for setting basic project settings.

When you create a new installation project, you must configure its General Information view settings. InstallShield creates new projects with default settings, but you should set your own values so that your project includes data that is specific to your needs.

The General Information view consists of the following elements:

- A row of buttons
- A grid of settings

The following table describes the buttons that are displayed in the General Information view.

**Table 6** • Controls in the General Information View

Name of Control	Icon	Description
<b>Categorized</b>		Sorts the settings according to categories.
<b>Alphabetical</b>		Sorts the settings alphabetically.

For descriptions of each of the settings in the General Information view, see [General Information View Settings](#).

## General Information View Settings

**Project** • The General Information view is available in the following project types:

- MSIX
- MSIX Modification Package

The General Information view settings are organized into the following main categories:

- [General](#)
- [Base Package Details](#)
- [Packaging](#)
- [Display Properties](#)

## General

Use the General area of the General Information view to specify details such as product name and product version. The following settings are available in this area.

**Table 7 • General**

Setting	Project Type	Description
<b>Project File Name</b>	MSIX, MSIX Modification Package	<p>This read-only setting displays the path and name of the InstallShield project file. It also shows the type of project.</p> <p>The extension of the project file varies, depending on the project type:</p> <ul style="list-style-type: none"> <li>• <b>.ism project file</b>—InstallShield uses this extension MSIX Module.</li> </ul> <p>To learn more, see <a href="#">Project Types</a>.</p>
<b>Project File Format</b>	MSIX, MSIX Modification Package	<p>Select the file format that you want to use for your project file (.ism or .dim). Available options are:</p> <ul style="list-style-type: none"> <li>• <b>Binary</b>—To save the .ism file as a database file, select this option. This format is best for the speed of opening and saving the project file.</li> </ul> <p>This is the default format for MSIX Module projects. If you select this project file format for these project types, you can modify the .ism file in a Windows Installer database editor. You can also modify the .ism file by using the Windows Installer API or its automation interface.</p>
 <p><b>Note</b> ▪ This project file format lets you build releases from the command line.</p>		

## Base Package Details

Use the **Base Package Details** area of the General Information view to define the relationship between a MSIX package and a MSIX modification package. These details will appear in modification package manifest file as below:

<Dependencies>

```
<uap4:MainPackageDependency Name="Main.App" Publisher="CN=Reverera, C=US" />
```

</Dependencies>

The following settings are available in this area:

**Table 8** • Base Package Details

Setting	Project Type	Description
<b>Base Package Name</b>	MSIX Modification Package	Required. Describes the base package identity name (Refer <Identity Name="Main.App"). The Name attribute is case-sensitive.
<b>Publisher Name</b>	MSIX Modification Package	To specify the Subject\Publisher name of the certificate that was used to sign the main package. For example,  CN=Reverera, O=Reverera, L=Itasca, S=Illinois, and C=US.

**Tip** ▪ The publisher name should be same as it appears in the Publisher attribute of the Identity element of the dependency/main package manifest.xml file. This field is optional if both main package and modification packages are using the same signing certificate.

## Packaging

The Packaging contains information about the Package Name, Package Version, Package Code and Default Language.

The following settings are available in the Packaging area in the General Information view..

**Table 9** • Packaging Settings

Setting	Project Type	Description
<b>Package Name</b>	MSIX, MSIX Modification Package	Describes the contents of the package. The Name attribute is case-sensitive. A string consists of alpha-numeric, period and dash characters.
<b>Package Version</b>	MSIX, MSIX Modification Package	The version number of the package. A version string in quad notation, "Major.Minor.Build.Revision" where Major cannot be "0".  For Windows 10 (UWP) packages, the last (fourth) section of the version number is reserved for Store use and must be left as 0 when you build your package (although the Store may change the value in this section). The other sections must be set to an integer between 0 and 65535 (except for the first section, which cannot be 0).
<b>Package Code</b>	MSIX	Enter a GUID that uniquely identifies this package.  Since this code uniquely identifies your package, changing the package code is not recommended.

**Table 9** • Packaging Settings (cont.)

Setting	Project Type	Description
<b>Default Language</b>	MSIX, MSIX Modification Package	The language for the resource contained is in the package. The syntax of this attribute is defined by the IETF's.

## Display Properties

The Display Properties contains information about the Display Name and Description.

The following settings are available in the Display Properties area in the General Information view..

**Table 10** • Display Properties Settings

Setting	Project Type	Description
<b>Display Name</b>	MSIX, MSIX Modification	A friendly name that can be displayed to the users.
<b>Description</b>	MSIX, MSIX Modification	A friendly description that can be displayed to the users.

## Visual Assets View

**Project** • The Visual Assets view is available in the following project types:

- MSIX
- MSIX Modification Package

The MSIX VisualAssets explorer offers an integrated, visual method for describing visual aspects of the MSIX apps.

You can modify its default tile, logo images, text and background colors, initial screen orientation, splash screen and lock screen tile appearance.

The Visual Assets view settings are organized into the following main categories:

- [Package Logo Settings](#)
- [Default Visual Asset Settings](#)
- [User Defined Settings](#)

## Package Logo Settings

**Project** • The Package Logo view is available in the following project types:

- [MSIX](#)
- [MSIX Modification Package](#)

Use the Package Logo area of the Visual Assets view to specify details such as display settings, package logo and scaled assets.

- [Display Settings](#)

## Display Settings

Describes the visual aspects of the Windows app package.

The following settings are available in this area..

**Table 11** • Package Logo Settings

Package Logo Settings	Project Type	Description
<b>Package Logo</b>	MSIX, MSIX Modification Package	A path to a file that contains an image. This image appears in App installer, Partner Center, the “Report an app” option in the Store, the “Write a review” option in the Store.
<b>Scaled Assets</b>	MSIX, MSIX Modification Package	<p>Select 'Yes' if you want to specify multiple versions of the same icon for different display scale factors. The scale factor determines the size of UI elements, such as text.</p> <p>Scale factors range from 100% to 400%. Larger values create larger UI elements, making them easier to see on high-DPI displays.</p>

## Default Visual Asset Settings

**Project** • The Default Visual Asset view is available in the following project types:

- [MSIX](#)

Use the Default Visual Asset area of the Visual Assets view to specify details such as display settings, tiles, app icon, splash screen, and notifications.

- [Display Settings](#)
- [Small Tile](#)
- [Medium Tile](#)
- [Wide Tile](#)
- [Large Tile](#)
- [App Icon](#)
- [Splash Screen](#)

- **Notifications**

## Display Settings

Describes the visual aspects of the Windows app package like Short Name, Background color, Splash Screen Background, and Show Name on Tiles.

The following settings are available in this area:

**Table 12** • Display Settings

Visual Asset Settings	Project Type	Description
<b>Short Name</b>	MSIX	A short name for the app that is displayed directly on the tile. A string between 1 and 40 characters in length.
<b>Background Color</b>	MSIX	Specifies the background color of the app tile. A three-byte hexadecimal number preceded by “#” or a named color.
<b>Splash Screen Background</b>	MSIX	Specifies the background color of the splash screen. A three-byte hexadecimal number preceded by “#” or a named color.
<b>Show Name on Tiles</b>	MSIX	Specify whether the app name should be shown on a Medium, Large, or / and Wide sized tiles. The tile sizes, as expressed by their logo size, that should display the app's display name.

## Small Tile

Specify a relative path to a small-sized (71x71) tile background image, or click the ellipsis button (...) to browse to a .png or .jpg file.

The following settings are available in this area:

**Table 13** • Small Tile

Visual Asset Settings	Project Type	Description
<b>Small Tile Image</b>	MSIX	Specify a relative path to a small-sized (71x71) tile background image, or click the ellipsis button (...) to browse to a .png or .jpg file.
<b>Scales Assets</b>	MSIX	<p>Select 'Yes' if you want to specify multiple versions of the same icon for different display scale factors. The scale factor determines the size of UI elements, such as text.</p> <p>Scale factors range from 100% to 400%. Larger values create larger UI elements, making them easier to see on high-DPI displays.</p>

## Medium Tile

Specify a relative path to a medium-sized (150x150) tile background image, or click the ellipsis button (...) to browse to a .png or .jpg file.

The following settings are available in this area:

**Table 14** • Medium Tile

Visual Asset Settings	Project Type	Description
<b>Medium Tile Image</b>	MSIX	Specify a relative path to a medium-sized (150x150) tile background image, or click the ellipsis button (...) to browse to a .png or .jpg file.
<b>Scaled Assets</b>	MSIX	<p>Select 'Yes' if you want to specify multiple versions of the same icon for different display scale factors. The scale factor determines the size of UI elements, such as text.</p> <p>Scale factors range from 100% to 400%. Larger values create larger UI elements, making them easier to see on high-DPI displays.</p>

### Wide Tile

Specify a 310x150 image file to be used for a wide tile, only when pinned and resized. This setting is optional. If specified, this will allow the tile to be set to Wide.

The following settings are available in this area:

**Table 15** • Wide Tile

Visual Asset Settings	Project Type	Description
<b>Wide Tile Image</b>	MSIX	Specify a 310x150 image file to be used for a wide tile, only when pinned and resized. This setting is optional. If specified, this will allow the tile to be set to Wide.
<b>Scales Assets</b>	MSIX	<p>Select 'Yes' if you want to specify multiple versions of the same icon for different display scale factors. The scale factor determines the size of UI elements, such as text.</p> <p>Scale factors range from 100% to 400%. Larger values create larger UI elements, making them easier to see on high-DPI displays.</p>

### Large Tile

Specify a 310x310 image file to be used for a large tile, only when pinned and resized. This setting is optional. If specified, this will allow the tile to be set to Large.

The following settings are available in this area:

**Table 16** • Large Tile

Visual Asset Settings	Project Type	Description
<b>Large Tile Image</b>	MSIX	Specify a 310x310 image file to be used for a large tile, only when pinned and resized. This setting is optional. If specified, this will allow the tile to be set to Large.
<b>Scales Assets</b>	MSIX	<p>Select 'Yes' if you want to specify multiple versions of the same icon for different display scale factors. The scale factor determines the size of UI elements, such as text.</p> <p>Scale factors range from 100% to 400%. Larger values create larger UI elements, making them easier to see on high-DPI displays.</p>

### App Icon

Specify a 44x44 image file to use as a small logo icon that is displayed in the left column of the Start Menu's All Apps list. If an image file is not provided, InstallShield generates a small logo from the target's tile configuration or the application's icon.

The following settings are available in this area:

**Table 17** • App Icon

Visual Asset Settings	Project Type	Description
<b>App Icon Image</b>	MSIX	Specify a 44x44 image file to use as a small logo icon that is displayed in the left column of the Start Menu's All Apps list. If an image file is not provided, InstallShield generates a small logo from the target's tile configuration or the application's icon.
<b>Scaled Assets</b>	MSIX	<p>Select 'Yes' if you want to specify multiple versions of the same icon for different display scale factors. The scale factor determines the size of UI elements, such as text.</p> <p>Scale factors range from 100% to 400%. Larger values create larger UI elements, making them easier to see on high-DPI displays.</p>

### Splash Screen

Defines the appearance of the splash screen, which is displayed by the app during launch.

The following settings are available in this area:

**Table 18** • Splash Screen

Visual Asset Settings	Project Type	Description
<b>Splash Screen Image</b>	MSIX	Defines the appearance of the splash screen, which is displayed by the app during launch.
<b>Scaled Assets</b>	MSIX	<p>Select 'Yes' if you want to specify multiple versions of the same icon for different display scale factors. The scale factor determines the size of UI elements, such as text.</p> <p>Scale factors range from 100% to 400%. Larger values create larger UI elements, making them easier to see on high-DPI displays.</p>

## Notifications

Defines the badge and notifications that represent the app on the lock screen, which is shown when the system is locked.

The following settings are available in this area:

**Table 19** • Notifications

Visual Asset Settings	Project Type	Description
<b>Lock Screen Notifications</b>	MSIX	<p>The type of tile that can be shown for an app on the lock screen. This can either be a Badge or BadgeAndTileText.</p> <p>This attribute can have one of the following values:</p> <ul style="list-style-type: none"> <li>● <b>Badge</b> - Displays either a number or a glyph to communicate status.</li> <li>● <b>BadgeAndTileText</b> - Both badge and text, which can display detailed status.</li> </ul>
<b>Badge Logo Image</b>	MSIX	A logo image that is shown next to the badge to identify the app. This image must be monochromatic, of type .png, and measure 24 x 24 pixels.
<b>Scaled Assets</b>	MSIX	<p>Select 'Yes' if you want to specify multiple versions of the same icon for different display scale factors. The scale factor determines the size of UI elements, such as text.</p> <p>Scale factors range from 100% to 400%. Larger values create larger UI elements, making them easier to see on high-DPI displays.</p>

## User Defined Settings

**Project** ▪ The User Defined view is available in the following project types:

- MSIX

By default, all shortcut entries created in shortcut view refer to 'Default Visual Asset'. You can as well define custom visual assets using context menu option. These custom defined Visual Assets can be mapped to any existing shortcut from the Application view.

You can create a new tile, logo images, text and background colors, initial screen orientation, splash screen and lock screen tile appearance. These Visual Assets can be mapped to any shortcut in the Application view.

For more information, see [Default Visual Asset Settings](#).

## Capabilities View

**Project** ▪ The Capabilities view is available in the following project types:

- MSIX

There are specific capabilities required to be enabled in app's package manifest to access certain API or resources like pictures, music, or devices such as the camera or the microphone.

The Capabilities view settings are organized into the following main categories:

- [Device Capabilities](#)
- [General Capabilities](#)
- [Restricted Capabilities](#)

## Device Capabilities

**Project** ▪ The Capabilities view is available in the following project types:

- MSIX

The device capabilities allows you to access peripheral and internal devices. It is specified with the Device Capability element in your app package manifest.

**Table 20** ▪ Device Capabilities

Device Capabilities Settings	Project Type	Description
Bluetooth	MSIX	Allows apps to communicate with already paired bluetooth devices over both Generic Attribute (GATT) or Classic Basic Rate (RFCOMM) protocol.

**Table 20** • Device Capabilities

Device Capabilities Settings	Project Type	Description
<b>Gaze Input (Eye Tracker)</b>	MSIX	Allows apps to detect where the user is looking within the application bounds when a compatible eye tracking device is connected.
<b>Location</b>	MSIX	Provides access to location functionality that is retrieved from dedicated hardware like a GPS sensor in the PC or derived from available network information.
<b>Low Level</b>	MSIX	Provides access to GPIO, I2C, SPI, and PWM devices.
<b>Microphone</b>	MSIX	Provides access to the microphone's audio feed, which allows the app to record audio from connected microphones.
<b>Point of Service</b>	MSIX	<p>The pointOfService device capability enables access to APIs in the Windows.Devices.PointOfService namespace. This namespace lets your app access Point of Service (POS) barcode scanners and magnetic stripe readers.</p> <p>The namespace provides a vendor-neutral interface for accessing POS devices from various manufacturers from a Windows Store app.</p>
<b>Proximity</b>	MSIX	Provides the capability to connect devices in close proximity to the PC via near field proximity radio or Wi-Fi Direct. Near field proximity may be used to send files or communicate with an app on a nearby device.
<b>Webcam</b>	MSIX	Provides access to the video feed of a built-in camera or external webcam, which allows the app to capture photos and videos.

## General Capabilities

**Project** • The Capabilities view is available in the following project types:

- MSIX

The general capabilities allows you to access most of the common app scenarios.

**Table 21** - General Capabilities

General Capabilities Settings	Project Type	Description
<b>3D Objects</b>	MSIX	Provides programmatic access to the user's 3D Objects, allowing the app to enumerate and access all files in the library without user interaction. This capability is typically used in 3D apps and games that need access the entire 3D Objects library.
<b>AllJoyn</b>	MSIX	Allows AllJoyn-enabled apps and devices on a network to discover and interact with each other.
<b>Appointments (Calendar)</b>	MSIX	Provides access to the user's appointment store. This capability allows read access to appointments obtained from the synced network accounts and to other apps that write to the appointment store. With this capability, your app can create new calendars and write appointments to calendars that it creates.
<b>Background Media Playback</b>	MSIX	Changes the behavior for media APIs to enable background playback by default. All active audio streams will no longer mute, but will continue to be audible when an app transitions to the background. Additionally, application lifetime will be extended automatically while playback is occurring.
<b>Blocked Chat Messages</b>	MSIX	Allows apps to read SMS and MMS messages that have been blocked by the Spam Filter app.
<b>Chat Message Access</b>	MSIX	Allows app to read and delete Text messages. It also allow apps to store chat messages in the system data store.
<b>Code Generation</b>	MSIX	Allows apps to generate code dynamically.
<b>Contacts</b>	MSIX	Provides ability to enumerate the aggregates on the Phone. With this capability your app can access all linked contacts and provides and uber view of the Person.
<b>Graphics Capture</b>	MSIX	Allows developers to acquire frames of a targeted item returned by the capture picker control.
<b>Internet (Client &amp; Server)</b>	MSIX	Provides inbound and outbound access to the Internet and the networks in Public places like airports and coffee shops. The capability is a superset of Internet(Client). Internet(Client) doesn't need to be enabled if this capability is also enabled.  Inbound access to critical ports is always blocked.

**Table 21** • General Capabilities

General Capabilities Settings	Project Type	Description
<b>Internet (Client)</b>	MSIX	<p>Provides outbound access to the Internet and networks in Public places like airports and coffee shops. For example, Intranet networks where the user has designated the network as public.</p> <p>Most apps that require Intranet access should use this capability.</p>
<b>Music Library</b>	MSIX	Provides the capability to add, change, or delete files in the Music Library for the local PC and HomeGroup PCs.
<b>Offline Maps Management</b>	MSIX	Allows apps to access MapControl APIs. This capability is needed in order to download map packages shared between users and apps.
<b>Phone Call</b>	MSIX	<p>Allows apps to access all of the phone lines on the device and perform the following functions:</p> <ul style="list-style-type: none"> <li>● Place a call on the phone line and show the system dialer without prompting the user.</li> <li>● Access line-related metadata.</li> <li>● Access line-related triggers.</li> <li>● Allows the user-selected spam filter app to set and check block list and call origin information.</li> </ul>
<b>Phone Calls History Public</b>	MSIX	Allows apps to read cellular and some VoIP call history information on the device. This capability also allows the app to write VoIP call history entries.
<b>Pictures Library</b>	MSIX	Provides the capability to add, change, or delete files in the Picture Library for the local PC and HomeGroup PCs.
<b>Private Networks (Client &amp; Server)</b>	MSIX	Provides inbound and outbound access to Intranet networks that have an authenticated domain controller, or that the user has designated as either home or work networks. Inbound access to critical ports is always blocked.
<b>Remote System</b>	MSIX	Provides access to devices associated with this user's Microsoft Account. This capability is needed in order to discover and connect to remote devices.
<b>Removable Storage</b>	MSIX	Provides the capability to add, change, or delete files on removable storage devices. The app can only access file types on removable storage that are defined in the manifest using the File Type Associations declaration.

**Table 21** ▪ General Capabilities

General Capabilities Settings	Project Type	Description
<b>Spatial Perception</b>	MSIX	Provides access to the location of a device that's tracked relative to the user's surroundings, such as a HoloLens or other Mixed Reality headset.
<b>User Account Information</b>	MSIX	Gives apps the ability to access the user's name and picture.
<b>User Data Tasks</b>	MSIX	Enable apps to select and acquire info about tasks.
<b>User Notification Listener</b>	MSIX	Allows ability to read and manage a user's notifications; typically used for Companion Device makers that mirror a user's notifications on a wearable device.
<b>Videos Library</b>	MSIX	Provides programmatic access to the user's Videos, allowing the app to enumerate and access all files in the library without user interaction.
<b>VOIP Calling</b>	MSIX	Allows apps to access the VoIP calling APIs.

## Restricted Capabilities

**Project** ▪ The Capabilities view is available in the following project types:

- MSIX

The restricted capabilities allows you to access special capabilities that are necessary and appropriate..

**Table 22** ▪ Restricted Capabilities

Restricted Capabilities Settings	Project Type	Description
<b>Elevation</b>	MSIX	Allows apps that are created by Microsoft partners and enterprises to preserve existing desktop functionality that requires auto-elevation on launch or during an app's lifetime.
<b>Enterprise Authentication</b>	MSIX	This capability is subject to the Store policy. Provides the capability to connect to enterprise intranet resources that require domain credentials. This capability is not typically needed for most apps.
<b>Full Trust Permission Level</b>	MSIX	Allows apps to run at the full trust permission level on the user's machine. This capability is also required for any desktop application that is delivered as an appx or msix package.

**Table 22** • Restricted Capabilities

Restricted Capabilities Settings	Project Type	Description
<b>Local System Services</b>	MSIX	The restricted capability of <code>localSystemServices</code> allows applications that are created by Microsoft partners and enterprises to install one or more Local System services along with the app (that is, your application can declare the <code>StartAccount</code> for the services to be LocalSystem). This scenario also requires the <code>packagesServices</code> capability.
<b>Shared User Certificates</b>	MSIX	This capability is subject to the Store policy. Provides the capability to access software and hardware certificates, such as a smart card certificates, for validating a user's identity. This capability is not necessary if your app includes a private certificate via a <code>Certificates</code> declaration.
<b>Packaged Services</b>	MSIX	The restricted capability of <code>packagedServices</code> allows applications that are created by Microsoft partners and enterprises to declare the <code>windows.service</code> extension in its package manifest to install one or more services along with the app. These services can be configured to run under the Local Service, Network Service, or Local System accounts. Only the Local Service and Network Service services require the <code>packagedServices</code> capability. Local System services require the <code>packagedServices</code> and <code>localSystemServices</code> capabilities.

## Declarations View

**Project** • The Declarations View is available in the following project types:

- MSIX

The Declarations View provides a visual tool for creating and managing the application, package level declarations and allows to configure their properties.

There are 2 types of Declarations:

- [Application Declaration Sets](#)
- [Package Declarations](#)

## Application Declaration Sets

**Project** • The Application Declaration Sets view is available in the following project type:

- MSIX

Application Declaration Sets allows you to add multiple Declaration Sets which are required for Application shortcut in the Application view to associate the Declarations to the Application.

Each Declaration's settings are displayed in the grid while selecting the Declaration type in the tree.

The Declaration Set consists of the following Declaration types:

- [Account Picture Provider](#)
- [Alarm](#)
- [App Extension Host](#)
- [App Service](#)
- [Appointments Provider](#)
- [AutoPlay Content](#)
- [AutoPlay Device](#)
- [Background Tasks](#)
- [Cached File Updater](#)
- [Camera Settings](#)
- [Dial Protocol](#)
- [File Open Picker](#)
- [File Save Picker](#)
- [File Type Associations](#)
- [Lock Screen](#)
- [Media Playback](#)
- [Personal Assistant Launch](#)
- [Print 3D Workflow](#)
- [Pre-installed Configuration](#)
- [Print Task Settings](#)
- [Protocol](#)
- [Restricted Launch](#)
- [Search](#)
- [Service](#)
- [Share Target](#)
- [Update Task](#)
- [Web Account Provider](#)
- [Windows Shared Fonts](#)

## Account Picture Provider

You can use this declaration to have Windows list your app in the Account Picture Settings control panel. The users can select this declaration to either replace their existing account picture or capture a new account picture.

**Note** - You are restricted to create only one instance per Declaration Set.

- **App Settings**

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Account Picture Provider declaration type:

**Table 23** - Account Picture Provider

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>• <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>• <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>• <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>

**Table 23** ▪ Account Picture Provider

Declaration	Project Type	Description
<b>Start Page</b>	MSIX	Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:  <, >, :, %, ",  , ?, or *.
<b>Resource Group</b>	MSIX	An app-defined name that determines the same host process for multiple tasks.  A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.

## Alarm

You can use this declaration to state applications as the System Alarm app. The users can set their System Alarm only to the selected applications that are stated as System Alarm apps.

**Note** ▪ You are restricted to create only one instance per Declaration Set.

- [App Settings](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Alarm declaration type:

**Table 24** ▪ Alarm

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	Application Settings specifies how to configure the Declaration default executable: <ul style="list-style-type: none"> <li>● <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>● <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>● <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>

Table 24 ▪ Alarm

Declaration	Project Type	Description
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## App Extension Host

You can use this declaration to register the supported HostNames for the app.

**Note** ▪ You are restricted to create only one instance per Declaration Set.

- [App Settings](#)
- [Names](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the App Extension Host declaration type:

**Table 25** - App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>● <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>● <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>● <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Names

A setting to register the supported HostNames for App Extension Host.

The following table describes the settings that are displayed in the App Extension Host declaration type:

**Table 26** ▪ Names

Declaration	Project Type	Description
<b>Names</b>	MSIX	<ul style="list-style-type: none"> <li>• <b>Names</b> - Specifies the App Extension Host Name supported by the App. To add a Name, click <b>Add New Name</b> button.</li> </ul>  <p><b>Important</b> ▪ Specifying one Name is mandatory.</p>

## App Service

This declaration helps you to use agreements to provide or launch the background tasks of an application that communicates with each other.

- [App Settings](#)
- [Properties](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the App Service declaration type:

**Table 27** ▪ App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>• <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>• <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>• <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>

**Table 27** ▪ App Settings

Declaration	Project Type	Description
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Properties

These are the settings for the App Service.

The following table describes the settings that are displayed in the App Service declaration type:

**Table 28** ▪ Properties

Declaration	Project Type	Description
<b>Name</b>	MSIX	Specify the Name for the App Service
<b>Server Name</b>	MSIX	Specify the Server Name for the App Service

## Appointments Provider

This declaration provides the capability for an application to interact with the calendar APIs and to create appointments.

**Note** ▪ You are restricted to create only one instance per Declaration Set.

- [App Settings](#)
- [Launch Actions](#)

## App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Appointments Provider declaration type:

**Table 29** • Appointments Provider

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>● <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>● <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>● <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Launch Actions

Settings to register the Calendar Appointment settings for the app.

The following table describes the settings that are displayed in the Appointments Provider declaration type:

**Table 30** - Launch Actions

Declaration	Project Type	Description
<b>Desired View</b>	MSIX	<p>Specify the Desired View field to indicate the amount of space the app's window needs when it is launched. This field can have one of the following values:</p> <ul style="list-style-type: none"> <li>• <b>Default</b></li> <li>• <b>Use Less</b></li> <li>• <b>Use Half</b></li> <li>• <b>Use More</b></li> <li>• <b>Use Minimum</b></li> </ul>
<b>Launch Actions</b>	MSIX	<p>Specifies the Appointment Launch Action supported by the App. To add a Launch Action, click <b>Add New Launch Action</b> button.</p>  <p><b>Important</b> - Specifying at least one Launch Action is mandatory.</p>
<b>Verb</b>	MSIX	<p>A unique identifier that is passed when it is launched to the app. This can have one of the following values:</p> <ul style="list-style-type: none"> <li>• <b>Add Appointment</b></li> <li>• <b>Remove Appointment</b></li> <li>• <b>Replace Appointment</b></li> <li>• <b>Show Timeframe</b></li> <li>• <b>Show Appointment Details</b></li> </ul>
<b>Verb - Entry Point</b>	MSIX	<p>Activatable class ID - A string between 1 and 256 characters in length that cannot contain these characters: &lt;, &gt;, :, %, ",  , ?, or *, representing the task handling the extension.</p>
<b>Verb - Executable</b>	MSIX	<p>Default launch executable - A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters: &lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Verb - Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p>
<b>Verb - Runtime Type</b>	MSIX	<p>The runtime provider. This field is used typically when there are mixed frameworks in an app.</p>

**Table 30** ▪ Launch Actions

Declaration	Project Type	Description
<b>Verb - Start Page</b>	MSIX	Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters: <, >, :, %, ",  , ?, or *.
<b>Verb - Desired View</b>	MSIX	Specify the Desired View field to indicate the amount of space the app's window needs when it is launched. This field can have one of the following values: <ul style="list-style-type: none"> <li>• <b>Default</b></li> <li>• <b>Use Less</b></li> <li>• <b>Use Half</b></li> <li>• <b>Use More</b></li> <li>• <b>Use Minimum</b></li> </ul>

## AutoPlay Content

This declaration helps you to register apps as options for AutoPlay Content events. AutoPlay Content events are raised when a volume device such as a camera memory card, thumb drive, or DVD is inserted into the PC.

- [App Settings](#)
- [Launch Actions](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the AutoPlay Content declaration type:

**Table 31** ▪ App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	Application Settings specifies how to configure the Declaration default executable: <ul style="list-style-type: none"> <li>• <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>• <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>• <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>

**Table 31** ▪ App Settings

Declaration	Project Type	Description
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Launch Actions

To register apps as options for AutoPlay content events. AutoPlay content events are raised when a volume device such as a camera memory card, thumb drive, or DVD is inserted into the PC.

The following table describes the settings that are displayed in the AutoPlay Content declaration type:

**Table 32** ▪ Launch Actions

Declaration	Project Type	Description
<b>Launch Actions</b>	MSIX	<p>Specifies the Appointment Launch Action supported by the App. To add a Launch Action, click <b>Add New Launch Action</b> button.</p> <p></p> <p><b>Important</b> ▪ Specifying at least one Launch Action is mandatory.</p>

**Table 32** - Launch Actions

Declaration	Project Type	Description
<b>Launch Action Verb</b>	MSIX	Specifies an activation string to pass to the App when the event arrives. 'Launch Action Verb' required to be unique across AutoPlay Content and AutoPlay Device 'Launch Action Verb'.
<b>Action Display Name</b>	MSIX	Specifies the string to display in the AutoPlay UI.
<b>Content Event</b>	MSIX	Specifies the type of event to recognize on arrival.

## AutoPlay Device

This declaration helps you to register apps as options for AutoPlay Device events. AutoPlay Device events are raised when a device is connected to a PC.

- [App Settings](#)
- [Launch Actions](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the AutoPlay Device declaration type:

**Table 33** - App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>• <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>• <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>• <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>

**Table 33** - App Settings

Declaration	Project Type	Description
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>
<b>Launch Actions</b>	MSIX	To register apps as options for AutoPlay Device events. AutoPlay device events are raised when a device is connected to a PC.

### Launch Actions

To register apps as options for AutoPlay Device events. AutoPlay device events are raised when a device is connected to a PC.

The following table describes the settings that are displayed in the AutoPlay Device declaration type:

**Table 34** - Launch Actions

Declaration	Project Type	Description
<b>Launch Actions</b>	MSIX	<p>Specifies the Appointment Launch Action supported by the App. To add a Launch Action, click <b>Add New Launch Action</b> button.</p>  <p><b>Important</b> - Specifying at least one Launch Action is mandatory.</p>
<b>Launch Action Verb</b>	MSIX	Specifies an activation string to pass to the App when the event arrives. 'Launch Action Verb' required to be unique across AutoPlay Content and AutoPlay Device 'Launch Action Verb'.
<b>Action Display Name</b>	MSIX	Specifies the string to display in the AutoPlay UI.

**Table 34** ▪ Launch Actions

Declaration	Project Type	Description
<b>Device Event</b>	MSIX	Specifies the type of event to recognize on arrival.

## Background Tasks

Even when the app is suspended, you can run the app code using the background tasks.

- [App Settings](#)
- [Supported Task Types](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Background Tasks declaration type:

**Table 35** ▪ App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>• <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>• <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>• <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>

**Table 35** ▪ App Settings

Declaration	Project Type	Description
<b>Start Page</b>	MSIX	Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:  <, >, :, %, ",  , ?, or *.
<b>Resource Group</b>	MSIX	An app-defined name that determines the same host process for multiple tasks.  A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.

### Supported Task Types

Apps can use background tasks to run app code even when the app is suspended. Background tasks are intended for small work items that require no interaction with the user.

The following table describes the settings that are displayed in the Background Tasks declaration types:

**Table 36** ▪ Supported Task Types

Declaration	Project Type	Description
<b>Bluetooth</b>	MSIX	Specifies to run Background task to handle Bluetooth.
<b>Bluetooth Device Connection</b>	MSIX	Specifies to run Background task to handle Bluetooth device connection events.
<b>Chat Message Notification</b>	MSIX	Specifies to run Background task to handle the Chat Message Notification.
<b>Control Channel</b>	MSIX	Specifies to run Background task for real-time apps that maintain open socket connections.
<b>Device Use Trigger</b>	MSIX	Specifies to access sensors and devices from Background tasks.
<b>General</b>	MSIX	To add a general Background task, such as to invoke from the foreground.
<b>Location</b>	MSIX	Specifies to get the geofence events in the Background tasks.
<b>Media Processing</b>	MSIX	Specifies to run Background task to process media files in the background.
<b>Phone Call</b>	MSIX	Specifies to run Background task on Phone Call.

**Table 36** ▪ Supported Task Types

Declaration	Project Type	Description
<b>Push Notification</b>	MSIX	Specifies to run a Background task for the Push Notification from the Windows Notification Server.
<b>System Event</b>	MSIX	Specifies to run background task to handle system events.
<b>Timer</b>	MSIX	Specifies to run Background task on Timer.
<b>VPN Client</b>	MSIX	Specifies to run background tasks for VPN plug-in applications.

## Cached File Updater

This declaration helps you to provide updates for particular files to help users who want to use the app as a central repository to track and maintain files.

**Note** ▪ You are restricted to create only one instance per Declaration Set.

- [App Settings](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Cached File Updater declaration type:

**Table 37** ▪ App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>• <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>• <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>• <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>

**Table 37** ▪ App Settings

Declaration	Project Type	Description
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Camera Settings

This declaration helps you to customize the flyout that displays more camera options for the UWP device apps.

**Note** ▪ You are restricted to create only one instance per Declaration Set.

- **App Settings**

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Camera Settings declaration type:

**Table 38** - App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>● <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>● <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>● <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Dial Protocol

If you are on a network device, you can use the DIAL protocol to launch applications on the Xbox One. If the application you are trying to run is not available, you can even use the DIAL network to install the application before running it.

- [App Settings](#)
- [Properties](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Dial Protocol declaration type:

**Table 39** • App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>• <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>• <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>• <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>

**Table 39** ▪ App Settings

Declaration	Project Type	Description
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Properties

These settings are for the Dial Protocol Name.

The following table describes the settings that are displayed in the Dial Protocol declaration type:

**Table 40** ▪ Properties

Declaration	Project Type	Description
<b>Name</b>	MSIX	Specifies the Name of the Application to launch by the Dial Protocol

## File Open Picker

This declaration helps users to pick files from the app directly while the user is using another app.

**Note** ▪ You are restricted to create only one instance per Declaration Set.

- [App Settings](#)
- [Supported File Types](#)

## App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the File Open Tracker declaration type:

**Table 41** - App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>● <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>● <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>● <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

### Supported File Types

Specifies to register the App for the file type operations.

The following table describes the settings that are displayed in the File Open Tracker declaration type:

**Table 42** ▪ Supported File Types

Declaration	Project Type	Description
<b>Supported Any File Type</b>	MSIX	<p>If Selected:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b> - The app recognizes all the file types</li> <li>● <b>No</b> - The app recognizes only the file types declared under the Supported File Type.</li> </ul>
<b>Supported File Types</b>	MSIX	<p>Specifies the File Type supported by the App. To add a File Type, click <b>Add New File Type</b> button.</p>  <p><b>Important</b> ▪ Specifying at least one file type is mandatory.</p>
<b>File Type</b>	MSIX	<p>Specifies the File Type that the App Supports, required to start with '.'</p>

## File Save Picker

This declaration helps users to save files to the app directly while the user is using another app.

**Note** ▪ You are restricted to create only one instance per Declaration Set.

- [App Settings](#)
- [Supported File Types](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the File Save Tracker declaration type:

**Table 43** - App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>● <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>● <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>● <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

### Supported File Types

Specifies to register the App for the file type operations.

The following table describes the settings that are displayed in the File Save Tracker declaration type:

**Table 44** ▪ Supported File Types

Declaration	Project Type	Description
<b>Supported Any File Type</b>	MSIX	<p>If Selected:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b> - The app recognizes all the file types</li> <li>● <b>No</b> - The app recognizes only the file types declared under the Supported File Type</li> </ul>
<b>Supported File Types</b>	MSIX	<p>Specifies the File Type supported by the App. To add a File Type, click <b>Add New File Type</b> button.</p>  <p><b>Important</b> ▪ Specifying at least one file type is mandatory.</p>
<b>File Type</b>	MSIX	Specifies the File Type that the App Supports, required to start with '.'

## File Type Associations

This declaration helps you to choose an app to register to become the default handler for a certain file type. The user can choose an app as the default handler for a certain file type, the selected app can be activated every time that type of file is launched.

- [App Settings](#)
- [Edit Flags](#)
- [Properties](#)
- [Supported File Types](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the File Type Associations declaration type:

**Table 45** - App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>● <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>● <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>● <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

**Table 45** ▪ App Settings

Declaration	Project Type	Description
<b>Desired View</b>	MSIX	Specify the Desired View field to indicate the amount of space the app's window needs when it is launched for the file type. This field can have one of the following values: <ul style="list-style-type: none"> <li>• <b>Default</b></li> <li>• <b>Use Less</b></li> <li>• <b>Use Half</b></li> <li>• <b>Use More</b></li> <li>• <b>Use Minimum</b></li> </ul>

### Edit Flags

Specify the Edit Flag for a group of file types.

The following table describes the settings that are displayed in the File Type Associations declaration type:

**Table 46** ▪ Edit Flags

Declaration	Project Type	Description
<b>Open is Safe</b>	MSIX	Indicates that the word ' <b>Open</b> ' for the file type can be invoked for any downloaded files.
<b>Always Unsafe</b>	MSIX	Indicates to override automatically when the file type is disabled.

### Properties

Settings for the File Type Association Properties

The following table describes the settings that are displayed in the File Type Associations declaration type:

**Table 47** ▪ Properties

Declaration	Project Type	Description
<b>Display Name</b>	MSIX	Specify the Display Name for a group of file types.
<b>Logo</b>	MSIX	Specify the logo that is used to identify the file type
<b>Info Tip</b>	MSIX	Specify the Info Tip to appear when the user hovers on the icon for a file of this type

**Table 47** ▪ Properties

Declaration	Project Type	Description
<b>Name</b>	MSIX	Choose a name for a group of file types that share the same display name, logo, info tip, and edit flags
		
		<b>Important</b> ▪ The Name must be in lower case letters.

## Supported File Types

Settings to register the App for the file type operations

The following table describes the settings that are displayed in the File Type Associations declaration type:

**Table 48** ▪ Supported File Types

Declaration	Project Type	Description
<b>Supported File Type</b>	MSIX	Specifies the File Type supported by the App. To add a File Type, click <b>Add New File Type</b> button.
		
		<b>Important</b> ▪ Specifying at least one file type is mandatory.
<b>File Type</b>	MSIX	Specifies the File Type that the App Supports, required to start with '.'
<b>Content Type</b>	MSIX	Specifies the MIME content type for the App's File Type, must contain at least one '/'.

## Lock Screen

This declaration helps the user to answer a VoIP phone call without unlocking the screen of the phone.

**Note** ▪ You are restricted to create only one instance per Declaration Set.

- [App Settings](#)

## App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Lock Screen declaration type:

**Table 49** - App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>● <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>● <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>● <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Media Playback

In order to support Windows Store apps, you must indicate those apps to support DVD playback.

**Note** - You are restricted to create only one instance per Declaration Set.

- [App Settings](#)
- [Supported Codecs](#)

## App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Media Playback declaration type:

**Table 50** - App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>• <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>• <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>• <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>

**Table 50** ▪ App Settings

Declaration	Project Type	Description
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Supported Codecs

Settings to register the supported media codec for Media Play Back.

The following table describes the settings that are displayed in the Media Playback declaration type:

**Table 51** ▪ Supported Codecs

Declaration	Project Type	Description
<b>Supported Codec</b>	MSIX	<p>Specifies the Media Codec supported by the App. To add a File Type, click <b>Add New Codec</b> button.</p> <p></p> <p><b>Important</b> ▪ Specifying at least one Codec is mandatory.</p>
<b>Codec</b>	MSIX	Specifies the Name of the Codec

## Personal Assistant Launch

This declaration helps you to provide deep links from a background app to the foreground app in a specific state or context.

**Note** ▪ You are restricted to create only one instance per Declaration Set.

- [App Settings](#)

## App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Personal Assistant Launch declaration type:

**Table 52** - App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>● <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>● <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>● <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Print 3D Workflow

This declaration helps you to use a Windows Store device app to provide a unique experience in the 3D print dialog.

**Note** - You are restricted to create only one instance per Declaration Set.

- [App Settings](#)

## App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Print 3D Workflow declaration type:

**Table 53** - App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>● <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>● <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>● <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>

**Table 53** ▪ App Settings

Declaration	Project Type	Description
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Pre-installed Configuration

This declaration allows you to immediately launch an update task without any user interaction to make sure the application is updated immediately.

**Note** ▪ You are restricted to create only one instance per Declaration Set.

- [App Settings](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Pre-installed Configuration declaration type:

**Table 54** ▪ App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>• <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>• <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>• <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>

**Table 54** • App Settings

Declaration	Project Type	Description
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Print Task Settings

This declaration allows you to use a Windows Store device app to customize the flyout that displays advanced print settings.

**Note** • You are restricted to create only one instance per Declaration Set.

- [App Settings](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Print Task Settings declaration type:

**Table 55** - App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>● <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>● <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>● <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Protocol

This declaration help you to use existing URI schemes, such as mailto, or create a custom URI scheme for the app. The URI activation extension enables you to define a custom URI scheme or register to handle an existing URI scheme.

- [App Settings](#)
- [Properties](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Protocol declaration type:

**Table 56** ▪ App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>• <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>• <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>• <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>

**Table 56** ▪ App Settings

Declaration	Project Type	Description
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Properties

Setting to register the App for the URL protocol.

The following table describes the settings that are displayed in the Protocol declaration type:

**Table 57** ▪ Properties

Declaration	Project Type	Description
<b>Logo</b>	MSIX	Specifies the icon image that appears in the Windows shell for protocols that match the app
<b>Display Name</b>	MSIX	Specifies an optional display name for this protocol handler
<b>Name</b>	MSIX	Specifies the name of the Protocol that supports the app

## Restricted Launch

This declaration allows the app to protect itself from the untrusted content. Child app containers provide an extra level of isolation at runtime when untrusted content may be executed by the Windows Store app.

**Note** ▪ You are restricted to create only one instance per Declaration Set.

- [App Settings](#)

## App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Restricted Launch declaration type:

**Table 58** - App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>● <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>● <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>● <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Share Target

This declaration allows you to help users share content from your app with another app or service, and vice versa. Apps that support the Share Target can automatically share content to and from any other app that also supports the declaration.

**Note** - You are restricted to create only one instance per Declaration Set.

- [App Settings](#)
- [Properties](#)
- [Data Formats](#)
- [Supported File Types](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Share Target declaration type:

**Table 59** - App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>• <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>• <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>• <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>

**Table 59** ▪ App Settings

Declaration	Project Type	Description
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Properties

Specify the Share Target properties to register the app to receive the sharable content

The following table describes the settings that are displayed in the Share Target declaration type:

**Table 60** ▪ Properties

Declaration	Project Type	Description
<b>Share Description</b>	MSIX	Specifies the Share Target's description that will appear in Windows

## Data Formats

Settings to specify the data formats supported by the App.

The following table describes the settings that are displayed in the Share Target declaration type:

**Table 61** ▪ Data Formats

Declaration	Project Type	Description
<b>Date Formats</b>	MSIX	To add a Data Format, click <b>Add New Data Format</b> button

## Supported File Types

Settings to register the App for the file type operations

The following table describes the settings that are displayed in the Share Target declaration type:

**Table 62** ▪ Supported File Types

Declaration	Project Type	Description
<b>Supported Any File Type</b>	MSIX	<p>If Selected:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b> - The app recognizes all the file types</li> <li>● <b>No</b> - The app recognizes only the file types declared under the Supported File Type</li> </ul>
<b>Supported File Types</b>	MSIX	<p>Specifies the File Type supported by the App. To add a File Type, click <b>Add New File Type</b> button.</p>  <p><b>Important</b> ▪ Specifying at least one file type is mandatory.</p>
<b>File Type</b>	MSIX	<p>Specifies the File Type that the App Supports, required to start with '.'</p>

## Search

This declaration allows you to add a search pane to the app so the users can search not only the app's content but content from other apps as well. Users can also transfer the search query itself to other apps.

**Note** ▪ You are restricted to create only one instance per Declaration Set.

- [App Settings](#)

## App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Search declaration type:

**Table 63** - App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>● <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>● <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>● <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Service

Specifies a service that is installed and registered along with the app. These services can be configured to run under either the Local Service, Network Service, or Local System account. Windows 10, version 2004, introduces support for running an MSIX package that includes services.

- [App Settings](#)
- [Properties](#)
- [Dependencies](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Update Task declaration type:

**Table 64** ▪ App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>• <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>• <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>• <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>

**Table 64** ▪ App Settings

Declaration	Project Type	Description
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Properties

**Table 65** ▪ Properties

Declaration	Project Type	Description
<b>Name</b>	MSIX	Specify the Name for the Service.
<b>Startup Type</b>	MSIX	<p>The startup type for the service. The following values are supported:</p> <ul style="list-style-type: none"> <li>• auto</li> <li>• manual</li> <li>• disabled</li> </ul>
<b>Start Account</b>	MSIX	<p>The type of account in which to run the service. The following values are supported:</p> <ul style="list-style-type: none"> <li>• localSystem</li> <li>• localServices</li> <li>• networkService</li> </ul>
<b>Arguments</b>	MSIX	Optional arguments to pass to the service.

## Dependencies

These are the settings for the windows.service dependencies. Dependency Services outside the package are not currently supported.

The following table describes the settings that are displayed in the MSIX Service declaration dependencies category:

**Table 66** ▪ Dependencies

Declaration	Project Type	Description
<b>Dependent Service</b>	MSIX	Specifies one or more dependent services for the current service.

## Update Task

This declaration is a background task that is run directly after the user updates the app to a newer version.

**Note** - You are restricted to create only one instance per Declaration Set.

- [App Settings](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Update Task declaration type:

**Table 67** - App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>• <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>• <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>• <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>

**Table 67** ▪ App Settings

Declaration	Project Type	Description
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Web Account Provider

This declaration helps you to allows user to sign on once and have that logging in action provide account information to multiple applications.

**Note** ▪ You are restricted to create only one instance per Declaration Set.

- [App Settings](#)
- [Properties](#)
- [Managed URLs](#)

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Web Account Provider declaration type:

**Table 68** ▪ App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	<p>Application Settings specifies how to configure the Declaration default executable:</p> <ul style="list-style-type: none"> <li>• <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>• <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>• <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>

**Table 68** - App Settings

Declaration	Project Type	Description
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Properties

Specifies the properties required to register the Web Account Provider

The following table describes the settings that are displayed in the Web Account Provider declaration type:

**Table 69** - Properties

Declaration	Project Type	Description
<b>URL</b>	MSIX	Specifies the main URL that identifies the Web Account Provider
<b>Background Entry Point</b>	MSIX	Specifies the Entry Point to an activatable class that can provide tokens in a background request

## Managed URLs

Specifies the additional URL that belongs to the same Web Account Provider.

The following table describes the settings that are displayed in the Web Account Provider declaration type:

**Table 70** ▪ Managed URLs

Declaration	Project Type	Description
<b>Managed URLs</b>	MSIX	Allows to create additional URL for the same web account provider.  To add a URL, click <b>Add New Managed URL</b> button.
<b>Managed URL</b>	MSIX	Additional URL that belongs to the same Web Account Provider, and it must be a valid HTTPS URL.

## Windows Shared Fonts

This declaration helps you to install and share the custom fonts with other applications in the system.

- [App Settings](#)
- [Windows Shared Fonts](#)

**Note** ▪ You are restricted to create only one instance per Declaration Set.

### App Settings

Application Setting specifies the default executable for the declaration. If not specified, the executable defined is used for the App in the Applications view.

The following table describes the settings that are displayed in the Windows Shared Fonts declaration type:

**Table 71** ▪ App Settings

Declaration	Project Type	Description
<b>Application Settings</b>	MSIX	Application Settings specifies how to configure the Declaration default executable: <ul style="list-style-type: none"> <li>• <b>Default Application</b> - Executable defined is used for the App in the Applications view.</li> <li>• <b>Custom Settings</b> - Default executable can be specified for the Declaration.</li> <li>• <b>Start Page</b> - Web Page that handles can be specified for the extensibility point.</li> </ul>

Declaration	Project Type	Description
<b>Executable</b>	MSIX	<p>A string between 1 and 256 characters in length that must end with ".exe" that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>It specifies the default executable for the declaration. If not specified, the Executable value is derived from the Application view which is used for the app.</p>
<b>Entry Point</b>	MSIX	<p>A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p> <p>representing the task handling the declaration. This is normally the fully namespace-qualified name of a Windows Runtime type. If Executable value is specified, the EntryPoint is mandatory for the app.</p>
<b>Start Page</b>	MSIX	<p>Web page that handles the extensibility point - A string between 1 and 256 characters in length that cannot contain these characters:</p> <p>&lt;, &gt;, :, %, ",  , ?, or *.</p>
<b>Resource Group</b>	MSIX	<p>An app-defined name that determines the same host process for multiple tasks.</p> <p>A tag that you can use to group extension activations together for resource management purposes (for example, CPU and memory). The value you can set ResourceGroup is free-form and flexible.</p>

## Windows Shared Fonts

Specifies one or more fonts to register with the system.

The following table describes the settings that are displayed in the Windows Shared Fonts declaration type:

**Table 72** • Windows Shared Fonts

Declaration	Project Type	Description
<b>Windows Shared Fonts</b>	MSIX	Allows to register one or more fonts with the system.

## Package Declarations

**Project** • The Package Declarations view is available in the following project type:

- [MSIX](#)

This declaration helps you to add package declarations like:

- [Certificates](#)
- [Enterprise Data Protection](#)
- [InProcessServer](#)

## Certificates

This declaration helps you to declare a package extensibility point of type windows.certificates. The app requires one or more certificates from the specified certificate stores.

**Note** - You are restricted to create only one instance per Package.

- [Properties](#)
- [Certificates](#)

### Properties

This view is used to declare and configure package declaration properties of type windows.certificates. Certificates declaration enables the package to install digital certificates, such as trusted root certificates, with the app. These certificates are used during secure connections to the web services over SSL.

The following table describes the settings that are displayed in the Certificates package declarations:

**Table 73** - Properties

Declaration	Project Type	Description
<b>Exclusive Trust</b>	MSIX	Either select <b>Yes</b> or <b>No</b> to Indicate whether the certificates for the package are exclusive to the package and determines certificate validation.
<b>Selection Criteria</b>	MSIX	<p>Defines selection criteria for the certificates defined for the package during client authentication.</p> <ul style="list-style-type: none"> <li>• <b>AutoSelect</b> - Select this option if the certificates are selected automatically.</li> <li>• <b>HardwareOnly</b> - Select this option if the specified certificates are hardware-specific.</li> </ul>

### Certificates

Declares a package extensibility point of type windows.certificates. Specifies the certificates that are installed in the application specific certificate store.

The following table describes the settings that are displayed in the Certificates package declarations:

**Table 74** • Certificates

Declaration	Project Type	Description
<b>Certificates</b>	MSIX	<ul style="list-style-type: none"> <li>● <b>Certificates</b> - Declare one or more number of certificates here.</li> </ul>

## Enterprise Data Protection

This declaration helps you to declare that the app is safe for auto-encryption and allows it to be managed without device enrollment via Windows Information Protection policy.

**Note** • You are restricted to create only one instance per Package.

- **Properties**

### Properties

Declares that the app is safe for auto-encryption and allows it to be managed without device enrollment via Windows Information Protection policy.

Use this extension only if the app is exclusively for work, and/or you provide a mechanism to restore any non-work personal data the app modifies. All files that the app creates or modifies will be encrypted on behalf of the managing organization, and become inaccessible after a selective wipe occurs, when the protection policy is removed from the device.

**Important** • Always use `enterpriseDataPolicy` capability to safely handle both work and personal data when managed with Windows Information Protection.

The following table describes the settings that are displayed in the Enterprise Data Protection package declarations:

**Table 75** • Properties

Declaration	Project Type	Description
<b>Protection Mode</b>	MSIX	<p>The mode of data protection:</p> <ul style="list-style-type: none"> <li>● <b>Auto</b></li> <li>● <b>Default</b></li> </ul>

## InProcessServer

This declaration helps you to declare a package extensibility point of type `windows.activatableClass.inProcessServer`. The app uses a dynamic link library (DLL) that exposes one or more activatable classes.

- **Properties**

- [Activatable Class](#)

## Properties

Declares a package extensibility point of type `windows.activatableClass.inProcessServer`. The app uses a dynamic link library (DLL) that exposes one or more activatable classes.

The following table describes the settings that are displayed in the `InProcessServer` package declarations:

**Table 76** • Properties

Declaration	Project Type	Description
<b>Path</b>	MSIX	The path to the in-process DLL. A string between 1 and 256 characters in length that cannot contain these characters:  <, >, :, %, ",  , ?, or *.

## Activatable Class

Declares an activatable runtime class associated with the extensibility point.

The following table describes the settings that are displayed in the `InProcessServer` package declarations:

**Table 77** • Activatable Class

Declaration	Project Type	Description
<b>Class ID</b>	MSIX	The identifier of the runtime class in the operating system.
<b>Threading Model</b>	MSIX	The type of threading model supported by the runtime class. This attribute can have any one of the following values: <ul style="list-style-type: none"> <li>• <a href="#">Both</a></li> <li>• <a href="#">Single-threaded Apartments (STA)</a></li> <li>• <a href="#">Multi-threaded Apartments (MTA)</a></li> </ul>
<b>Activatable Class Attributes</b>	MSIX	Defines one or more activatable class attributes.
<b>Activatable Class Attribute</b>	MSIX	Defines an attribute instance of the class that is stored in the Windows Runtime property store.
<b>Name</b>	MSIX	An attribute name. An alphanumeric string between 1 and 255 characters in length. Must begin with an alphabetic character.
<b>Type</b>	MSIX	An attribute type. This attribute can have one of the following values: <ul style="list-style-type: none"> <li>• <a href="#">string</a></li> <li>• <a href="#">integer</a></li> </ul>

**Table 77** • Activatable Class

Declaration	Project Type	Description
<b>Value</b>	MSIX	An attribute value. A string between 1 and 255 characters in length.

## Content URIs View

**Project** • The Content URIs view is available in the following project types:

- MSIX

Use this page to specify the URIs that can use `window.external.notify` to send a Script-Notify event to the app. URIs can include wild-card characters in sub-domain names (for example, `https://*.revenera.com` or `https://*.revenera.com`)

The Content URIs view specifies the pages in the web context that have access to the system's geolocation devices (if the app has permission to access this capability) and access to the clipboard.

If more than one rule is defined, then the order of the rules is important.

To define the Match attribute with an IRI for a web resource, you can specify only secure “https:” sites - insecure “http:” sites aren't allowed.

## Organization View

**Project** • The Organization view is available in the following project types:

- Advanced UI
- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database
- Suite/Advanced UI
- Transform

The first step in building anything is to lay a solid foundation. The base of your project is formed by specifying application information through the General Information view and—for installation projects—creating features in the Features view.

## Setup Design

---

**Project** ▪ The Setup Design view is available in the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- MSI Database
- Transform

The most important step in designing any setup is to lay out the various elements, the “building blocks” of the installation. You need to think both from your user’s perspective as well as your own. The Setup Design view gives you a full look at your setup and all the features, components, and redistributables associated with it.

## Features

---

**Project** ▪ The Features view is available in the following project types:

- Advanced UI
- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- MSI Database
- Suite/Advanced UI
- Transform

Features are the building blocks of your installation. They represent a distinct piece of your application—such as program files, help files, or clip art—to your end users. You can create features and subfeatures in the Features view.

## Components

---

**Project** ▪ The Components view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database
- Transform

Components are setup-authoring tools that help you organize similar application data, such as files, registry entries, and shortcuts, into logical groups. Unlike features, they constitute the developer's view of a project.

## Setup Types

**Project** • The Setup Types view is available in the following project types:

- InstallScript
- InstallScript MSI

Setup types offer your customers multiple configurations of your applications. Generally, these configurations include Complete and Custom. Setup types allows your users to choose the best configuration for their needs. This view is available only for InstallScript and InstallScript MSI setup projects.

## Packages

**Project** • The Packages view is available in the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

Use the Packages view to add packages and InstallShield prerequisites that you want to include in your Advanced UI or Suite/Advanced UI installation. This view is also where you define conditions for each package, associate each package with one or more Advanced UI or Suite/Advanced UI features, and configure other settings for each package.

## DIM References

**Project** • The DIM References view is available in Basic MSI projects.

Use the DIM References view to manage all of the DIM references in your project, view any specific instructions that are required for the referenced DIMs, and associate each referenced DIM with one or more features. This view also lets you schedule the DIM's custom actions and dialogs in the Basic MSI installation's sequences.

## Setup Design View

**Project** • The Setup Design view is available in the following project types:

- Basic MSI
- InstallScript

- *InstallScript MSI*
- *InstallScript Object*
- *MSI Database*
- *Transform*

The most important step in designing any installation is to lay out the various elements, the building blocks of the installation. You need to think both from the end user's perspective, as well as your own.

You can design the entire installation hierarchy for your application visually under the Setup Design view. This is the only view in which you can associate components with features and subfeatures.

## Features

Features are the building blocks of your application from the end user's perspective. They can be installed or uninstalled based on the end user's selections. Your entire application should be divided into discrete features that perform a specific purpose. Features can be created in both the Setup Design view and the Features view.

## Components

Components enable you to group your application data together. Unlike features, components constitute the developer's view of a project—containing data such as files, registry entries, and shortcuts. Components are associated with features in the Setup Design view, and a component may belong to more than one feature. Components can be created in both the Setup Design view and the Components view.

---

**Tip** ▪ The Components section contains the *Files*, *Registry Entries*, and *Shortcuts* nodes, in addition to the *Advanced Settings* for the component. If you do not want to see the subordinate nodes when they do not contain data, right-click *Setup Design* and select **Show Only Nodes with Data**. When this option is selected, only the nodes that contain data are displayed.

## DIMs

Developer installation manifest (DIMs) are separate pieces of an installation project that can be incorporated into a Basic MSI project to create a complete product installation. You can divide your product into separate, logical units to foster collaboration, enable distributed installation development, and enable reuse.

## Redistributables

Redistributables enable you to install distinct, pre-existing pieces of functionality. For example, if your application requires Visual Basic run-time .dll files, you can include the Visual Basic Virtual Machine merge module, rather than add a file to your installation project and trying to determine its installation requirements.

---

**Note** ▪ You can add redistributables—including *InstallShield prerequisites*, *merge modules*, and *objects*—to your installation in the *Redistributables* view (or the *Prerequisites* view in *InstallScript* projects and the *Objects* view in *InstallScript* and *InstallScript Object* projects).

## Files, Registry Data, and Shortcuts

Files, registry data, and shortcuts are elements that are added to a component to complete the hierarchy.

## Advanced Settings

**Advanced Component Settings** let you handle installation of components with special requirements. By specifying the advanced settings, you can publish your component and register COM servers, file extension servers, MIME types, and so on. You can also use the component's advanced settings to create an application paths entry in the registry.

## Features View

---

**Project** ▪ The Features view is available in the following project types:

- Advanced UI
- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- MSI Database
- Suite/Advanced UI
- Transform

A feature is the smallest installable part of a product, from the end user's perspective. It represents a specific capability of your product—such as its help files or a part of a product suite that can be installed or uninstalled based on the end user's selections. Your entire installation should be divided into features, each of which performs a specific purpose.

Subfeatures are further divisions of a feature. Because features should be self-contained elements of a product or product suite that an end user can selectively install, it might make sense for you to organize portions of your installation as subfeatures of a parent feature.

---

**Tip** ▪ Although you can create many levels of subfeatures, you should keep the design as simple as possible for organizational purposes.

## Feature Settings

---

**Project** ▪ Feature settings are available in the following project types:

- Advanced UI
- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- MSI Database
- Suite/Advanced UI
- Transform

The settings in the Features view (and the feature settings in the Setup Design view) are organized into the following main categories:

- [General](#)
- [Feature Events](#)
- [Run-Time Settings](#)

## General

When you select a feature in the Features view or the Setup Design view, the following settings are available in the General area:

**Table 78** • General Settings for a Feature

Setting	Project Type	Description
<b>Display Name</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	<p>Enter the name that you want to be displayed for this feature on the CustomSetup dialog (or in Advanced UI or Suite/Advanced UI projects, on the InstallationFeatures wizard page).</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<div>  <p><b>Project</b> • In Advanced UI and Suite/Advanced UI projects: When you type a value for this setting, you can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p> </div>		

**Table 78** ▪ General Settings for a Feature (cont.)

Setting	Project Type	Description
<b>Description</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, MSI Database, Suite/ Advanced UI, Transform	<p>Enter a brief description of the feature. A feature's description is displayed on the CustomSetup dialog (or, in Advanced UI and Suite/Advanced UI installations, on the InstallationFeatures wizard page) when the end user clicks a feature or subfeature.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p> <p></p> <p><b>Project</b> ▪ In Advanced UI and Suite/Advanced UI projects: When you type a value for this setting, you can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p>
<b>Remote Installation</b>	Basic MSI, InstallScript MSI, MSI Database, Transform	<p>Indicate the default install state for the feature. Valid options are:</p> <ul style="list-style-type: none"> <li>● <b>Favor Source</b>—The files in this feature are set to be run directly from the source medium, such as a CD-ROM or a network location, by default.</li> <li>● <b>Favor Local</b>—The files in this feature are set to be installed on the target system by default.</li> <li>● <b>Favor Parent</b>—The subfeature has the same default state as its parent feature. This option is available only if the feature is a subfeature.</li> </ul> <p>For more information, see <a href="#">Setting a Feature's Remote Installation Setting</a>.</p> <p></p> <p><b>Caution</b> ▪ If any of the feature's components contain a Windows service, select Favor Local. Although an end user could change the installation state through the CustomSetup dialog, the Windows Installer cannot install a service remotely.</p>

**Table 78** ▪ General Settings for a Feature (cont.)

Setting	Project Type	Description
<b>Destination</b>	Basic MSI, InstallScript MSI, MSI Database, Transform	<p>Select the folder on the target system into which the feature's files should be installed, or click the ellipsis button (...) to select or create a directory.</p>  <p><b>Note</b> ▪ If you want the destination to be configurable at run time, the destination folder that you select must be a public property (containing all uppercase letters).</p> <p>For more information, see <a href="#">Setting a Feature's Destination</a>.</p>
<b>Install Level</b>	Basic MSI, InstallScript MSI, MSI Database, Transform	<p>Enter an integer for this feature's install level. Unless the end user deselects features in the CustomSetup dialog, all features with an install level less than or equal to the value of the package's <b>INSTALLLEVEL</b> property are installed. You can change the <b>INSTALLLEVEL</b> property for the entire project in the Property Manager.</p> <p>The Install Level setting for a feature is compared against the <b>INSTALLLEVEL</b> property at run time to determine which features are available for installation. You can use this setting to create specific feature configurations.</p>  <p><b>Project</b> ▪ For InstallScript MSI installations, this setting is used only if no <b>setup types</b> are defined for the project.</p>

**Table 78** ▪ General Settings for a Feature (cont.)

Setting	Project Type	Description
<b>Display</b>	Basic MSI, InstallScript MSI, MSI Database, Transform	<p>Indicate how you want the feature presented to the end user in the CustomSetup dialog (in Basic MSI, MSI Database, and Transform projects) or the feature selection dialog (in InstallScript MSI projects).</p> <ul style="list-style-type: none"> <li>● <b>Visible and Collapsed</b>—The feature is displayed in the run-time dialog with its subfeatures collapsed by default.</li> <li>● <b>Visible and Expanded</b>—The feature is displayed in the run-time dialog with its subfeatures expanded by default.</li> <li>● <b>Not Visible</b>—The feature and subfeatures are not displayed in the run-time dialog.</li> </ul> <p>This setting does not have any direct impact on whether a feature is installed. A feature is not automatically installed if it is not visible—it just cannot be deselected if it would otherwise be installed, or selected if it should not be installed.</p> <p>For more information, see <a href="#">Displaying Features to End Users</a>.</p>
<b>Visible</b>	Advanced UI, InstallScript, Suite/Advanced UI	<p>Specify whether the feature should be visible on the feature selection dialog in InstallScript installations or the InstallationFeatures wizard page in Advanced UI and Suite/Advanced UI installations.</p> <p>This setting does not have any direct impact on whether a feature is installed. A feature is not automatically installed if it is not visible—it just cannot be deselected if it would otherwise be installed, or selected if it should not be installed.</p> <div data-bbox="829 1400 867 1444" data-label="Image"> </div> <p><b>Note</b> ▪ Since the only way for end users to change the selection status of an invisible feature is by selecting or deselecting a visible feature that requires the invisible feature, you should make every invisible feature a required feature for one or more visible features. Otherwise, end users will not be able to select or install features that are initially deselected.</p>

**Table 78** • General Settings for a Feature (cont.)

Setting	Project Type	Description
<b>Advertised</b>	Basic MSI, MSI Database, Transform	<p>Select the appropriate advertisement option for this feature. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Allow Advertise</b>—End users have the ability to select the advertisement option for this feature in the <b>CustomSetup dialog</b>. Although advertisement is allowed, it is not the default option when the installation is run.</li> <li>● <b>Favor Advertise</b>—The feature is advertised by default. End users can change the advertisement option for a feature in the CustomSetup dialog.</li> <li>● <b>Disallow Advertise</b>—Advertising is not allowed for this feature. End users cannot elect to have the feature advertised in the CustomSetup dialog.</li> <li>● <b>Disable Advertise if Not Supported</b>—Advertisement works only on systems with Internet Explorer 4.01 or later. If the target system does not meet this criterion, advertising is not allowed. If the target system can support advertisement, advertising is allowed.</li> </ul> <p>For more information, see <a href="#">Advertising Features</a>.</p>
<b>Required</b>	Basic MSI, InstallScript MSI, MSI Database, Transform	<p>Indicate whether the feature is required on the target system; if the feature is required, end users cannot deselect it in the CustomSetup dialog (in Basic MSI, MSI Database, and Transform projects) or the feature selection dialog (in InstallScript MSI projects).</p> <div>  </div> <p><b>Project</b> • In InstallScript MSI projects, this setting is applicable to root-level features during a first-time installation. It is also applicable to subfeatures in an upgrade or patch. This setting is ignored for subfeatures during a first-time installation.</p>

**Table 78** ▪ General Settings for a Feature (cont.)

Setting	Project Type	Description
<b>Condition</b>	Advanced UI, Suite/Advanced UI	<p>This setting lets you specify one or more conditions that the Advanced UI or Suite/Advanced UI installation should use to evaluate whether the feature should be selected for installation by default on the InstallationFeatures wizard page.</p> <p>For example, if you want a particular feature to be selected by default on target systems that have a particular version of Windows, you can create a condition that specifies that version of Windows. Depending on how you configure the condition, you can have that Advanced UI or Suite/Advanced UI feature selected by default on the InstallationFeatures wizard page when an end user runs the Advanced UI or Suite/Advanced UI installation on that platform. Unless the end users deselects the feature, the Advanced UI or Suite/Advanced UI installation installs it.</p> <p>To add one or more new feature conditions, click the New Condition button in this setting. InstallShield adds a new row under the Condition setting. Select the appropriate option—All, Any, or None—from the list in this row. Then in this row, click the New Condition button, and select the appropriate option to continue building the conditional statement.</p> <p>If one or more conditional statements are configured, the Condition setting says <b>(Condition)</b>. If none are configured, the Condition setting says <b>(Empty)</b>.</p> <p>For descriptions of each of the condition settings, see <a href="#">Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects</a>.</p>
<b>Release Flags</b>	Advanced UI, Basic MSI, InstallScript MSI, Suite/Advanced UI	<p>If you want to use release flags to be able to selectively include and exclude this feature from different builds of your installation, enter one or more release flags to identify this feature. Separate multiple flags with a comma.</p> <p>For more information, see <a href="#">Assigning Release Flags to Features</a>.</p>

**Table 78** • General Settings for a Feature (cont.)

Setting	Project Type	Description
<b>Condition</b>	Basic MSI, InstallScript MSI, MSI Database, Transform	<p>This setting lets you specify one or more conditional install levels. If a condition is true on the target system, the feature is given the corresponding install level.</p> <p>At run time, the feature's install level value is compared to the value of the global public property <code>INSTALLLEVEL</code> to determine whether the feature should be selected for installation by default.</p> <p>To specify one or more conditions, click the ellipsis button (...) in this setting. For more information, see <a href="#">Setting Feature Conditions</a>.</p> <p>When you add a condition, InstallShield adds a new row to the grid of feature settings. The new row shows the install level for the feature, as well as the corresponding conditional statement that you added.</p>
<b>Comments</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object	Enter comments to help you track the changes you make to a feature, or for any future reference. The feature's comments are stored only in the project file and are not used in the installation at any time.
<b>Required Features</b>	InstallScript, InstallScript MSI, InstallScript Object	If one or more other features must be installed whenever the selected feature is installed, click the ellipsis button (...) and specify the other required features. For more information, see <a href="#">Using the Required Features Setting</a> .
<b>Allow UI Selection Change</b>	Advanced UI, Suite/Advanced UI	<p>Indicate whether end users should be allowed to select or deselect the feature on the InstallationFeatures wizard page. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—End users should be able to select or deselect the feature through the wizard interface. This is the default option.</li> <li>● <b>No</b>—End users should not be able to select or deselect the feature through the wizard interface. If this feature is visible on the InstallationFeatures wizard page, it appears in a read-only state (either selected or deselected, based on other factors, such as the feature's condition).</li> </ul>

**Table 78** • General Settings for a Feature (cont.)

Setting	Project Type	Description
<b>Follow Parent State</b>	Advanced UI, Suite/Advanced UI	<p>This setting is available for subfeatures; it is not available for root-level features.</p> <p>Indicate whether you want the subfeature's state to be determined by its parent feature. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—The selected subfeature will be installed whenever its parent feature is installed.</li> <li>● <b>No</b>—If the selected subfeature's parent feature is installed, the selected subfeature can be either installed or not installed. This is the default option.</li> </ul> <p>Note that if the selected subfeature's parent feature is not installed, the selected subfeature cannot be installed.</p> <p>This setting is especially useful if you want the subfeature to be hidden on the InstallationFeatures wizard page, but its parent feature is not hidden.</p>
<b>Status Text</b>	InstallScript, InstallScript Object	<p>Specify the status text for the feature. Your end users will see this text in the uppermost line of the progress indicator during the transfer of this feature.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>File Need</b>	InstallScript, InstallScript Object	<p>Indicate the severity of allowing end users to deselect the feature in a Custom setup type. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Standard</b>—End users should be allowed to deselect the feature; no error messages are displayed.</li> <li>● <b>Highly Recommended</b>—End users should be advised that the feature is highly recommended.</li> <li>● <b>Critical</b>—End users should be warned that the feature should not be deselected.</li> </ul> <p>Your script can read this setting using the InstallScript function <b>FeatureGetData</b> with the <b>FEATURE_FIELD_FILENEED</b> constant. Depending on the return value, your script can display a message to alert the end user if a critical or highly recommended feature is deselected.</p>

**Table 78** ▪ General Settings for a Feature (cont.)

Setting	Project Type	Description
<b>Include in Build</b>	InstallScript, InstallScript Object	<p>Specify whether the feature should be included in your release when you build it.</p> <p>Note that in the Features panel of the Release Wizard, you can override this setting for any of the features in your project.</p>
<b>Password</b>	InstallScript	<p>If you want to password-protect the feature, enter a password.</p> <p>You can specify a different password for each feature. You can also specify a password for the entire installation (in the Media Password setting on the Setup.exe tab in the Releases view).</p> <p>Note that the default script does not automatically validate a feature's password. You must modify the script to validate the password by inserting a dialog function (such as <b>AskText</b>) that prompts the end user to enter a password, and then calling the <b>FeatureValidate</b> function from within the script.</p> <div data-bbox="824 1010 870 1052" data-label="Image"> </div> <p><b>Caution</b> ▪ Experienced hackers may be able to extract this password from your release. If security is a critical issue, it is recommended that you not depend solely on this password protection functionality.</p>

**Table 78** • General Settings for a Feature (cont.)

Setting	Project Type	Description
<b>Encryption</b>	InstallScript	<p>Specify whether the files for the feature should be encrypted. Encrypted files can be read only by the InstallScript engine (or by an experienced hacker).</p> <p>If you plan to offer end users the option of running your product directly from the distribution media, do not encrypt the relevant files. InstallShield decrypts files only during installation to the end user's hard drive.</p> <p>Encryption is not the same as password protection. Encrypting a file scrambles it so that if someone opens it in a text editor, they cannot read strings and other data to get confidential information about your product. Password-protecting a feature prevents it from being installed by someone who does not know the password. You can encrypt a feature's files or you can password-protect the feature—or, for maximum security, you can do both.</p> <p>If a feature's files are encrypted but neither the feature nor the release is password-protected, the feature can be installed by anyone who obtains your distribution media (or a copy). If a feature is password-protected but its files are not encrypted, someone can open the files in a text editor and read confidential information—possibly including the feature's password.</p>

**Table 78** • General Settings for a Feature (cont.)

Setting	Project Type	Description
<b>CD-ROM Folder</b>	InstallScript, InstallScript Object	<p>Specify the folder in the disk image in which the feature's files should be placed if the CD_ROM Folder(s) option is selected in the Media Layout panel of the Release Wizard, or if the feature's check box is selected on the Custom Media Layout panel of the Release Wizard. If either of these conditions are met but no folder is specified, the feature is placed in the root of the disk image or, if it is a subfeature, in the same folder as its parent feature.</p> <p>Folder names on CD-ROMs should conform to ISO 9660 (Level 1) standards. That is, folder names should be no more than eight characters long (with no extensions), and use only the characters A-Z, 0-9, and _ (underscore).</p> <p>By putting a folder structure on your CD-ROM, you can allow your product to be run from the CD-ROM. The folder structure on the CD-ROM does not need to mirror the folder structure that would be installed to a hard drive. All that is necessary is that your product be able to work with either folder structure.</p> <p>This functionality is typically used only for CD-ROM distribution; for other distribution media, you usually want to compress all features into .cab files.</p> <div>  <p><b>Project</b> • For InstallScript Object projects, the value of this setting has no effect on where the object's files are placed when the object is included in an installation project.</p> </div>
<b>Included Components</b>	InstallScript, InstallScript Object	<p>This read-only setting lists the components that are associated with the feature.</p> <p>It is essential to an installation that components be associated with features; otherwise, no files will be installed. Use the Setup Design view to associate components with features. For more information, see <a href="#">Component-Feature Associations</a>.</p>
<b>GUID</b>	InstallScript, InstallScript Object	<p>Enter a GUID that uniquely identifies this feature. To have InstallShield generate a different GUID for you, click the <b>Generate a new GUID</b> button ({...}) in this setting.</p> <p>The feature GUID identifies the feature in the installation's log file; if you change a feature's GUID in an upgrade, the InstallScript engine treats it as a new feature rather than an update to an existing feature.</p>

## Feature Events

When you select a feature in the Features view or the Setup Design view of an InstallScript, InstallScript MSI, or InstallScript Object project, the following settings are available in the Feature Events area:

**Table 79** • Feature Event Settings for a Feature

Setting	Project Type	Description
<b>OnInstalling</b>	InstallScript, InstallScript MSI, InstallScript Object	<p>This setting lets you specify an InstallScript function to be called before this feature is installed. Select the desired function from the list.</p> <p>Only exported functions appear in the list. Exported functions have this prototype:</p> <pre>export prototype FunctionName( );</pre>
<b>OnInstalled</b>	InstallScript, InstallScript MSI, InstallScript Object	<p>This setting lets you specify an InstallScript function to be called after this feature is installed. Select the desired function from the list.</p> <p>Only exported functions appear in the list. Exported functions have this prototype:</p> <pre>export prototype FunctionName( );</pre>
<b>OnUninstalling</b>	InstallScript, InstallScript MSI, InstallScript Object	<p>This setting lets you specify an InstallScript function to be called before this feature is uninstalled. Select the desired function from the list.</p> <p>Only exported functions appear in the list. Exported functions have this prototype:</p> <pre>export prototype FunctionName( );</pre>
<b>OnUninstalled</b>	InstallScript, InstallScript MSI, InstallScript Object	<p>This setting lets you specify an InstallScript function to be called after this feature is uninstalled. Select the desired function from the list.</p> <p>Only exported functions appear in the list. Exported functions have this prototype:</p> <pre>export prototype FunctionName( );</pre>

## Run-Time Settings

When you select a feature in the Features view or the Setup Design view of an InstallScript, InstallScript MSI, or InstallScript Object project, the following settings are available in the Run-Time Settings area:

**Table 80** ▪ Run-Time Settings for a Feature

Setting	Project Type	Description
<b>FTP Location</b>	InstallScript, InstallScript MSI, InstallScript Object	<p>If you want to associate an FTP location with the feature, enter the FTP address in the following format:</p> <p><b>ftp.domain.com</b></p> <p>The address that you enter can be accessed from within the script using the <b>FeatureGetData</b> function with the FEATURE_FIELD_FTPLOCATION constant.</p>
<b>HTTP Location</b>	InstallScript, InstallScript MSI, InstallScript Object	<p>If you want to associate an HTTP address with the feature, enter the HTTP address in the following format:</p> <p><b>http://www.domain.com</b></p> <p>The address that you enter can be accessed from within the script using the <b>FeatureGetData</b> function with the FEATURE_FIELD_HTTPLOCATION constant.</p>
<b>Miscellaneous</b>	InstallScript, InstallScript MSI, InstallScript Object	<p>If you want to associate a text string with the feature, enter the text string.</p> <p>The text string that you enter can be accessed from within the script using the <b>FeatureGetData</b> function with the FEATURE_FIELD_MISC constant.</p>

## Components View

**Project** ▪ The Components view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database
- Transform

Components are installation-authoring elements that help you organize similar application data, such as files, registry entries, and shortcuts, into logical groups. Unlike features, components constitute the developer's view of a project.

You can create and modify components in the Setup Design view (for installation projects) or the Components view.

**Tip** ▪ The Components explorer contains nodes for the files, registry data, and so on for each component. If you do not want to see the subordinate nodes when they do not contain data, right-click the top-level explorer and then click *Show Only Nodes with Data*. When this command is selected, only the nodes that contain data are displayed.

**Note** ▪ To improve performance, the list displayed in the Files view truncates when there are more than a predefined number of files in a dynamically linked file with subfolders. **List Truncated** appears as the first item in the file list when this occurs. All files contained in the subfolders are built into your project.

## Component-Feature Relationships

Components are associated with features in the Setup Design view. For more information, see [Associating New Components with Features](#).

## Component Settings

For descriptions of each of the settings that are displayed when you click a component, see [Component Settings](#).

## Advanced Settings for a Component

For information about advanced settings that you can configure for a component, see [Advanced Settings for a Component](#).

## Component Settings

**Project** ▪ Component settings are available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database
- Transform

The settings in the Components view (and the component settings in the Setup Design view) are organized into the following main categories:

- [General](#)
- [Target Machine](#)
- [.NET Settings](#)
- [Run-Time Settings](#)

General

When you select a component in the Components view or the Setup Design view, the following settings are available in the General area:

Table 81 - Component Settings in the General Area

Setting	Project Type	Description
Destination	Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, MSI Database, MSM Database, Transform	<p>Select the folder on the target system into which the component's files should be installed, or click the ellipsis button (...) to select or create a directory.</p> <p>To install the files to the product's default destination folder, select the appropriate location, depending on which project type you are using:</p> <ul style="list-style-type: none"><li>● <b>[INSTALLDIR]</b>—in a Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, or Transform project</li><li>● <b>&lt;TARGETDIR&gt;</b>—in an InstallScript or InstallScript Object project</li></ul> <div></div> <p><b>Project</b> - In Basic MSI, InstallScript MSI, MSI Database, and Transform projects, if you want the destination to be configurable at run time, the destination folder that you select must be a public property (containing all uppercase letters).</p> <p>Note that in some project types (Basic MSI, InstallScript MSI, MSI Database, and Transform), you can also set the destination folder of a component's feature. For information on the effects of setting the destination for a feature as well as its components, see <a href="#">Component Destination vs. Feature Destination</a>.</p> <p>In InstallScript and InstallScript Object projects, if you are installing files to WINSYS64, you may need to select Yes for the component's 64-Bit Component setting. Otherwise, files being installed to WINSYS64 may be redirected to SysWOW64, the 32-bit Windows system folder. For more information, see <a href="#">Targeting 64-Bit Operating Systems with InstallScript Installations</a>.</p>

**Table 81** ■ Component Settings in the General Area (cont.)

Setting	Project Type	Description
<b>Destination Permissions</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>To set permissions for the component's destination folder, click the ellipsis button (...) in this setting.</p>  <p><b>Note</b> ■ Unless you need to designate specific permissions, it is recommended that you leave this setting undefined so that normal user permissions can apply to the destination folder.</p>
<b>Component Code</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Enter a GUID that uniquely identifies this component. To have InstallShield generate a different GUID for you, click the Generate a new GUID button ({...}) in this setting.</p>
<b>Shared</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, MSI Database, MSM Database, Transform	 <p><b>Project</b> ■ The behavior of this setting varies slightly, depending on whether the project type is Windows Installer based (Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, or Transform project) or InstallScript based (InstallScript or InstallScript Object project).</p> <ul style="list-style-type: none"> <li>● <b>For a Windows Installer-based project</b>—Specify whether you want to mark this component's <b>key file</b> as shared. If the installation installs the key file and Yes is selected for its component's Shared setting, a reference count is created in the registry—if it does not already exist—and incremented.</li> <li>● <b>For an InstallScript-based project</b>—Specify whether you want to mark this component as shared. If the installation installs the component's files and Yes is selected for the component's Shared setting, a reference count for each of the component's files is created in the registry—if it does not already exist—and incremented.</li> </ul> <p>Note that the installation increments any existing reference count for any file in a component regardless of whether you mark the component as shared. However, if no reference count exists, the installation does not create one unless you select Yes for this Shared setting.</p> <p>For more information, see <a href="#">Managing Reference Counts for Shared Files</a>.</p>

**Table 81** • Component Settings in the General Area (cont.)

Setting	Project Type	Description
<b>Permanent</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Specify whether you want to mark this component as permanent. If you select Yes, none of the component's data (such as files, registry entries, and shortcuts) are removed from the target system when the component's feature is uninstalled.</p> <p>Validation rules require that you select Yes for any component being installed to [SystemFolder].</p>  <p><b>Note</b> • If you are installing a font, it is recommended that you select Yes.</p>
<b>Uninstall</b>	InstallScript, InstallScript Object	<p>Specify whether the component's files, registry entries, and other data should be uninstalled when the component's feature is uninstalled.</p> <p>This setting is useful for preventing the uninstallation of files that may be used by other products. If the component's files are not used by other products, the Uninstall setting should typically be set to Yes.</p>
<b>Condition</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>This setting lets you enter a statement that the installation must evaluate before setting up your component's data on the target system. The component is not installed if its condition evaluates to false. However, the component is installed or advertised if its condition evaluates to true, assuming that its feature is selected for installation.</p> <p>To create a condition for the component, click the ellipsis button (...) in this setting. For more information, see <a href="#">Configuring Component Conditions</a>.</p>

**Table 81** • Component Settings in the General Area (cont.)

Setting	Project Type	Description
<b>Remote Installation</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Indicate the default install state for the component. Valid options are:</p> <ul style="list-style-type: none"> <li>● <b>Favor Source</b>—The files in this component are set to be run directly from the source medium, such as a CD-ROM or a network location, by default.</li> <li>● <b>Favor Local</b>—The files in this component are set to be installed on the target system by default.</li> <li>● <b>Optional</b>—The component uses the Remote Installation setting of its feature.</li> </ul> <p>For more information, see <a href="#">Setting a Component's Remote Installation Setting</a>.</p> <hr/> <p> <b>Caution</b> • If the component contains a Windows service, select the <i>Favor Local</i> option. Although an end user could change the feature's installation state through the <i>CustomSetup</i> dialog, the Windows Installer cannot install a service remotely.</p>

**Table 81** • Component Settings in the General Area (cont.)

Setting	Project Type	Description
<b>COM Extract at Build</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	<p>Specify whether you want InstallShield to extract COM data from this component's <b>key file</b> at build time. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>No</b>—InstallShield does not extract the COM information at build time.</li> <li>● <b>Yes</b>—InstallShield extracts the COM information every time that you build a release. If your COM server's interfaces are subject to change, this option is preferable to maintaining statically acquired or provided data in the COM Registration area under the component's Advanced Setting area.</li> </ul> <p>Select the No option if you want InstallShield to register the file according to the information that is statically contained in the COM Registration area under the component's Advanced Setting area. This advanced setting stores information about the file's COM classes, ProgIDs, and so on, that were either extracted in the Component Wizard or entered manually in the Advanced Setting area.</p> <div>  <p><b>Best Practice</b> - If you have marked a file for this component as self-registering, you should select No for the COM Extract at Build setting. Note, however, that calling self-registration functions is a violation of <b>setup best practices</b>.</p> <p>To learn more about COM registration, see <a href="#">Extracting COM Registration Data at Build Time</a>.</p> </div>

**Table 81** • Component Settings in the General Area (cont.)

Setting	Project Type	Description
<b>Languages</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>The Languages setting for a component enables you to specify the languages for which the component is intended, for use in build-time filtering. By default, components are language independent, meaning that none of the component's data (such as files and registry entries) are specific to a particular language.</p>  <p><b>Project</b> • In InstallScript and InstallScript Object projects, if a language is not selected in the General Information view of a project, it is not listed as one of the available languages for the project's components.</p> <p>To designate that the component is intended for only certain languages, click the ellipsis button (...) in this setting. The Languages dialog box opens, enabling you to select the appropriate languages for the component.</p> <p>For more information, see <a href="#">Marking Components as Language Dependent</a>.</p>  <p><b>Tip</b> • To learn how to specify which language-dependent components are installed at run time, see <a href="#">Installing Components Based on Language</a>.</p>
<b>Reevaluate Condition</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Specify whether you want the Windows Installer to reevaluate the component's condition when the product is reinstalled.</p> <p>This setting is useful for authoring transitive components—components that can replace each other when a product is reinstalled, for example, after an operating system upgrade. For more information, see <a href="#">Reevaluating Component Conditions During Reinstallation</a>.</p>

**Table 81** • Component Settings in the General Area (cont.)

Setting	Project Type	Description
<b>Never Overwrite</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Specify whether you want your installation to avoid overwriting a file if it already exists on the target system:</p> <ul style="list-style-type: none"> <li>● If you select Yes, the file—if it exists on the target system—is never overwritten, regardless of the file version. Selecting Yes for this setting overrides file versioning rules.</li> <li>● If you select No and the file version on the target system is newer than the version being installed, the file on the target system is not overwritten. However, if the version being installed is newer, the file on the target system is overwritten.</li> </ul> <div>  <p><b>Important</b> • The Windows Installer checks for the existence of the component's <b>key file</b> when determining if it should install the component. If the component's key file does not exist on the target system, Windows Installer installs the component as if No were selected for the Never Overwrite setting. For more information on how the Windows Installer determines whether a component should be installed, see <a href="#">Overwriting Files and Components on the Target System</a>.</p> </div>
<b>64-Bit Component</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, MSI Database, MSM Database, Transform	<div>  <p><b>Project</b> • The use of this setting varies, depending on whether the project type is Windows Installer based (Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, or Transform project) or InstallScript based (InstallScript or InstallScript Object project).</p> </div>

**Table 81** ■ Component Settings in the General Area (cont.)

Setting	Project Type	Description
<b>64-Bit Component (cont.)</b>		<p><b>For Windows Installer-Based Projects</b></p> <p>Specify whether you want to mark this component as 64 bit. The component should be marked as 64 bit if any of the following are true:</p> <ul style="list-style-type: none"> <li>• The component contains files that need to be installed to a 64-bit location.</li> <li>• The component contains registry data that needs to be installed to a 64-bit area of the registry.</li> <li>• The component contains a 64-bit COM server and it needs to be self-registered.</li> </ul> <p>Note the following details:</p> <ul style="list-style-type: none"> <li>• If you include a 64-bit component in your installation, the installation cannot be run on 32-bit machines, and the Template Summary property must specify a 64-bit value.</li> <li>• If the component is 64 bit and it is replacing a 32-bit component, be sure to specify a new GUID for the component in the Component Code setting.</li> </ul> <p>For more information about 64-bit support, see <a href="#">Targeting 64-Bit Operating Systems with Basic MSI and InstallScript MSI Installations</a>.</p>
		<p><b>For InstallScript-Based Projects</b></p> <p>Specify whether you want to mark this component as 64 bit.</p> <p>If you want your installation to install the files and registry data in this component to 64-bit locations on 64-bit systems and 32-bit locations on 32-bit systems, you can mark the component as 64 bit.</p> <p>For more information about 64-bit support, see <a href="#">Targeting 64-Bit Operating Systems with InstallScript Installations</a>.</p>

**Table 81** • Component Settings in the General Area (cont.)

Setting	Project Type	Description
<b>Source Location</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	<p>Specify the name of a subfolder where the component's files should be stored in the source disk images if the component's files are not compressed. When you build a release, InstallShield copies the component's files to this subfolder in your disk image.</p> <p>This setting enables you to create unique folders for each component's files, which is necessary if you have different files with the same name in more than one component. If you do not specify a value for Source Location setting, you run the risk of overwriting files with the same name when you build an uncompressed release.</p> <p>This setting does not require a value, and in most cases, may be left blank. If you do enter a value, it must be a valid Windows folder name.</p> <p>For more information, see <a href="#">Installing Files of the Same Name</a>.</p>
<b>Disable Registry Reflection</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Registry reflection keeps the 32-bit registry view and the 64-bit registry view in sync on the target machine.</p> <p>To enable registry reflection for all existing and new registry keys that are affected by the selected component, select No, which is the default value.</p> <p>To disable registry reflection on all existing and new registry keys that are affected by this component, select Yes. Windows Installer calls the <b>RegDisableReflectionKey</b> function on each key being accessed by the component. This function disables registry reflection for the specified key. Disabling reflection for a key does not affect reflection of any subkeys.</p> <p></p> <p><b>Note</b> • Only 64-bit systems with Windows Installer 4 or later support this setting. In addition, only Windows Vista and later and Windows Server 2008 and later support it. Other systems ignore this setting.</p> <p>For more information about registry reflection, see <a href="#">Registry Reflection</a> in the MSDN Library.</p>

**Table 81** • Component Settings in the General Area (cont.)

Setting	Project Type	Description
<b>Multiple Package Shared Component</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>To enable shared component patching for the selected component, select Yes; otherwise, select No, which is the default value. If this multiple-package sharing feature were enabled in at least one package that is installed on the target system, Windows Installer 4.5 treats the component as shared among all of those packages. If a patch that shares this component is uninstalled, Windows Installer can continue to share the highest version of the component's files on the system.</p> <p>The purpose of this multiple-package component sharing is to prevent files from being downgraded during the uninstallation of a patch that contains a component that is shared with one or more other installed packages. The intent is to keep the highest version of the component's files present on the machine after uninstallation of that patch.</p> <p>The following scenario helps to illustrate the behavior:</p> <ul style="list-style-type: none"> <li>● Install product A with shared file 1.0.0.0.</li> <li>● Install product B with shared file 1.1.0.0.</li> <li>● Apply an uninstalleable patch for product A with shared file 1.2.0.0.</li> <li>● Uninstall the patch for product A.</li> </ul>

**Table 81** ▪ Component Settings in the General Area (cont.)

Setting	Project Type	Description
<b>Multiple Package Shared Component (cont.)</b>		<p>Either of the following results may occur:</p> <ul style="list-style-type: none"> <li>● If the value of the Multiple Package Shared Component setting is Yes for either product A or product B and if Windows Installer 4.5 is present, uninstalling the patch from product A could restore version 1.1.0.0 to the target system.</li> <li>● If the value of this setting is No for product A and product B, the file would be downgraded to version 1.0.0.0, even though product B used 1.1.0.0. As a result, if product B requires version 1.1.0.0, product B may no longer work properly.</li> </ul> <p></p> <p><b>Note</b> ▪ <i>If the <code>DisableSharedComponent</code> policy is set to 1 on a target system, Windows Installer ignores this setting for all packages.</i></p> <p><i>Windows Installer 4.0 and earlier ignore this setting.</i></p> <p>To learn more about this setting, see <a href="#">Specifying Whether Shared Component Patching Should Be Enabled for a Component</a>.</p>

**Table 81** • Component Settings in the General Area (cont.)

Setting	Project Type	Description
<b>Uninstall Superseded Component</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>This setting determines how Windows Installer handles the selected component during installation of a superseding patch under certain conditions. It is designed to prevent the component's feature from being changed to an advertised state if a patch that is installed or uninstalled changes the component count for the feature. If the feature state changes to advertised, none of the feature's remaining components can be maintained.</p> <p>To specify that this component in the current patch should be flagged for uninstallation in order to avoid leaving this component orphaned on the target system after a superseding patch is applied, select Yes. If a subsequent patch is installed and it is flagged to supersede the first patch (that is, if Yes is selected in the Supersede column for the patch's family on the Sequence tab for the patch configuration in the Patch Design view), Windows Installer can unregister and uninstall this component if appropriate. If you select No, the superseding patch can leave an orphaned component on the target system. The default value for this setting is No.</p> <p>If you select No and the superseded patch installs a component for the product but the superseding patch removes that component, the component's feature state is changed to advertised, and it is not reinstalled. In addition, none of the remaining components associated with that feature can be maintained. If you select Yes, Windows Installer unregisters and uninstalls the component when the superseding patch is applied.</p> <p></p> <p><b>Note</b> • Windows Installer 4.5 includes support for this Uninstall Superseded Component setting. Earlier versions of Windows Installer ignore it.</p> <p></p> <p><b>Tip</b> • Setting the MSIUNINSTALLSUPERSEDEDCOMPONENTS property has the same effect as selecting Yes for the Uninstall Superseded Component setting of all components in the patch.</p>
<b>REG File to Merge at Build</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	<p>If you want to merge a .reg file with the component's registry entries at build time, enter the complete path for the .reg file. As an alternative, you can click the ellipsis button (...) in this setting to browse to the .reg file.</p>

**Table 81** • Component Settings in the General Area (cont.)

Setting	Project Type	Description
<b>Self-Register</b>	InstallScript, InstallScript Object	<p>Specify whether the component's files are self-registering. (A self-registering file is an OLE server that can place information about itself in the registry so that it is seen by other OLE applications. Such a file can also remove this information from the registry when it is uninstalled.)</p>  <p><b>Important</b> • If you select Yes but one or more files in the component are not self-registering, an error occurs when the installation runs.</p>  <p><b>Project</b> • InstallScript and InstallScript Object projects support self-registration of .dll files, .exe files, and type libraries—that is, .tlb and .olb files.</p> <p>In Basic MSI and InstallScript MSI projects, self-registration is set at the file level, rather than the component level.</p>
<b>Potentially Locked</b>	InstallScript, InstallScript Object	<p>Specify whether already-installed versions of the component's files may be locked—that is, in use by another product—during installation.</p> <p>If a file is locked during installation or uninstallation, and that file is in a component whose Potentially Locked setting is set to Yes, the file operation is automatically performed after restart. If a file is locked during installation or uninstallation, and that file is in a component whose Potentially Locked setting is set to No, the <b>OnFileLocked</b> event handler function is called. (The default code for this function automatically performs the file operation after restart.)</p> <p>Note that InstallShield always treats shared files as potentially locked files.</p>
<b>Compressed</b>	InstallScript, InstallScript Object	<p>Specify whether you want to compress the files in the component if its files are built into a .cab file at build time.</p> <p>This setting has no effect if you select the check box for the component's feature in the Custom Media Layout panel of the Release Wizard.</p>

**Table 81** • Component Settings in the General Area (cont.)

Setting	Project Type	Description
<b>Overwrite</b>	InstallScript, InstallScript Object	<p>This setting indicates the installation's behavior when it encounters an existing file with the same name as the one being installed; you can selectively replace each file in a component based on its version number or modification date. To change the behavior, click the ellipsis button (...) in this setting. The Overwrite dialog box opens, enabling you to specify the appropriate run-time behavior.</p> <p></p> <p><b>Tip</b> • If the component consists of files—such as data and configuration files—that end users may have updated, consider selecting the <i>Never Overwrite</i> option.</p> <p>Files that are associated with a component that has the <i>Never Overwrite</i> option selected for the Overwrite setting are logged for uninstallation; that is, even if such a file is not copied to the target system, because a file with the same name already exists there, that file is removed when the application is uninstalled. To prevent an already existing file from being uninstalled, select <i>Yes</i> for the <i>Shared</i> setting of the file's component.</p>
<b>Difference</b>	InstallScript, InstallScript Object	<p>Specify whether you want InstallShield to include the component's files in a release when you are building a <b>differential release</b>. (When you define a differential release, you specify one or more existing releases to which the current project should be compared when the new differential release is built.)</p> <p>Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Include If Appropriate</b>—InstallShield excludes a file in this component from the differential release if the same file (with the same date, time, size, and attributes) exists in each of the specified comparison releases. This is the default option.</li> <li>● <b>Include Always</b>—InstallShield includes all of the component's files in the differential release, even if the same file (with the same date, time, size, and attributes) exists in each of the specified comparison releases.</li> </ul>
<b>Link Type</b>	InstallScript, InstallScript Object	Specify whether the component's file links are static or dynamic and, if the latter, how the links are determined at the time of the release build.

**Table 81** ▪ Component Settings in the General Area (cont.)

Setting	Project Type	Description
<b>Comments</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Enter comments about this component. Your comments are saved in the project file for your reference and are not used in the installation at any time.

## Target Machine

When you select a component in the Components view or the Setup Design view of an InstallScript, InstallScript MSI, or InstallScript Object project, the following settings are available in the Target Machine area:

**Table 82** ▪ Component Settings in the Target Machine Area

Setting	Project Type	Description
<b>Operating Systems</b>	InstallScript, InstallScript MSI, InstallScript Object	<p>If a component is specific to one or more operating systems, use this setting to indicate those operating systems. If the target machine's operating system does not match one of the operating systems that are specified for this setting, the component is not installed.</p> <p>By default, components are operating system independent, meaning that none of the component's data are specific to certain operating systems.</p> <p>To change the value of this setting, click the ellipsis button (...) in this setting.</p>

**Table 82** ▪ Component Settings in the Target Machine Area (cont.)

Setting	Project Type	Description
<b>Platform Suite(s)</b>	InstallScript, InstallScript Object	<p>If a component is specific to one or more platform suites, use this setting to indicate the suites. If you specify more than suite, you can indicate whether all or any of the suites must be present on the target machine in order for the component to be installed.</p> <p>By default, components are platform suite independent, meaning that none of the component's data are specific to a particular platform suite.</p> <hr/>  <p><b>Tip</b> ▪ This setting provides an additional layer of filtering beyond the Operating Systems setting. Select platform suites for the Platform Suite(s) setting only if necessary, and be sure to select only those platform suites that are required for the proper functioning of your application. For example, if a component should be installed on both the Home and Professional editions of Windows XP, you can leave Suite Independent as the value for this setting; selecting Windows XP for the Operating Systems setting encompasses both editions.</p> <p>You can control the platform suites that your installation supports at run time by calling the <b>FeatureFilterOS</b> function. In the <b>OnFilterComponents</b> event handler, the framework typically calls this function with the platform suites that match the target system so that only the appropriate components are installed. By calling <b>FeatureFilterOS</b>, you can override this default behavior to install or prevent the installation of components based on any platform suite criteria that you specify.</p>

## .NET Settings

When you select a component in the Components view or the Setup Design view, the following settings are available in the .NET Settings area:

**Table 83** • Component Settings in the .NET Settings Area

Setting	Project Type	Description
<b>.NET COM Interop</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	<p>Specify whether you want to use COM interoperation (the ability to call .NET objects from COM) for the component.</p> <p>For example, if you have a Visual Basic .NET class library that defines the ComClass attribute and contains at least one public (COM-callable) function, you can select Yes for this setting; InstallShield extracts the COM Interop information at build time and adds it to the Registry table of your .msi database. At run time, registry entries that allow COM objects to call your .NET assembly are created on the target system.</p>  <p><b>Note</b> • This setting is applicable only if the component's <i>key file</i> is a .NET assembly.</p>
<b>.NET Precompile Assembly</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	<p>Specify whether you want the installation to create a native image from the .NET assembly at run time and install it to the native image cache on the target system. This allows the assembly to load and execute faster, because it restores code and data structures from the native image cache rather than from just-in-time (JIT) compilation.</p>
<b>.NET Assembly</b>	InstallScript, InstallScript Object	<p>Specify whether the component's files should be installed as local .NET assemblies. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Local Assembly</b>—The component contains a .NET assembly. In addition, the installation performs COM interop registration and configures .NET installer class information for the component at run time.</li> <li>● <b>Not a .NET Assembly</b>—The component does not contain a .NET assembly. This is the default option.</li> </ul> <p>If you want InstallShield to scan the assembly in this component for .NET dependencies at run time, Local Assembly must be selected for this setting. To learn more, see <a href="#">Identifying Properties and Dependencies of .NET Assemblies</a>.</p>

**Table 83** ■ Component Settings in the .NET Settings Area (cont.)

Setting	Project Type	Description
<b>.NET Scan at Build</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	 <p><b>Project</b> ■ The functionality for this setting depends on whether the project type is Windows Installer based (Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, or Transform project) or InstallScript based (InstallScript or InstallScript Object project).</p> <ul style="list-style-type: none"> <li>● <b>For a Windows Installer-based project</b>—Indicate whether you want the key file of this component to be scanned for .NET dependencies, properties, or both at build time.</li> <li>● <b>For an InstallScript-based project</b>—Indicate whether you want the files of this component to be scanned for .NET dependencies at build time.</li> </ul> <p>For more information, see <a href="#">Identifying Properties and Dependencies of .NET Assemblies</a>.</p>
<b>.NET Application File</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	<p>This setting is used when this component is scanned at build time (based on the .NET Scan at Build setting) or by the <a href="#">Static Scanning Wizard</a>. The scanner uses this setting—along with the component destination—to determine the value of the File Application setting for the assembly.</p> <p>For optimal advertising and repair, select the .NET executable file that uses the assembly in this component.</p> <p>The key file of the component is displayed in this setting if the .NET Scan at Build setting is set to Dependencies and Properties or Properties. You can select any other key or portable executable file in the project.</p>  <p><b>Note</b> ■ This setting is applicable only if the component's <a href="#">key file</a> is a .NET assembly.</p> <p>The value for this setting is ignored if the file that is selected is not a .NET assembly file.</p>

**Table 83** ▪ Component Settings in the .NET Settings Area (cont.)

Setting	Project Type	Description
<b>.NET Installer Class</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	 <p><b>Note</b> ▪ This setting is applicable only if the component's <i>key file</i> is a .NET assembly that contains a class that is derived from <code>System.Configuration.Install.Installer</code>.</p> <p>If the assembly's Install, Commit, Rollback, and Uninstall methods should be called at the appropriate times at run time, select Yes.</p>
<b>.NET Installer Class Arguments</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	<p>To specify arguments that should be passed to the .NET installer class, click the ellipsis button (...) in this setting. The .NET Installer Class Arguments dialog box opens, enabling you to specify arguments for the Install, Commit, Rollback, and Uninstall methods.</p> <p>For sample code, see <a href="#">Reading Properties Passed to the .NET Installer Class</a>.</p>  <p><b>Note</b> ▪ This setting is applicable only if the component's <i>key file</i> is a .NET assembly.</p>

## Run-Time Settings

When you select a component in the Components view or the Setup Design view of an InstallScript or InstallScript Object project, the following settings are available in the Run-Time Settings area:

**Table 84** ▪ Component Settings in the Run-Time Settings Area

Setting	Project Type	Description
<b>FTP Location</b>	InstallScript, InstallScript Object	<p>If you want to associate an FTP location with the component, enter the FTP address.</p> <p>The location that you enter cannot be accessed from within a script. Note that this same setting is also available for features; however, the location that you specify for the feature setting can be accessed from within a script.</p>
<b>HTTP Location</b>	InstallScript, InstallScript Object	<p>If you want to associate an HTTP address with the component, enter the HTTP address.</p> <p>The location that you enter cannot be accessed from within a script. Note that this same setting is also available for features; however, the location that you specify for the feature setting can be accessed from within a script.</p>

**Table 84** • Component Settings in the Run-Time Settings Area (cont.)

Setting	Project Type	Description
<b>Miscellaneous</b>	InstallScript, InstallScript Object	<p>If you want to associate a text string with the component, enter the text string.</p> <p>The location that you enter cannot be accessed from within a script. Note that this same setting is also available for features; however, the location that you specify for the feature setting can be accessed from within a script.</p>

## Advanced Settings for a Component

**Project** • The Advanced Settings area for a component is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The Advanced Settings area under a component in the Components view (and in the Setup Design view) enables you to fulfill installation requirements for special component types. For example, when you copy an .ocx file to the target system, you must register its classes, ProgIDs, and type libraries so that the file's methods can be properly accessed. Advanced settings use Windows Installer's built-in functionality for registering COM servers; setting up ODBC drivers, data sources, and translators; installing or controlling Windows services; and registering a file association.

By specifying the advanced settings, you can publish your component and register COM servers, file extension servers, and MIME types. If the component is selected, an advanced setting is made on the target system when the component is installed or advertised. That way, the file is ready to execute once it is installed. Publishing components—a type of advertising—is accomplished through the Publishing advanced setting.

## Categories of Advanced Settings

The Advanced Settings area under a component in the Components view (and in the Setup Design view) is organized into the following main categories:

**Table 85** • Categories for the Advanced Settings of a Component

Category	Description
<b>Application Paths</b>	<p>Use this advanced setting to specify the paths to your component's files and folders. When you run your installation, it will create an App Paths key for your component under the following registry key:</p> <p>HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\App Paths\ProgramName.exe.</p>
<b>Assembly</b>	<p>Use this advanced setting to install a Win32 or .NET assembly when its component is installed.</p>
<b>COM Registration</b>	<p>In the COM Registration area, you can enter or modify registration information for the COM server that you have set as your component's key file. The COM Registration advanced setting is intended to replace self-registration, which is a violation of <a href="#">Setup Best Practices</a>.</p> <p>The recommended way to specify file registration is to use the <a href="#">Component Wizard</a> and have it automatically extract the necessary information for you. Use the COM Registration explorer only if you need to make advanced modifications.</p>
<b>File Types</b>	<p>This advanced setting registers information about a file type on the target system when the component is installed or advertised.</p>
<b>Services</b>	<p>Use the Services area to install, configure, start, stop, and uninstall Windows services during installation and uninstallation.</p> <p>As an alternative, you can use the Services view to install, configure, start, stop, and uninstall Windows services. If you configure service information in either of these areas, the other area is automatically updated accordingly.</p>
<b>Publishing</b>	<p>Use this advanced setting to publish your component. Publishing is a type of advertising (just-in-time installation) in which no user-interface elements are created for the component during installation, but the component can be installed through the Add or Remove Programs or when an installed component requests the published component from the installer.</p>
<b>Device Driver</b>	<p>The Device Driver advanced setting enables you to specify whether the current component includes a device driver, the type of driver, and the order in which the project's device drivers (not just the current component's device drivers) should be installed.</p>
<b>Other Data</b>	<p>The Other Data advanced setting lists various Windows Installer tables that are related to the component.</p>

## Application Path Settings

**Project** ▪ The Application Paths area for a component is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The following columns are available in the Application Paths area under the Advanced Settings node of the Components view and the Setup Design view:

**Table 86** ▪ Assembly Settings

Column	Description
<b>Check Box</b>	To add an application path for the component, select the check box for the executable file whose application path you want to define.
<b>File</b>	This read-only column shows the executable files that are in the selected component.
<b>Application Path</b>	<p>Enter a sequence of directories that the executable file should use as a search path for its DLLs (whether linked to the executable at build time, or loaded with the <b>LoadLibrary</b> API). Separate multiple directories with a semicolon (;).</p> <p>Do not use hard-coded paths, such as <b>C:\MyDir</b>, for one of your paths. Instead, use Windows Installer folder properties in square brackets, as in <b>[INSTALLDIR]MyDir</b> and <b>[CommonFilesFolder]MyProgram</b>, or the name of the component after a dollar sign, such as <b>[\$ComponentName]</b>. The Windows Installer resolves these values and writes the resulting locations to the application path key.</p>

## Assembly Settings

**Project** ▪ The Assembly area for a component is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database

- *MSM Database*
- *Transform*

The following settings are available in the Assembly area under the Advanced Settings node of the Components view and the Setup Design view:

**Table 87** • Assembly Settings

Setting	Description
<b>Manifest</b>	<p>For a .NET assembly, this setting is automatically set to the first .exe or DLL file in the component.</p> <p>For a Win32 assembly, this setting is automatically set to the first file in the component with the .manifest extension. The file name of the manifest is the application executable name, followed by the .manifest extension.</p> <p>This setting should be left blank if Global Assembly Cache is selected for the assembly's File Application setting.</p> <p>The Manifest setting cannot be deleted.</p>
<b>File Application</b>	<p>For a .NET assembly, this setting lets you specify whether to install the assembly in the global assembly cache. Select the appropriate file to install the assembly in your application's private cache, or select Global Assembly Cache to install the assembly in the global assembly cache.</p> <p>For a Win32 assembly, this setting lets you specify whether to install the assembly privately for the selected .exe or to install the assembly to the global assembly cache. If you select Global Assembly Cache, the assembly can be used by any .NET application on the target system.</p> <p>The File Application setting cannot be deleted.</p> <p>The value of this setting affects the component's <a href="#">Destination setting</a>. If the File Application setting is set to Global Assembly Cache, the component's Destination setting is also set to Global Assembly Cache. For optimal advertising and repair, select the executable file that uses the assembly in this component.</p>  <p><b>Note</b> • To install a .NET assembly to the global assembly cache, the assembly must meet certain criteria. For details, consult Microsoft's .NET documentation.</p> <p>To install a Win32 assembly to the global assembly cache, your files must be signed and have catalog (.cat) files. For details, see "Creating Signed Files and Catalogs" in the Platform SDK help.</p>

**Table 87** ▪ Assembly Settings (cont.)

Setting	Description
<b>Properties</b>	<p>Enter the property names and values. To create a new entry, right-click in the grid and click New.</p> <p>For a Win32 assembly, you must enter values for the following properties: type, name, version, language, publicKeyToken, and processorArchitecture.</p> <p>For a private .NET assembly, you must enter values for the following properties: Name, Version, and Culture. For a global .NET assembly, you must enter values for the following properties: Name, Version, Culture, and PublicKeyToken.</p> <p>InstallShield adds the property name and value that you enter to the MsiAssemblyName table of your Windows Installer database. You can view the records in this table using the Direct Editor.</p>  <p><b>Note</b> ▪ The property and values that you enter for your assembly must match the information in the assembly's manifest file. If they do not match, the assembly might be left on the target system when your product is uninstalled.</p>

## COM Registration Settings

**Project** ▪ The COM Registration area for a component is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The COM Registration area under the Advanced Settings node of the Components view and the Setup Design view is organized into the following categories:

- COM Classes
- ProgIDs
- Type Libraries

## COM Classes

When you select a COM class in the COM Registration area of the Components view or the Setup Design view, the following settings are available:

**Table 88** • COM Class Settings

Setting	Description
<b>ProgID</b>	<p>Select a ProgID for this COM class from the list of ProgIDs created for this COM server.</p> <p>You can also create a ProgID by typing a new name; if you do this, InstallShield adds the new ProgID under the ProgIDs node.</p>
<b>File Type Mask</b>	<p>Enter the file type mask in the following format:</p> <p><b>offset, cb, mask, value</b></p> <ul style="list-style-type: none"> <li>• <b>offset</b>—The position, in bytes, from the beginning of the file, indicating where the byte range begins. Number of bytes from the end of the file if the offset value is a negative integer.</li> <li>• <b>cb</b>—The number of bytes in the file, starting from the offset value, that will be used to perform a logical AND operation with the mask.</li> <li>• <b>mask</b>—A value that is used to perform a logical AND operation with the bits in the file so that the result can be compared with a specified value (the next entry). If you leave this value empty, it is assumed to be all ones.</li> <li>• <b>value</b>—The bytes that will be compared with the result of a logical AND operation between the mask and the byte range in a file in order to determine the file's class ID.</li> </ul> <p>A file type mask is part of a pattern registered under HKEY_CLASSES_ROOT\FileType\CLSID\pattern. Windows APIs such as <b>OleCreateFromFile</b> and <b>GetClassFile</b> can retrieve a class ID for a file by comparing information in this key to the bytes in the file. For example, <b>0,4,FFFFFFFF,AABBCCDD</b> would mean that the first four bytes in the file must be AA BB CC DD for the system to use this component's class ID for a specified file.</p> <p>You can specify more than one mask that the file has to match. Separate multiple patterns with a semicolon (;). When the installation creates these keys, the subkeys for each pattern are automatically numbered sequentially starting with the number 0.</p>
<b>Icon File</b>	<p>Enter the fully qualified path to the file that contains the icon associated with this COM class, or click the ellipsis button (...) in this setting to browse to the path.</p> <p>You can specify an .ico, .exe, or .dll file. An icon will be extracted from the file for you if you browse for an executable file or DLL and select a specific icon.</p>

**Table 88** • COM Class Settings (cont.)

Setting	Description
<b>Icon Index</b>	<p>If there is more than one icon resource in the file, enter the index for the appropriate icon.</p> <p>A nonnegative integer refers to the order of the icon resources in the executable file. For example, 0 is for the first icon in the file, 1 for the second, 2 for the third, and so on.</p> <p>Use a negative number to refer to a specific resource ID. For example, the icon index -12 points to the icon with a resource ID of 12.</p>
<b>AppID</b>	<p>Select an AppID for this DCOM or COM+ class from the list of AppID names that you have already created for this file's registration.</p> <p>An AppID is a GUID that is registered under HKEY_CLASSES_ROOT\AppID used for grouping all of the security and configuration options of distributed COM objects.</p> <p>To create a new AppID, you need to use the Direct Editor: Navigate to the AppID table and enter the information for your new AppID. Once you have created an AppID, you can select it from the list in this setting.</p> <p>To permanently delete an AppID, delete its row in the AppID from within the Direct Editor.</p>
<b>Description</b>	<p>Enter a description for this COM class.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Relative Path</b>	<p>Specify whether you want to register a relative path to the file under its class ID. Available options are:</p> <ul style="list-style-type: none"> <li>• <b>No</b>—The installation registers the fully qualified path to the file under its class ID. Then, when any client application instantiates an object from this class, the system always points to the registered COM server. This is the default option.</li> <li>• <b>Yes</b>—The installation registers only the name of the file without any path. Doing so allows you to install side-by-side components, meaning that the operating system uses the copy of the COM server in the current directory and that other applications can maintain separate copies of the file in their respective folders.</li> </ul> <div>  <p><b>Note</b> • If the path is relative and the file is not in the system's path, the operating system will not be able to find the class when a client attempts to create an object outside of the server's current directory.</p> </div>

When you select a LocalServer32, LocalServer, or InprocServer32 context type under a COM class in the COM Registration area of the Components view or the Setup Design view, the following settings are available:

**Table 89** ▪ COM Class Context Settings

Setting	Description
<b>Default Inproc Handler</b>	Select the InprocHandler value for this LocalServer or LocalServer32 context type.
<b>Argument</b>	Enter the argument that OLE will use when calling this COM server.

## ProgIDs

When you select a ProgID in the COM Registration area of the Components view or the Setup Design view, the following settings are available:

**Table 90** ▪ ProgID Settings

Setting	Description
<b>COM Class</b>	<p>Select the COM class, if any, to which this ProgID refers.</p> <p>If you later change the class ID (CLSID) for the COM class, you will need to select it again from the list to restore the association.</p>
<b>Description</b>	<p>Enter a description of this ProgID.</p> <p>The description is registered as the default value for the ProgID under the registry key HKEY_CLASSES_ROOT\class.object when this component is installed. When the user right-clicks a file associated with your file extension and then clicks Properties, the General tab displays the description that you enter here.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Icon File</b>	<p>Enter the fully qualified path to the file that contains the icon associated with this ProgID, or click the ellipsis button (...) in this setting to browse to the path.</p> <p>You can specify an .ico, .exe, or .dll file. An icon will be extracted from the file for you if you browse for an executable file or DLL and select a specific icon.</p>

**Table 90** ▪ ProgID Settings (cont.)

Setting	Description
<b>Icon Index</b>	<p>If there is more than one icon resource in the file, enter the index for the appropriate icon.</p> <p>A nonnegative integer refers to the order of the icon resources in the executable file. For example, 0 is for the first icon in the file, 1 for the second, 2 for the third, and so on.</p> <p>Use a negative number to refer to a specific resource ID. For example, the icon index -12 points to the icon with a resource ID of 12.</p>

When you select a version-independent ProgID in the COM Registration area of the Components view or the Setup Design view, the following settings are available:

**Table 91** ▪ Version-Independent ProgID Settings

Setting	Description
<b>Description</b>	<p>Enter a description of this version-independent ProgID.</p> <p>The description is registered as the default value for the version-independent ProgID under its root key (HKEY_CLASSES_ROOT\<i>version-independent ProgID</i>) when this component is installed.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

## Type Libraries

When you select a type library in the COM Registration area of the Components view or the Setup Design view, the following settings are available:

**Table 92** ▪ Type Library Settings

Setting	Description
<b>Locale ID</b>	<p>Enter the decimal value of the type library's locale ID.</p> <p>Since type libraries are usually language-neutral, the number zero is the most common language of type libraries.</p>
<b>Version</b>	<p>Provide the version number of the type library. If this setting is left blank, Windows Installer automatically determines the version of the type library at run time.</p> <p>Windows Installer requires the type library version to be in the format <i>x.y</i>, where <i>x</i> and <i>y</i> are decimal (base-10) integers.</p>

**Table 92** • Type Library Settings (cont.)

Setting	Description
<b>Cost</b>	Enter the cost that is associated with registering this type library. Use non-negative numbers only. Enter the number 1 if no specific value is available.
<b>Help Path</b>	<p>Select the destination folder where the help file for this type library will be installed, or click the ellipsis button (...) to select or create a directory.</p> <p>To use the component's default destination directory, select [INSTALLDIR].</p>
<b>Description</b>	<p>Enter a description of this type library.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

## File Type Settings

**Project** • The File Types area for a component is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The File Types area under the Advanced Settings node of the Components view and the Setup Design view is organized into the following categories:

- [Extension](#)
- [Verbs](#)
- [MIME Type](#)
- [ProgIDs](#)

## Extension

When you select an extension in the File Types area of the Components view or the Setup Design view, the following settings are available:

**Table 93** • Extension Settings

Setting	Description
<b>ProgID</b>	<p>Select the ProgID that should be registered for this file extension.</p> <p>You can also create a ProgID by typing a new name; if you do this, InstallShield adds the new ProgID under the ProgIDs node.</p> <p>A file type's ProgID is an arbitrary string, but it should be unique on the target system. One ProgID naming convention is to append the word <i>file</i> to your extension without a dot—the <i>.ext</i> extension might use the ProgID <i>extfile</i>. Another convention is to name a file-type ProgID after the application used to open the file type, as in <b>SampleApp.Document</b>.</p>
<b>MIME Type</b>	<p>Select the MIME type, if any, that is associated with this file extension.</p> <p>To create a new MIME type for your extension, right-click its icon and click New MIME Type.</p>

## Verbs

When you select a verb under a file extension in the File Types area of the Components view or the Setup Design view, the following settings are available:

**Table 94** • Verb Settings

Setting	Description
<b>Command Sequence</b>	<p>Enter a sequence number for the command verb. If this file extension has more than one verb associated with it, the sequence numbers determine the order in which the verbs are displayed on the context menu (also known as a right-click menu or pop-up menu).</p> <p>If you do not specify a sequence number, or if more than one verb has the same sequence number, the verbs are listed alphabetically.</p> <p>The first verb in the command sequence is displayed in bold as the default option on the file type's context menu.</p>

**Table 94** • Verb Settings (cont.)

Setting	Description
<b>Display Name</b>	<p>Enter the text that you want to display for this verb on the context menu that Windows Explorer displays when an end user right-clicks a file with the current extension. For example, to display <b>Open with SampleApp</b> (with an underlined letter <i>O</i>) on the context menu for this file extension, enter <b>&amp;Open with SampleApp</b>.</p> <p>This setting is optional. If you do not specify a display name, the name of the verb as it appears in the Extensions tree is used on the file-type's context menu on the target system. Note that if you use one of the canonical verbs—such as <i>open</i>, <i>print</i>, or <i>find</i>, and you do not specify a display name, Windows automatically localizes the verb on each system.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Argument</b>	<p>Enter the command-line arguments for this verb.</p> <p>Use %1 in the argument in place of the selected file name. For example, suppose an end user right-clicks C:\File.ext and <b>-p %1</b> is the argument for the verb, the command-line argument becomes <b>-p C:\File.ext</b>.</p> <p>In some cases, it may be necessary to place quotation marks around the %1 argument—that is, enter "%1" as the argument—to correctly handle file names that contain spaces.</p>

## MIME Types

When you select a verb under a file extension in the File Types area of the Components view or the Setup Design view, the following settings are available:

**Table 95** • Mime Type Settings

Setting	Description
<b>Class ID</b>	Enter the class ID that is associated with this MIME type.

## ProgIDs

When you select a ProgID in the File Types area of the Components view or the Setup Design view, several settings are available. For descriptions of each setting, see [ProgIDs](#).

## Services Settings

**Project** ▪ The Services area for a component is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

**Note** ▪ A service must be a single executable file (.exe), since the Windows Installer does not support driver services.

The service executable file must be the key file of its component. For more information, see [Component Key Files](#).

For information about the Services settings, see [Services View](#).

## Publishing Settings

**Project** ▪ The Publishing area for a component is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

You can add the following types of items to the Publishing explorer in the Publishing area under the Advanced Settings node of the Components view and the Setup Design view:

**Table 96** ▪ Publishing Settings

Setting	Description
<b>ComponentID</b>	<p>The componentID, a GUID, is a category identifier that represents the category of components that are being grouped together as a qualified component. Each componentID must have at least one qualifier.</p> <div data-bbox="667 1766 704 1808" data-label="Image"> </div> <p><b>Note</b> ▪ Do not confuse the componentID with the GUID that is entered in the Component Code setting for the component; they must be unique values.</p>

**Table 96** ▪ Publishing Settings (cont.)

Setting	Description
<b>Qualifier</b>	The qualifier is a string that you can use to distinguish this language or version of the component from any other (for example, to specify a language). It must be unique for the component.

The following settings are available when you select a qualifier in the Publishing area:

**Table 97** ▪ Qualifier Settings

Setting	Description
<b>Application Data</b>	<p>Enter the application data that corresponds with its qualifier. The application data is a text string that may be displayed to end users. This setting is optional.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

## Device Driver Settings

**Project** ▪ The Device Driver area for a component is available in the following project types:

- Basic MSI
- InstallScript MSI
- MSI Database
- Transform

The following tabs are available in the Device Driver area under the Advanced Settings node of the Components view and the Setup Design view:

- [Common tab](#)
- [Sequence tab](#)

## Common Tab

The Common tab contains the following run-time settings for device drivers:

**Table 98** • Device Driver Settings on the Common Tab

Options	Description
<b>Always overwrite any existing device driver</b>	Replace any existing driver for the device with this driver. If this check box is cleared and a driver already exists for the device, your driver is not installed.
<b>Do not show Connect Device to Computer dialog</b>	To prevent the Connect Device to Computer dialog from being displayed during the installation of a device driver if a device matching the driver is not connected to a computer, select this option.
<b>Do not create Add or Remove Programs entry for device driver</b>	<p>If you select this check box, the installation does not create an Add or Remove Programs entry for the device driver. If you clear this check box, the installation does create an Add or Remove Programs entry.</p> <p>DIFxApp does not support this feature on Windows Vista and later.</p>
<b>Install unsigned driver files and drivers with missing files</b>	By default, DIFxApp does not install unsigned driver packages or driver packages that have missing files. To override this default behavior, select this check box. Selecting this check box enables you to fully test drivers more easily before shipping final signed versions.
<b>Remove binary files associated with driver during uninstall</b>	<p>By default, when DIFxApp uninstalls a driver package, DIFxApp does not remove the binary files that were copied to the system when it installed the driver. To override this default behavior, select this check box.</p> <p>If you select this check box, DIFxApp removes a binary file from the system only if the binary file is identical to the corresponding binary file in the driver store.</p> <div>  <p><b>Caution</b> • Select the <b>Remove binary files associated with driver during uninstall</b> check box only if you can verify that the driver's binary files are not required by any other driver package or application.</p> </div>

**Table 98** • Device Driver Settings on the Common Tab (cont.)

Options	Description
<b>Include all localized installation runtime dialogs</b>	<p>When this check box is selected, the installation uses a custom action runtime .dll that includes dialogs and text for the following languages:</p> <ul style="list-style-type: none"> <li>• Arabic (Saudi Arabia)</li> <li>• Chinese (People's ROC)</li> <li>• Chinese (Taiwan)</li> <li>• Czech (Czech Republic)</li> <li>• Danish (Denmark)</li> <li>• Dutch (Netherlands)</li> <li>• English (United States)</li> <li>• Finnish (Finland)</li> <li>• French (France)</li> <li>• German (Germany)</li> <li>• Greek (Greece)</li> <li>• Hebrew (Israel)</li> <li>• Hungarian (Hungary)</li> <li>• Italian (Italy)</li> <li>• Japanese (Japan)</li> <li>• Korean (Korea)</li> <li>• Norwegian (Bokmål) (Norway)</li> <li>• Polish (Poland)</li> <li>• Portuguese (Brazil)</li> <li>• Portuguese (Portugal)</li> <li>• Russian (Russia)</li> <li>• Spanish - Modern Sort (Spain)</li> <li>• Swedish (Sweden)</li> <li>• Turkish (Turkey)</li> </ul> <p>If you clear this check box, the installation uses runtime dialogs for English only. The English runtime .dll file is smaller than the localized .dll file, so if space is an issue and you do not need the extra language runtime dialogs, clear this check box.</p> <p>This check box applies to all of the components in the project that contain device drivers.</p>

**Table 98** • Device Driver Settings on the Common Tab (cont.)

Options	Description
<b>Device driver machine architecture</b>	<p>This area has several options. Select the appropriate option.</p> <ul style="list-style-type: none"> <li>• Device driver targets 32 bit machines</li> <li>• Device driver targets Itanium 64 bit machines</li> <li>• Device driver targets AMD 64 bit machines</li> </ul> <p>This setting applies to all of the components in the project that contain device drivers.</p>

## Sequence Tab

The Sequence tab enables you to specify the order in which the project's device drivers (not just the current component's device drivers) should be installed.

## Other Data Settings

**Project** • The Other Data area for a component is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The Other Data area for a component is available in the Components view and the Setup Design view.

### Task

#### Using the Other Data node:

- Click the Other Data node to view a list of Windows Installer tables that are related to the component. The list also includes the name of any SQL script files associated with a component. In addition, the Other Data node lists the number of records found in the Complus, DuplicateFile, Environment, IniFile, MoveFile, RemoveIniFile, RemoveRegistry, and ReserveCost tables.
- To go to a table in the Direct Editor, click the table name.

## Setup Types View

**Project** • The Setup Types view is available in the following project types:

- InstallScript

- *InstallScript MSI*

To create setup types for a Basic MSI project, use the feature's *Install Level* property.

Setup types enable you to provide different versions of your product to your end users. For example, the default setup types are Complete and Custom. The Complete setup type installs all of the files included in your installation. The Custom setup type lets the end user select which features are installed.

Setup types are based on features. You select the features that you would like to associate with each setup type. Then, when an end user selects a certain setup type, only those features that you associated with that setup type are installed.

By default, each project that you create contains predefined setup types. In the Setup Types view, you can add or remove setup types, rename existing setup types, and change which features are associated with each one.

## Default Setup Types

**Table 99** - Default Setup Types

Setup Type	Project Type	Description
<b>Complete</b>	InstallScript, InstallScript MSI	The Complete setup type includes all of your installation program's features.
<b>Custom</b>	InstallScript, InstallScript MSI	The Custom setup type lets end users select which features they would like to install. Required features should be marked as such, so that they are always installed. However, features such as the online help may not need to be installed. In these cases, the end user can select which of the optional features to install.

## Additional Setup Types

You can create additional setup types in this view. To learn how to add setup types to your project, see [Working with Setup Types](#).

## Setup Type Settings

When you select a setup type in the Setup Types view, the following settings are available:

**Table 100** - Setup Type Settings

Setting	Description
<b>Display Name</b>	<p>Enter the name of the setup type. This is the name that is displayed to end users when they run your installation.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

**Table 100** ■ Setup Type Settings (cont.)

Setting	Description
<b>Description</b>	<p>Type a description for the setup type.</p>  <p><b>Note</b> ■ This description is displayed to end users during the installation process only if you call <code>SdSetupTypeEx</code> in your script.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Comment</b>	<p>Type comments about the setup type. The comments are for your use only and do not appear in the installation.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

## Packages View

**Project** ■ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Project-specific differences are noted where appropriate.

**Edition** ■ The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

Use the Packages view to add one package to an Advanced UI project, or one or more packages to a Suite/Advanced UI project. For information on how to determine which type of package format to include, see [Guidelines for Adding Packages to an Advanced UI or Suite/Advanced UI Project](#).

This view also lets you import one or more InstallShield prerequisites into your project as .msi packages, .msp packages, or .exe packages, depending on the type of file that is configured to run for the prerequisites.

Use this view to define conditions for each package, associate each package with one or more Advanced UI or Suite/Advanced UI features, and configure other settings for each package.

At run time, the Setup.exe file launches each package based on the conditions that you have defined and the order in which you listed the packages in the Packages view.

When you select a package in the Packages view, the following tabs are available:

- [Common](#)
- [Features](#)

When you select a dynamically linked folder in the Packages view, two settings are available. For more information, see [Dynamic Link Settings](#).

## Common Tab

---

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

*Project-specific differences are noted where appropriate.*

---

**Edition** ▪ The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The Common tab in the Packages view is organized into the following main categories:

- [General](#)
- [Operation](#)
- [Configuration](#) (This is available for Web Deploy packages.)
- [Events](#) (This is available in Suite/Advanced UI projects.)

### General Settings

Use a package's General settings to specify details such as the display name and the conditions under which the Advanced UI or Suite/Advanced UI installation should launch the package.

Note that some settings are not applicable to all types of Advanced UI or Suite/Advanced UI package files.

**Table 101** ▪ General Settings on the Common Tab

Setting	Type of Package File	Description
<b>Package GUID</b>	.msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project	Enter a GUID that uniquely identifies this package. To have InstallShield generate a different GUID for you, click the <b>Generate a new GUID</b> button ({...}) in this setting.
<b>Display Name</b>	.msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project	<p>Enter the name that you want to be displayed for this package at run time.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p> <p>When you type a value for this setting, you can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p>
<b>Product Configuration</b>	Basic MSI project	<p>Select the product configuration that contains the release in the InstallShield project that you want to associate with the selected package.</p> <p>When you start a build of a release for a Suite/Advanced UI project that includes one or more InstallShield project packages, InstallShield first builds the designated releases in the associated InstallShield projects, and includes them as packages in the Suite/Advanced UI installation that it generates.</p>

**Table 101** ▪ General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Release</b>	Basic MSI project, InstallScript project	<p>Select the release in the InstallShield project that you want to associate with the selected package.</p> <p>When you start a build of a release for a Suite/Advanced UI project that includes one or more InstallShield project packages, InstallShield first builds the designated releases in the associated InstallShield projects, and includes them as packages in the Suite/Advanced UI installation that it generates.</p>
<b>Location</b>	.msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project	<p>Specify where the package should be located. Available options are:</p> <ul style="list-style-type: none"> <li> <b>Copy From Source Media</b>—Store the package and its files on the source media.           <p>If the Advanced UI or Suite/Advanced UI installation will be run uncompressed from fixed media—such as CD, DVD, or local network—use this option.</p> </li> <li> <b>Extract From Setup.exe</b>—Compress the package and its files into Setup.exe, to be extracted at run time, if necessary.           <p>If the entire Advanced UI or Suite/Advanced UI installation must be self-contained in Setup.exe, select this option. Note that the Download From The Web option results in smaller installations and shorter download time; however, the Extract From Setup.exe option provides for a completely self-contained installation.</p> </li> <li> <b>Download From The Web</b>—Download the package and its files (if necessary) from the URL that is specified for the package.           <p>This option is recommended if your installation will be downloaded from the Internet and you want to minimize the Advanced UI or Suite/Advanced UI package size and download time. An Advanced UI or Suite/Advanced UI package is not downloaded if the correct version is already present on the target system.</p> </li> </ul> <p>Note that the option that you select in the Location setting may be overridden in the Releases view.</p>

**Table 101** ■ General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>URL</b>	.msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project	Enter the URL for the root folder that will contain the selected package and its folders and files. The package and any accompanying files are downloaded from this location to target systems at run time if the package needs to be launched.  This setting is applicable if Download From The Web is selected in the Location setting.
<b>Package Type</b>	.msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project	 <p><b>Project</b> ■ <i>In Suite/Advanced UI projects, this setting is available for edit. In Advanced UI projects, this setting is read-only, since an Advanced UI project has support for only one primary package.</i></p> <p>In a Suite/Advanced UI project: Select the type of package that identifies whether the presence of this package on the target system should influence whether the Suite/Advanced UI installation runs in first-time-installation mode or maintenance mode.</p> <p>Available options for this setting are:</p> <ul style="list-style-type: none"> <li>● <b>Primary</b>—The selected package is a main part of the Advanced UI or Suite/Advanced UI installation.  At run time, if all of the primary packages in the installation are absent from the target system, the installation runs as a first-time installation. If any of the primary packages are present on the target system, the installation runs in maintenance mode.</li> <li>● <b>Dependency</b>—The selected package should not be a factor in determining which mode is used to run the Advanced UI or Suite/Advanced UI installation.</li> </ul> <p>For more information, see <a href="#">Primary Packages vs. Dependency Packages in Advanced UI and Suite/Advanced UI Projects</a>.</p>

**Table 101** ■ General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Cache Path</b>	.msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project	<p>Specify where the cached package and other package files should be stored on the end user's system. You can enter a hard-coded value such as <b>C:\CachedFiles</b>, but it is recommended that you use a destination property value in the list for the path. The default value is as follows:</p> <p><b>[LocalAppDataFolder]Downloaded Installations</b></p> <p>The Setup.exe tab in the Releases view lets you specify whether you want to cache the packages on target systems for any packages that are run on target systems and that have a cache path defined. If you are building an uncompressed release, you may want to avoid caching packages on the target system.</p> <p>When you type a value for this setting, you can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p>
<b>Certificate File</b>	.appx	<p>The versions of Windows that support Windows App packages do not install a sideloading package unless they trust the source of the package. If you are using a custom certificate, such as the one that is generated in Visual Studio, the Suite/Advanced UI installation can make Windows trust the source of your package by adding the custom certificate to the certificate store of target systems. The Suite/Advanced UI installation does this if you include the .cer file in your sideloading package, and specify it here.</p>
<b>Require Elevated Privileges</b>	.msi, .msp, .exe, InstallScript, Web Deploy, Basic MSI project, InstallScript project	<p>Specify whether the package requires elevation on Windows Vista and later and Windows Server 2008 and later systems.</p>

**Table 101** ■ General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Minor Upgrade Handling</b>	.msi, Basic MSI project	<p>Indicate the appropriate behavior that should occur when an earlier version of the package is present on the target system. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>None</b>—The Advanced UI or Suite/Advanced UI installation launches the package without running it in minor upgrade mode. That is, the Advanced UI or Suite/Advanced UI installation does not set the REINSTALL or REINSTALLMODE properties for the package.</li> <li>● <b>Automatic</b>—The Advanced UI or Suite/Advanced UI installation launches the package in upgrade mode by setting the REINSTALL property to <i>ALL</i> and the REINSTALLMODE property to <i>nomus</i>. It does not inform the end user that the product will be upgraded.</li> <li>● <b>Ask the User</b>—The Advanced UI or Suite/Advanced UI installation displays a secondary window that asks the end user whether they want to continue. If the end user chooses to continue, the Advanced UI or Suite/Advanced UI installation launches the package in upgrade mode. If the end user chooses to not continue, the package does not run.</li> </ul>

**Table 101** ▪ General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Status Messages Reported</b>	.msi, .msp, Basic MSI project	<p>Specify what sort of status messages you want to be available for displaying in the user interface of the Advanced UI or Suite/Advanced UI installation. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Action Text</b>—The Advanced UI or Suite/Advanced UI installation’s status messages include the action text from the standard actions and custom actions in the package.</li> <li>● <b>Action Text and Action Data</b>—The Advanced UI or Suite/Advanced UI installation’s status messages include the action text as well as action data from the standard actions and custom actions in the package.</li> </ul> <p>At run time, the Advanced UI or Suite/Advanced UI installation updates the ISParcelStatus property with the action text and, if applicable, the action data in the ISParcelStatus property, which is displayed on the InstallationProgress wizard page of the Advanced UI or Suite/Advanced UI installation by default.</p> <p>For example, when the InstallFiles action in an .msi package is executing, the ISParcelStatus property is updated with the action text “Copying new files” to inform end users about the current progress of the installation. If you choose to include action data in the status messages, the ISParcelStatus property may also be updated with action data such as the name, directory, and size of each file as it is being installed on the target system.</p>

**Table 101** ■ General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Shared</b>	.msi, .msp, .exe, .appx, InstallScript, Basic MSI project, InstallScript project	<p>Specify whether you want to mark this package as shared.</p> <p>The shared package functionality helps to ensure that if two or more Advanced UI or Suite/Advanced UI installations are sharing a package, the package remains on the target system until all of the Advanced UI and Suite/Advanced UI products are removed.</p> <p>If you select Yes for this setting, ensure that you also use the same package GUID in all Advanced UI and Suite/Advanced UI projects that are sharing the package.</p> <p>To learn more, see <a href="#">Sharing Common Packages Among Different Advanced UI and Suite/Advanced UI Installations</a>.</p>
<b>Enable Logging Support</b>	.msi, .msp, .exe, InstallScript, Basic MSI project, InstallScript project	<p>Specify whether you want the package to generate a log file if the Advanced UI or Suite/Advanced UI installation is launched from the command line with the /log command-line parameter. Note that if a package does not have support for logging, it is recommended that you do not enable logging support for that package.</p> <p>If you select Yes, configure each subsetting under this setting as needed.</p> <p>For more information, see <a href="#">Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation</a>.</p>
<b>Log File</b>	.msi, .msp, Basic MSI project	<p>This setting is enabled if Yes is selected for the Enable Logging Support setting.</p> <p>Specify a name for the log file. Do not include a path for the file; the Advanced UI or Suite/Advanced UI /log command-line parameter lets end users specify the directory for the package log files.</p> <p>If you leave this setting blank, the name of the log file that the installation creates is <i>PackageGUID.log</i>, where <i>PackageGUID</i> is the GUID that is assigned to the package in the Package GUID setting in the Packages view.</p> <p>For more information, see <a href="#">Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation</a>.</p>

**Table 101** ■ General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Log Options</b>	.msi, .msp, Basic MSI project	<p>This setting is enabled if Yes is selected for the Enable Logging Support setting.</p> <p>Specify the Windows Installer log /L flags that you want the package to use when generating the log file. For example, to generate a log file that logs everything verbosely, enter the following in this setting:</p> <p>*v</p> <p>For additional valid flags, see the <a href="#">/L description</a>.</p> <p>If you leave this setting blank, the asterisk (*) and v flags are used to generate the log file.</p> <p>For more information, see <a href="#">Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation</a>.</p>
<b>Logging Command Line</b>	.exe, InstallScript, InstallScript project	<p>This setting is enabled if Yes is selected for the Enable Logging Support setting.</p> <p>Specify the command line that the Advanced UI or Suite/Advanced UI installation should pass to the .exe package to enable the logging. Include any appropriate supported flags. If the .exe package that you are configuring supports it, include a path that references the Advanced UI or Suite/Advanced UI property ISLogDir, enclosed within square brackets, in place of the path to the directory where the log file should be created.</p> <p>For example, to generate a log file that logs everything verbosely for an .msi package that is run by a Setup.exe file that InstallShield built, enter the following command line:</p> <pre>/v"/1*v "[ISLogDir]FileName.log"</pre> <p>The Advanced UI or Suite/Advanced UI installation replaces [ISLogDir] with the path to the folder that will contain the log file. The Advanced UI or Suite/Advanced UI /log command-line parameter lets end users specify the path to the directory for the package log files.</p> <p>For more information, see <a href="#">Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation</a>.</p>

**Table 101** ▪ General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Detection Condition</b>	.msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project	<p>This setting lets you specify one or more conditions that the Advanced UI or Suite/Advanced UI installation should use to evaluate whether the package is already installed on target systems. For example, if the package installs a specific file or registry entry, you can create a condition that specifies the file or registry key that the installation should search for.</p> <p>To add one or more new detection conditions, click the New Condition button in this setting. InstallShield adds a new row under the Detection Condition setting. Select the appropriate option—All, Any, or None—from the list in this row. Then in this row, click the New Condition button, and select the appropriate option to continue building the conditional statement.</p> <p>For more information, see <a href="#">Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects</a>.</p> <p>If one or more conditional statements are configured, the Detection Condition setting says <b>(Condition)</b>. If none are configured, the Detection Condition setting says <b>(Empty)</b>.</p>

**Table 101** ▪ General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Eligibility Condition</b>	.msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project	<p>This setting lets you specify one or more conditions that the Advanced UI or Suite/Advanced UI installation should use to determine whether the target system meets the requirements that are necessary for the package to be run. For example, if the package should be run only on 64-bit systems, you could set up an x64 platform requirement in a condition; the Advanced UI or Suite/Advanced UI installation would launch the package only on 64-bit systems. You may also want to set up an eligibility condition to prevent end users from being able to install the current package version over a future newer version.</p> <p>To add one or more new eligibility conditions, click the New Condition button in this setting. InstallShield adds a new row under the Eligibility Condition setting. Select the appropriate option—All, Any, or None—from the list in this row. Then in this row, click the New Condition button, and select the appropriate option to continue building the conditional statement.</p> <p>For more information, see <a href="#">Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects</a>.</p> <p>If one or more conditional statements are configured, the Eligibility Condition setting says <b>(Condition)</b>. If none are configured, the Eligibility Condition setting says <b>(Empty)</b>.</p>

**Table 101** ▪ General Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Windows Features</b>	.msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project	 <p><b>Project</b> ▪ This setting is available in Suite/Advanced UI projects.</p> <p>This setting lets you specify one or more Windows roles and features that the selected package requires be enabled on target systems that have Windows Vista or later or Windows Server 2008 or later. At run time, if this package is eligible to be installed and it requires one or more Windows roles and features that are disabled, the Suite/Advanced UI installation enables them before launching the package.</p> <p>To specify a required Windows role or feature, click the Add New Windows Feature button in this setting, and then click one of the available options. The Custom option lets you specify any Windows role or feature that is not listed as an option in this setting.</p> <p>When you select an option, InstallShield adds a new Windows Feature row under the Windows Features setting. Configure the Windows Feature setting as needed.</p> <p>For more information, see <a href="#">Enabling Windows Roles and Features During a Suite/Advanced UI Installation</a>.</p>
<b>Release Flags</b>	.msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project	<p>If you want to use release flags to be able to selectively include and exclude this package from different builds of your Advanced UI or Suite/Advanced UI installation, enter one or more release flags to identify this package. Separate multiple flags with a comma.</p>

## Operation Settings

Use a package's Operation settings to specify information such as the behavior that should occur if the Advanced UI or Suite/Advanced UI installation is installing, removing, repairing, or modifying the package. This includes information such as the command line that should be used when launching the package and the behavior that should occur if the package requires that the target system be rebooted.

Note that some settings are not applicable to all types of Advanced UI and Suite/Advanced UI package formats.

**Table 102** ▪ Operation Settings on the Common Tab

Setting	Type of Package File	Description
<b>Install</b>	.msi, .msp, .exe, .appx, InstallScript, Basic MSI project, InstallScript project	<p>If the Advanced UI or Suite/Advanced UI installation runs in first-time installation mode, specify whether you want this package to be launched as a first-time installation. The install operation is applicable if the target system meets the package's eligibility conditions and if this package's product is not already installed.</p> <p>If you select Yes for this setting, configure the subsettings under this setting as needed. If you select No, the subsettings under this setting are disabled.</p>
<b>Remove</b>	.msi, .exe, .appx, InstallScript, Basic MSI project, InstallScript project	<p>If the Advanced UI or Suite/Advanced UI installation runs in remove mode, specify whether you want the product that this package installed to be removed. The remove operation is applicable if the target system meets the package's eligibility conditions and if this package's product is installed.</p> <p>If you select Yes for this setting, configure the subsettings under this setting as needed. If you select No, the subsettings under this setting are disabled.</p>
<b>Repair</b>	.msi, .exe, InstallScript, Basic MSI project, InstallScript project	<p>If the Advanced UI or Suite/Advanced UI installation runs in repair mode, specify whether you want this package to be launched in repair mode to repair the product that is installed by this package. The repair operation is applicable if the target system meets the package's eligibility conditions and if this package's product is installed.</p> <p>If you select Yes for this setting, configure the subsettings under this setting as needed. If you select No, the subsettings under this setting are disabled.</p>
<b>Modify</b>	.msi, .msp, .exe, InstallScript, Basic MSI project, InstallScript project	<p>If the Advanced UI or Suite/Advanced UI installation runs in modify mode, specify whether you want this package to be launched in maintenance mode to enable end users to install, remove, or modify the product that is installed by this package. The modify operation is applicable if the target system meets the package's eligibility conditions and if this package's product is installed.</p> <p>If you select Yes for this setting, configure the subsettings under this setting as needed. If you select No, the subsettings under this setting are disabled.</p>

**Table 102** ▪ Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Target</b>	.msi, .msp, .exe, InstallScript	<p>This setting is a subsetting under the Install setting for .msi, .msp, .exe, and InstallScript packages. It is also under the Remove, Repair, and Modify settings for .exe packages.</p> <p>Select the file in the package—the .msi file, the .msp file, or the executable file setup launcher—that the Advanced UI or Suite/Advanced UI installation should invoke.</p>
<b>EXE Command Line</b>	.exe	<p>This setting is a subsetting under the Install, Remove, Repair, and Modify settings.</p> <p>If applicable, specify the command line that should be used to launch the target file (that is, the file that is selected in the Target setting) whenever the Advanced UI or Suite/Advanced UI installation is running with a user interface. Do not include the name of the file in this setting.</p> <p>If all of the customization can be done without end-user intervention, consider including the command-line parameter for running the .exe package silently.</p> <p>When you type a value for this setting, you can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p> <p>For more information, including valid types of entries for this setting, see <a href="#">Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation</a>.</p>

**Table 102** ▪ Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>MSI Command Line</b>	.msi, Basic MSI project	<p>This setting is a subsetting under the Install, Remove, Repair, and Modify settings.</p> <p>If applicable, specify the command line that should be used to launch the target file (that is, the file that is selected in the Target setting) whenever the Advanced UI or Suite/Advanced UI installation is running with a user interface. Do not include the name of the file in this setting.</p> <p>If you are configuring the Install and Remove operations for an .msi package, the only type of command-line parameters that you should enter are Windows Installer properties. If you are configuring the Repair and Modify operations for an .msi package, the only type of command-line parameters that you should enter are Windows Installer feature properties.</p> <p>To enter a Windows Installer property, use the following format:</p> <pre>MYPROPERTYNAME=MyPropertyValue</pre> <p>Note that an Advanced UI or Suite/Advanced UI installation always launches .msi packages silently. Therefore, it is not necessary to pass a command-line parameter that hides the user interface of the .msi package.</p> <p>When you type a value for this setting, you can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p> <p>For more information, including valid types of entries for this setting, see <a href="#">Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation</a>.</p>

**Table 102** ▪ Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>MSP Command Line</b>	.msp	<p>This setting is a subsetting under the Install, Remove, Repair, and Modify settings.</p> <p>If applicable, specify the command line that should be used to launch the target file (that is, the file that is selected in the Target setting) whenever the Advanced UI or Suite/Advanced UI installation is running with a user interface. Do not include the name of the file in this setting.</p> <p>To update all of the features through an .msp package, you would enter command-line properties such as the following:</p> <pre>REINSTALLMODE=vomus REINSTALL=ALL</pre> <p>To update only certain features that are included in the .msp package, you would set REINSTALL to a comma-separated list of features that you want to be updated:</p> <pre>REINSTALLMODE=vomus REINSTALL=Feature1,Feature3,Feature5</pre> <p>Note that an Advanced UI or Suite/Advanced UI installation always launches .msp packages silently. Therefore, it is not necessary to pass a command-line parameter that hides the user interface of the .msp package.</p> <p>When you type a value for this setting, you can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p> <p>For more information, including valid types of entries for this setting, see <a href="#">Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation</a>.</p>

**Table 102** ▪ Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Command Line</b>	InstallScript, InstallScript project	<p>This setting is a subsetting under the Install, Remove, Repair, and Modify settings.</p> <p>If applicable, specify the command line that should be used to launch the InstallScript package that is associated with the selected target file (that is, the data1.hdr file that is selected in the Target setting) whenever the Advanced UI or Suite/Advanced UI installation is running with a user interface. Do not include the name of the file in this setting.</p> <p>If you are configuring the Install and Modify operations for an InstallScript package, you can use the Advanced UI or Suite/Advanced UI properties ISFeatureInstall and ISFeatureRemove in your command line. Set these properties to a comma-delimited list of feature names as follows:</p> <pre>ISFeatureInstall=Feature1,Feature2 ISFeatureRemove=Feature3</pre> <p>In the above example, <b>Feature1</b> and <b>Feature2</b> are selected to be installed; <b>Feature3</b> is selected to be removed, if it is present.</p> <p>Note that an Advanced UI or Suite/Advanced UI installation launches InstallScript packages silently by default. Therefore, it is not necessary to pass a command-line parameter that hides the user interface of the InstallScript package.</p> <p>When you type a value for this setting, you can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p> <p>For more information, including valid types of entries for this setting, see <a href="#">Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation</a>.</p>

**Table 102** ▪ Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>EXE Silent Command Line</b>	.exe	<p>This setting is a subsetting under the Install, Remove, Repair, and Modify settings.</p> <p>If applicable, specify the command line that should be used to launch the target file (that is, the file that is selected in the Target setting) whenever the Advanced UI or Suite/Advanced UI installation is running silently (that is, without a user interface). Do not include the name of the file in this setting.</p> <p>If all of the customization can be done without end-user intervention, consider including the command-line parameter for running the .exe package silently.</p> <p>When you type a value for this setting, you can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p> <p>For more information, including valid types of entries for this setting, see <a href="#">Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation</a>.</p>

**Table 102** ▪ Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>MSI Silent Command Line</b>	.msi, Basic MSI project	<p>This setting is a subsetting under the Install, Remove, Repair, and Modify settings.</p> <p>If applicable, specify the command line that should be used to launch the target file (that is, the file that is selected in the Target setting) whenever the Advanced UI or Suite/Advanced UI installation is running silently (that is, without a user interface). Do not include the name of the file in this setting.</p> <p>If you are configuring the Install and Remove operations for an .msi package, the only type of command-line parameters that you should enter are Windows Installer properties. If you are configuring the Repair and Modify operations for an .msi package, the only type of command-line parameters that you should enter are Windows Installer feature properties.</p> <p>To enter a Windows Installer property, use the following format:</p> <pre>MYPROPERTYNAME=MyPropertyValue</pre> <p>Note that an Advanced UI or Suite/Advanced UI installation always launches .msi packages silently. Therefore, it is not necessary to pass a command-line parameter that hides the user interface of the .msi package.</p> <p>When you type a value for this setting, you can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p> <p>For more information, including valid types of entries for this setting, see <a href="#">Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation</a>.</p>

**Table 102** ▪ Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>MSP Silent Command Line</b>	.msp	<p>This setting is a subsetting under the Install, Remove, Repair, and Modify settings.</p> <p>If applicable, specify the command line that should be used to launch the target file (that is, the file that is selected in the Target setting) whenever the Advanced UI or Suite/Advanced UI installation is running silently (that is, without a user interface). Do not include the name of the file in this setting.</p> <p>To update all of the features through an .msp package, you would enter command-line properties such as the following:</p> <pre>REINSTALLMODE=vomus REINSTALL=ALL</pre> <p>To update only certain features that are included in the .msp package, you would set REINSTALL to a comma-separated list of features that you want to be updated:</p> <pre>REINSTALLMODE=vomus REINSTALL=Feature1,Feature3,Feature5</pre> <p>Note that an Advanced UI or Suite/Advanced UI installation always launches .msp packages silently. Therefore, it is not necessary to pass a command-line parameter that hides the user interface of the .msp package.</p> <p>When you type a value for this setting, you can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p> <p>For more information, including valid types of entries for this setting, see <a href="#">Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation</a>.</p>

**Table 102** ▪ Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Silent Command Line</b>	InstallScript, InstallScript project	<p>If applicable, specify the command line that should be used to launch the InstallScript package that is associated with the selected target file (that is, the data1.hdr file that is selected in the Target setting) whenever the Advanced UI or Suite/Advanced UI installation is running silently (that is, without a user interface). Do not include the name of the file in this setting.</p> <p>If you are configuring the Install and Modify operations for an InstallScript package, you can use the Advanced UI or Suite/Advanced UI properties ISFeatureInstall and ISFeatureRemove in your command line. Set these properties to a comma-delimited list of feature names as follows:</p> <pre>ISFeatureInstall=Feature1,Feature2 ISFeatureRemove=Feature3</pre> <p>In the above example, <b>Feature1</b> and <b>Feature2</b> are selected to be installed; <b>Feature3</b> is selected to be removed, if it is present.</p> <p>Note that an Advanced UI or Suite/Advanced UI installation launches InstallScript packages silently by default. Therefore, it is not necessary to pass a command-line parameter that hides the user interface of the InstallScript package.</p> <p>When you type a value for this setting, you can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p> <p>For more information, including valid types of entries for this setting, see <a href="#">Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation</a>.</p>

**Table 102** ▪ Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Exit Behavior</b>	.exe	<p>This setting is a subsetting under the Install, Remove, Repair, and Modify settings.</p> <p>If a detection condition is still not met on a target system after the package has been run, either one of the following may be true:</p> <ul style="list-style-type: none"> <li>• The executable file package was not run successfully.</li> <li>• The detection conditions that were specified for the package were not accurate.</li> </ul> <p>For example, a detection condition may indicate that the executable file needs to be launched if a particular file does not exist on the target system. If the file is still missing even after the Advanced UI or Suite/Advanced UI installation has run the executable file package, it is possible that the condition was created erroneously.</p> <p>Specify the behavior that should occur if one or more of the detection conditions still indicate that the package needs to be launched. Available options are:</p> <ul style="list-style-type: none"> <li>• <b>Ask whether to continue the setup</b>—If the Advanced UI or Suite/Advanced UI installation should display a message box that prompts the end user to specify whether the Advanced UI or Suite/Advanced UI installation should continue, select this option.</li> <li>• <b>Abort the setup</b>—If the Advanced UI or Suite/Advanced UI installation should end without proceeding further, select this option.</li> <li>• <b>Continue the setup</b>—If the Advanced UI or Suite/Advanced UI installation should essentially ignore the executable file's unmet condition and proceed to the next package in the installation (if one is required), select this option.</li> </ul>

**Table 102** ▪ Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Reboot Request</b>	.msi, .msp, .exe, InstallScript, Basic MSI project, InstallScript project	<p>This setting is a subsetting under the Install, Remove, Repair, and Modify settings.</p> <p>The installation of an Advanced UI or Suite/Advanced UI package may require that the target system be restarted, as described in <a href="#">Restarting a Target System for an Advanced UI or Suite/Advanced UI Package</a>.</p> <p>Specify the behavior that should occur if the package requires that a target system be restarted. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Allow the machine to reboot</b>—If the need for a restart is detected, the Advanced UI or Suite/Advanced UI installation exits and lets the package trigger a restart. If the package restarts the target system, the Advanced UI or Suite/Advanced UI installation continues with the next package in the Advanced UI or Suite/Advanced UI after the restart. If the package does not trigger a restart, the Advanced UI or Suite/Advanced UI installation resumes after the next restart.</li> <li>● <b>Ignore the reboot request</b>—The Advanced UI or Suite/Advanced UI installation continues without restarting the target system. Thus, if it appears that a restart is required but you want the Advanced UI or Suite/Advanced UI installation to try to skip it, select this option. If the package restarts the target system, the Advanced UI or Suite/Advanced UI installation then resumes with the next package in the installation.</li> </ul>

**Table 102** ▪ Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
Reboot Request (cont.)		<ul style="list-style-type: none"> <li> <b>Delay the prompt, then exit or reboot the machine</b>—If the package requires that the target system be restarted, the restart is postponed until a subsequent package triggers a restart, or until the end of the Advanced UI or Suite/Advanced UI installation, after the last package has completed. If the restart occurs because of a subsequent package, the restart behavior follows the reboot behavior that is configured for that subsequent package. If the restart occurs at the end of the Advanced UI or Suite/Advanced UI installation, the Advanced UI or Suite/Advanced UI installation displays a message box that asks the end user whether to restart. If the end user chooses not to allow the restart, the Advanced UI or Suite/Advanced UI installation exits instead of restarting the target system. </li> <li> <b>Prompt, then exit or reboot the machine</b>—If the Advanced UI or Suite/Advanced UI installation detects that the package requires that the target system be restarted, the Advanced UI or Suite/Advanced UI installation displays a message box that asks the end user whether to restart. If the end user chooses to allow the restart, the Advanced UI or Suite/Advanced UI installation resumes after the restart. If the end user chooses not to allow the restart, the Advanced UI or Suite/Advanced UI installation exits instead of restarting the target system. </li> </ul>

**Table 102** ▪ Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Reboot Request (cont.)</b>		<ul style="list-style-type: none"> <li>● <b>Always prompt, then exit or reboot the machine</b>—When the package installation is complete, the Advanced UI or Suite/Advanced UI installation displays a message box that asks the end user whether to proceed with the restart, even if the Advanced UI or Suite/Advanced UI installation has not detected the need for a restart. If the end user chooses to allow the restart, the Advanced UI or Suite/Advanced UI installation resumes after the restart. If the end user chooses not to allow the restart, the Advanced UI or Suite/Advanced UI installation exits instead of restarting the target system.</li> <li>● <b>Always reboot the machine</b>—The Advanced UI or Suite/Advanced UI installation restarts the target system regardless of whether the Advanced UI or Suite/Advanced UI installation detects the need for a restart. The Advanced UI or Suite/Advanced UI installation resumes after the restart.</li> </ul> <p>For details on determining the best option to select, see <a href="#">Specifying the Behavior for an Advanced UI or Suite/Advanced UI Package that Requires a Restart</a>.</p>
<b>Reboot Codes</b>	.exe	<p>This setting is a subsetting under the Install, Remove, Repair, and Modify settings.</p> <p>If the selected package requires that the target system be restarted after the product is installed, type the return code in this setting.</p> <p>If multiple return codes exist, list each one separated by a comma.</p> <p>If you do not know the return codes for the file that you are launching as the Advanced UI or Suite/Advanced UI package, contact the author of the package.</p> <p>For more information on Advanced UI or Suite/Advanced UI packages that require a restart, see <a href="#">Restarting a Target System for an Advanced UI or Suite/Advanced UI Package</a>.</p>

**Table 102** ▪ Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Force Application Shutdown</b>	.appx	If the selected sideloaded app package (or any package that depends on this package) is in use at installation run time, you can require that the processes that are associated with the package are forced to shut down so that registration can proceed. Use this setting to indicate whether you want to force application shutdown in that scenario.

## Configuration Settings

Use a Web Deploy package's Configuration settings to specify the values of various Web Deploy settings. For more information, see [Adding a Web Deploy Package to a Suite/Advanced UI Project](#).

**Table 103** ▪ Operation Settings on the Common Tab

Setting	Type of Package File	Description
<b>Computer Name</b>	Web Deploy	<p>Specify the name of the server where the Web Deploy package should be deployed.</p> <p>You can leave the Suite/Advanced UI property that InstallShield assigns to this setting by default when you add the package to your project, or you can specify your own property (enclosed within square brackets). As an alternative, you can specify a hard-coded value.</p> <p>For more information, see <a href="#">Adding a Web Deploy Package to a Suite/Advanced UI Project</a>.</p>
<b>User Name</b>	Web Deploy	<p>Specify the user name of the end user who will be deploying the Web Deploy package.</p> <p>You can leave the Suite/Advanced UI property that InstallShield assigns to this setting by default when you add the package to your project, or you can specify your own property (enclosed within square brackets). As an alternative, you can specify a hard-coded value.</p> <p>For more information, see <a href="#">Adding a Web Deploy Package to a Suite/Advanced UI Project</a>.</p>

**Table 103** ▪ Operation Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Password</b>	Web Deploy	<p>Specify the password for the user account that will be used to deploy the Web Deploy package.</p> <p>You can leave the Suite/Advanced UI property that InstallShield assigns to this setting by default when you add the package to your project, or you can specify your own property (enclosed within square brackets). As an alternative, you can specify a hard-coded value.</p> <p>For more information, see <a href="#">Adding a Web Deploy Package to a Suite/Advanced UI Project</a>.</p>
<b>Site</b>	Web Deploy	<p>Specify the site where the Web Deploy package should be deployed.</p> <p>You can leave the Suite/Advanced UI property that InstallShield assigns to this setting by default when you add the package to your project, or you can specify your own property (enclosed within square brackets). As an alternative, you can specify a hard-coded value.</p> <p>For more information, see <a href="#">Adding a Web Deploy Package to a Suite/Advanced UI Project</a>.</p>
<b>Parameters</b>	Web Deploy	<p>If the parameters XML file for the Web Deploy package contains various configurable parameters, the Parameters subsettings let you specify values for those parameters.</p> <p>You can leave the Suite/Advanced UI properties that InstallShield assigns to these subsettings by default when you add the package to your project, or you can specify your own properties (enclosed within square brackets). As an alternative, you can specify a hard-coded value.</p> <p>For more information, see <a href="#">Adding a Web Deploy Package to a Suite/Advanced UI Project</a>.</p>

## Events Settings

**Project** ▪ The Events area is available in Suite/Advanced UI projects.

Use a package's Events settings to schedule run-time actions that you want the Suite/Advanced UI installation to launch when installing, removing, repairing, or modifying the package. For more information, see [Using Actions to Extend the Behavior of a Suite/Advanced UI Installation](#).

**Table 104** ▪ Events Settings on the Common Tab

Setting	Type of Package File	Description
<b>Package Configuring</b>	.msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project	<p>This setting lets you specify one or more run-time actions that the Suite/Advanced UI installation should launch before installing, removing, repairing, or modifying the package. The actions must already be added under the Actions explorer in the Events view.</p> <p>To specify an action, click the Add Events button in this setting, and then click the action. InstallShield adds a new Action setting under the Package Configuring setting, and sets its value to the name of the action that you selected. Use the buttons in the Action setting to specify one or more conditions that the Suite/Advanced UI installation should use to evaluate whether the action should be launched.</p>
<b>Package Configured</b>	.msi, .msp, .exe, .appx, InstallScript, Basic MSI project, InstallScript project	<p>This setting lets you specify one or more run-time actions that the Suite/Advanced UI installation should launch after installing, removing, repairing, or modifying the package. The actions must already be added under the Actions explorer in the Events view.</p> <p>To specify an action, click the Add Events button in this setting, and then click the action. InstallShield adds a new Action setting under the Package Configuring setting, and sets its value to the name of the action that you selected. Use the buttons in the Action setting to specify one or more conditions that the Suite/Advanced UI installation should use to evaluate whether the action should be launched.</p>
<b>Action</b>	.msi, .msp, .exe, .appx, InstallScript, Basic MSI project, InstallScript project	<p>This read-only setting shows the name of an action that is associated with the selected package and defined in the Events view. To define a condition that determines whether this action is run for this package, configure the subsettings under the Action setting as needed.</p> <p>If you associate more than one action with the package, list the actions from top to bottom in chronological order, according to when they are launched at run time. To change the order of the actions, point to the Move Condition button in the setting of an action that you want to move, and then click the appropriate direction (Move Up or Move Down).</p>

**Table 104** ■ Events Settings on the Common Tab (cont.)

Setting	Type of Package File	Description
<b>Condition</b>	.msi, .msp, .exe, .appx, InstallScript, Basic MSI project, InstallScript project	<p>This setting lets you specify one or more conditions that the Suite/Advanced UI installation should use to evaluate whether the installation should run an action for the selected package.</p> <p>To add one or more new action conditions, click the New Condition button in this setting. InstallShield adds a new row under the Condition setting. Select the appropriate option—All, Any, or None—from the list in this row. Then in this row, click the New Condition button, and select the appropriate option to continue building the conditional statement.</p> <p>For more information, see <a href="#">Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects</a>.</p> <p>If one or more conditional statements are configured, the Condition setting says <b>(Condition)</b>. If none are configured, the Condition setting says <b>(Empty)</b>.</p>
<b>Display Text</b>	.msi, .msp, .exe, .appx, InstallScript, Basic MSI project, InstallScript project	<p>Enter text that describes the selected action. For example, if the action is running a script that configures the target system, you could enter the following string:</p> <p>Configuring the system</p> <p>If the installation launches the action when the InstallationProgress wizard page is displayed, the text that you enter is displayed on the wizard page.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p> <p>When you type a value for this setting, you can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p>

## Features Tab

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Project-specific differences are noted where appropriate.

**Edition** ▪ The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The Features tab in the Packages view displays the feature tree for the Advanced UI or Suite/Advanced UI project. Use this tab to select the check box of each feature that you want to contain the selected package. Clear the check box of each feature that should not contain the selected package.

## Dynamic Link Settings

**Project** ▪ This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Project-specific differences are noted where appropriate.

**Edition** ▪ The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The Dynamic Link pane in the Packages view shows settings for the dynamic link that has been created for a package in the project. The Source and Filter settings are available for all dynamic links. The other settings may be available as subsettings under the Filter setting.

**Table 105** ▪ Dynamic Link Settings

Setting	Description
<b>Source</b>	<p>This setting shows the path to the source folder that contains the package that you want to include in your Advanced UI or Suite/Advanced UI project. It also is the source of dynamically included files for the package.</p> <p>Instead of hard-coding a location, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value.</p>

**Table 105** ▪ Dynamic Link Settings (cont.)

Setting	Description
<b>Filter</b>	<p>This setting lets you specify one or more filters that you want to configure for including and excluding files and folders from the project.</p> <p>To add a filter, click the <b>New filter</b> button in this setting. InstallShield adds a new row that you can use to define the filter.</p> <p>To remove a filter, click the subsetting of the filter that you want to remove, and in that subsetting, click the <b>Delete this filter</b> button.</p> <p>To learn more, see <a href="#">Defining Filters for a Dynamically Linked Folder in an Advanced UI or Suite/Advanced UI Project</a>.</p>
<b>Include File</b>	<p>Specify the name of the dynamic file that you want to include in your dynamic link. You can use an asterisk (*) as a wild-card character. You can also include a path that is relative to refer to the source folder. For example, to refer to a <b>ReadMe.txt</b> file in a subfolder called <b>MyDirectory</b>, where <b>MyDirectory</b> is a subfolder of the folder that contains the package, you could use the following filter:</p> <p><code>.\MyDirectory\ReadMe.txt</code></p> <p>For more information, including background on how InstallShield determines which files and folders to include in and exclude from the release, see <a href="#">Defining Filters for a Dynamically Linked Folder in an Advanced UI or Suite/Advanced UI Project</a>.</p>
<b>Exclude File</b>	<p>Specify the name of the dynamic file that you want to exclude from your dynamic link. You can use an asterisk (*) as a wild-card character. You can also include a path that is relative to refer to the source folder. For example, to refer to a <b>ReadMe.txt</b> file in a subfolder called <b>MyDirectory</b>, where <b>MyDirectory</b> is a subfolder of the folder that contains the package, you could use the following filter:</p> <p><code>.\MyDirectory\ReadMe.txt</code></p> <p>For more information, including background on how InstallShield determines which files and folders to include in and exclude from the release, see <a href="#">Defining Filters for a Dynamically Linked Folder in an Advanced UI or Suite/Advanced UI Project</a>.</p>

**Table 105** ▪ Dynamic Link Settings (cont.)

Setting	Description
<b>Include Folder</b>	<p>Specify the name of the dynamic folder whose files you want to include in your dynamic link. You can use an asterisk (*) as a wild-card character. You can also include a path that is relative to refer to the source folder. For example, to refer to a <b>MyLibrary</b>, where <b>MyLibrary</b> is a subfolder of the folder that contains the package, you could use the following filter:</p> <p><b>.\MyLibrary</b></p> <p>For more information, including background on how InstallShield determines which files and folders to include in and exclude from the release, see <a href="#">Defining Filters for a Dynamically Linked Folder in an Advanced UI or Suite/Advanced UI Project</a>.</p>
<b>Exclude Folder</b>	<p>Specify the name of the dynamic folder whose files you want to exclude in your dynamic link. You can use an asterisk (*) as a wild-card character. You can also include a path that is relative to refer to the source folder. For example, to refer to a <b>MyLibrary</b> folder, where <b>MyLibrary</b> is a subfolder of the folder that contains the package, you could use the following filter:</p> <p><b>.\MyLibrary</b></p> <p>For more information, including background on how InstallShield determines which files and folders to include in and exclude from the release, see <a href="#">Defining Filters for a Dynamically Linked Folder in an Advanced UI or Suite/Advanced UI Project</a>.</p>

## DIM References View

**Project** ▪ The DIM References view is available in Basic MSI projects.

Use the DIM References view to add and manage references to DIM projects in your Basic MSI project. This view also enables you to view any pertinent instructions that the DIM author noted, associate the DIM references with features in the Basic MSI project, override the default destination of the files in the DIM, schedule custom actions, and more.

The DIM support in InstallShield is targeted toward engineering teams who want to foster collaboration, enable distributed installation development, and maximize efficiency in their organizations. A DIM is a feature-sized collection of related items such as product files, shortcuts, registry entries, text file changes, IIS Web sites, and other elements that together make up a discrete, logically separated portion of a product installation. Once you have created a DIM, you can include references to it in one or more Basic MSI installation projects.

When you select a DIM reference in the DIM References view, several tabs are available:

- [General tab](#)
- [Instructions tab](#)

- [Build Options tab](#)
- [Features tab](#)
- [Sequences tab](#)

## General Tab

**Project** ▪ The DIM References view is available in Basic MSI projects.

The General tab in the DIM References view displays the following read-only settings for the selected DIM reference. Note that the values in these settings are not displayed or used at run time. You can use these settings as a reference for internally identifying a project.

**Table 106** ▪ Settings on the General Tab in the DIM References View

Setting	Description
<b>File</b>	This setting indicates the name of the selected DIM project file (.dim).
<b>Name</b>	This setting indicates the name of the feature or unit that this DIM represents. This setting is configured in the Subject setting in the General Information view of the DIM project.
<b>DIM GUID</b>	This setting displays the GUID that uniquely identifies the DIM. Whenever you create a new DIM, InstallShield generates a new GUID for it.
<b>Package Code</b>	This setting identifies the package code, which is the GUID for your DIM.
<b>Version</b>	This setting identifies the version number of the DIM.
<b>Description</b>	This setting indicates a description of the DIM. This setting is configured in the Title setting in the General Information view of the DIM project.
<b>Author</b>	This setting is the name of the author of this DIM.
<b>Link to</b>	This setting indicates the location of the selected DIM project file (.dim).

## Instructions Tab

**Project** ▪ The DIM References view is available in Basic MSI projects.

The Instructions tab in the DIM References view displays the guidance, tips, or other comments that the author of the DIM project entered in the Build Instructions setting of the General Information view. These instructions may contain critical information that is necessary to properly configure any Basic MSI project that contains a references to this DIM.

## Build Options Tab

**Project** ▪ The DIM References view is available in Basic MSI projects.

The Build Options tab in the DIM References view displays the following read-only settings for the selected DIM reference:

**Table 107** ▪ Settings on the Build Options Tab in the DIM References View

Setting	Description
<b>Destination</b>	<p>Select the folder on the target system into which the DIM's files should be installed, or click the ellipsis button (...) to select or create a directory. This setting lets you override the destination that was set in the DIM project. The default value of this setting is the value that was set in the DIM project.</p> <p>To install the files to the product's default destination folder, select <b>[INSTALLDIR]</b>.</p> <p>If you want the destination to be configurable at run time, the destination folder that you specify must be a public property (containing all uppercase letters).</p> <p>You can also set the destination folder of a component's feature. For information on the effects of setting the destination for a feature as well as its components, see <a href="#">Component Destination vs. Feature Destination</a>.</p>
<b>Conflict Resolution</b>	<p>Indicate how you want to resolve conflicts between values of settings in the Basic MSI project with those in the selected DIM project. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Use Base Project Value</b>—If InstallShield encounters a conflict when merging the DIM data into the Basic MSI installation at build time, InstallShield uses the value that is in the Basic MSI project instead of the value that is in the DIM project.</li> <li>● <b>Use DIM Project Value</b>—If InstallShield encounters a conflict when merging the DIM data into the Basic MSI installation at build time, InstallShield uses the value that is in the DIM project instead of the value that is in the Basic MSI project.</li> </ul> <p>For more information, see <a href="#">Resolving Build-Time Conflicts Between a Basic MSI Project and a DIM Reference</a>.</p>

## Features Tab

**Project** ▪ The DIM References view is available in Basic MSI projects.

The Features tab in the DIM References view displays the feature tree for the Basic MSI project. Use this tab to select the check box of each feature that you want to contain the selected DIM. Clear the check box of each feature that should not contain the selected DIM.

## Sequences Tab

**Project** • The DIM References view is available in Basic MSI projects.

Sequences direct all of the actions that are performed during the installation process—from file transfer to user interface display. These actions are given a number in the sequence, which then executes from the lowest number to the highest. Use the Sequences tab in the DIM References view to insert DIM actions and dialogs into a sequence, or edit the sequence timeline. To learn more, see [Scheduling Custom Actions and Dialogs from a DIM Reference](#).

## Application Data View

**Project** • The Application Data view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database
- Transform

Application data includes all of the files that you add to your project.

## Files and Folders

**Project** • The Files and Folders view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database
- Transform

The Files and Folders view lets you add files to your project. This view behaves similarly to Windows Explorer, enabling you to drag and drop files into your project. For installation projects, you can select which feature and component you would like your files associated with and the destination directory for those files.

## Redistributables

---

**Project** ▪ The Redistributables view is available in the following project types:

- Basic MSI
- InstallScript MSI
- MSI Database
- Transform

The Redistributables view enables you to add InstallShield objects and merge modules to Windows Installer-based projects. Including redistributables to your project lets you add distinct pieces of functionality to your installation. Examples of these types of functionality include Visual Basic run-time .dll files and the Microsoft C run-time libraries.

You can also use the Redistributables view to add InstallShield prerequisites to Basic MSI and InstallScript MSI projects. An InstallShield prerequisite is an installation for a product or technology framework that is required by your product. You can add any of the existing InstallShield prerequisites to your installation projects and configure many of their settings. You can also create your own InstallShield prerequisites, and add them to your projects.

Including InstallShield prerequisites in your project enables you to chain multiple installations together, bypassing the Windows Installer limitation that permits only one Execute sequence to be run at a time. The Setup.exe setup launcher serves as a bootstrap application that manages the chaining.

## Prerequisites

---

**Project** ▪ The Prerequisites view is available in InstallScript projects.

The Prerequisites view enables you to add InstallShield prerequisites to InstallScript projects.

## Objects

---

**Project** ▪ The Objects view is available in the following project types:

- InstallScript
- InstallScript Object

The Objects view enables you to add objects and merge modules to InstallScript and InstallScript Object projects.

## Files and Folders View

**Project** ▪ The Files and Folders view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database
- Transform
- MSIX
- MSIX Modification Package

**Note** ▪ The Files and Folders view from within Microsoft Visual Studio differs from the Files and Folders view in InstallShield. For more information, refer to [Adding References to Visual Studio Solutions](#).

The main purpose of most installations is to transfer files from the source medium to the target destination. With InstallShield, adding files to your project is a simple drag-and-drop process in the Files and Folders view. This view contains a files explorer that enables you to drag and drop files from folders on your source machine to folders on the destination machine. The two left panes in the files explorer contain folders, and the two right panes display the files that are located within those folders.

**Project** ▪ In installation projects (including InstallScript and Basic MSI), the Files and Folders view includes the View Filter list above the files explorer panes. This list contains all of the features in your project. You can use this filter to show and hide files and folders in the destination panes of this view:

- To see in this view only files and folders that belong to a particular feature, select that feature in the View Filter list.
- To add a file or folder to a specific feature, select that feature in the View Filter list. Then add the file or folder to the appropriate location in the **Destination computer's folders** pane.
- To see all of the files and folders that are in your project, select the All Application Data option in the View Filter list.

The following four panes are available in the Files and Folders view.

**Table 108** ▪ Panes in the Files and Folders View

Pane	Description
<b>Source computer's folders (Top Left)</b>	The <b>Source computer's folders</b> pane is similar to the left pane in Windows Explorer. This pane contains folders located either locally or on a network. From here, you can navigate to the folder that contains the files that you want to add to your installation.
<b>Source computer's files (Top Right)</b>	The <b>Source computer's files</b> pane displays the files contained in the currently selected folder of the Source computer's folders pane. You can drag files from this pane to a destination folder in the Destination computer's pane. The files you drop into the bottom panes are added to your installation project.
<b>Destination computer's folders (Bottom Left)</b>	In the <b>Destination computer's folders</b> pane, you can add files to destination folders or components, create new destination folders, or modify existing components.
<b>Destination computer's files (Bottom Right)</b>	The <b>Destination computer's files</b> pane displays all the files you have added to the currently selected destination folder. By right-clicking a file in this pane, you can copy, paste, or delete the file, or edit the file's properties. For Windows Installer-based projects only, you can also right-click a file to set or clear it as the key file of its component.

You can add files to your installation project in one of three different ways:

**Table 109** ▪ Methods for Adding Files to a Project

Method	Description
<b>Dragging and Dropping Files</b>	<p>You can add files to your project using the Files explorer in the Files and Folders view. The top two panes in this view are functionally equivalent to Windows Explorer. The bottom two panes represent the destination for your files.</p> <p>You can drag source files from the top pane to the destination folder in the bottom pane. InstallShield also provides a context menu with additional drag and drop options that allow you to drag folder only and to preserve the source structure.</p>

**Table 109** ■ Methods for Adding Files to a Project (cont.)

Method	Description
<b>Dynamic File Linking</b>	<p>The second way to add files to your project is by linking to the contents of an entire folder, or to specific files in the folder. This method allows you to point to a specific folder, either locally or on a network, that contains files for your installation. Every time you build your installation, the contents of the folder are added to your feature.</p> <p>Additionally, you can use wildcards to filter which files are added to your project. For more information, see <a href="#">Creating a Dynamic Link</a>.</p>  <p><b>Note</b> ■ To improve performance, the list displayed in the Files and Folders view is truncated when there are more than a predefined number of files in a dynamically linked file with subfolders. <b>List Truncated</b> appears as the first item in the file list when this occurs. All files contained in the subfolders are built into your project.</p>
<b>Dependency Scanning</b>	<p>The final way to add files to your project is accomplished through the Dependency Scanners view. This view contains three wizards that can scan your project, a running application, or a Visual Basic project for possible dependency files and add them to your project. All three of these wizards can also be launched from the Project menu.</p>

## Destination Folders

**Project** ■ Some folders are not available in all project types. Project-specific differences are noted where appropriate.

When you add files to your installation project, you do so by placing them in a destination folder. The following destination folders are provided by default. Each one is dynamic, meaning that they do not use hard-coded paths. Instead, the value for each destination folder is obtained from the operating system of the target machine.

### Folders in Basic MSI and InstallScript MSI Projects

The following folders are available only for Basic MSI and InstallScript MSI projects:

**Table 110** ■ Default Destination Folders for Basic MSI and InstallScript MSI Projects

Folder Name	Description
<b>AdminToolsFolder</b>	Points to the folder where administrative tools are located.
<b>ALLUSERSPROFILE</b>	<p>This is the full path to the folder containing program data for all users. A common path is:</p> <p>C:\ProgramData</p>

**Table 110** ▪ Default Destination Folders for Basic MSI and InstallScript MSI Projects (cont.)

Folder Name	Description
<b>AppDataFolder</b>	This property holds the full path to the current user's Application Data folder. A typical value of this property is:  C:\Users\UserName\AppData\Roaming
<b>CommonAppDataFolder</b>	This is the full path to the folder containing application data for all users. A common path is:  C:\ProgramData
<b>CommonFiles64Folder</b>	The value of this property is the full path to the 64-bit Common Files folder. This property requires Windows Installer version 2.0 or later.
<b>CommonFilesArmFolder</b>	The value of this property is the full path to the Arm\Arm64 Common Files folder. This property requires Windows Installer version 5.0 and the Template summary points to Arm\Arm64.
<b>CommonFilesFolder</b>	The value of this property is the full path to the 32-bit Common Files folder.
<b>DesktopFolder</b>	This property is used to hold the full path to the Desktop folder for the current user. If the setup is being run for All Users, and the ALLUSERS property is set, the DesktopFolder property should hold the full path to the All Users desktop folder.
<b>FavoritesFolder</b>	The FavoritesFolder property contains the full path to the Favorites folder for the current user.
<b>FontsFolder</b>	This property holds the full path to the Fonts folder.
<b>IISROOTFOLDER</b>	This property stores the root directory of the Web server on a target system. If you are using IIS functionality in your installation project and you have added a Web site, then IISROOTFOLDER is automatically added.  For more information, see <a href="#">Adding IISROOTFOLDER Support</a> .
<b>INSTALLDIR</b>	This property stores the default destination folder for your installation program's files. You can set an initial value for <b>INSTALLDIR</b> in the General Information view.
<b>LocalAppDataFolder</b>	The location of locally stored application data. A typical value of this property is:  C:\Users\UserName\AppData\Local
<b>MyPicturesFolder</b>	This property holds the full path to the current user's My Pictures folder.

**Table 110** ▪ Default Destination Folders for Basic MSI and InstallScript MSI Projects (cont.)

Folder Name	Description
<b>PersonalFolder</b>	This property holds the full path to the current user's Personal folder.
<b>ProgramFiles64Folder</b>	This property holds the full path to the 64-bit Program Files folder. This property requires Windows Installer version 2.0 or later.
<b>ProgramFilesArmFolder</b>	This property holds the full path to the Arm\Arm64 Program Files folder. This property requires Windows Installer version 5.0 and the Template summary points to Arm\Arm64.
<b>ProgramFilesFolder</b>	This property holds the full path to the 32-bit Program Files folder.
<b>ProgramMenuFolder</b>	This property is used to hold the full path to the Program menu for the current user. If the installation is being run for All Users, and the ALLUSERS property is set, the ProgramMenuFolder property should hold the full path to the All Users Programs menu.
<b>PUBLIC</b>	This property holds the full path to the Users Public folder.
<b>SendToFolder</b>	This property holds the full path to the current user's SendTo folder.
<b>StartMenuFolder</b>	This property is used to hold the full path the Start menu folder for the current user. If the installation is being run for All Users, and the ALLUSERS property is set, the StartMenuFolder property should hold the fully qualified path to the All Users program menu.
<b>StartupFolder</b>	This property is used to hold the full path to the Startup folder for the current user. If the setup is being run for All Users, and the ALLUSERS property is set, the StartupFolder property should hold the full path to the All Users program menu.
<b>System16Folder</b>	This property holds the full path to the folder containing the system's 16-bit .dll file. (In Windows Installer version 2.0, this property is no longer used.)
<b>SystemArmFolder</b>	This property holds the full path to the Arm\Arm64 Windows system folder. This property requires Windows Installer version 5.0 and the Template summary points to Arm\Arm64.
<b>SystemFolder</b>	This property holds the full path to the 32-bit Windows system folder.
<b>System64Folder</b>	This property holds the full path to the 64-bit Windows system folder. This property requires Windows Installer version 2.0 or later.
<b>TempFolder</b>	This property holds the full path to the Temp folder.
<b>TemplateFolder</b>	This property holds the full path to the current user's Templates folder.

**Table 110** ▪ Default Destination Folders for Basic MSI and InstallScript MSI Projects (cont.)

Folder Name	Description
<b>WindowsFolder</b>	This property holds the full path to the Windows folder.
<b>WindowsVolume</b>	This property holds the volume of the Windows folder. It is set to the drive where Windows is installed.

## Folders in InstallScript Projects

The following folders are available only for InstallScript projects:

**Table 111** ▪ Default Destination Folders for InstallScript Projects

Folder Name	Description
<b>Script-Defined Folders</b>	This folder allows you to create folders whose location is determined in your script. Files cannot be added directly to this folder, but only to its subfolders; to create a subfolder, right-click the folder and select New Folder. Specify a folder name that is enclosed in angle brackets, for example, <MYFOLDER>; to assign the folder a location through your script, call FeatureSetTarget.
<b>Application Target Folder</b>	This folder's location is determined by the value of the system variable TARGETDIR.
<b>Program Files</b>	This folder's location is the 32-bit Program Files folder.
<b>Program Files (64-bit)</b>	This folder's location is the 64-bit Program Files folder.
<b>Program Files\Common Files</b>	This folder's location is the 32-bit Common Files folder.
<b>Program Files (64-bit)\Common Files (64-bit)</b>	This folder's location is the 64-bit Common Files folder.
<b>Support Folder</b>	This folder's location is determined by the value of the system variable SUPPORTDIR.
<b>Windows</b>	This folder's location is the Windows folder.
<b>Windows\Fonts Folder</b>	This folder's location is the Windows Fonts folder.
<b>Windows\Windows System</b>	This folder's location is the 32-bit Windows System folder.
<b>Windows\Windows System (64-bit)</b>	This folder's location is the 64-bit Windows System folder.

## Redistributables View

**Project** - The Redistributables view is available in the following project types:

- Basic MSI
- InstallScript MSI
- MSI Database
- Transform

Note that you can use the Prerequisites view and the Objects view to add redistributables to InstallScript projects.

The Redistributables view contains all of the InstallShield objects and third-party merge modules that are included with InstallShield. In Basic MSI and InstallScript MSI projects, this view also contains InstallShield prerequisites that you can add to your project.

### InstallShield Prerequisites (Basic MSI and InstallScript MSI Projects)

An InstallShield prerequisite is an installation for a product or technology framework that is required by your product. You can add any of the existing InstallShield prerequisites to your installation projects and configure many of their settings. You can also create your own InstallShield prerequisites, and add them to your projects.

Including InstallShield prerequisites in your project enables you to chain multiple installations together, bypassing the Windows Installer limitation that permits only one Execute sequence to be run at a time. The Setup.exe setup launcher serves as a bootstrap application that manages the chaining.

InstallShield includes a base set of InstallShield prerequisites. You can also use the [InstallShield Prerequisite Editor](#) in InstallShield to define custom InstallShield prerequisites or to edit settings for any existing InstallShield prerequisites.

InstallShield includes support for two types of InstallShield prerequisites:

- **Setup prerequisite**—The installation for this type of prerequisite runs before your installation runs.
- **Feature prerequisite**—This type of prerequisite is associated with one or more features. It is installed if the feature that contains the prerequisite is installed and if the prerequisite is not already installed on the system. Thus, if a feature has a condition that is not met on the target system, or if the end user chooses not to install the feature, the feature is not installed. As a result, none of its associated feature prerequisites are installed, unless the feature prerequisites are also associated with other features that are installed.

**Project** - Basic MSI projects include support for feature prerequisites.

### Merge Modules

A merge module (or .msm file) contains all of the logic and files needed to install distinct pieces of functionality. For example, many applications require Microsoft Visual Basic run-time .dll files. Instead of having to include the file in a component and figure out its installation requirements, you can simply attach the Visual Basic Virtual Machine merge module to one of your project's features.

**Note** ▪ Many of the merge modules included in the Redistributables view are authored by Microsoft or another third party. InstallShield distributes these modules as a courtesy to assist you in creating your installation project. However, InstallShield cannot modify or fix any problems that may exist within third party-authored modules. You are encouraged to contact the vendor regarding issues with specific third party-authored modules.

## InstallShield Objects

Like merge modules, objects contain logic and files needed to install distinct pieces of functionality. Some objects, such as the DirectX object included with InstallShield, require customization through a wizard. As soon as you add such an object to your installation, its customization wizard opens. You can either customize your object at the time you add it, or cancel the wizard and customize your object later by right-clicking the object and then clicking Change Objects Settings.

## Redistributables Gallery

Because the file size of many of the redistributables is so large, some that are available for use in your projects are not added to your computer when you install InstallShield. However, these redistributables are still available for [download from the Internet to your computer](#).

## Configurable Merge Modules

A configurable redistributable is a merge module or an object that has at least one row in the ModuleConfiguration table that is referenced by at least one row in the ModuleSubstitution table. This enables you to change a value in the redistributable. When you select a configurable module in the Redistributables view, the [Merge Module Configurable Values dialog box](#) is displayed to enable you to configure the module at the time you add it. To customize the merge module later, right-click it and click select **Configure merge module**.

## Working with the Redistributables View

The Redistributables view consists of the following elements:

- A row of buttons and other controls
- A group box area (below the row of buttons)
- A list of redistributables
- A details pane, which shows information about the selected redistributables

The following table describes all of the buttons and other controls that are displayed in the Redistributables view.

**Table 112** ▪ Controls in the Redistributables View

Name of Control	Icon	Description
<b>Expand All Groups</b>		Shows all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.
<b>Collapse All Groups</b>		Hides all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.

**Table 112** ▪ Controls in the Redistributables View (cont.)

Name of Control	Icon	Description
<b>Show Details</b>		Shows or hides the right pane in this view, which shows details about the InstallShield prerequisite, merge module, or object that is selected in the list of available redistributables. This details pane provides information such as which files a redistributable installs.
<b>Show Group Box</b>		Shows or hides the group box area below the row of buttons in this view.
<b>Refresh</b>		Refreshes the list of redistributables.
<b>Search Grid</b>		Dynamically filters the redistributables that are displayed in the Redistributables view according to the string that you specify in this search box. As you type a string in this box, InstallShield hides all of the rows that do not contain it.
<b>Redistributables View Help</b>		Displays the help for the Redistributables view.
<b>Drag a column header here to group that column</b>		<p>Use this group box area to group rows in the view. The view supports multiple levels of grouping simply by dragging the column headings and dropping them onto the group box. InstallShield displays the rows in the view hierarchically according to column arrangement in the group box.</p> <p>To learn more, see <a href="#">Working with the Group Box Area in Various Views</a>.</p>

The following table describes each of the columns in the Redistributables view.

**Table 113** ▪ Columns in the Redistributables View

Column	Description
<b>Check Box</b>	This column shows a check box for each redistributable. To add a redistributable to your project, select its check box.
<b>Type/Status</b>	This column shows an icon that represents the type of redistributable, as well as its status. For details about each icon, see <a href="#">Managing the Redistributables Gallery</a> .
<b>Name</b>	This column shows the name of each redistributable.
<b>Version</b>	This column shows the version number of the redistributable.
<b>Type</b>	This column lists the type of redistributable.

**Table 113** ■ Columns in the Redistributables View (cont.)

Column	Description
<b>Location</b>	This column indicates whether the redistributable is installed locally on your machine or it needs to be downloaded. For more information, see <a href="#">Downloading Redistributables to Your Computer</a> .

## Prerequisites View

**Project** ■ The Prerequisites view is available in InstallScript projects.

Note that you can use the Redistributables view to add InstallShield prerequisites to Basic MSI and InstallScript MSI projects.

The Prerequisites view contains all of the InstallShield prerequisites that are included with InstallShield. An InstallShield prerequisite is an installation for a product or technology framework that is required by your product. You can add any of the existing InstallShield prerequisites to your installation projects and configure many of their settings. You can also create your own InstallShield prerequisites, and add them to your projects.

InstallShield includes a base set of InstallShield prerequisites. You can also use the [InstallShield Prerequisite Editor](#) in InstallShield to define custom InstallShield prerequisites or to edit settings for any existing InstallShield prerequisites.

InstallShield includes support for two types of InstallShield prerequisites:

- **Setup prerequisite**—The installation for this type of prerequisite runs before your installation runs.
- **Feature prerequisite**—This type of prerequisite is associated with one or more features. It is installed if the feature that contains the prerequisite is installed and if the prerequisite is not already installed on the system. Thus, if a feature has a condition that is not met on the target system, or if the end user chooses not to install the feature, the feature is not installed. As a result, none of its associated feature prerequisites are installed, unless the feature prerequisites are also associated with other features that are installed.

**Project** ■ Basic MSI projects include support for feature prerequisites.

## Redistributables Gallery

Because the file size of many of the redistributables is so large, some that are available for use in your projects are not added to your computer when you install InstallShield. However, these redistributables are still available for [download from the Internet to your computer](#).

## Working with the Prerequisites View

The Prerequisites view consists of the following elements:

- A row of buttons and other controls
- A group box area (below the row of buttons)
- A list of redistributables

- A details pane, which shows information about the selected redistributables

The following table describes all of the buttons and other controls that are displayed in the Prerequisites view.

**Table 114** ▪ Controls in the Prerequisites View

Name of Control	Icon	Description
<b>Expand All Groups</b>		Shows all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.
<b>Collapse All Groups</b>		Hides all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.
<b>Show Details</b>		Shows or hides the right pane in this view, which shows details about the InstallShield prerequisite that is selected in the list of available redistributables. This details pane provides information such as which files a redistributable installs.
<b>Show Group Box</b>		Shows or hides the group box area below the row of buttons in this view.
<b>Refresh</b>		Refreshes the list of redistributables.
<b>Search Grid</b>		Dynamically filters the redistributables that are displayed in the Prerequisites view according to the string that you specify in this search box. As you type a string in this box, InstallShield hides all of the rows that do not contain it.
<b>Prerequisites View Help</b>		Displays the help for the Prerequisites view.
<b>Drag a column header here to group that column</b>		<p>Use this group box area to group rows in the view. The view supports multiple levels of grouping simply by dragging the column headings and dropping them onto the group box. InstallShield displays the rows in the view hierarchically according to column arrangement in the group box.</p> <p>To learn more, see <a href="#">Working with the Group Box Area in Various Views</a>.</p>

The following table describes each of the columns in the Prerequisites view.

**Table 115** ▪ Columns in the Prerequisites View

Column	Description
<b>Check Box</b>	This column shows a check box for each redistributable. To add a redistributable to your project, select its check box.

**Table 115** ■ Columns in the Prerequisites View (cont.)

Column	Description
<b>Type/Status</b>	This column shows an icon that represents the type of redistributable, as well as its status. For details about each icon, see <a href="#">Managing the Redistributables Gallery</a> .
<b>Name</b>	This column shows the name of each redistributable.
<b>Version</b>	This column shows the version number of the redistributable.
<b>Location</b>	This column indicates whether the redistributable is installed locally on your machine or it needs to be downloaded. For more information, see <a href="#">Downloading Redistributables to Your Computer</a> .

## Objects View

**Project** ■ The Objects view is available in the following project types:

- InstallScript
- InstallScript Object

Note that you can use the Redistributables view to add merge modules to Basic MSI and InstallScript MSI projects.

The Objects view lets you add InstallScript objects and third-party merge modules to your projects.

### Merge Modules

A merge module (or .msm file) contains all of the logic and files needed to install distinct pieces of functionality. For example, many applications require Microsoft Visual Basic run-time .dll files. Instead of having to include the file in a component and figure out its installation requirements, you can simply attach the Visual Basic Virtual Machine merge module to one of your project's features.

**Note** ■ Many of the merge modules included in the Objects view are authored by Microsoft or another third party. InstallShield distributes these modules as a courtesy to assist you in creating your installation project. However, InstallShield cannot modify or fix any problems that may exist within third party-authored modules. You are encouraged to contact the vendor regarding issues with specific third party-authored modules.

### InstallScript Objects

InstallShield enables you to create your own InstallScript objects that can be used in any of your installation projects or distributed for use by other installation developers.

## Redistributables Gallery

Because the file size of many of the redistributables is so large, some that are available for use in your projects are not added to your computer when you install InstallShield. However, these redistributables are still available for [download from the Internet to your computer](#).

# System Configuration View

---

**Project** • The System Configuration view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database
- Transform

Every installation changes the target system in some way. The simplest installations might only copy files. More in-depth installations make registry changes, edit .ini files, or create shortcuts. InstallShield provides the following views for making advanced configurations.

## Shortcuts

---

**Project** • The Shortcuts view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

Shortcuts offer quick access to your installed application. You can create shortcuts and program folders on the desktop, the Start menu, and various other locations.

## Registry

---

**Project** • The Registry view is available in the following project types:

- Basic MSI

- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*
- *QuickPatch*

In the Registry view, you can create registry entries or import existing registry data into your setup.

## ODBC Resources

---

**Project** • *The ODBC Resources view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

In the ODBC Resources view, you can add drivers, translators, and data sources to one or more of your application's features. Select from installed ODBC resources or add new ones to the list, associate them with features, and then customize their attributes.

## INI File Changes

---

**Project** • *The INI File Changes view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

*The InstallScript language includes several initialization file functions for manipulating .ini files.*

Although editing system .ini files is not recommended, you can edit these files in the INI File Changes view. This view enables you to create sections and keywords, or edit an .ini file on the target system.

## Environment Variables

---

**Project** ▪ The Environment Variables view is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The InstallScript language includes the `GetEnvVar` function for retrieving the current value of an environment variable, and it enables you to create an environment variable.

If you need to create, modify, or remove environment variables from the target system, you can define their settings in the Environment Variables view.

## XML File Changes

---

**Project** ▪ The XML File Changes view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module
- MSI Database
- Transform

Sometimes you need to modify XML files that store settings related to your product as well as standard configuration files like `web.config` and `machine.config`. You can use the XML File Changes view in InstallShield to specify any XML file changes that should be made on the target system.

## Text File Changes

---

**Project** ▪ The Text File Changes view is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- Transform

The InstallScript language includes string functions for finding and modifying string variables and literals.

The Text File Changes view is where you configure search-and-replace behavior for content in text files—for example, .txt, .htm, .xml, .config, .ini, and .sql files—that you want to modify at run time on the target system. The text files can be part of your installation, or they can be files that are already present on target systems.

**Tip** ▪ The Text File Changes view enables you to modify XML files without using MSXML (which is a run-time requirement if you use the XML File Changes view to modify XML files).

## Scheduled Tasks

**Project** ▪ The Scheduled Tasks view is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- Transform

The Scheduled Tasks view is where you create and configure automated tasks that you want to be created through the Windows task scheduler at run time on target systems. The files that you want to be launched by the scheduled tasks can be part of your installation, or they can be files that are already present on target systems.

## Services

**Project** ▪ The Services view is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- Transform

The Services view is where you specify whether to install, configure, start, stop, and uninstall Windows services during installation and uninstallation.

As an alternative, you can use the Services area under the Advanced Settings node of the Components view and the Setup Design view to install, configure, start, stop, and uninstall Windows services. If you configure service information in either of these areas, the other area is automatically updated accordingly.

## Shortcuts View

**Project** ▪ The Shortcuts view is available in the following project types:

- Basic MSI
- DIM

- *InstallScript*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The Shortcuts view provides a simple, visual way to create shortcuts to your application on the target system. This view contains a Shortcuts explorer that shows a set of predefined destination folders under which you can create shortcuts and subfolders. InstallShield offers the following standard shortcut destinations.

**Table 116** ■ Standard Shortcut Destinations

Shortcut Destination	Project Type	Description
<b>Programs Menu and Startup</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	The Programs Menu and Startup folders are located on the Start menu. The Programs Menu folder is the industry-standard place for installing product shortcuts. The Startup folder should contain shortcuts to only those items that need to be launched whenever Windows starts.
<b>Send To</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>The Send To folder is available when an end user right-clicks a file; the context menu that is displayed contains a command called Send To. If you create a shortcut for your program in this folder, an end user can click any file and send it to your product.</p> <p>For example, you might want your end users to be able to open an HTML page in Notepad. If you created a shortcut to Notepad in the Send To folder in the Shortcuts view, end users could right-click an HTML file and click Notepad from your Send To menu. The source file for that page opens in Notepad.</p>
<b>Desktop</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>The Desktop folder contains shortcuts for the end user's desktop. When you create a shortcut in the Desktop folder, your product's icon is displayed on the end user's desktop.</p>  <p><b>Note</b> ■ <i>The desktop is the most visible place to put a shortcut, but too many shortcut icons can clutter the end user's desktop.</i></p>

When you add a new shortcut, InstallShield adds it as a new node to the Shortcuts explorer in this view. The new shortcut node is displayed with the same icon that is selected in the Icon File setting for the shortcut—which is the icon that is used when the shortcut is added to target systems at run time—unless either of the following conditions is true:

- The project type is InstallScript.
- The shortcut is for a preexisting file on the target system.

For both of the aforementioned conditions, the icon file is not known until run time. Therefore, InstallShield shows the following icon for each shortcut in the Shortcuts explorer, instead of displaying the icon that is used at run time on target systems.

InstallShield also uses this icon for a shortcut in the Shortcuts explorer if the icon file does not contain an icon.

---

**Note** • You cannot create shortcuts to a dynamically linked file. For more information, see [Limitations of Dynamic File Linking](#).

For details about each of the settings that you can configure for shortcuts, folders, as well as tiles, see:

- [Shortcut Settings](#)
- [Folder Settings](#)
- [Tile Configuration Settings](#)

## Shortcut Settings

---

**Project** • The Shortcuts view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The settings for a shortcut are organized into the following main categories in the Shortcuts view:

- [Appearance](#)
- [Behavior](#)
- [General](#)
- [Windows App Package Tile Overrides](#)
- [Package Support Framework](#)

---

**Edition** • Windows App Package Tile Overrides settings are available in Basic MSI projects edited with the Premier edition only. InstallScript MSI, direct-mode projects (Windows Installer Databases, Transforms), and

InstallShield or Express editions will not see the Windows App-related options in the **Releases** view or the **Shortcuts** view.

Appearance

Use a shortcut’s Appearance settings to specify details such as the display name and the icon for the shortcut.

Table 117 ▪ Appearance Settings

Setting	Project Type	Description
Display Name	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Enter the name of the shortcut as it should appear on the target system.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p> <div></div> <p><b>Project ▪</b> For Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—You must enter a value for this setting; otherwise, a build error occurs.</p> <p>The display name is of the Windows Installer <a href="#">Filename</a> data type. If the display name that you enter is not already in the 8.3 format, InstallShield uses the ShortName LongName format for this setting. For example, if you enter My Product Name as the value in this setting, InstallShield sets the value to MyProd~1 My Product Name, or something similar, so that a short name is available at run time if needed.</p>

**Table 117** ■ Appearance Settings (cont.)

Setting	Project Type	Description
<b>Display Resource</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>If you are preparing an installation for a multilingual application and you are separating language-neutral portable executable files from .mui files for the display name of your shortcut, use the following settings:</p> <ul style="list-style-type: none"> <li>● <b>Display Resource</b>—Click the ellipsis button (...) in this setting if you want to browse to the DLL file that contains the multilingual user interface (MUI) manifest.</li> </ul> <p>InstallShield lists the path and file name in this setting if you do either of the following: you select a DLL file by browsing for it, or you manually enter a path and file name in the Display Resource DLL setting. InstallShield also lists the resource index that is specified in the Display Resource Index setting.</p> <p>If this setting contains a value, the value for the Display Name setting is ignored. If you leave this setting blank, Windows Installer uses the value for the Display Name setting.</p> <ul style="list-style-type: none"> <li>● <b>Display Resource DLL</b>—If you want to manually specify the path and file name of the DLL file that contains the MUI manifest, enter it. You can include Windows Installer directory properties—for example, <b>[INSTALLDIR]MyResource.dll</b>—instead of hard-coded directory paths.</li> </ul> <p>If you click the ellipsis button in the Display Resource setting to browse to the DLL file, InstallShield uses the format <b>[#filekey]</b> in the Display Resource DLL setting to identify the DLL file.</p> <ul style="list-style-type: none"> <li>● <b>Display Resource Index</b>—Specify the display name index for the shortcut. This must be a non-negative number.</li> </ul>

**Note** ■ If you specify a DLL, you must also enter a value for the Display Resource Index setting.

These settings enable you to separate language-neutral portable executable files from .mui files, which contain all of the language-dependent resources, and later add resources for additional languages without having to recompile or relink the application.

Windows Vista and later and Windows Server 2008 and later include support for the display resource. Earlier systems ignore it.

**Table 117** ▪ Appearance Settings (cont.)

Setting	Project Type	Description
<b>Description</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Enter a description of the shortcut. The text that you enter is displayed as a tooltip when the end user places the mouse pointer over the shortcut. It is also displayed in the Description field of the shortcut's Properties dialog box.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

**Table 117** ▪ Appearance Settings (cont.)

Setting	Project Type	Description
<b>Description Resource</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>If you are preparing an installation for a multilingual application and you are separating language-neutral portable executable files from .mui files for the description of your shortcut, use the following settings:</p> <ul style="list-style-type: none"> <li> <b>Description Resource</b>—Click the ellipsis button (...) in this setting if you want to browse to the DLL file that contains the multilingual user interface (MUI) manifest. </li> </ul> <p>InstallShield lists the path and file name in this setting if you do either of the following: you select a DLL file by browsing for it, or you manually enter a path and file name in the Description Resource DLL setting. InstallShield also lists the resource index that is specified in the Description Resource Index setting.</p> <p>If this setting contains a value, the value for the Description setting is ignored. If you leave this setting blank, Windows Installer uses the value for the Description setting.</p> <ul style="list-style-type: none"> <li> <b>Description Resource DLL</b>—If you want to manually specify the path and file name of the DLL file that contains the MUI manifest, enter it. You can include Windows Installer directory properties—for example, <b>[INSTALLDIR]MyResource.dll</b>—instead of hard-coded directory paths. </li> </ul> <p>If you click the ellipsis button in the Description Resource setting to browse to the DLL file, InstallShield uses the format <b>[#filekey]</b> in the Description Resource DLL setting to identify the DLL file.</p> <ul style="list-style-type: none"> <li> <b>Description Resource Index</b>—Specify the description index for the shortcut. This must be a non-negative number. </li> </ul>

**Note** ▪ If you specify a DLL, you must also enter a value for the Description Resource Index setting.

These settings enable you to separate language-neutral portable executable files from .mui files, which contain all of the language-dependent resources, and later add resources for additional languages without having to recompile or relink the application.

Windows Vista and later and Windows Server 2008 and later include support for the description resource. Earlier systems ignore it.

**Table 117** ■ Appearance Settings (cont.)

Setting	Project Type	Description
<b>Icon</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>To specify the icon that you want to be displayed for the shortcut, use the following settings:</p> <ul style="list-style-type: none"> <li>● <b>Icon</b>—Specify the file that contains the icon for the shortcut that you are creating. You must specify an .ico file or the executable file (.dll or .exe) that contains the icon resource. InstallShield lists the icon path and index in the Icon setting if you do either of the following: you select a file by browsing for it, or you manually enter a path and file name in the Icon File setting.</li> </ul> <p>The method that you use to specify the file depends on the type of project that you are using.</p> <div style="text-align: center;"></div> <hr/> <p><b>Project</b> ■ For Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—Click the ellipsis button (...) in this setting if you want to browse to the .ico file or the .exe or .dll file that contains the icon resource.</p> <p>For InstallScript projects—Click the ellipsis button (...) in this setting if you want to browse to the location on the target system of the .ico file or the .exe or .dll file that contains the icon resource.</p> <ul style="list-style-type: none"> <li>● <b>Icon File</b>—If you want to manually specify the path and name of the file that contains the icon, enter it.</li> <li>● <b>Icon Index</b>—If the icon file that you specify contains more than one icon resource, enter the index in this setting.</li> </ul> <p>A nonnegative integer refers to the order of the icon resources in the executable file. For example, 0 refers to the first icon in the file, 1 refers to the second icon, and 2 refers to the third icon.</p> <p>Use a negative number to refer to a specific resource ID. For example, the icon index -12 points to the icon with a resource ID of 12.</p> <div style="text-align: center;"></div> <hr/> <p><b>Project</b> ■ For Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—Note that because Windows Installer requires a separate icon file when the component is to be advertised, InstallShield extracts the first icon from the .exe or .dll file unless an icon index is specified. If you do not specify an icon file, the key file of this component is automatically used for the shortcut's icon.</p>

## Behavior

Use a shortcut's Behavior settings to specify details such as the target and keyboard shortcut.

**Table 118** ▪ Behavior Settings

Setting	Project Type	Description
<b>Advertised</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Specify whether you want to create an advertised shortcut.</p> <p>If you select Yes and the end user advertises the product or the feature that contains the shortcut, the shortcut is created but the component's files are not installed until the end user launches the shortcut. The first time that the shortcut is launched, the Windows Installer installs the component's files and other data, and then the shortcut launches the target file. Every time that the shortcut is used from then on, it behaves like a normal shortcut.</p>  <p><b>Note</b> ▪ To create an advertised shortcut, the shortcut's component must have a <b>key file</b>. The key file is the shortcut's target.</p>
<b>Target</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Enter the path to the file on the target system that should be launched when end users launch the shortcut. As an alternative to manually entering a value, you can click the ellipsis button (...) to browse to the shortcut target.</p>  <p><b>Project</b> ▪ For Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—Use Windows Installer directory properties—for example, <b>[INSTALLDIR]File.exe</b>—instead of hard-coded directory paths. If the shortcut is an advertised shortcut, this setting is read-only. The key file of the shortcut's component is automatically set as the shortcut's target. If the shortcut's component does not have a key file, the shortcut will not function properly on the target system.</p> <p>For InstallScript projects—Use system variables—for example, <b>&lt;TARGETDIR&gt;\File.exe</b>—instead of hard-coded directory paths.</p>

**Table 118** ■ Behavior Settings (cont.)

Setting	Project Type	Description
<b>Arguments</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Enter the command-line arguments for the shortcut. The arguments are added to the Target value on the shortcut's Properties dialog box on the target system. These arguments work in the same way as any other command-line arguments. For example, you can link a file to an executable file or cause an executable file to run silently by passing command-line arguments.</p>  <p><b>Note</b> ■ Verify that the syntax is correct because InstallShield does not do this.</p>  <p><b>Tip</b> ■ Use %1 in the argument for the selected file name. For example, if the end user right-clicks the file C:\File.ext and -p %1 is the argument for this shortcut, the command-line argument becomes -p C:\File.ext. In some cases, it is necessary to enclose the %1 argument in quotation marks—as in "%1"—to correctly handle file names that contain spaces.</p>
<b>Working Directory</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Enter the working directory for the shortcut target, or click the ellipsis button (...) to select or create a directory.</p> <p>The directory that you specify is displayed as the <b>Start in</b> field on the shortcut's Properties dialog box on the target system. The working directory is the default directory that is displayed in standard file-opening and file-saving dialog boxes, as well as the current directory used by the product.</p>  <p><b>Project</b> ■ For example, in Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects, if you want your working directory to be set to a subdirectory of INSTALLDIR called <b>Files</b>, select <b>[INSTALLDIR]</b> from the list and add the subdirectory name <b>Files</b> to the end of it. When you are finished, it should read <b>[INSTALLDIR]Files</b>.</p> <p>In an InstallScript project, if you want your working directory to be set to a subdirectory of TARGETDIR called <b>Files</b>, select <b>&lt;TARGETDIR&gt;</b> from the list and add the text <b>\Files</b> to the end of it. When you are finished, it should read <b>&lt;TARGETDIR&gt;\Files</b>.</p>

**Table 118** ■ Behavior Settings (cont.)

Setting	Project Type	Description
<b>Hot Key</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>This setting contains the decimal value of the keyboard shortcut that is assigned to your shortcut. You can assign a keyboard shortcut to your product's shortcut so that end users can press the appropriate hot keys to launch the shortcut.</p> <p>If you want InstallShield to calculate the decimal value of the keyboard shortcut, click the ellipsis button (...) in this setting.</p> <p>For more information, see <a href="#">Specifying a Keyboard Shortcut for Accessing a Shortcut</a>.</p>  <p><b>Caution</b> ■ <i>It is recommended that you avoid configuring keyboard shortcuts for your shortcuts because they may conflict with existing keyboard shortcuts on the target system.</i></p>
<b>Run</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Select the style of window that the target file should use when end users launch the shortcut. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Normal Window</b>—The file is launched in a standard-sized window.</li> <li>● <b>Maximized Window</b>—The file is launched in full-screen view.</li> <li>● <b>Minimized Window</b>—The file is launched in a minimized window, visible only on the taskbar.</li> </ul>
<b>Run As Administrator</b>	Basic MSI, InstallScript, InstallScript MSI	<p>Select to set the shortcut to “Run As Administrator”.</p> <p>Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—Enables the shortcut to Run As Administrator.</li> <li>● <b>No</b>—To not to set the shortcut to Run As Administrator.</li> </ul>  <p><b>Note</b> ■ <i>An installer should run in an Elevated mode in order to set the shortcut with Run as Administrator.</i></p> <p><i>Run as Administrator will be disabled for Advertised Shortcut and Internet Shortcut.</i></p>

**Table 118** ▪ Behavior Settings (cont.)

Setting	Project Type	Description
<b>Prevent Pinning</b>	InstallScript	<p>Specify whether you want to prevent end users from being able to pin a shortcut to the taskbar and to the Start menu after end users install your product. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—When the shortcut is installed, the context menu commands for pinning a shortcut to the taskbar and to the Start menu are hidden.</li> <li>● <b>No</b>—When the shortcut is installed, the context menu commands for pinning the shortcut to the taskbar and to the Start menu are available, enabling end users to pin the shortcut. This is the default option.</li> </ul> <p>Windows 7 introduced support for this setting. Earlier versions of Windows ignore this setting.</p> <p>You may want to disable pinning for shortcuts that are for tools and secondary products that are part of your installation. Note that if you configure the shortcut to prevent this pinning, the target of the shortcut is ineligible for inclusion in the most frequently used list on the Start menu.</p> <p>For more information, see <a href="#">Specifying Whether End Users Should Be Able to Pin a Shortcut to the Taskbar or Start Menu</a>.</p>
<b>Do Not Highlight as New</b>	InstallScript	<p>Specify whether you want to prevent a shortcut on the Start menu from being highlighted as newly installed after end users install your product. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—If the installation adds the shortcut to the Start menu, the shortcut is not highlighted as newly installed. This has the same effect as clearing the <b>Highlight newly installed programs</b> check box in the Customize Start Menu dialog box for an individual item on a target system.</li> <li>● <b>No</b>—If the installation adds the shortcut to the Start menu, the shortcut is highlighted as newly installed. This is the default option.</li> </ul> <p>Windows 7 introduced support for this setting. Earlier versions of Windows ignore this setting.</p> <p>You may want to select Yes for shortcuts that are for tools and secondary products that are part of your installation.</p> <p>For more information, see <a href="#">Preventing a Shortcut on the Start Menu from Being Highlighted as Newly Installed</a>.</p>

**Table 118** ■ Behavior Settings (cont.)

Setting	Project Type	Description
<b>Allow Initial Pin to Start</b>	InstallScript	<p>Specify whether you want the shortcut to be pinned by default to the Start screen on Windows 8 target systems. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—When the shortcut is installed on Windows 8 systems, it is pinned to the Start screen. End users can optionally unpin the shortcut. This is the default option.</li> <li>● <b>No</b>—When the shortcut is installed on Windows 8 systems, it is not pinned to the Start screen. It is available in the Apps list that contains shortcuts to all of the applications on the system.</li> </ul> <p>For more information, see <a href="#">Suppressing Initial Pinning of a Shortcut to the Windows 8 Start Screen</a>.</p>

## General

Use a shortcut's General settings to specify details such as the component that contains the shortcut.

**Table 119** ■ General Settings

Setting	Project Type	Description
<b>Key Name</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter a key name for the shortcut. The key name is an internal name; it is not displayed to end users.
<b>Internal Name</b>	InstallScript	Enter an internal name for the shortcut. The internal name is not displayed to end users.
<b>Component</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>This setting indicates the component that contains the shortcut. Click the ellipsis button (...) to display the Browse for a Component dialog box, which lets you create new components or select an existing component for the shortcut.</p> <p>The shortcut is created on the target system if the selected component is installed.</p>  <p><b>Project</b> ■ In InstallScript projects, you can select more than one component for the shortcut.</p>

**Table 119** ■ General Settings (cont.)

Setting	Project Type	Description
<b>Feature</b>	Basic MSI, InstallScript MSI, MSI Database, Transform	This setting indicates the feature or features with which the shortcut component is associated. If there is no feature-component association, this setting is blank.
<b>Uninstall</b>	InstallScript	Specify whether the shortcut should be removed when the product is uninstalled.
<b>Replace Existing (If Found)</b>	InstallScript	Specify whether the shortcut should overwrite an already existing shortcut with the same display name in the same location on the target system.
<b>Internet Shortcut</b>	InstallScript	Specify whether the shortcut is an Internet shortcut. The default setting is No; if you select Yes, the Target setting for the shortcut should be a valid URL.
<b>VS .NET Project Output</b>	InstallScript	Specify whether the shortcut points to a Visual Studio project output.
<b>Type</b>	InstallScript	<p>Specify how the shortcut should be created. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Automatic</b>—The installation automatically determines where the shortcut should appear based on the value of the <i>ALLUSERS</i> system variable.  If <i>ALLUSERS</i> is non-zero, the shortcut is created in the All Users profile so that it is available on the target system for all end users. If <i>ALLUSERS</i> is FALSE, the shortcut is created in the current user's profile.</li> <li>● <b>Personal</b>—The shortcut is created in the current user's profile.</li> <li>● <b>Common</b>—The shortcut is created in the All Users profile.</li> </ul>
<b>Comments</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter comments for this shortcut. Comments are saved in the project file for your reference and are not displayed to the end user.

**Table 119** ■ General Settings (cont.)

Setting	Project Type	Description
<b>Shell Properties</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>This setting lets you specify one or more shortcut properties that need to be set by the Windows Shell at run time.</p> <p>To specify one or more properties, click the Add New Shell Shortcut Property button in this setting, and then click one of the available options:</p> <ul style="list-style-type: none"> <li>● <b>Prevent Pinning</b>—The context menu commands for pinning the shortcut to the taskbar or the Start menu are not displayed for this shortcut after end users install your product. In addition, this option makes the target of the shortcut ineligible for inclusion in the most frequently used list on the Start menu.</li> </ul> <p>If you select this option, InstallShield adds a Key Name setting, plus additional rows of subsettings, and configures them as needed.</p> <ul style="list-style-type: none"> <li>● <b>Do Not Highlight as New</b>—The Start menu entry for the shortcut is not highlighted as newly installed after end users install your product. This has the same effect as clearing the <b>Highlight newly installed programs</b> check box in the Customize Start Menu dialog box for an individual item on a target system. You may want to set this property for shortcuts that are for tools and secondary products that are part of your installation. If you select this option, InstallShield adds a Key Name setting, plus additional rows of subsettings, and configures them as needed.</li> <li>● <b>Suppress Initial Pin to Windows 8 Start Screen</b>—If you select this option, InstallShield suppresses the Windows 8 default behavior of pinning a shortcut to the Start screen during initial installation on Windows 8 target systems. The installation sets a Windows Shell property that was introduced in Windows 8. You may want to suppress pinning for shortcuts that are tools and secondary products that are part of your installation.</li> <li>● <b>Custom Property</b>—To specify a custom property and value for shortcut properties that need to be set by the Windows Shell at installation run time, select this option. InstallShield adds a new Key Name setting, plus additional subsettings, that let you configure the appropriate property name and value.</li> </ul> <p>Specify additional properties as needed.</p> <div>  </div> <p><b>Note</b> ■ Windows Installer 5 introduced support for the Shell property settings. Earlier versions of Windows Installer ignore these settings.</p> <p>For more information, see <a href="#">Setting Shell Properties for a Shortcut</a>.</p>

**Table 119** ▪ General Settings (cont.)

Setting	Project Type	Description
<b>Key Name</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>This setting is displayed if you have used the Shell Properties setting to add one or more Shell properties to your shortcut.</p> <p>Enter a key name for the Shell shortcut property. The key name is an internal name; it is not displayed to end users.</p>  <hr/> <p><b>Note</b> ▪ Windows Installer 5 introduced support for the Shell property settings. Earlier versions of Windows Installer ignore these settings.</p> <p>For more information, see <a href="#">Setting Shell Properties for a Shortcut</a>.</p>
<b>Property</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>This setting is displayed if you have used the Shell Properties setting to add one or more Shell properties to your shortcut.</p> <p>Enter the shortcut property that you want the Windows Shell to set at run time.</p>  <hr/> <p><b>Note</b> ▪ Windows Installer 5 introduced support for the Shell property settings. Earlier versions of Windows Installer ignore these settings.</p> <p>For more information, see <a href="#">Setting Shell Properties for a Shortcut</a>.</p>
<b>Value</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>This setting is displayed if you have used the Shell Properties setting to add one or more Shell properties to your shortcut.</p> <p>Enter the value for the Shell shortcut property.</p>  <hr/> <p><b>Note</b> ▪ Windows Installer 5 introduced support for the Shell property settings. Earlier versions of Windows Installer ignore these settings.</p> <p>For more information, see <a href="#">Setting Shell Properties for a Shortcut</a>.</p>

## Windows App Package Tile Overrides

**Edition** ▪ Windows App Package Tile Overrides settings are available in Basic MSI projects edited with the Premier edition.

Use a shortcut's Windows App Package Tile Overrides settings to configure tiles created in the Windows App package. Refer to the following table for descriptions of these settings. Refer to the [Windows App Logo Considerations](#) subsection for additional information.

**Table 120** ▪ Windows App Package Tile Overrides Settings

Setting	Project Type	Description
<b>Include in Windows App Package</b>	Basic MSI	<p>Specify whether you want this shortcut to be included in all Windows App packages created from this project.</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—Include this shortcut in all Windows App packages created from this project. The shortcut will be turned into a tile if it points to an .exe installed by the Windows App package.</li> <li>● <b>No</b>—This shortcut will be excluded from all Windows App packages created from this project.</li> </ul>
<b>Short Name</b>	Basic MSI	<p>Specify a short string to appear on a medium or larger size tile created in the Windows App package. If nothing is specified, the name is copied from the <b>Display Name</b> setting of the shortcut.</p>
<b>Background Color</b>	Basic MSI	<p>Select a color to be used as the background color of the tile created in the Windows App package. A drop-down selection provides several predefined colors, or an ellipsis button (...) lets you choose additional colors or specify an RGB hex color. If nothing is specified, the transparency that is set by Windows is used as the default tile background.</p>
<b>Small Logo</b>	Basic MSI	<p>Specify a 44x44 image file to use as a small logo icon that is displayed in the left column of the Start Menu's All Apps list. If an image file is not provided, InstallShield generates a small logo from the target's tile configuration or the shortcut's icon.</p>
<b>Medium Logo</b>	Basic MSI	<p>Specify a 150x150 image file to use as a medium tile when pinned and to use as the scaled-down small tile. A medium-sized logo image is required; if an image file is not provided, InstallShield generates a medium logo from the target's tile configuration or the shortcut's icon.</p> <p>The following subsetting is available:</p> <ul style="list-style-type: none"> <li>● <b>Show Name on Medium Logo</b>—Specify whether you want to show a name of the application on a medium tile created in the Windows App package. Available options are: <ul style="list-style-type: none"> <li>● <b>Yes</b>—Display the name specified in the <b>Short Name</b> field over the logo image on a medium tile. If nothing is specified for <b>Short Name</b> the name is pulled from the <b>Display Name</b> setting of the shortcut.</li> <li>● <b>No</b>—No name will be displayed on the medium tile created in the Windows App package.</li> </ul> </li> </ul>

**Table 120** ▪ Windows App Package Tile Overrides Settings (cont.)

Setting	Project Type	Description
<b>Large Logo</b>	Basic MSI	<p>Specify a 310x310 image file to be used for a large tile, only when pinned and resized. This setting is optional. If specified, this will allow the tile to be set to Large.</p> <p>The following subsetting is available:</p> <ul style="list-style-type: none"> <li>● <b>Show Name on Large Logo</b>—Specify whether you want to show a name of the application on a large tile created in the Windows App package. Available options are: <ul style="list-style-type: none"> <li>● <b>Yes</b>—Display the name specified in the <b>Short Name</b> field over the logo image on a large tile. If nothing is specified for <b>Short Name</b> the name is pulled from the <b>Display Name</b> setting of the shortcut.</li> <li>● <b>No</b>—No name is displayed on the large tile created in the Windows App package.</li> </ul> </li> </ul>
<b>Wide Logo</b>	Basic MSI	<p>Specify a 310x150 image file to be used for a wide tile, only when pinned and resized. This setting is optional. If specified, this will allow the tile to be set to Wide.</p> <p>The following subsetting is available:</p> <ul style="list-style-type: none"> <li>● <b>Show Name on Large Logo</b>—Specify whether you want to show a name of the application on a large tile created in the Windows App package. Available options are: <ul style="list-style-type: none"> <li>● <b>Yes</b>—Display the name specified in the <b>Short Name</b> field over the logo image on a wide tile. If nothing is specified for <b>Short Name</b> the name is pulled from the <b>Display Name</b> setting of the shortcut.</li> <li>● <b>No</b>—No name is displayed on the wide tile created in the Windows App package.</li> </ul> </li> </ul>

## Windows App Logo Considerations

**Important** ▪ InstallShield must be installed on a Windows 10 machine or a machine with the Windows 10 SDK installed on it in order to utilize Windows App-related image variants described in this section. If the Windows 10 SDK and in particular *MakePRI.exe* cannot be found on the build machine, image variants are collected anyway, but no *resources.pri* file can be generated. Without the *resources.pri* file created by *MakePRI*, Windows only uses the neutral image variant. The neutral image variant has no qualifiers in its name, and is created as a scale-100 size image.

The following table provides Windows App logo considerations.

Topic	Consideration
<b>Logo Sizes</b>	<p>All logos are expected to be of certain sizes. In addition, multiple contrast variants and scale factors (DPI-based scaling) can be provided in a mix of two ways. For each variant that is found, InstallShield will include the file, converting or resizing it as necessary. The scanning process is similar to that used by InstallShield's suite High DPI support. Both implementations are inspired by the process Windows uses at run time, described in <a href="#">Globalization and accessibility for tile and toast notifications (Windows Runtime apps)</a>:</p> <ul style="list-style-type: none"> <li>● Related image files next to a source image will be scanned. For example, if including a file called <code>&lt;images&gt;\Logo.png</code>, InstallShield will look for that file as the unqualified file, and several other qualified variants: <ul style="list-style-type: none"> <li>● <code>&lt;images&gt;\contrast-black\scale-nnn\Logo.png</code></li> <li>● <code>&lt;images&gt;\contrast-white\Logo.scale-nnn.png</code></li> <li>● <code>&lt;images&gt;\scale-nnn\Logo.png</code></li> <li>● <code>&lt;images&gt;\Logo.scale-nnn.png</code></li> </ul> </li> <li>● If the original source is an icon resource of an .exe or .dll, and a more appropriate scale variant is not found per the above naming conventions, InstallShield will use the original as the source for any scale.</li> </ul>
<b>Scale Factors</b>	<p>Scale factors result in different required sizes. For example, a Large Logo is normally 310x310, but at scale-150, it is 465x465 (<math>310 * 150 / 100 = 465</math>). InstallShield currently scans for and includes scale-100, scale-125, scale-150, scale-200, and scale-400 images. You do not have to have an actual image without the scale-<i>nnn</i> component, but it makes using InstallShield's file browse a lot simpler.</p>
<b>Source Image Type</b>	<p>If a specified source image is not a .png or .jpg file, or is the wrong size, it will be converted to a .png of the correct size at build time.</p>  <p><b>Note</b> ▪ Converting an icon resource at multiple scales may result in different size icon sources being in use for each different scale. For example, a scale-200 Medium Logo is 300x300, which would use a 256x256 icon that the scale-100 Medium Logo likely would not.</p>
<b>Logo Image Layout Recommendations</b>	<p>There are recommendations on logo image layouts from Microsoft with additional detail in <a href="#">Guidelines for tile and icon assets</a>. Microsoft suggests a certain amount of padding around the core portion of a logo. For example, on the Medium tile (150x150), they suggest 45 pixels or 33% padding, resulting in a 60x60 (or 50x50) core area for the logo. InstallShield does nothing to follow or enforce this recommendation.</p>

## Folder Settings

**Project** ▪ The Shortcuts view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The following settings are available for a folder in the Shortcuts view.

**Table 121** ▪ Folder Settings

Setting	Project Type	Description
<b>Key Name</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter a key name for the folder. The key name is the internal name that is used for the folder in the Directory column of the Directory table; it is not displayed to end users.
<b>Internal Name</b>	InstallScript	Enter an internal name for the folder. The internal name is not displayed to end users.

**Table 121** ■ Folder Settings (cont.)

Setting	Project Type	Description
<b>Display Name</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Enter the name of the folder as it should appear on the target system.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>  <p><b>Project</b> ■ For Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects—You must enter a value for this setting; otherwise, a build error occurs.</p> <p>The display name is of the Windows Installer <a href="#">DefaultDir</a> data type. If the display name that you enter has more than eight characters, InstallShield uses the ShortName LongName format for this setting. For example, if you enter <i>My Product Name</i> as the value in this setting, InstallShield sets the value to <i>MyProd~1 My Product Name</i>, or something similar, so that a short name is available at run time if needed.</p> <p>For InstallScript and InstallScript MSI projects—You can enter the group name system variable <code>&lt;SHELL_OBJECT_FOLDER&gt;</code> as the display name for your folder. You can then define the display name of this folder at run time by setting the system variable <code>SHELL_OBJECT_FOLDER</code> in InstallScript. To use this functionality in an InstallScript MSI installation, any letters that are specified for the Key Name setting of the folder must be all uppercase (for example, <code>NEWFOLDER1</code>). For more information, see <code>SHELL_OBJECT_FOLDER</code>.</p>
<b>Description</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Enter a description of the folder.
<b>Shared</b>	InstallScript	<p>Specify whether this file is shared with other installations:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—If this folder contains any subfolders or files that were not created by the installation, the folder is not removed from the target system when your product is uninstalled.</li> <li>● <b>No</b>—When your product is uninstalled from the target system, this folder is removed.</li> </ul>

## Tile Configuration Settings

**Project** ▪ Tile Configuration Settings are available within the Shortcuts view for the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

The settings for tile configurations are organized into the following main categories:

- General
- Appearance

### General

Use the tile configuration's General setting to view the path of the .exe file that is associated to the tile.

**Table 122** ▪ General Settings

Setting	Project Type	Description
<b>Target</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Displays the path of the .exe file (for example, <b>[INSTALLDIR]File.exe</b> ) that is associated to the tile.

## Appearance

Use a tile configuration's Appearance settings to specify tile customizations such as the background color of the tile.

**Table 123** ▪ Appearance Settings

Setting	Project Type	Description
<b>Text Color</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Choose a foreground text color that is used to display the app name on a medium-sized tile. Available drop-down options are:</p> <ul style="list-style-type: none"> <li>● <b>Light</b>—Sets the text color that is displayed on a medium-sized tile to be light (white text).</li> <li>● <b>Dark</b>—Sets the text color that is displayed on the medium-sized tile to be dark (black text).</li> </ul>  <p><b>Note</b> ▪ Only a medium-sized tile (150x150) has room to display a name on the tile. Also, in order for the <b>Text Color</b> setting to have an effect, the <b>Show Name on Medium Tile</b> setting must be <b>Yes</b>.</p>
<b>Background Color</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Specify a color to be used as the background color of the tile. This color must be in RGB hex string format #rrggbb, or must be a known color. A drop-down selection provides a list of known colors, or an ellipsis button (...) lets you choose a custom color interactively.</p>

**Table 123** ■ Appearance Settings (cont.)

Setting	Project Type	Description
<b>Small Tile Image</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Specify a relative path to a small-sized (70x70) tile background image, or click the ellipsis button (...) to browse to a .png or .jpg file.</p>  <p><b>Important</b> ■ If you choose to use custom images, refer to the following considerations:</p> <ul style="list-style-type: none"> <li>• Custom images must be added to the project manually and you must specify an image for both the <b>Small Tile Image</b> (70x70) and the <b>Medium Tile Image</b> (150x150). If you specify only one, the default Windows styling for the app icon and background is applied to the tile.</li> <li>• If you provide scaled, high-contrast, or localized images, you need to manually create a <code>resources.pri</code> file and place it in the same directory as the app's <code>.exe</code> file and its <code>.visualElementsmanifest.xml</code> file. For more information about using images or creating a <code>resources.pri</code> file, refer to the following MSDN article: <a href="#">How to customize Start screen tiles for desktop apps (Windows Runtime apps)</a>.</li> <li>• When browsing for a tile image, if you have created or will create a <code>resources.pri</code> file, the specific image selected may include qualifiers that the <code>resources.pri</code> file maps to (such as <code>ISLogo.scale-80.png</code>). In this case, the qualifiers should be removed from the value for <b>Small Tile Image</b> or <b>Medium Tile Image</b>. However if a <code>resources.pri</code> is not being used or doesn't have a mapping for this particular file, then the qualifiers are part of the file name and should be retained. If qualifiers are detected, a dialog appears to let you choose which path and file name to use.</li> </ul>

**Table 123** ■ Appearance Settings (cont.)

Setting	Project Type	Description
<b>Medium Tile Image</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Specify a relative path to a medium-sized (150x150) tile background image.</p>  <p><b>Important</b> - If you choose to use custom images, refer to the following considerations:</p> <ul style="list-style-type: none"> <li>Custom images must be added to the project manually and you must specify an image for both the <b>Small Tile Image</b> (70x70) and the <b>Medium Tile Image</b> (150x150). If you specify only one, the default Windows styling for the app icon and background is applied to the tile.</li> <li>If you provide scaled, high-contrast, or localized images, you need to manually create a <code>resources.pri</code> file and place it in the same directory as the app's <code>.exe</code> file and its <code>.visualElementsmanifest.xml</code> file. For more information about using images or creating a <code>resources.pri</code> file, refer to the following MSDN article: <a href="#">How to customize Start screen tiles for desktop apps (Windows Runtime apps)</a>.</li> <li>When browsing for a tile image, if you have created or will create a <code>resources.pri</code> file, the specific image selected may include qualifiers that the <code>resources.pri</code> file maps to (such as <code>ISLogo.scale-80.png</code>). In this case, the qualifiers should be removed from the value for <b>Small Tile Image</b> or <b>Medium Tile Image</b>. However if a <code>resources.pri</code> is not being used or doesn't have a mapping for this particular file, then the qualifiers are part of the file name and should be retained. If qualifiers are detected, a dialog appears to let you choose which path and file name to use.</li> </ul>
<b>Show Name on Medium Tile</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Specify whether the app name should be shown on a medium-sized tile (150x150). Available options are:</p> <ul style="list-style-type: none"> <li><b>Yes</b>—Display the app name on the tile when a medium-sized tile is used.</li> <li><b>No</b>—Do not display the app name on the tile.</li> </ul> <p><i>This setting has no effect when a small-sized tile is used.</i></p>

## MSIX Applications View

**Project** - The MSIX Applications view is available in the following project types:

- MSIX

The MSIX Applications explorer offers an integrated, visual method for designing windows app properties that comprises part of or all of the functionality delivered in the package.

- [Application Settings](#)

## Application Settings

**Project** - The MSIX Applications view is available in the following project types:

- MSIX

The settings for an application are organized into the following main categories in the Applications view:

- [Appearance](#)
- [Behavior](#)
- [Tile Update](#)
- [Package Support Framework](#)

### Appearance

Use MSIX Application's Appearance settings to specify details such as the Display Name, Description, Visual Asset, Supported Rotations, Content URI, and Declaration Set for the application.

**Table 124** - Appearance Settings

Setting	Project Type	Description
<b>Display Name</b>	MSIX	Enter the name of the application as it should appear on the target system. This should be a string between 1 and 256 characters in length.
<b>Description</b>	MSIX	Enter a description of the windows app. This should be a string between 1 and 2048 characters in length that cannot include characters such as tabs, carriage returns and line feeds.
<b>Visual Asset</b>	MSIX	Specify Visual Asset name to be associated with the application. Visual elements of this application are retrieved from selected visual asset name in Visual Assets view.

**Table 124** ▪ Appearance Settings (cont.)

Setting	Project Type	Description
<b>Supported Rotations</b>	MSIX	<p>Describes the orientations in which the app would prefer to be shown for the best user experience. On a device that can be rotated, such as a tablet, the app will not be redrawn for orientations that are not specified here. For instance, if the app specifies only Landscape and LandscapeFlipped orientations, and the device is rotated to a Portrait orientation, the app will not rotate.</p>  <p><b>Important ▪</b> <i>The devices that can't be rotated, an app might be shown in that device's default orientation and the app's preferred orientation will be ignored. However, on a device with a rotation lock activated, your app's preferred rotation will still be honored.</i></p> <p>This attribute can have one of the following orientation:</p> <ul style="list-style-type: none"> <li>● <b>Portrait</b></li> <li>● <b>Landscape</b></li> <li>● <b>PortraitFlipped</b></li> <li>● <b>LandscapeFlipped</b></li> </ul>
<b>Content URI</b>	MSIX	Specify Content URI name to be associated with the application. Content URIs for this application are retrieved from selected Content URI Set in Content URIs view.
<b>Declaration Set</b>	MSIX	Specify the Declaration Set name to be associated with this application. Declarations for this application are retrieved from the selected Declaration Set defined in the Declaration view.

## Behavior

Use MSIX Application's Behavior settings to specify details such as the key name, target and entry point.

**Table 125** ▪ Behavior Settings

Setting	Project Type	Description
<b>Key Name</b>	MSIX	<p>The unique identifier of the application is within the package. This value is sometimes referred to as the package-relative app identifier (PRAID). The ID is unique within the package but not globally. There may be another package on the system that uses the same ID. The same ID cannot be used for more than once in the same package.</p> <p>This string contains alpha-numeric fields separated by periods. Each field must begin with an ASCII alphabetic character.</p> <p>You cannot use these as field values:</p> <p>"CON", "PRN", "AUX", "NUL", "COM1", "COM2", "COM3", "COM4", "COM5", "COM6", "COM7", "COM8", "COM9", "LPT1", "LPT2", "LPT3", "LPT4", "LPT5", "LPT6", "LPT7", "LPT8", and "LPT9".</p> <p>Enter a key name for the application.</p>
<b>Target</b>	MSIX	<p>The default launch executable for the app. This file must be present in the package.</p> <p>This should be a string between 1 and 256 characters in length that must end with ".exe" and cannot contain these characters: &amp;lt;, &amp;gt;, :, &amp;quot;,  , ?, or *. It specifies the default executable for the extension. If not specified, the executable defined for the app is used. As an alternative to manually entering a value, you can click the ellipsis button (...) to browse to the application target.</p>
<b>Entry Point</b>	MSIX	<p>The activatable class ID, such as "Office.Winword.Class". Default is 'Windows.FullTrustApplication' for Windows applications.</p>

## Tile Update

Describes how the app tile receives update notifications.

**Table 126** ▪ Tile Update Settings

Setting	Project Type	Description
<b>Recurrence</b>	MSIX	<p>The recurrence interval for tile update notifications.</p> <p>This attribute can have one of the following values:</p> <ul style="list-style-type: none"> <li>● <b>HalfHour</b></li> <li>● <b>Hour</b></li> <li>● <b>SixHours</b></li> <li>● <b>TwelveHours</b></li> <li>● <b>Daily</b></li> </ul>
<b>URI Template</b>	MSIX	The URI template for tile update notifications.

## Package Support Framework

The Package Support Framework is an opensource kit that helps you apply fixes to your existing win32 application when you don't have access to the source code, so that it can run in an MSIX container.

It helps your application follow the best practices of the modern runtime environment. It contains an executable, a runtime manager DLL, and a set of runtime fixes to a package.

In InstallShield 2019 R2 and later, you can now use the Package Support Framework that contains runtime fixes such as the File Redirection Fixup and Custom Fixup in MSIX.

Describes how to apply runtime fixes to a package.

**Table 127** ▪ Package Support Framework Settings

Setting	Project Type	Description
<b>Fixup Type</b>	MSIX, Basic MSI	<p>Specifies the supported Package Support Framework types by the application.</p> <p>To add a Fixup Type, click <b>Add Fixup Type</b> button.</p> <p>Supported Fixup Types are:</p> <ul style="list-style-type: none"> <li>● <b>File Redirection Fixup</b></li> <li>● <b>Custom Fixup</b></li> </ul>

**Table 127** ■ Package Support Framework Settings

Setting	Project Type	Description
<b>Architecture</b>	MSIX, Basic MSI	<p>Specifies various architecture options for Package Support Framework to apply fixes. Based on this selection, the application will pick up the runtime files.</p> <p>Select the type of architecture validation that you want to use at the build time. Available options are given below:</p> <ul style="list-style-type: none"> <li>● <b>x64</b></li> <li>● <b>x86</b></li> </ul>
<b>File Redirection Fixup</b>	MSIX, Basic MSI	<p>You can use the File Redirection Fixup to redirect attempts to write or read data in a directory that isn't accessible from an application that runs in an MSIX container.</p> <p>For example, if your application writes to a log file that is in the same directory as your applications executable, then you can use the File Redirection Fixup to create that log file in another location, such as the local app data store.</p> <p>The sample location path is given below:</p> <p>C:\Program Files (x86)\InstallShield\2021\Samples\Package Support Framework\File Redirection Fixup</p>
<b>Executable</b>	MSIX, Basic MSI	<p>Enter the name of the redirection fixup parameter executable name. By default, this field is populated with the primary process name.</p> <p>If the redirection fixup parameter executable has multiple processes, one specific process runs the file redirection, and you can enter a name for that executable in this field.</p> <p></p> <p><b>Important</b> • <i>The executable name is case sensitive.</i></p> <p>Only enter a name for this executable if you are certain of the executable name that is responsible for the file-redirection. If you are not certain, you can get the executable name by running the Process Monitor application (procman.exe).</p> <p>You can enter <code>.*</code>, if you have common file redirection properties to be applied for all the added applications.</p>

**Table 127** ■ Package Support Framework Settings

Setting	Project Type	Description
<b>Base</b>	MSIX, Basic MSI	<p>Specifies the path where redirection has to be applied. It can either be a known folder which can be selected from the given list of known folders or path which is relative to package root directory. It can be empty if you want to redirect to any directory relative to package root-level.</p> <p>For MSIX and Basic MSI:</p> <ul style="list-style-type: none"> <li>● If redirection has to occur for INSTALLDIR, you can select [INSTALLDIR].</li> <li>● If it has to occur for non-known folder cases, you can give only the relative path portion which will be considered as relative to package root level.</li> <li>● If the created shortcut is under any known folders and redirection has to occur in the current directory, select the known folder as base where the executable resides.</li> </ul> <p>For Basic MSI:</p> <ul style="list-style-type: none"> <li>● If files are added under the package root level folder; Add VFS/AppVPackageDrive to the folder structure, i.e VFS/AppVPackageDrive/[SampleFolderName]</li> </ul>
<b>Patterns</b>	MSIX, Basic MSI	<p>File type patterns for which redirection has to be applied. An array whose values are expected to be the values of a type string, each of which gets interpreted as a regular expression for matching the paths relative to the base + relative path.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>● <b>For log file types - *.*\log</b></li> <li>● <b>For text file types - *.*\txt</b></li> </ul>
<b>Custom Fixup</b>	MSIX, Basic MSI	<p>Custom redirection fixup will solve application compatibility issues based on the custom fixup details provided by custom json configuration file.</p> <p>The sample location path is given below:</p> <p>C:\Program Files (x86)\InstallShield\2021\Samples\Package Support Framework\Custom Fixup</p>

**Table 127** ▪ Package Support Framework Settings

Setting	Project Type	Description
<b>JSON Path</b>	MSIX, Basic MSI	<p>Specifies custom json configuration file which contains details about custom fixup to be applied on the application including dll details.</p> <p>For MSIX, add custom fixup dlls in the package root level or place them under below directories based on x86 or x64 architecture:</p> <p>For Basic MSI, place custom fixup dlls under below directories based on x86 or x64 architecture:</p> <ul style="list-style-type: none"> <li>• Location for x64 fixup dlls:&lt;InstallShield INSTALLDIR&gt;&lt;InstallShield_VERSION&gt;\redist\Language Independent\x64\PSF\Fixups</li> <li>• Location for x86 fixup dlls:&lt;InstallShield INSTALLDIR&gt;&lt;InstallShield_VERSION&gt;\redist\Language Independent\x86\PSF\Fixups</li> </ul>

For more information on Package Support Framework, Click [here](#).

For more information on Fixup Authoring, Click [here](#).

## Registry View

**Project** ▪ The Registry view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database
- Transform
- MSIX
- MSIX Modification Package

The Registry view enables you to define registry keys and values to be created by your installation. This view has four different panes. The two top panes show the registry data contained on your development system, and the two bottom panes are where you set up the registry data to be created on the target system.

For Windows Installer projects (Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform), you can use the View Filter list at the top of the view to select the component whose registry data you want to display.

All registry data (except the <Default> registry set in a InstallScript project) must be associated with a component. This way, for installation projects, if the component's feature is selected for installation, the component's registry data are set up on the target system.

In InstallScript projects, groups of registry keys and values are called registry sets. There is no limit to the number of registry sets you can create (or the number of keys and values inside a single registry set).

The installer automatically creates certain registry entries based on values you provide in the General Information view. These informational keys are required by Windows logo guidelines. Also, all of a component's advanced settings are used to register files on the target system.

## ODBC Resources View

---

**Project** ▪ The ODBC Resources view is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

One of the more complex areas of system configuration involves setting up ODBC drivers, data source names (DSNs), and translators. The ODBC resource must be properly registered on the system with all of the required attributes and, in the case of drivers and translators, install the necessary files, including any installation .dll files. This process is simplified in the ODBC Resources view, in which you can select the drivers, data sources, and translators installed on your development system.

For details about each of the settings that you can configure for ODBC resources, see [ODBC Resource Settings](#).

---

**Project** ▪ For installation projects: The ODBC Resources view is exclusively for installing ODBC-related resources. To install the core ODBC files, select the MDAC 2.5 merge module in the Redistributables view.

For DIM and Merge Module projects: The Merged Feature check box in the Associated Feature(s) pane of this view is selected when you add an item and cleared when you remove an item in the ODBC Resources pane. It does not affect your project.

## ODBC Resource Settings

---

**Project** ▪ The ODBC Resources view is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI

- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

There is no universal list of ODBC resource attributes and their possible values. Check with the file's vendor or author if you are unsure about what to specify for its installation. Some attributes are common to each type of ODBC resource, as described below.

**Note** ▪ You can add your own ODBC attribute by clicking in the last row of the grid in the ODBC Resources view and specifying the property and value.

## Drivers

In addition to the required attributes below, the driver must have a name in the tree. This name is registered as the driver's description. The driver's name cannot be localized, which means that it does not appear as one of your project's string entries. Because of this, the same value is used regardless of the system's language.

**Table 128** ▪ ODBC Driver Attributes

Attribute	Expected Value
<b>Driver Component</b>	Enter the name of the component that you want to install the selected ODBC driver and its attributes.
<b>Driver DLL</b>	Enter the path to the DLL file that is on the development system and that serves as the ODBC driver, or click the ellipsis button (...) to browse to the file. This file is included in the component that is identified in the Driver Component setting. It is recommended that you have only one DLL per component; therefore, if you select a different DLL, delete the previous one from the Components view.
<b>Setup Component</b>	Enter the name of the component that you want to install the setup DLL for the ODBC driver. Usually, this component is the same one as the component for the driver if the setup code is in the same DLL.
<b>Setup DLL</b>	Enter the path to the setup DLL on the development system, or click the ellipsis button (...) to browse to the file. This file is included in the component that is identified in the Setup Component setting. If the driver file is also the setup DLL, you can leave this setting blank. It is recommended that you have only one DLL per component; therefore, if you select a different DLL, delete the previous one from the Components view.

## Data Sources

In addition to the required attributes below, the DSN must have a name in the tree. This name is registered as the DSN's description. The DSN's name cannot be localized, which means that it does not appear in your project's list of string entries. Because of this, the same value is used regardless of the system's language.

**Table 129** ▪ Required Data Source Attributes

Attribute	Expected Value
<b>Registration</b>	Specify whether you want to use a system data source or a user data source. <ul style="list-style-type: none"> <li>• <b>System data source</b>—The data source is available to all users on the system.</li> <li>• <b>User data source</b>—The data source is registered only for the current user.</li> </ul>

## Translators

In addition to the required attributes below, the translator must have a name in the tree. This name is registered as the translator's description. The translator's name cannot be localized, which means that it does not appear in your project's list of string entries. Because of this, the same value is used regardless of the system's language.

**Table 130** ▪ ODBC Translator Attributes

Attribute	Expected Value
<b>Translator Component</b>	Enter the name of the component that you want to install the translator and its attributes.
<b>Translator DLL</b>	Enter the path to the DLL file that is on the development system and that serves as the translator, or click the ellipsis button (...) to browse to the file. This file is included in the component that is identified in the Translator Component setting. It is recommended that you have only one DLL per component; therefore, if you select a different DLL, delete the previous one from the Components view.
<b>Setup Component</b>	Enter the name of the component that you want to install the setup DLL for the translator. Usually, this component is the same one as the component for the driver if the setup code is in the same DLL.
<b>Setup DLL</b>	Enter the path to the setup DLL on the development system, or click the ellipsis button (...) to browse to the file. This file is included in the component that is identified in the Setup Component setting. If the driver file is also the setup DLL, you can leave this setting blank. It is recommended that you have only one DLL per component; therefore, if you select a different DLL, delete the previous one from the Components view.

**Note** ▪ You cannot add an attribute to a translator.

## INI File Changes View

**Project** ▪ The INI File Changes view is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

This view is not available in InstallScript projects; however, the InstallScript language includes .ini file functions for modifying .ini file data.

The INI File Changes view enables you to specify changes that should be made to initialization (.ini) files on the target system. These types of files serve as a database in which you can store and retrieve information between the uses of your applications. Some .ini files, such as Boot.ini and Wininit.ini, are used by the operating system. Although you can edit any .ini file found on the target system, editing system .ini files is not recommended.

### Task

**Editing an .ini file involves three steps:**

1. Create an .ini file reference.
2. Add a section to the .ini file.
3. Add a keyword to the .ini file.

Before you can create an .ini file reference, you must have at least one component in your project. If no components exist when your .ini file reference is created, the [Create a New Component dialog box](#) is displayed, enabling you to create a component.

**Tip** ▪ InstallShield lets you import an existing .ini file into your project. Once you have imported the .ini file, you can use the INI File Changes view to configure the changes that you want to be made on the target system as needed. To learn more, see [Importing an Existing .ini File](#).

For details about each of the settings that you can configure for .ini file changes, see:

- [.ini File Settings](#)
- [Section Settings for an .ini File](#)
- [Keyword Settings for an .ini File](#)

## .ini File Settings

**Project** ▪ The INI File Changes view is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

When you add an .ini file to your project, configure the following settings:

**Table 131** ▪ .ini File Settings

Setting	Description
<b>Display Name</b>	<p>Enter the name of the .ini file, including the file extension, that you would like to edit—for example, INIFile.ini.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>  <p><b>Note</b> ▪ The display name is of the Windows Installer <i>Filename</i> data type. If the display name that you enter is not already in the 8.3 format, InstallShield uses the ShortName LongName format for this setting. For example, if you enter My File Name.ini as the value in this setting, InstallShield sets the value to MyFile~1.ini My File Name.ini, or something similar, so that a short name is available at run time if needed.</p>
<b>Component</b>	<p>Select the component with which you want to associate this .ini file by using one of the following methods:</p> <ul style="list-style-type: none"> <li>• To select from a list of components that are already in your project, click the arrow.</li> <li>• To browse to the component that you want to use or to create a new component for the .ini file changes, click the ellipsis button (...).</li> </ul> <p>If the selected component is installed at run time, the .ini file is changed. The .ini file is not modified if the component is not installed.</p>

**Table 131** ▪ .ini File Settings (cont.)

Setting	Description
<b>Target</b>	Specify the location of the .ini file on the target system. Instead of entering a hard-coded path, you can select a Windows Installer <b>folder property</b> from the list.
	 <p><b>Tip</b> ▪ Do not separate subfolders from the folder property with a backslash, but separate further levels of subfolders with a backslash—for example, <code>[ProgramFilesFolder]MyCompany\Subdirectory</code>.</p>

## Section Settings for an .ini File

**Project** ▪ The INI File Changes view is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

When you select a section in the INI File Changes view, the following setting is displayed.

**Table 132** ▪ .ini File Section Settings

Setting	Description
<b>Display Name</b>	<p>Enter the section name of the .ini file that you would like to edit. Although the section name has square brackets around it in the .ini file, you do not need to include square brackets when you type the section name in this setting. For example, to make a change to the [INISection] section of an .ini file, you could type <b>INISection</b> in this setting.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

## Keyword Settings for an .ini File

**Project** ▪ The INI File Changes view is available in the following project types:

- Basic MSI
- DIM

- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

When you select a keyword in the INI File Changes view, several settings are displayed.

**Table 133** ■ .ini File Keyword Settings

Setting	Description
<b>Display Name</b>	<p>Enter the name of the keyword that you would like to edit, exactly as it should appear in the target .ini file.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Action</b>	<p>Select the action that you would like to perform. Valid options are:</p> <ul style="list-style-type: none"> <li>• <b>Replace Old Value</b>—The existing value is replaced with the value that you enter in the Data Value setting. If it does not exist, the installation creates it.</li> <li>• <b>Do Not Overwrite</b>—Your value is added to the .ini file if the keyword does not already exist. No changes are made if the keyword is already present in the .ini file.</li> <li>• <b>Append Tag</b>—Select this option if you would like to add an additional tag to an keyword value. Tags are comma separated. If the keyword to which you would like to append a tag does not exist, no changes are made.</li> <li>• <b>Remove Whole Value</b>—The keyword and its value are both removed from the .ini file. If the specified keyword does not exist, no changes are made. If you select this option, leave the Data Value setting blank.</li> <li>• <b>Remove Tag</b>—Multiple values for a keyword are known as <i>tags</i>. Tags are separated by commas. To remove a tag from a keyword's value, select this option. In the Data Value setting, enter the tag that you want to be removed.</li> </ul>
<b>Data Value</b>	<p>Enter the value for the keyword. If you are adding or appending a value, enter the new value. If you are removing a tag, enter the tag that you would like to remove. If you are removing the keyword and value, leave this setting blank.</p> <p>You can use Windows Installer properties in your keyword's value. To do this, surround the property with square brackets—for example, [INSTALLDIR].</p>

## Environment Variables View

**Project** ■ The Environment Variables view is available in the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The InstallScript language includes the *GetEnvVar* function for retrieving the current value of an environment variable, and it enables you to create an environment variable.

Environment variables are variables that can be accessed by multiple applications on the target system. In the Environment Variables view, you can create new environment variables, modify the values of existing variables, and remove variables. The environment variable creation, modification, or removal takes place on the target system when the component that is associated with the environment variable is installed.

## Environment Variable Settings

**Project** - The Environment Variables view is available in the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

The InstallScript language includes the *GetEnvVar* function for retrieving the current value of an environment variable, and it enables you to create an environment variable.

By specifying environment variable settings, you indicate how you want to affect existing variables on the target system and create new variables. Each environment variable property is described below:

**Table 134** - Environment Variable Settings

Setting	Description
<b>Component</b>	<p>Select the component with which you want to associate this environment variable by using one of the following methods:</p> <ul style="list-style-type: none"> <li>• To select from a list of components that are already in your project, click the arrow.</li> <li>• To browse to the component that you want to use or to create a new component for the environment variable, click the ellipsis button (...).</li> </ul> <p>The environment variable creation, modification, or removal takes place on the target system when the component that is associated with the environment variable is installed.</p>

**Table 134** ■ Environment Variable Settings (cont.)

Setting	Description
<b>Value</b>	<p>Enter the path or value for this environment variable. You can use a predefined folder as part of this value—such as <b>[INSTALLDIR]Bin</b>.</p> <p>To enter multiple paths, separate the paths with a semicolon (;).</p>  <p><b>Note</b> ■ If you select <i>Remove</i> for the <i>On Install</i> setting, <i>InstallShield</i> clears any value entered in the <i>Value</i> setting, and the <i>Value</i> setting becomes read-only.</p>
<b>On Install</b>	<p>Indicate the action that you want to take place when the associated component is installed to the target system. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Create</b>—The installation creates the specified environment variable on the target system—if it does not already exist—and sets its value.</li> <li>● <b>Set</b>—In conjunction with the <i>Placement</i> setting, this option sets the value of an existing environment variable. If you select this option and the environment variable does not already exist on the target system, the installation creates it and then sets its value. If the environment variable exists on the target system, the installation sets its value.</li> <li>● <b>Remove</b>—The installation removes the specified environment variable from the target system.</li> </ul>  <p><b>Note</b> ■ If you select <i>Remove</i> for the <i>On Install</i> setting, any value entered in the <i>Value</i> setting is cleared, and the <i>Value</i> setting becomes read-only.</p>
<b>Placement</b>	<p>Select the action that you would like to perform. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Append</b>—The installation appends the new value that is entered in the <i>Value</i> setting to the end of the existing value.</li> <li>● <b>Prefix</b>—The installation adds the new value that is entered in the <i>Value</i> setting to the beginning of the existing value.</li> <li>● <b>Replace</b>—The installation replaces the value of the specified environment variable with the new value that is entered in the <i>Value</i> setting.</li> </ul>  <p><b>Note</b> ■ If you select <i>Create</i> for the <i>On Install</i> setting and the specified environment variable already exists on the target system, the <i>Placement</i> setting indicates how the new value should be added to the existing environment variable's value or if it should replace the existing environment variable's value. However, if—in this scenario—the specified environment variable does not exist on the target system, it is created and the <i>Placement</i> setting is ignored.</p>

**Table 134** ■ Environment Variable Settings (cont.)

Setting	Description
<b>On Uninstall</b>	<p>Indicate whether the environment variable should be updated when the associated component is uninstalled. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Remove</b>—If you select Append or Prefix for the Placement setting and the environment variable value on the target system contains the specified value at uninstallation time, only that value is removed from the existing variable's value.</li> </ul> <p>If you select Replace for the Placement setting, and if either of the following conditions are true at uninstallation time, the entire environment variable is removed: the value on the target system matches the specified value, or the value on the target system is empty.</p> <p>In all other cases, the environment variable and its value are left as is on the target system.</p> <ul style="list-style-type: none"> <li>● <b>Leave</b>—The environment variable and, if it is available, its value are left as is on the target system.</li> </ul>
<b>Type</b>	<p>Indicate whether the environment variable name refers to a system or user environment variable. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>System</b>—The installation creates, modifies, or removes the specified system environment variable.</li> <li>● <b>User</b>—The installation creates, modifies, or removes the environment variable from the end user's environment. The specified environment variable is available only to the end user who is logged on at the time of installation.</li> </ul>

## XML File Changes View

**Project** ■ The XML File Changes view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module
- MSI Database
- Transform

The XML File Changes view is where you add references for nodes and node sets of XML files that you want to change at run time. The XML files can be part of your installation, or they can be files that are already present on target systems.

Two key parts of this view are the View Filter (a list of the project's features and components) and the XML Files explorer (a tree view):

- The View Filter enables you to filter data by feature or component.
- The XML Files explorer is where you add references to XML files and XML data that you want to create, modify, or remove at run time. Each node represents an XPath expression that your installation carries out at run time to select existing nodes or node sets in an XML file.

**Important** • The XML File Changes view is not designed to list a node for every node in an XML file. To improve performance, the XML File Changes view should show only the settings that differ from the base XML file:

- If the XML file that you are modifying is part of your installation, the XML File Changes view should list only the nodes and node sets that should be added, changed, or deleted after the XML file is installed at run time.
- If the XML file that you are modifying is a file that is already present on the target system, the XML File Changes view should list only the nodes that need to be added, changed, or deleted at run time.

Therefore, when you are importing a file, import only the nodes in the XML file that you want to modify at run time.

Note that the XML File Changes view does not enable you to specify the order in which new elements should be listed in the XML file. Therefore, importing only the nodes that you want to modify at run time helps to avoid issues that may occur if your product requires that the elements be listed in a particular order.

The XML File Changes view also displays different tabs in the right pane, depending on what is selected in the XML Files explorer. For reference information about each of the settings on these tabs, see the following:

- [General Tab for an XML File](#)
- [Advanced Tab for an XML File](#)
- [Namespace Tab for an XML File](#)
- [General Tab for an XML Element](#)
- [Advanced Tab for an XML Element](#)

To learn more about how to use the XML Files Changes view and configure XML file changes, see [Modifying XML Files](#).

## General Tab for an XML File

**Project** • The XML File Changes view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module
- MSI Database
- Transform

The General tab exposes the following settings for an XML file in the XML File Changes view:

**Table 135** ▪ General Tab Settings for a File in the XML File Changes View

Setting	Description
<b>File Name</b>	<p>The file name represents the XML file name as it appears in the explorer.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) next to this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>XML File Destination</b>	Specify the location of the XML file on the target machine. Click Browse to locate an existing directory or to add or create a new one.
<b>Select the Features the XML File Belongs to</b>	<p>Select or clear the check boxes for one or more features that you want to associate with the XML file. InstallShield automatically associates a feature with an XML file when it is added to the XML File Changes view.</p> <div>  </div> <p><b>Project</b> ▪ For DIM and Merge Module projects—The Merged Feature check box in this pane is selected and disabled when you select an XML file in this view. When you add a DIM or merge module to an installation project, you specify the feature that should contain that DIM or merge module.</p>

## Advanced Tab for an XML File

**Project** ▪ The XML File Changes view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module
- MSI Database
- Transform

The Advanced tab exposes the following settings for an XML file in the XML File Changes view.

## XML file options

The following file settings are available at run time:

**Table 136** ▪ XML File Settings Available at Run Time

Setting	Description
<b>Always create XML file if it does not already exist</b>	If an XML file does not exist on the target system at run time, then one will be created based on the specifications for that file in the XML File Changes view.
<b>Remove XML file on uninstall</b>	Select this check box if you want to remove the XML file on the target system upon uninstallation.
<b>Format XML after changes</b>	<p>If you want the XML file to be formatted after the run-time changes are made to the file, select this check box. When formatting the file, the installation adds indentations to the file and replaces empty-element tags with start tags and end tags.</p> <p>Note that the formatting may cause problems for web.config files, so you may want to clear this check box for the XML file.</p>
<b>Use Absolute XPath</b>	<p>The path of a node in an XML document can be either absolute or relative. Absolute paths start at the root. When adding a new child element to an XML file that has the same name as a child element in an existing parent element, it is necessary to use the absolute path. To do this, you select the <b>Use Absolute XPath</b> option.</p> <ul style="list-style-type: none"> <li>● <b>Selected</b>—If this option is selected, Absolute XPath will be used when adding a child element.</li> <li>● <b>Not selected</b>—if this option is not selected, Generic XPath will be used when adding a child element. By default, the <b>Use Absolute XPath</b> option is not selected.</li> </ul>
<b>Encoding used for a new file</b>	<p>Specify the encoding that should be used for a new XML file.</p> <p>Note that if the XML file is already present on the target machine, or if it is being installed as part of your installation, the installation uses the encoding that is specified in the XML file, rather than the encoding that is specified in this setting.</p> <p>The encoding value that you specify is used only if you have used the XML File Changes view to create the entire XML file.</p>

## XPath Query

This read-only grid displays the XPath expressions to be executed on the target machine at run time based on the XML changes you have configured in the XML File Changes view.

**Tip** ▪ For more information about XPath expressions, consult the [World Wide Web Consortium \(W3C\)](#) Web site as well as the [Things to Know and Avoid When Querying XML Documents with XPath](#) article MSDN Library.

## Namespace Tab for an XML File

**Project** ▪ The XML File Changes view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module
- MSI Database
- Transform

The Namespace tab contains a table with the following settings for an XML file in the XML File Changes view.

**Table 137** ▪ XML Namespace Settings

Setting	Description
<b>Prefix</b>	Specify the prefix that should be added to elements that are associated with this namespace.
<b>URI</b>	Specify the uniform resource identifier that identifies the Internet resource for the namespace. The URI can be a URL or a string of characters.
	 <p><b>Note</b> ▪ The MSXML parser does not use the URI to look up information about the namespace. The only purpose of the URI is to give the namespace a unique name within the XML file.</p>

## General Tab for an XML Element

**Project** ▪ The XML File Changes view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module
- MSI Database
- Transform

The General tab exposes the following settings for an XML element in the XML File Changes view.

### Element Name

The element name represents the declared element type for the XML file.

When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) next to this setting to select an existing string. For more information, see [Using String Entries in InstallShield](#).

## Attributes

**Table 138** ▪ Settings for XML Element Attributes

Setting	Description
<b>Attribute</b>	<p>Enter the name of an XML element attribute to created, updated, or removed at run time. You can add Windows Installer properties for the attribute.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Value</b>	<p>Enter the value for the attribute type.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Operation</b>	<p>Select from the following run-time operations:</p> <ul style="list-style-type: none"> <li>● <b>Create</b>—Adds the attribute to the element at run time.</li> <li>● <b>Remove</b>—Removes the attribute from the element at run time.</li> <li>● <b>Append</b>—Appends the attribute value that you specify to the end of the existing value.</li> </ul>
<b>Scheduling</b>	<p>Specify when to apply the attribute changes by selecting from the following scheduling options: Install, Uninstall, and Both.</p>

**Tip** ▪ You can use dynamic values from Windows Installer properties or text substitution to store different values into the XML file.

## Advanced Tab for an XML Element

**Project** ▪ The XML File Changes view is available in the following project types:

- Basic MSI

- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

The Advanced tab exposes the following settings for an XML element in the XML File Changes view.

**Table 139** • XML Element Settings

Setting	Description
<b>Update first matching element only</b>	<p>To modify only the first matching element in the target XML file, select this check box.</p> <p>If you clear this check box, every matching element in the target XML file is changed.</p>
<b>Always create this element if it does not already exist</b>	<p>To always create this element on the target machine if it does not already exist, select this check box.</p> <p>Note that if this check box is cleared for an element that is not present in the target file, its child elements are not created at run time. Thus, for an XML file such as //A/B/C, C is not created on the target system if B is neither present nor set to be created.</p>
<b>Remove element on uninstall</b>	<p>To remove this element from the XML file when the component containing this XML file change is uninstalled, select this check box.</p>
<b>Set Element Content</b>	<p>To add text content to the element, select this check box and enter the text in the Content box.</p> <p>In the following XML example, <b>feature</b> is the content for the element <b>product</b>:</p> <pre>&lt;product&gt;feature&lt;/product&gt;</pre>
<b>Content</b>	<p>Enter a string with which to update the element. There is a 255-character limitation.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) next to this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

## Text File Changes View

**Project** • The Text File Changes view is available in the following project types:

- *Basic MSI*

- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

*This view is not available in InstallScript projects; however, the InstallScript language includes string functions for finding and modifying string variables and literals.*

The Text File Changes view is where you configure search-and-replace behavior for content in text files—for example, .txt, .htm, .xml, .config, .ini, and .sql files—that you want to modify at run time on the target system. The text files can be part of your installation, or they can be files that are already present on target systems.

#### **Task** *Configuring text file changes involves the following steps:*

1. [Create a text change set.](#)
2. [Specify the change](#) for the text file.

**Note** ▪ Each text change set must be associated with a component in your project. Therefore, before you can create a text change set, your project must have at least one component. If no components exist when you are creating a text change reference, the [Create a New Component dialog box](#) is displayed, enabling you to create a component.

**Tip** ▪ The Text File Changes view enables you to modify XML files without using MSXML (which is a run-time requirement if you use the XML File Changes view to modify XML files).

For details about each of the settings that you can configure for text file changes, see:

- [Change Set Settings](#)
- [Change Settings](#)

## Change Set Settings

**Project** ▪ The Text File Changes view is available in the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *Transform*

*This view is not available in InstallScript projects; however, the InstallScript language includes string functions for finding and modifying string variables and literals.*

When you select a change set item in the Text File Changes explorer of the Text File Changes view, the following settings are available for you to configure.

**Table 140** ■ Change Set Settings

Setting	Description
<b>Target Folder</b>	<p>Specify the location of the text file (that is, any non-binary file, such as a .txt, .htm, .xml, .config, .ini, or .sql file) on the target system. Instead of entering a hard-coded path, you can select a Windows Installer <b>folder property</b> from the list.</p>  <p><b>Tip</b> ■ Do not separate subfolders from the folder property with a backslash, but separate further levels of subfolders with a backslash—for example, <b>[ProgramFilesFolder]MyCompany\Subdirectory</b>.</p>
<b>Include Files</b>	<p>Specify one or more text files that you want to be searched. Separate multiple files with a semicolon (;).</p> <p>To indicate a wild-card character, use an asterisk (*). For example, if you want to search all .xml and .config files in the specified directory, enter the following:</p> <p><b>*.xml;*.config</b></p>  <p><b>Tip</b> ■ You can use Windows Installer public properties to specify the names of the text files that you want to include in or exclude from your search. This enables you to use data that end users enter in dialogs, or other configuration information that is determined at run time, when your product's text files are modified at run time. To learn more, see <a href="#">Using Windows Installer Properties to Dynamically Modify Text Files</a>.</p>
<b>Exclude Files</b>	<p>Specify the file or files that you want to be excluded from the search. Separate multiple files with a semicolon (;).</p> <p>To indicate a wild-card character, use an asterisk (*). For example, if you want to exclude all .htm and .html files in the specified directory, enter the following:</p> <p><b>*.htm;.html</b></p>  <p><b>Tip</b> ■ You can use Windows Installer public properties to specify the names of the text files that you want to include in or exclude from your search. This enables you to use data that end users enter in dialogs, or other configuration information that is determined at run time, when your product's text files are modified at run time. To learn more, see <a href="#">Using Windows Installer Properties to Dynamically Modify Text Files</a>.</p>
<b>Include Subfolders</b>	<p>Specify whether you want the installation to search the subfolders of the location that you specified in the Target Folder setting.</p>

**Table 140** ▪ Change Set Settings (cont.)

Setting	Description
<b>Run on Install</b>	Specify whether you want the search-and-replace behavior to occur when the change set's component is installed on the target system.
<b>Run on Uninstall</b>	Specify whether you want the search-and-replace behavior to occur when the change set's component is removed from the target system.
<b>Component</b>	<p>Select the component with which you want to associate this text file by using one of the following methods:</p> <ul style="list-style-type: none"> <li>● To select from a list of components that are already in your project, click the arrow.</li> <li>● To browse to the component that you want to use or to create a new component for the text file changes, click the ellipsis button (...).</li> </ul>

## Change Settings

**Project** ▪ The Text File Changes view is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- Transform

*This view is not available in InstallScript projects; however, the InstallScript language includes string functions for finding and modifying string variables and literals.*

When you select a change item in the Text File Changes explorer of the Text File Changes view, the following settings are available for you to configure.

**Table 141** ▪ Change Settings

Setting	Description
<b>Action</b>	<p>Specify the type of change that you want to make in the applicable text file or files on target systems. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Replace</b>—Search for existing text and replace it.</li> <li>● <b>Insert at Beginning of File</b>—Add text to the beginning of the file.</li> <li>● <b>Insert at End of File</b>—Add text to the end of the file.</li> <li>● <b>Insert Before Text</b>—Search for existing text and add text before it.</li> <li>● <b>Insert After Text</b>—Search for existing text and add text after it.</li> </ul>

Table 141 ▪ Change Settings (cont.)

Setting	Description
Find What	<p>This setting is available for the following types of text change actions:</p> <ul style="list-style-type: none"><li>● Replace</li><li>● Insert Before Text</li><li>● Insert After Text</li></ul> <p>Enter the string that you want to change, or select a Windows Installer property from the list. The list consists of all of the properties that are available in the Property Manager view of your project.</p> <div></div> <p><b>Tip ▪</b> You can use Windows Installer public properties to specify the search strings and the replacement strings. This enables you to use data that end users enter in dialogs, or other configuration information that is determined at run time, when your product's text files are modified at run time. To learn more, see <a href="#">Using Windows Installer Properties to Dynamically Modify Text Files</a>.</p>
Replace With	<p>This setting is available for the Replace type of text change action.</p> <p>Enter the new string that should replace the existing string that is found, or select a Windows Installer property from the list. The list consists of all of the properties that are available in the Property Manager view of your project.</p> <div></div> <p><b>Tip ▪</b> You can use Windows Installer public properties to specify the search strings and the replacement strings. This enables you to use data that end users enter in dialogs, or other configuration information that is determined at run time, when your product's text files are modified at run time. To learn more, see <a href="#">Using Windows Installer Properties to Dynamically Modify Text Files</a>.</p> <div></div> <p><b>Tip ▪</b> You can enter escape sequence characters in this field to specify line breaks or tabs. See <a href="#">Parse Escape Sequences</a> for more information.</p>

**Table 141** ■ Change Settings (cont.)

Setting	Description
<b>Insert Text</b>	<p>This setting is available for the following types of text change actions:</p> <ul style="list-style-type: none"> <li>● Insert at Beginning of File</li> <li>● Insert at Beginning of File</li> <li>● Insert Before Text</li> <li>● Insert After Text</li> </ul> <p>Enter the new string that should be inserted into the text file or files.</p>  <p><b>Tip</b> ■ You can use Windows Installer public properties to specify the search strings and the inserted strings. This enables you to use data that end users enter in dialogs, or other configuration information that is determined at run time, when your product's text files are modified at run time. To learn more, see <a href="#">Using Windows Installer Properties to Dynamically Modify Text Files</a>.</p>
<b>Match Whole Word Only</b>	<p>This setting is available for the following types of text change actions:</p> <ul style="list-style-type: none"> <li>● Replace</li> <li>● Insert Before Text</li> <li>● Insert After Text</li> </ul> <p>Specify whether you want to find only whole-word instances of the value that you have entered for the Find What setting. For example, if you specify Yes and you enter <code>install</code> for the Find What setting, the installation searches only for instances of <code>install</code>; it does not search for other forms of the word, such as <code>installs</code>, <code>installation</code>, or <code>uninstall</code>.</p>
<b>Match Case</b>	<p>This setting is available for the following types of text change actions:</p> <ul style="list-style-type: none"> <li>● Replace</li> <li>● Insert Before Text</li> <li>● Insert After Text</li> </ul> <p>Specify whether you want to restrict your search to strings with the same capitalization that you use in the Find What setting.</p> <p>For example, if you specify Yes and you enter <code>install</code> for the Find What setting, the installation searches only for all-lowercase instances of that string. If you select No, the installation searches for <code>install</code>, as well as <code>INSTALL</code>, <code>Install</code>, and other mixed-case instances.</p>

**Table 141** ■ Change Settings (cont.)

Setting	Description
<b>Replace Only Once</b>	<p>This setting is available for the Replace type of text change action.</p> <p>Specify whether you want the installation to replace only the first occurrence of the search string.</p> <p>If you specify No, the installation replaces all instances of the search string.</p>
<b>Insert Only Once</b>	<p>This setting is available for the following types of text change actions:</p> <ul style="list-style-type: none"> <li>● Insert Before Text</li> <li>● Insert After Text</li> </ul> <p>Specify whether you want the installation to insert the text at only the first occurrence of the search string.</p> <p>If you specify No, the installation adds the string for all instances of the search string.</p>
<b>Parse Escape Sequences</b>	<p>Specify <b>Yes</b> if you want the installer to parse escape sequence characters in the <b>Replace With</b> string. The following escape sequence characters are supported:</p> <ul style="list-style-type: none"> <li>● New line (\r\n)</li> <li>● Tab (\t)</li> </ul>

## Scheduled Tasks View

**Project** ■ The Scheduled Tasks view is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- Transform

The Scheduled Tasks view is where you add to your project automated tasks that you want to be created through the Windows task scheduler at run time on target systems. The scheduled tasks that you create can launch files that are part of your installation, or ones that are already present on target systems.

For details about each of the settings that you can configure for a scheduled task, see [Scheduled Tasks Settings](#).

**Note** ■ Each scheduled task must be associated with a component in your project. Therefore, before you can add a scheduled task, your project must have at least one component. If no components exist when you are adding a scheduled task, the Create a New Component dialog box is displayed, enabling you to create a component.

## Scheduled Tasks Settings

**Project** ▪ The Scheduled Tasks view is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- Transform

The settings for a scheduled task are organized into the following main categories in the Scheduled Task view.

- [General](#)
- [Schedule](#)

### General

Use a scheduled task's General settings to specify details such as the name of the task, the component that contains the task, and the file that you want the task to run.

**Table 142** ▪ General Settings for a Scheduled Task

Setting	Description
<b>Task Name</b>	<p>Enter the name that you want to use for the selected scheduled task.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) next to this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Component</b>	<p>Select the component that you want to contain this scheduled task by using one of the following methods:</p> <ul style="list-style-type: none"> <li>• To select from a list of components that are already in your project, click the arrow in this setting.</li> <li>• To browse to the component that you want to use or to create a new component for the scheduled task, click the ellipsis button (...) in this setting.</li> </ul> <p>If the installation installs this component at run time, the scheduled task is added to the target system.</p>

**Table 142** ▪ General Settings for a Scheduled Task (cont.)

Setting	Description
<b>Comments</b>	<p>Enter the description that you want to be displayed in the Windows task scheduler for this task.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) next to this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Target</b>	<p>Enter the path to the file on the target system that should be launched when the scheduled task is run. Use Windows Installer directory properties—for example, <b>[INSTALLDIR]File.exe</b>—instead of hard-coded directory paths. As an alternative to manually entering a value, you can click the ellipsis button (...) to browse to the target location and specify the file name.</p>
<b>Arguments</b>	<p>Enter the command-line arguments for the target file.</p>
<b>Working Directory</b>	<p>Enter the working directory for the target, or click the ellipsis button (...) to select or create a directory.</p> <p>For example, if you want your working directory to be set to a subdirectory of <b>INSTALLDIR</b> called <b>Files</b>, select <b>[INSTALLDIR]</b> from the list and add the subdirectory name <b>Files</b> to the end of it. When you are finished, it should read <b>[INSTALLDIR]Files</b>.</p>
<b>Run As</b>	<p>Enter the account that should be used to run the scheduled task. For example:</p> <p><b>DomainName\UserName</b></p> <p>Note that if you select Yes for this setting, you must also specify a password in the Password setting. Otherwise the scheduled task cannot be created at run time, and the installation aborts.</p> <div>  <p><b>Tip</b> ▪ You can use a Windows Installer public property to specify this information. This enables you to use data that end users enter in dialogs, or other configuration information that is determined at run time, when a scheduled task is configured at run time. For more information, see <a href="#">Using Windows Installer Properties to Dynamically Configure a Scheduled Task</a>.</p> </div>

**Table 142** ▪ General Settings for a Scheduled Task (cont.)

Setting	Description
<b>Password</b>	<p>Enter the password that should be used to with the user account that is specified in the Run As setting to run the scheduled task.</p> <p>Note that if you select Yes for the Run Only If Logged On setting, you must also specify a password in the Password setting. Otherwise the scheduled task cannot be created at run time, and the installation aborts.</p>  <p><b>Tip</b> ▪ You can use a Windows Installer public property to specify this information. This enables you to use data that end users enter in dialogs, or other configuration information that is determined at run time, when a scheduled task is configured at run time. For more information, see <a href="#">Using Windows Installer Properties to Dynamically Configure a Scheduled Task</a>.</p>
<b>Run Only If Logged On</b>	<p>Specify whether you want the task to run only if the user account that is specified in the Run As setting is logged on to the system at the time that the task is scheduled.</p> <p>Note that if you select Yes for this setting, you must also specify a password in the Password setting (which is under the Run As setting). Otherwise the scheduled task cannot be created at run time, and the installation aborts.</p>

## Schedule

Use a scheduled task's Schedule settings to specify details such as how often you want the task to run. Note that some of the settings are displayed only if you select certain schedule options.

**Table 143** ▪ Schedule Settings for a Scheduled Task

Setting	Description
<b>Schedule Type</b>	Select the option that describes how often you want the scheduled task to be run.
<b>Start Time</b>	<p>Enter the time that the task should start to be run in the following format:</p> <p>hh:mm</p> <p>where hh is the number of hours that have passed since midnight, and mm is the number of minutes that have passed since the start of the hour. The time that you specify should be from 00:00 to 23:59. For example, for a start time of 2:45 PM, enter <b>14:45</b>.</p>
<b>Start Date</b>	Enter the date on which the task should start to be run. Use the same date format that is configured for the operating system of the machine on which you are using InstallShield.
<b>Interval</b>	Specify how often the scheduled task should be run, starting at the specified time and date.

**Table 143** ▪ Schedule Settings for a Scheduled Task (cont.)

Setting	Description
<b>Run On</b>	<p>This setting varies, depending on the option that you select in the Schedule Type setting.</p> <ul style="list-style-type: none"> <li>● <b>For a weekly schedule</b>—To specify the days of the week on which you want the weekly scheduled task to be run, click the ellipsis button (...) in this setting, and then select the check boxes of the appropriate days.</li> <li>● <b>For a monthly schedule</b>—Specify whether you want the scheduled task to be run on a specific day or week of the month.</li> <li>● <b>For a run-once schedule</b>—Enter the date on which the task should be run. Use the same date format that is configured for the operating system of the machine on which you are using InstallShield.</li> </ul>
<b>Week</b>	Select which week of the month you want the monthly scheduled task to be run.
<b>Day</b>	To specify the days on which you want the monthly scheduled task to be run, click the ellipsis button (...) in this setting, and then select the check boxes of the appropriate days.
<b>Months</b>	To specify the months of the year in which you want the monthly scheduled task to be run, click the ellipsis button (...) in this setting, and then select the appropriate check boxes.
<b>Idle Time</b>	Specify the number of minutes that the target system should be idle before running the scheduled task.

## Services View

**Project** ▪ The Services view (and the Services area for a component) is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

You can use the Services view to configure a component that installs, starts, stops, or deletes a service during installation or uninstallation. You can also use this view to configure extended service customization options that are available with Windows Installer 5. As an alternative to using the Services view, you can use the Services area under the Advanced Settings node of the Components view or the Setup Design view. If you configure service information in any of these areas, the other areas are automatically updated accordingly.

Note the following details about working with services:

- The name that you enter for the service in the Services node must match the name that is shown on the service's Properties dialog box. (To access an installed service's properties: In the Services administrative tool, right-click the service and then click Properties.)
- The service that you are starting, stopping, deleting, or configuring can either be already present on the target system during installation or uninstallation, or it can be installed as part of your installation.
- The service executable file should be the key file of its component. For more information, see [Component Key Files](#).
- The Remote Installation setting for the service's component must be set to Favor Local. For more information, see [Setting a Component's Remote Installation Setting](#).

**Note** ▪ A service must be a single executable file (.exe), since the Windows Installer does not support driver services.

For details about each of the settings that you can configure for a service, see [Services View Settings](#).

## Services View Settings

**Project** ▪ The Services view (and the Services area for a component) is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

**Tip** ▪ The View Filter at the top of the Services view lets you select a component or feature whose service data you want to display in the view. The View Filter lists your project's hierarchy of features, subfeatures, and components. Selecting a feature shows the services for all of the components in that feature.

The Services settings are organized into the following main categories:

- [General Settings](#)
- [Install Settings](#)
- [Control Settings](#)
- [Configure Settings](#)

**Tip** ▪ You must be familiar with the technical details of your service before you can configure its settings.

## General Settings

Use the General area to specify the component that you want to contain your service.

**Table 144** ▪ General Settings

Setting	Description
<b>Component</b>	<p>Select the component that contains the service executable file, or click the ellipsis button (...) in this setting to create or select a component for the service executable file.</p> <p>The service executable file should be the key file of its component. For more information, see <a href="#">Component Key Files</a>.</p> <p>In addition, the Remote Installation setting for the component must be set to Favor Local. For more information, see <a href="#">Setting a Component's Remote Installation Setting</a>.</p>

## Install Settings

Use the Install Settings area to specify whether you want the installation to install your service. If the service should be installed, also use these settings to specify information such as the display name and description, as well as when the service should be started.

**Table 145** ▪ Install Settings

Setting	Description
<b>Enable Service Install</b>	<p>Specify whether the service should be installed at run time.</p> <p>If you select No for this setting, any values that you entered for the remaining settings in the Install Settings section are deleted from the project. Note that when No is selected for this setting, the remaining settings in the Install Settings section are read-only.</p>
<b>Key Name</b>	<p>Enter a key name for the service. The key name is a database key; it is not displayed to end users.</p>
<b>Display Name</b>	<p>Enter the name that you want to be displayed in the service control manager for this service. If you leave this setting blank, the service's name (that is, the text that is used for the name of your service's subnode under the Advanced Settings node) is used.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

**Table 145** ■ Install Settings (cont.)

Setting	Description
<b>Description</b>	<p>Enter a description of the service. This description is registered on the target system when the service is installed, and it is displayed in the service control manager's Description column. It is also displayed in the Description box on the General tab of the service's Properties dialog box.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Service Type</b>	<p>Select the type of service that you are installing. Available options are:</p> <ul style="list-style-type: none"> <li>• Win32 that runs in its own process</li> <li>• Win32 that shares a process</li> </ul> <p>The WIN32_OWN_PROCESS type of service contains the code for only one service. The WIN32_SHARE_PROCESS type of service contains code for more than one service, enabling them to share code.</p>
<b>Interact with Desktop</b>	<p>Specify whether the service interacts with the desktop. If your service has a user interface, select Yes.</p> <p>If you select Yes, the User Name setting must be left blank, since the service will be installed to run in the built-in LocalSystem account.</p>
<b>Start Type</b>	<p>Specify when to start the service. Available options are:</p> <ul style="list-style-type: none"> <li>• <b>Automatic</b>—The service starts automatically when the system starts.</li> <li>• <b>On Demand</b>—The service starts when the service is requested through the service control manager.</li> <li>• <b>Disabled</b>—The service cannot be started.</li> </ul> <p>Note that some services may support other start types (that is, during operating system initialization or by the operating system loader). However, these options are not available for the Start Type setting because the Windows Installer does not include support for them.</p>
<b>Error Control</b>	<p>Select the appropriate action that the service control manager should perform if the service fails to start. Available options are:</p> <ul style="list-style-type: none"> <li>• Log the error and continue</li> <li>• Log the error, display a message, and continue</li> <li>• Log the error and restart</li> </ul>

**Table 145** ■ Install Settings (cont.)

Setting	Description
<b>Abort Install on Failure</b>	<p>Specify whether the entire installation should fail if the service cannot be installed on the target system. The default value is No.</p>  <p><b>Note</b> ■ If you select Yes for this setting and end users run the installation in silent or basic UI mode, Windows Installer 3 or later must be present on the target system.</p>
<b>Load Order Group</b>	Enter the name of the load-ordering group, if any, of which this service is a member.
<b>Dependencies</b>	<p>Enter any service or load-ordering groups that this service requires. The system attempts to start the required service or at least one member of the load-ordering group before starting this service.</p> <p>Separate multiple dependencies with a comma (,).</p> <p>You must precede the name of each load-ordering group with the SC_GROUP_IDENTIFIER—which is typically the plus sign (+)—so that the service control manager can distinguish it from a service.</p>
<b>User Name</b>	<p>Enter the account under which the service will be logged on. To install the service under the local system account, leave this setting blank. (Microsoft does not recommend installing services that impersonate the privileges of a single user.)</p> <p>If the service type is <b>Win32 that runs in its own process</b>, the value that you enter should use the following format:</p> <p><code>DomainName\UserName</code></p> <p>If the service will be logged on under the built-in domain, you can use the following format:</p> <p><code>.\UserName</code></p>
<b>Password</b>	Enter a password for this service. Leave this setting blank if the User Name setting is empty—that is, when the service is logged on under the local system account. The password is not used if you have not specified a user name.
<b>Start Parameters</b>	Enter any command-line parameters or properties that are required to run the service.

**Table 145** ■ Install Settings (cont.)

Setting	Description
<b>Permissions</b>	<p>This setting lets you set permissions for your service.</p> <p>To configure permissions, click the Add New Service Permissions button. InstallShield adds a new permission setting, plus additional rows of related settings under it. Configure each of the settings as necessary.</p> <p>You may want to add multiple permission items if, for example, you want to pass different arguments during installation and uninstallation.</p>  <p><b>Note</b> ■ The permission settings are supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore these settings.</p> <p>An installation should not contain both the MsiLockPermissionsEx table and the LockPermissions table. If you use this Permissions setting, and the settings under it, you are configuring the MsiLockPermissionsEx table of the package. If <b>Traditional Windows Installer handling</b> is selected for the Locked-Down Permissions setting in the General Information view and you have set permissions for one or more files, folders, or registry keys in your project, you are configuring the LockPermissions table of the package.</p>
<b>Key Name</b>	<p>Enter a key name for the permissions. The key name is an internal name; it is not displayed to end users.</p>  <p><b>Note</b> ■ The permission settings are supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore these settings.</p> <p>An installation should not contain both the MsiLockPermissionsEx table and the LockPermissions table. If you use this Permissions setting, and the settings under it, you are configuring the MsiLockPermissionsEx table of the package. If <b>Traditional Windows Installer handling</b> is selected for the Locked-Down Permissions setting in the General Information view and you have set permissions for one or more files, folders, or registry keys in your project, you are configuring the LockPermissions table of the package.</p>

Table 145 ■ Install Settings (cont.)

Setting	Description
<b>Security Descriptor</b>	<p>Use valid security descriptor definition language (SDDL) to enter a valid SDDL string. For more information about SDDL, see the “Access Control” section of the Microsoft Windows Software Development Kit (SDK).</p>  <p><b>Tip</b> ■ You can use angle brackets (for example, <code>&lt;DomainName\UserName&gt;</code>) or environment variables (for example, <code>[%UserDomain][%UserName]</code>) to indicate the domain and user name of the user whose account SID is going to be determined at run time.</p>  <p><b>Note</b> ■ The permission settings are supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore these settings.</p> <p>An installation should not contain both the MsiLockPermissionsEx table and the LockPermissions table. If you use this Permissions setting, and the settings under it, you are configuring the MsiLockPermissionsEx table of the package. If <b>Traditional Windows Installer handling</b> is selected for the Locked-Down Permissions setting in the General Information view and you have set permissions for one or more files, folders, or registry keys in your project, you are configuring the LockPermissions table of the package.</p>
<b>Condition</b>	<p>This setting lets you enter a statement that the installation must evaluate before securing permissions for the service on the target system. The permissions are not configured if the condition evaluates to false. However, the permissions are configured if the condition evaluates to true, assuming that the service's feature is installed.</p> <p>To create a condition for the permissions, click the ellipsis button (...) in this setting. For more information, see <a href="#">Condition Builder Dialog Box</a>.</p>  <p><b>Note</b> ■ The permission settings are supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore these settings.</p> <p>An installation should not contain both the MsiLockPermissionsEx table and the LockPermissions table. If you use this Permissions setting, and the settings under it, you are configuring the MsiLockPermissionsEx table of the package. If <b>Traditional Windows Installer handling</b> is selected for the Locked-Down Permissions setting in the General Information view and you have set permissions for one or more files, folders, or registry keys in your project, you are configuring the LockPermissions table of the package.</p>

## Control Settings

Use the Control Settings area to specify how you want to control the service when this component is installed or uninstalled. For example, before updating a running service, your installation may need to delete it.

**Table 146** ■ Control Settings

Setting	Description
<b>Events</b>	<p>This setting lets you specify one or more control events that are required for your service.</p> <p>To add an event, click the <b>Add New Service Control Event</b> button. InstallShield adds a new event setting, plus additional rows of related settings under it. Configure each of the settings as necessary.</p> <p>You can place all of your control options in a single event. However, you might need to create additional events if, for example, you want to pass different arguments during installation and uninstallation.</p>
<b>Key Name</b>	Enter a key name for the control event. The key name is an internal name; it is not displayed to end users.
<b>Operation Time</b>	<p>To specify how you would like to schedule the operation that occurs for the service at run time, select the appropriate option for each of the following settings:</p> <ul style="list-style-type: none"> <li>● <b>Install Start</b>—Specify whether you want to start the service during installation. If you select Yes, the service starts when the installation reaches the StartServices action in the Installation sequence.</li> <li>● <b>Install Stop</b>—Specify whether you want to stop the service during installation. If you select Yes, the service stops when the installation reaches the StopServices action in the Installation sequence.</li> <li>● <b>Install Delete</b>—Specify whether you want to delete the service during installation. If you select Yes, the service is deleted when the installation reaches the DeleteServices action in the Installation sequence.</li> <li>● <b>Uninstall Start</b>—Specify whether you want to start the service during uninstallation. If you select Yes, the service starts when the uninstallation reaches the StartServices action in the Installation sequence.</li> <li>● <b>Uninstall Stop</b>—Specify whether you want to stop the service during uninstallation. If you select Yes, the service stops when the uninstallation reaches the StopServices action in the Installation sequence.</li> <li>● <b>Uninstall Delete</b>—Specify whether you want to delete the service during uninstallation. If you select Yes, the service is deleted when the uninstallation reaches the DeleteServices action in the Installation sequence.</li> </ul>

**Table 146** ▪ Control Settings (cont.)

Setting	Description
<b>Wait Type</b>	<p>Specify how Windows Installer should proceed after initiating the control event. Available options are:</p> <ul style="list-style-type: none"> <li>• <b>Wait for the event to complete</b>—Windows Installer waits for the event—starting, stopping, or deleting—to finish, up to a maximum of 30 seconds, before proceeding. Select this option if the event is critical to the installation and you want to allow additional time for the event to return a failure error.</li> <li>• <b>Wait for the SCM</b>—Windows Installer waits for the service control manager to report that the service is in a pending state.</li> </ul> <p>The service control manager maintains the system's database of services and exposes an interface for controlling these services.</p>
<b>Service Argument</b>	Specify the arguments that you want to be passed to the service. Separate multiple arguments with a comma (,).

## Configure Settings

Use the Configure Settings area to specify how to customize the service that is included in the selected component.

**Note** ▪ The configuration settings are supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore these settings.

**Table 147** ▪ Configure Settings

Setting	Description
<b>Events</b>	<p>This setting lets you specify one or more configuration changes that are required for your service.</p> <p>To add an event, click the <b>Add New Service Configuration Event</b> button. InstallShield adds a new event setting, plus additional rows of related settings under it. Configure each of the settings as necessary.</p>  <p><b>Note</b> ▪ This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.</p>

**Table 147** ▪ Configure Settings (cont.)

Setting	Description
<b>Key Name</b>	<p>Enter a key name for the configuration event. The key name is an internal name; it is not displayed to end users.</p>  <p><b>Note</b> ▪ This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.</p>
<b>Run Time</b>	<p>To specify when you would like the service configuration event to occur at run time, select the appropriate option for each of the following settings:</p> <ul style="list-style-type: none"> <li>• <b>During Install</b>—Specify whether you want the event to occur during installation.</li> <li>• <b>During Uninstall</b>—Specify whether you want the event to occur during uninstallation.</li> <li>• <b>During Reinstall</b>—Specify whether you want the event to occur during reinstallation.</li> </ul>  <p><b>Note</b> ▪ This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.</p>

**Table 147** ■ Configure Settings (cont.)

Setting	Description
<b>Configuration Type</b>	<p>Specify what configuration change should be made to the service. The change takes effect the next time that the system is started. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Configure time delay of an auto-start</b>—This option is applicable if the service is an installed auto-start service, or if Automatic is selected for the Start Type setting in the Install Settings area. If you select this option, click the ellipsis button (...) in the Arguments setting to indicate the time delay.</li> <li>● <b>Configure when to run recovery actions</b>—If you select this option, click the ellipsis button (...) in the Arguments setting to specify when to run the recovery actions for the selected service.</li> <li>● <b>Add a service SID type to the process token</b>—If you select this option, click the ellipsis button (...) in the Arguments setting to indicate the appropriate security identifier (SID) type that you want to add for the service.</li> <li>● <b>Change list of required privileges</b>—If you select this option, click the ellipsis button (...) in the Arguments setting to select the appropriate privileges.</li> <li>● <b>Configure SCM pre-shutdown delay</b>—If you select this option, enter the length of the time delay (in milliseconds) in the Arguments setting. To reset the time delay to the default of 3 minutes, leave the Arguments setting blank. The service control manager waits for the specified period of time after sending the SERVICE_CONTROL_PRESHUTDOWN notification to the service.</li> </ul> <p>Note that each option has its own set of corresponding values for the Arguments setting. Therefore, if you change the value for the Arguments setting and next change the value for the Configuration Type setting, you may need to change the value for the Arguments setting again.</p> <div>  </div> <hr/> <p><b>Note</b> ■ This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.</p>
<b>Arguments</b>	<p>To specify the value that corresponds with the configuration change that you selected in the Configuration Type setting, click the ellipsis button (...).</p> <div>  </div> <hr/> <p><b>Note</b> ■ This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.</p>

**Table 147** ▪ Configure Settings (cont.)

Setting	Description
<b>Recovery Actions</b>	<p>This setting lets you specify one or more recovery actions that are to be run after the service fails.</p> <p>To add a recovery action, click the <b>Add New Recovery Action</b> button. InstallShield adds a new recovery action setting, plus additional rows of related settings under it. Configure each of the settings as necessary.</p>  <p><b>Note</b> ▪ This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.</p>
<b>Key Name</b>	<p>Enter a key name for the recovery action. The key name is an internal name; it is not displayed to end users.</p>  <p><b>Note</b> ▪ This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.</p>
<b>Run Time</b>	<p>To specify when the system should run the recovery action after the service has failed, select the appropriate option for each of the following settings:</p> <ul style="list-style-type: none"> <li>● <b>During Install</b>—Run the action when the service's component is being installed.</li> <li>● <b>During Uninstall</b>—Run the action when the service's component is being uninstalled.</li> <li>● <b>During Reinstall</b>—Run the action when the service's component is being reinstalled.</li> </ul>  <p><b>Note</b> ▪ This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.</p>

**Table 147** ▪ Configure Settings (cont.)

Setting	Description
<b>Reset Period</b>	<p>Specify the amount of time (in seconds) between the reset intervals for the service's failure count.</p> <p>The service control manager counts the number of times that the service has failed since the system was last restarted. When this interval has elapsed, the count is reset to the number 0 if the service has not failed during the reset period. When the service fails, the system performs an action that is specified for the SCM Actions setting. The appropriate action is determined by subtracting the number 1 from the number of failures since the last system restart. For example, if the action fails a sixth time, the system performs the fifth action type that is listed in the SCM Actions setting. If actions are not specified in the SCM Actions setting, the Reset Period setting is ignored.</p> <p>To indicate that the failure count should never be reset, leave this setting blank.</p>  <p><b>Note</b> ▪ This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.</p>
<b>Reboot Message</b>	<p>Specify the message that should be displayed before the computer is restarted in response to a service control manager action of Reboot Computer. Note that Reboot Computer must be listed as one of the action types for the SCM Actions setting; otherwise, the Reboot Message setting is ignored.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>  <p><b>Note</b> ▪ This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.</p>

**Table 147** ▪ Configure Settings (cont.)

Setting	Description
<b>Run Command</b>	<p>Specify the command line that should be run in response to a service control manager action of Run Command. Use the absolute path; UNC paths are not supported. For example, enter <code>C:\myscripts\recovery.cmd</code>, rather than <code>\\computername\c\$\myscripts\recovery.cmd</code>. Programs or scripts that you specify should not require input from end users.</p> <p>The command line that you specify is used by a new process that runs under the same account as the service.</p> <p>Note that Run Command must be listed as one of the action types for the SCM Actions setting; otherwise, the Run Command setting is ignored.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>  <p><b>Note</b> ▪ This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.</p>
<b>SCM Actions</b>	<p>This setting lets you specify one or more service control manager actions that should occur if the service fails. The actions are performed in the order that they are listed under this setting.</p> <p>To add an action, click the <b>Add New SCM Action Event</b> button. InstallShield adds a new Type setting, plus a Delay setting under it. Configure both of the settings as necessary.</p>  <p><b>Note</b> ▪ This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.</p>

**Table 147** ■ Configure Settings (cont.)

Setting	Description
<b>Type</b>	<p>Specify the type of action that the service control manager should perform if the service fails. Available options are:</p> <ul style="list-style-type: none"> <li>• Run Command</li> <li>• Reboot Computer</li> <li>• Take No Action</li> <li>• Restart Service</li> </ul>  <p><b>Note</b> ■ The Restart Service action is not supported with .msi packages. Including this action with an .msi package will result in <a href="#">Windows Installer Error 1939</a>.</p>  <p><b>Note</b> ■ The Type setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.</p>
<b>Delay</b>	<p>Specify the time (in milliseconds) that the service control manager should wait before performing the action that is specified in the Type setting.</p>  <p><b>Note</b> ■ This setting is supported beginning with Windows Installer 5. Earlier versions of Windows Installer ignore this setting.</p>

## Server Configuration View

**Project** ■ The Server Configuration view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

InstallShield offers the following views to help you configure server-side installations.

## Internet Information Services (IIS)

**Project** ▪ The Internet Information Services view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

If you want to create an IIS Web site, application, virtual directory, application pool, or Web service extension on the target machine upon installation, you can configure it in the Internet Information Services view.

## Component Services

**Project** ▪ The Component Services view is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The Component Services view enables you to manage COM+ server applications and components for your installation package.

## SQL Scripts

**Project** ▪ The SQL Scripts view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

The SQL Scripts view provides a central location for managing and organizing all SQL scripts by connections and settings.

## Internet Information Services View

**Project** ▪ The Internet Information Services view is available in the following project types:

- Basic MSI
- DIM
- InstallScript

- *InstallScript MSI*
- *Merge Module*

The Internet Information Services view enables you to create and manage new IIS Web sites, applications, virtual directories, application pools, and Web service extensions.

The Internet Information Services view contains several areas:

- **Web Sites** (This area lets you add Web applications and virtual directories. For more information, see [Application and Virtual Directory Settings](#).)
- **Application Pools**
- **Web Service Extensions**

The following table describes the buttons that are displayed above the settings in the Internet Information Services view. The buttons are displayed if a Web site, application, virtual directory, application pool, or Web service extension is selected in the center pane.

**Table 148** ■ Controls in the Internet Information Services View

Name of Control	Icon	Description
<b>Categorized</b>		Sorts the settings according to categories.
<b>Alphabetical</b>		Sorts the settings alphabetically.

**Tip** ■ You can configure an IIS setting dynamically at run time through the use of Windows Installer public properties (in Basic MSI, DIM, InstallScript MSI, and Merge Module projects) or text substitution string variables (in InstallScript projects). This enables you to let end users specify the name of the virtual directory, the TCP port, the site number, or other IIS settings for the Web sites, applications, virtual directories, application pools, and Web service extensions that they are installing on the target machine. To learn more, see [Using Windows Installer Properties to Dynamically Modify IIS Settings](#) and [Using InstallScript Text Substitution to Dynamically Modify IIS Settings](#).

## Web Site Settings

**Project** ■ The Internet Information Services view is available in the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *Merge Module*

Use the Web Sites item in the Internet Information Services view to add and delete Web sites, and to configure system-wide settings for the Web server.

## Web Server Settings that Apply to All Web Sites in a Project

When you select the Web Sites explorer in the Internet Information Services view, the following Web server settings are displayed.

**Table 149** ▪ Web Server Settings

Setting	Description
<b>Restart Web Server After Configuring IIS (IIS 6 and earlier only)</b>	<p>To restart IIS after each time the installation is done making IIS changes to the system, select Yes. Some applications may require IIS to be restarted.</p> <p>This setting applies to IIS 6 and earlier. IIS 7 ignores this setting.</p>
<b>SSIEnableCmdDirective Registry Value</b>	<p>Specify how you want the SSIEnableCmdDirective registry value for the HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\W3SVC\Parameters registry key to be set on the target system. The SSIEnableCmdDirective registry value controls whether the Web server allows the #exec CMD directive of server-side includes (SSIs) to be used to execute shell commands. Valid options are:</p> <ul style="list-style-type: none"> <li>● <b>Ignore</b>—Do not change the SSIEnableCmdDirective registry value on the target system. This is the default option.</li> <li>● <b>FALSE (0)</b>—Set the SSIEnableCmdDirective registry value on the target system to 0. This prevents the #exec CMD directive of server-side includes to be used to execute shell commands. Note that if you select this value and an IIS Web server has applications that rely on #exec CMD directives, those applications may stop working properly after your installation project's Web site and virtual directory are installed.</li> <li>● <b>TRUE (1)</b>—Set the SSIEnableCmdDirective registry value on the target system to 1. This allows the #exec CMD directive of server-side includes to be used to execute shell commands.</li> </ul> <p>If you select the FALSE or TRUE options, InstallShield stores the value—either 0 for FALSE or 1 for TRUE—in the INSTALLSHIELD_SSI_PROP property.</p> <p>Because of security concerns, the default SSIEnableCmdDirective registry value is FALSE (0); the FALSE (0) value prevents end users from running unauthorized server-side executable files.</p> <div>  </div> <p><b>Note</b> ▪ If your product is uninstalled from a target system, the SSIEnableCmdDirective registry value is not changed, even if its value was changed during installation.</p> <p>For more information, see <a href="#">Specifying Whether a Web Server Should Allow the CMD Command to Be Used for SSI #exec Directives</a>.</p>

**Note** ▪ The aforementioned Web server settings are not updated on a target system at installation run time if no IIS items (Web sites, applications, virtual directories, application pools, or Web service extensions) are installed.

## Settings that Are Configurable for Each Web Site in a Project

When you select a Web site in the explorer, many settings are displayed. The Web site settings are organized into several main categories:

- Identification
- General
- Home Directory
- Application Settings
- Security
- Advanced

### Identification Settings

The following settings are available in the Identification area for a Web site in the Internet Information Services view.

**Table 150** ▪ Identification Settings for a Web Site

Setting	Description
<b>Name</b>	<p>Enter a name for the Web site.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>IP Address</b>	<p>To target a specific IP address, enter it.</p> <p>As an alternative, you can leave an asterisk (*), which is the default value. An asterisk or a blank value for this setting indicates that any unused IP address should be used.</p>
<b>TCP Port</b>	<p>The TCP Port setting for an IIS Web site indicates the port number on which the service is running on the target machine. Some versions of the IIS Web server can host multiple Web sites. Each Web site is associated with a unique port number.</p> <p>If you do not know what the port number on the target system should be, you can enter 0 for this setting.</p> <p>To learn which port and site numbers are used for the Web site when it is installed, see <a href="#">Configuring the TCP Port and Site Numbers</a>.</p>

**Table 150** ▪ Identification Settings for a Web Site (cont.)

Setting	Description
<b>Host Header Name</b>	<p>To specify the host header name that identifies the IIS Web site that is installed during your installation, type it in this box. For example:</p> <p><code>www.mycompany.com</code></p> <p>Host headers (also known as domain names) enable you to assign more than one Web site to an IP address on a Web server.</p>
<b>Site Number</b>	<p>The Site Number setting indicates the number in the path at which the Web site will be created (that is, w3svc/3). The default value is 0.</p> <p>If you do not know what the site number on the target system should be, you can enter 0 for this setting.</p> <p>To learn which port and site numbers are used for the Web site when it is installed, see <a href="#">Configuring the TCP Port and Site Numbers</a>.</p>

## General Settings

The following settings are available in the General area for a Web site in the Internet Information Services view.

**Table 151** ▪ General Settings for a Web Site

Setting	Description
<b>Component</b>	Select the component with which the Web site is associated. You can also click the ellipsis button (...) to locate an existing component or create a new one.
<b>ASP.NET Version</b>	<p>To set the ASP.NET version for the Web site, enter the complete version number, or select it from the list.</p> <p>For example, to specify version 2 of ASP.NET, type <b>2.0.50727</b>. To specify version 1.1 of ASP.NET, type <b>1.1.4322</b>.</p> <p>If you specify an ASP.NET version for a Web site, IIS uses that same version number for any of the Web site's applications.</p> <p></p> <p><b>Important</b> ▪ If your installation may be run on a Windows Vista or later system, you may not want to set the ASP.NET version. Also note that if you specify version 3 of ASP.NET, an error occurs at run time. For more information, see <a href="#">Setting the ASP.NET Version for a Web Site or Application</a>.</p>

**Table 151** ■ General Settings for a Web Site (cont.)

Setting	Description
<b>ASP.NET Platform</b>	<p>If the installation may be run on a 64-bit version of Windows with the .NET Framework, specify which ASP.NET platform should be used to map the Web site or application to the ASP.NET version:</p> <ul style="list-style-type: none"> <li>● <b>32-bit</b>—The 32-bit version of the ASP.NET IIS Registration tool should be used. Select this option if Yes is selected for the application pool's Enable 32-Bit Applications setting; otherwise the installation fails.</li> <li>● <b>64-bit</b>—The 64-bit version of the ASP.NET IIS Registration tool should be used. Select this option if No is selected for the application pool's Enable 32-Bit Applications setting; otherwise the installation fails.</li> </ul> <p>For more information, see <a href="#">Considerations for Supporting IIS 6 on 64-Bit Platforms</a>.</p>
<b>Delete on Uninstall</b>	<p>Specify whether you want to delete the selected Web site during uninstallation.</p> <p>For more information, see <a href="#">Uninstalling Web Sites, Applications, and Virtual Directories</a>.</p>
<b>Default Documents</b>	<p>Type the name of the default page on your Web site. To specify multiple pages, separate each with a comma.</p> <p>A Web site serves a default page whenever a browser request does not specify a document name.</p>

## Home Directory Settings

The following settings are available in the Home Directory area for a Web site in the Internet Information Services view.

**Table 152** ■ Home Directory Settings for a Web Site

Setting	Description
<b>Content Source Path (Local or UNC)</b>	<p>This setting identifies the local path or network directory path that stores your Web site files.</p> <ul style="list-style-type: none"> <li>● If the content for the Web site is on the target system, click the ellipsis button (...) in this setting to specify a local path. The Browse for Directory dialog box opens. In a Basic MSI or InstallScript MSI project, this dialog box enables you to select a Windows Installer property (such as [IISROOTFOLDER]) or create a new one. In an InstallScript project, this dialog box enables you to select an InstallScript variable (such as &lt;IISROOTFOLDER&gt;) or create a new one.</li> </ul> <p>By default, the files are stored in IISROOTFOLDER.</p> <ul style="list-style-type: none"> <li>● If the content for the Web site is not on the target system, click the UNC button in this setting to specify a network location. Following is an example:</li> </ul> <p>\\server\share</p>  <p><b>Tip</b> ■ Each Web site should have a unique physical path, especially if the Web site is going to be installed on a Windows Vista or later system or a Windows Server 2008 or later system. To learn more, see <a href="#">Run-Time Requirements for IIS Support</a>.</p>
<b>Script Source Access</b>	Specify whether you want to allow end users to access source code if either read or write permissions are set. Source code includes scripts in ASP applications.
<b>Read Access</b>	Specify whether you want to provide end users with read access to the Web site.
<b>Write Access</b>	Specify whether you want to provide end users with write access to the Web site. This means that end users can change the Web site's properties on the target machine.
<b>Directory Browsing</b>	Specify whether you want to allow end users to see all the virtual directories and subdirectories below this Web site.
<b>Log Visits</b>	Specify whether you want to record visits to this Web site in a log file. Visits are recorded only if logging is enabled for this Web site.

**Table 152** ▪ Home Directory Settings for a Web Site (cont.)

Setting	Description
<b>Index this Resource</b>	Specify whether you want to allow Microsoft Indexing Service to include this directory in a full-text index of your Web site.  This setting applies to IIS 6 and earlier. IIS 7 ignores this setting.

## Application Settings

The following settings are available in the Application Settings area for a Web site in the Internet Information Services view.

**Table 153** ▪ Application Settings for a Web Site

Setting	Description
<b>Application Pool</b>	To associate the selected Web site with an application pool, select its name in the list. As an alternative, you can click the ellipsis button (...) to select or create a string entry for the application pool. For more information, see <a href="#">Using String Entries in InstallShield</a> .  This setting applies to IIS 6 and later. Earlier versions of IIS ignore this setting.  
	<b>Important</b> ▪ The application pool that you specify should be on the target system at run time or part of your installation; otherwise, the server may generate an error such as error 403.18.
<b>Application Mappings</b>	To customize the directory's application mappings, click the ellipsis button (...) in this setting. This opens the <a href="#">Application Mappings dialog box</a> , which enables you to add, edit, and delete a mapping between a file name extension and the application that processes those files.
<b>MIME Types</b>	To add, edit, or delete MIME types for the selected Web site, click the ellipsis button (...) in this setting. This opens the <a href="#">MIME Types dialog box</a> , which enables you to add, edit, and delete a mapping between a file name extension and the corresponding content type that is served as a static file by the Web server on the target system to a browser or mail client.
<b>Session Timeout (minutes)</b>	Specify the number of minutes that a session can remain idle before the server terminates it automatically. If the end user does not refresh or request a page within the timeout period, the session ends. The default value is 20 minutes.
<b>ASP Script Timeout (seconds)</b>	Specify the length of time in seconds that .asp pages will allow a script to run before terminating and writing an event to the Windows Event Log. The minimum value for this property is 1 second; the default value is 90 seconds.

## Security Settings

When you select a Web site in the Internet Information Services view, InstallShield displays several security-related settings in the Security area. The Security area lets you configure your Web server to verify the identity of users. You can authenticate users to prevent unauthorized ones from establishing a Web (HTTP) connection to restricted content. For more information, refer to the IIS documentation.

The Security area contains several categories of settings:

- Anonymous Connection
- Authenticated Access
- Secure Communication

The settings in the Anonymous Connection area are as follows.

**Table 154** - Anonymous Connection Settings in the Security Settings Area

Setting	Description
<b>Enable Anonymous Access</b>	<p>Specify whether you want to allow users to establish an anonymous connection. If you do want to allow anonymous connections, also enter the appropriate Windows user account information.</p> <p>If you do not need the Web server to confirm the identity of end users before they can access the content, select No for this setting.</p>
<b>IIS Controls Anonymous Password</b>	<p>Specify whether you want to automatically synchronize your anonymous password settings with those set in Windows on the target system. If the password that you type for the anonymous account differs from the password that Windows has, anonymous authentication will not work.</p> <div data-bbox="587 1182 626 1228" data-label="Image"> </div> <p><b>Note</b> - Password synchronization should be used only with anonymous user accounts defined on the local computer, not with anonymous accounts on remote computers.</p>
<b>Anonymous User Name</b>	If you are enabling anonymous connections, type the name of the anonymous account.
<b>Anonymous Password</b>	If you have selected No for the IIS Controls Anonymous Password setting, type the anonymous user account password. The password is used only within Windows. Anonymous users do not log on by using a user name and password.

The settings in the Authenticated Access area are as follows.

**Table 155** ▪ Authenticated Access Settings in the Security Settings Area

Setting	Description
<b>Basic Authentication</b>	<p>Specify whether you want to enable the basic authentication method for collecting user name and password information for end users who access the Web site.</p>  <p><b>Important</b> ▪ With the basic method of authentication, user names and passwords are not encrypted when they are transmitted across the network. An unscrupulous end user who has network monitoring tools could intercept user names and passwords.</p>
<b>Integrated Windows Authentication</b>	<p>Specify whether you want to enable integrated Windows authentication. Integrated Windows authentication uses a cryptographic exchange with the end user's browser to confirm the identity of the user.</p> <p>When integrated Windows authentication is enabled, the Web site will use it only under the following conditions:</p> <ul style="list-style-type: none"> <li>• Anonymous access is disabled.</li> <li>• Anonymous access is denied because Windows file system permissions have been set, requiring end users to provide a Windows user name and password before establishing a connection with restricted content.</li> </ul>
<b>Forms Authentication</b>	<p>Set this option to <b>Yes</b> to enable forms authentication. ASP.NET forms-based authentication works well for sites or applications on public Web servers that receive many requests. This authentication mode lets you manage client registration and authentication at the application level, instead of relying on the authentication mechanisms provided by the operating system.</p>  <p><b>Important</b> ▪ Forms authentication sends the user name and password to the Web server as plain text. You should use Secure Sockets Layer (SSL) encryption for the Log On page and for all other pages in your application except the Home page.</p>

The settings in the Secure Communication area are as follows.

**Table 156** ▪ Secure Communication Settings in the Security Settings Area

Setting	Description
<b>SSL certificate</b>	<p>To specify a server certificate that should be installed on the target system, click the ellipsis button (...) in this setting, and then select the appropriate security certificate file (.cer or .pfx). As an alternative, you can select a certificate from the list if your project already contains one or more certificates.</p> <p>InstallShield stores the .cer file in the Binary table.</p> <p>If no certificate is configured to be installed, this setting is blank.</p>
<b>SSL certificate password</b>	If the certificate that you specified has a password, enter it in this setting.

### Advanced Settings

The following settings are available in the Advanced area for a Web site in the Internet Information Services view.

**Table 157** ▪ Advanced Settings for a Web Site

Setting	Description
<b>Custom Errors</b>	<p>To customize HTTP errors that are sent to clients when Web server errors occur, select the ellipsis button (...) in this setting. The <a href="#">Custom Errors dialog box</a> opens, enabling you to specify the page that should be displayed for one or more HTTP errors.</p> <p>Administrators can use generic HTTP 1.1 errors, detailed custom error pages that IIS provides, or your own custom error pages that are you including in the installation.</p>
<b>Other IIS Properties</b>	<p>To specify values for IIS settings that are not displayed in the other areas in this view, select the ellipsis button (...) in this setting. The <a href="#">Other IIS Properties dialog box</a> opens, enabling you to set the value of one or more IIS properties. To learn more, see <a href="#">Configuring Advanced IIS Settings</a>.</p> <p>The advanced settings apply to IIS 6 and earlier. IIS 7 ignores these settings.</p> <p>For help on specific settings, see <a href="#">Metabase Property Reference</a> on the MSDN Web site.</p>

## Application and Virtual Directory Settings

**Project** ▪ The Internet Information Services view is available in the following project types:

- Basic MSI
- DIM
- InstallScript

- *InstallScript MSI*
- *Merge Module*

You can add applications and virtual directories to your Web site in the Internet Information Services view. When you select an application or virtual directory in this view, many settings are displayed. The settings are organized into several main categories:

- [General](#)
- [Virtual Directory](#)
- [Application Settings](#)
- [Security](#)
- [Advanced](#)

## General Settings

The following settings are available in the General area for an application or a virtual directory in the Internet Information Services view.

**Table 158** ▪ General Settings for an Application or a Virtual Directory

Setting	Description
<b>Name</b>	<p>Enter a name for the application or virtual directory.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Component</b>	<p>Select the component with which the application or virtual directory is associated. You can also click the ellipsis button (...) to locate an existing component or create a new one.</p>

**Table 158** ■ General Settings for an Application or a Virtual Directory (cont.)

Setting	Description
<b>ASP.NET Version</b>	 <p><b>Note</b> ■ This setting applies to applications but not virtual directories.</p> <p>To set the ASP.NET version for the application, enter the complete version number, or select it from the list.</p> <p>For example, to specify version 2 of ASP.NET, type <b>2.0.50727</b>. To specify version 1.1 of ASP.NET, type <b>1.1.4322</b>.</p> <p>If you specify an ASP.NET version for a Web site, IIS uses that same version number for any of the Web site's applications.</p>  <p><b>Important</b> ■ If your installation may be run on a Windows Vista or later system, you may not want to set the ASP.NET version. Also note that if you specify version 3 of ASP.NET, an error occurs at run time. For more information, see <a href="#">Setting the ASP.NET Version for a Web Site or Application</a>.</p>
<b>ASP.NET Platform</b>	 <p><b>Note</b> ■ This setting applies to applications but not virtual directories.</p> <p>If the installation may be run on a 64-bit version of Windows with the .NET Framework, specify which ASP.NET platform should be used to map the application to the ASP.NET version:</p> <ul style="list-style-type: none"> <li>● <b>32-bit</b>—The 32-bit version of the ASP.NET IIS Registration tool should be used. Select this option if Yes is selected for the application pool's Enable 32-Bit Applications setting; otherwise the installation fails.</li> <li>● <b>64-bit</b>—The 64-bit version of the ASP.NET IIS Registration tool should be used. Select this option if No is selected for the application pool's Enable 32-Bit Applications setting; otherwise the installation fails.</li> </ul> <p>For more information, see <a href="#">Considerations for Supporting IIS 6 on 64-Bit Platforms</a>.</p>
<b>ASP.NET Registration</b>	<p>To set the ASP.NET application registration option with Internet Information Services (IIS), select one of the following options:</p> <ul style="list-style-type: none"> <li>● <b>Recursive</b>—Updates script maps and application-pool assignments for the specified application and for all sub-applications.</li> <li>● <b>Non Recursive</b>—Updates script maps and application-pool assignments for only the specific application. No sub-applications are changed.</li> </ul>
<b>Default Documents</b>	<p>Type the name of the default page on your application or virtual directory. To specify multiple pages, separate each with a comma.</p> <p>A application or virtual directory serves a default page whenever a browser request does not specify a document name.</p>

## Virtual Directory Settings

The following settings are available in the Virtual Directory area for an application or a virtual directory in the Internet Information Services view.

**Table 159** ▪ Virtual Directory Settings for an Application or a Virtual Directory

Setting	Description
<b>Content Source Path (Local or UNC)</b>	<p>This setting identifies the local path or network directory path that stores the default files for your application or virtual directory.</p> <ul style="list-style-type: none"> <li>● If the content for the application or virtual directory is on the target system, click the ellipsis button (...) in this setting to specify a local path. The Browse for Directory dialog box opens. In a Basic MSI or InstallScript MSI project, this dialog box enables you to select a Windows Installer property (such as [IISROOTFOLDER]) or create a new one. In an InstallScript project, this dialog box enables you to select an InstallScript variable (such as &lt;IISROOTFOLDER&gt;) or create a new one.</li> </ul> <p>By default, the files are stored in IISROOTFOLDER.</p> <ul style="list-style-type: none"> <li>● If the content for the application or virtual directory is not on the target system, click the UNC button in this setting to specify a network location. Following is an example:</li> </ul> <p>\\server\share</p>  <p><b>Tip</b> ▪ Each application or virtual directory should have a unique physical path, especially if it is going to be installed on a Windows Vista or later system or a Windows Server 2008 or later system. To learn more, see <a href="#">Run-Time Requirements for IIS Support</a>.</p>
<b>Script Source Access</b>	Specify whether you want to allow end users to access source code if either read or write permissions are set. Source code includes scripts in ASP applications.
<b>Read Access</b>	Specify whether you want to provide end users with read access to the application or virtual directory.
<b>Write Access</b>	Specify whether you want to provide end users with write access to the application or virtual directory. This means that end users can change the application's or virtual directory's properties on the target machine.
<b>Directory Browsing</b>	Specify whether you want to allow end users to see all the virtual directories and subdirectories below this application or virtual directory.
<b>Log Visits</b>	Specify whether you want to record visits to this application or virtual directory in a log file. Visits are recorded only if logging is enabled.

**Table 159** ▪ Virtual Directory Settings for an Application or a Virtual Directory (cont.)

Setting	Description
<b>Index this Resource</b>	Specify whether you want to allow Microsoft Indexing Service to include this application or virtual directory in a full-text index.  This setting applies to IIS 6 and earlier. IIS 7 ignores this setting.

## Application Settings

The following settings are available in the Application Settings area for an application or a virtual directory in the Internet Information Services view.

**Table 160** ▪ Application Settings for an Application or a Virtual Directory

Setting	Description
<b>Application Name</b>	<p>To associate the selected virtual directory with an application, specify the application name.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>  <p><b>Note</b> ▪ This setting is available for virtual directories, but not for applications.</p> <p>If the virtual directory was created in InstallShield 2009 or earlier and then upgraded to the current version of InstallShield, this setting is displayed. Otherwise, this setting is not included.</p>
<b>Application Pool</b>	 <p><b>Note</b> ▪ This setting applies to applications but not virtual directories.</p> <p>To associate the selected application with an application pool, select its name in the list. As an alternative, you can click the ellipsis button (...) to select or create a string entry for the application pool. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p> <p>This setting applies to IIS 6 and later. Earlier versions of IIS ignore this setting.</p>  <p><b>Important</b> ▪ The application pool that you specify should be on the target system at run time or part of your installation; otherwise, the server may generate an error such as error 403.18.</p>

**Table 160** ▪ Application Settings for an Application or a Virtual Directory (cont.)

Setting	Description
<b>Application Mappings</b>	To customize the directory's application mappings, click the ellipsis button (...) in this setting. This opens the <a href="#">Application Mappings dialog box</a> , which enables you to add, edit, and delete a mapping between a file name extension and the application that processes those files.
<b>MIME Types</b>	To add, edit, or delete MIME types for the selected application or virtual directory, click the ellipsis button (...) in this setting. This opens the <a href="#">MIME Types dialog box</a> , which enables you to add, edit, and delete a mapping between a file name extension and the corresponding content type that is served as a static file by the Web server on the target system to a browser or mail client.
<b>Session Timeout (minutes)</b>	Specify the number of minutes that a session can remain idle before the server terminates it automatically. If the end user does not refresh or request a page within the timeout period, the session ends. The default value is 20 minutes.
<b>ASP Script Timeout (seconds)</b>	Specify the length of time in seconds that .asp pages will allow a script to run before terminating and writing an event to the Windows Event Log. The minimum value for this property is 1 second and the default value is 90 seconds.
<b>Execute Permissions</b>	Specify what level of program execution is allowed for the selected application or virtual directory. Available options are: <ul style="list-style-type: none"> <li>● <b>None</b>—Only static files such as HTML and image files can be accessed.</li> <li>● <b>Scripts Only</b>—Only scripts such as ASP scripts can be run.</li> <li>● <b>Scripts and Executables</b>—All file types can be accessed or run.</li> </ul>
<b>Application Protection</b>	 <p><b>Note</b> ▪ This setting applies to applications but not virtual directories.</p> <p>Specify the level of protection:</p> <ul style="list-style-type: none"> <li>● <b>High</b>—The application is run in an isolated process that is separate from other processes.</li> <li>● <b>Medium</b>—The application is run in an isolated pooled process with other applications.</li> <li>● <b>Low</b>—The application is run in the same process as Web services.</li> </ul> <p>This setting applies to IIS 5 and earlier. Later versions ignore this setting.</p>

## Security Settings

When you select an application or a virtual directory in the Internet Information Services view, InstallShield displays several security-related settings in the Security area. The Security area lets you configure your application or virtual directory to verify the identity of users. You can authenticate users to prevent unauthorized ones from establishing a Web (HTTP) connection to restricted content. For more information, refer to the IIS documentation.

The Security area contains the following categories of settings:

- Anonymous Connection
- Authenticated Access

The settings in the Anonymous Connection area are as follows.

**Table 161** ■ Anonymous Connection Settings in the Security Settings Area

Setting	Description
<b>Enable Anonymous Access</b>	<p>Specify whether you want to allow users to establish an anonymous connection. If you do want to allow anonymous connections, also enter the appropriate Windows user account information.</p> <p>If you do not need the Web server to confirm the identity of end users before they can access the content, select No for this setting.</p>
<b>IIS Controls Anonymous Password</b>	<p>Specify whether you want to automatically synchronize your anonymous password settings with those set in Windows on the target system. If the password that you type for the anonymous account differs from the password that Windows has, anonymous authentication will not work.</p> <div data-bbox="587 1167 626 1211" data-label="Image"> </div> <p><b>Note</b> ■ Password synchronization should be used only with anonymous user accounts defined on the local computer, not with anonymous accounts on remote computers.</p>
<b>Anonymous User Name</b>	If you are enabling anonymous connections, type the name of the anonymous account.
<b>Anonymous Password</b>	If you have selected No for the IIS Controls Anonymous Password setting, type the anonymous user account password. The password is used only within Windows. Anonymous users do not log on by using a user name and password.

The settings in the Authenticated Access area are as follows.

**Table 162** ▪ Authenticated Access Settings in the Security Settings Area

Setting	Description
<b>Basic authentication</b>	<p>Specify whether you want to enable the basic authentication method for collecting user name and password information for end users who access the application or virtual directory.</p>  <p><b>Important</b> ▪ With the basic method of authentication, user names and passwords are not encrypted when they are transmitted across the network. An unscrupulous end user who has network monitoring tools could intercept user names and passwords.</p>
<b>Integrated Windows authentication</b>	<p>Specify whether you want to enable integrated Windows authentication. Integrated Windows authentication uses a cryptographic exchange with the end user's browser to confirm the identity of the user.</p> <p>When integrated Windows authentication is enabled, the Web site will use it only under the following conditions:</p> <ul style="list-style-type: none"> <li>• Anonymous access is disabled.</li> <li>• Anonymous access is denied because Windows file system permissions have been set, requiring end users to provide a Windows user name and password before establishing a connection with restricted content.</li> </ul>

## Advanced Settings

The following settings are available in the Advanced area for an application or a virtual directory in the Internet Information Services view.

**Table 163** ▪ Advanced Settings for an Application or a Virtual Directory

Setting	Description
<b>Custom Errors</b>	<p>To customize HTTP errors that are sent to clients when Web server errors occur, select the ellipsis button (...) in this setting. The <b>Custom Errors dialog box</b> opens, enabling you to specify the page that should be displayed for one or more HTTP errors.</p> <p>Administrators can use generic HTTP 1.1 errors, detailed custom error pages that IIS provides, or your own custom error pages that are you including in the installation.</p>

**Table 163** ▪ Advanced Settings for an Application or a Virtual Directory (cont.)

Setting	Description
<b>Other IIS Properties</b>	<p>To specify values for IIS settings that are not displayed in the other areas in this view, select the ellipsis button (...) in this setting. The <a href="#">Other IIS Properties dialog box</a> opens, enabling you to set the value of one or more IIS properties. To learn more, see <a href="#">Configuring Advanced IIS Settings</a>.</p> <p>The advanced settings apply to IIS 6 and earlier. IIS 7 ignores these settings.</p> <p>For help on specific settings, see <a href="#">Metabase Property Reference</a> on the MSDN Web site.</p>

## Application Pool Settings

**Project** ▪ The Internet Information Services view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

**Note** ▪ Application pools are available only on machines with IIS 6.0 or later installed.

Use the Application Pools item in the Internet Information Services view to add and delete application pools.

When you select an application pool in the explorer, many settings are displayed. The application pool settings are organized into several main categories:

- [General](#)
- [CPU Settings](#)
- [Process Model](#)
- [Recycling](#)

## General Settings

The following settings are available in the General area for an application pool in the Internet Information Services view.

**Table 164** ■ General Settings for an Application Pool

Setting	Description
<b>Name</b>	<p>Provide a display name for the application pool that you want to configure.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Component</b>	<p>Select the component with which the application pool is associated. You can also click the ellipsis button (...) to locate an existing component or create a new one.</p>
<b>Overwrite Existing Application Pool</b>	<p>Select the appropriate option to indicate the behavior that you want to occur if the application pool already exists on the target system at run time. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—If the application pool already exists on the target system, the installation overwrites its settings with the values that you have configured for it in your project. During uninstallation, the application pool is uninstalled.</li> <li>● <b>No</b>—If the application pool already exists on the target system, the installation does not overwrite any of its settings; during uninstallation, the application pool is left on the target system. If the application pool does not exist on the target system, the installation creates it; during uninstallation, the application pool is uninstalled.</li> </ul>
<b>Mark Component as Permanent</b>	<p>Specify whether you want the component that contains the application pool to be removed when the component's feature is uninstalled. If you want the component to be marked as permanent so that it is not uninstalled, select Yes.</p>
<b>.NET Framework Version</b>	<p>If appropriate, select the .NET Framework version that the application pool should load.</p> <p>This setting applies to IIS 7 and later. Earlier versions of IIS ignore this setting.</p>
<b>Queue Length</b>	<p>Specify the maximum number of requests that HTTP.sys should queue for the application pool. The default value is 4000.</p>

**Table 164** ▪ General Settings for an Application Pool (cont.)

Setting	Description
<b>Managed Pipeline Mode</b>	<p>Specify the appropriate request-processing pipeline mode for the selected application pool:</p> <ul style="list-style-type: none"> <li>● <b>Integrated</b>—The ASP.NET request processing is integrated into the IIS 7 request-processing pipeline. This is the default option.</li> <li>● <b>Classic</b>—IIS routes requests for code through ISAPI, which processes the requests as if the application were running in IIS 6.</li> </ul> <p>This setting applies to IIS 7. Earlier versions of IIS ignore this setting.</p>
<b>Enable 32-Bit Applications</b>	<p>Specify whether you want to allow 32-bit applications in the selected application pool to be run on 64-bit systems.</p> <p>This setting applies to application pools that are installed on IIS 7 or later. Earlier versions of IIS ignore this setting.</p> <p>For more information, see <a href="#">Considerations for Supporting IIS 6 on 64-Bit Platforms</a>.</p>

## CPU Settings

The following settings are available in the CPU area for an application pool in the Internet Information Services view.

**Table 165** ▪ CPU Settings for an Application Pool

Setting	Description
<b>Limit</b>	<p>Specify the maximum percentage of CPU time (in 1/1000ths of a percent) that the worker processes in the application pool are allowed to consume over the period of time that is indicated for the Limit Interval setting.</p> <p>To avoid limiting the worker processes to a percentage of CPU time, specify the number 0. If you leave this setting blank, InstallShield does not configure the CPU limit, and whatever value is set by default on the server is used for your application pool.</p>
<b>Limit Action</b>	<p>Specify the action that should occur if the CPU limit that is set for the application pool is exceeded. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>No action</b>—An event entry is added to the event log. No other action occurs.</li> <li>● <b>Shutdown</b>—An event entry is added to the event log. In addition, the application pool is shut down for the remainder of the limit interval.</li> </ul>

**Table 165** ▪ CPU Settings for an Application Pool (cont.)

Setting	Description
<b>Limit Interval (minutes)</b>	<p>Specify the amount of time (in minutes) between the reset intervals for CPU monitoring and throttling limits on the application pool.</p> <p>When this time interval has elapsed, IIS resets the CPU timers for the logging and limit intervals.</p> <p>To disable CPU monitoring, specify the number 0. If you leave this setting blank, InstallShield does not configure the CPU limit interval, and whatever value is set by default on the server is used for your application pool.</p>

## Process Model Settings

The following settings are available in the Process Model area for an application pool in the Internet Information Services view.

**Table 166** ▪ Process Model Settings for an Application Pool

Setting	Description
<b>Identity</b>	<p>Specify the account under which the application pool's worker process should run. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>NetworkService</b>—This account is a member of the Users group, and it has the fewest user rights that are required to run the application. This account provides the most security against an attack that might try to take over the Web server.</li> <li>● <b>LocalService</b>—This account is a member of the Users group, and it has the same user rights as the NetworkService account. However, the LocalService account is limited to the local computer.</li> <li>● <b>LocalSystem</b>—This account has all user rights, and it is part of the Administrators group.</li> <li>● <b>SpecificUser</b>—If you do not want to use one of the predefined accounts, select this option, and also specify the user name and password for the account that you want to use.</li> <li>● <b>ApplicationPoolIdentity</b>—This account uses a virtual identity that is unique to the selected application pool for running the application pool's worker process. Support for this option is available on target systems that have IIS 7 and later. If this new option is selected in an installation that is run on a system that has IIS 6, the NetworkService account is used instead for the application pool's identity.</li> </ul>
 <p><b>Note</b> ▪ If you use a <i>SpecificUser</i> identity, ensure that the user account that you specify is a member of the IIS_IUSRS group on the Web server so that the account can access the appropriate resources.</p>	

**Table 166** ■ Process Model Settings for an Application Pool (cont.)

Setting	Description
<b>SpecificUser User Name</b>	If you select SpecificUser for the Identity setting, enter the specific user's user name.
<b>SpecificUser User Password</b>	<p>If you select SpecificUser for the Identity setting, enter the specific user's password.</p>  <p><b>Project</b> ■ In Basic MSI and InstallScript MSI projects, you can specify a Windows Installer property for the password. To prevent the password from being logged, set the value of the MsiHiddenProperties property to the name of the Windows Installer property that you are using for the password. For more information, see <a href="#">MsiHiddenProperties</a> in the Windows Installer Help Library.</p>
<b>Idle Timeout (minutes)</b>	Specify the amount of time (in minutes) for which a worker process should remain idle before it is shut down.
<b>Maximum Worker Processes</b>	<p>Specify the maximum number of worker processes that can service requests for the application pool.</p> <p>If you specify a number greater than 1, the application pool is considered to be a Web garden.</p>
<b>Load User Profile</b>	<p>Select the appropriate option to load the user profile for an application pool entity. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—IIS loads the user profile for the application pool.</li> <li>● <b>No</b>—IIS does not load the user profile for the application pool. This is the same behavior that occurred with IIS 6.0.</li> </ul>

## Recycling Settings

The Recycling settings for an application pool in the Internet Information Services view let you configure the recycling of worker processes. In worker process isolation mode, you can configure IIS to periodically restart worker processes in an application pool, enabling you to manage precisely those worker processes that are faulty. This helps to ensure that specified applications in those pools remain healthy and that system resources can be recovered.

The following settings are available in the Recycling area for an application pool in the Internet Information Services view.

**Table 167** ■ Recycling Settings for an Application Pool

Setting	Description
<b>Regular Time Interval (minutes)</b>	<p>Specify the amount of time (in minutes) after which the application pool should be recycled.</p> <p>To prevent the application pool from being recycled on a regular interval, enter the number 0.</p>
<b>Request Limit</b>	<p>Specify the maximum number of requests that the application pool can process before it is recycled.</p> <p>To allow the application pool to process an unlimited number of requests, enter the number 0.</p>
<b>Specific Times</b>	<p>To specify the time of day when the application pool should be recycled, click the ellipsis button (...) in this setting. The Recycling Specific Times dialog box opens, enabling you to configure the specific local time or times.</p> <p>When you specify a time, use the 24-hour format. For example, to specify 10:00 P.M., enter a time of <b>22:00</b>.</p> <p>In this setting, InstallShield indicates the number of times that were specified, and also lists the times in square brackets. Times are separated with a vertical bar. For example, the following value indicates that the specific recycling times are 5:00 A.M. and 11:00 P.M.:</p> <p><b>2 defined [05:00 23:00]</b></p>

## Web Service Extension Settings

**Project** ■ The Internet Information Services view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

**Note** ■ Web service extensions are available only on machines with IIS 6.0 or later installed.

On systems with IIS 7, Web service extensions require that the IIS Metabase and IIS 6 Configuration Compatibility feature be installed. For more information, see [Version-Specific Information for IIS Support in InstallShield](#).

Use the Web Service Extensions item in the Internet Information Services view to add and delete Web service extensions.

When you select a Web service extension in the explorer, the following settings are available for you to configure.

**Table 168** ▪ General Settings for a Web Service Extension

Setting	Description
<b>Description</b>	Type the name of the new Web service extension file. The name is associated with a string ID, which can be translated. Click the Browse button to locate an existing string, or create a new one once the Select String dialog box has been launched.
<b>Component</b>	Select the component with which the Web service extension is associated. You can also click the ellipsis button (...) to locate an existing component or create a new one.
<b>Mark Component as Permanent</b>	Specify whether you want the component that contains the Web service extension to be removed when the component's feature is uninstalled. If you want the component to be marked as permanent so that it is not uninstalled, select Yes.
<b>Full Path to File</b>	Type the name of the Web service extension file.   <b>Tip</b> ▪ You can use directory IDs to specify a file. For example, you can specify a directory and a file as <b>[INSTALLDIR]file.exe</b> .
<b>Group ID</b>	Type the name of Web service extension's group ID. Group IDs enable you to classify different DLLs and common gateway interfaces (CGIs) and have dependencies for the applications.   <b>Tip</b> ▪ You can use directory IDs to specify a group.
<b>Allow</b>	Specify whether you want to set the status of the Web service extension to Allow.
<b>UI Deletable</b>	Specify whether you want to allow the Web service extension file to be deleted from within IIS Manager.
<b>Overwrite Existing Extensions</b>	Specify whether you want to enable existing extensions to be overwritten.

## Component Services View

**Project** ▪ The Component Services view is available in the following project types:

- Basic MSI

- *DIM*
- *InstallScript MSI*
- *Merge Module*

The Component Services view enables you to manage COM+ applications and components for your installation package. You can manage both COM+ server applications and application proxies. A COM+ application proxy consists of a subset of the attributes of the server application, and it enables remote access from a client machine to the machine where the application resides.

Note the following information regarding component services in InstallShield:

- Only non-system COM+ applications can be added to your project. Therefore, InstallShield displays only non-system COM+ applications under the COM+ Applications explorer in the Component Services view.
- Only the COM+ applications that are installed on the local machine are included in the Component Services view and available for you to add to your projects.
- An application proxy is available for COM+ server applications only, not for library applications.

When you select a COM+ application in the Component Services view, several tabs are displayed:

- Installation
- General
- Security
- Identity
- Activation
- Queuing
- Advanced
- Dump
- Pooling/Recycling

The settings on the Installation tab are InstallShield-specific settings. The settings on the other tabs are similar to those in the Component Services administrative tool in the Control Panel. For details on each of the settings on the Installation tab, see [Installation Tab](#). To learn about the settings on the other tabs, consult the Component Services help.

## Installation Tab

---

**Project** ▪ *The Component Services view is available in the following project types:*

- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*

The Installation tab is one of the tabs that is displayed when you select a COM+ application in the Component Services view.

**Table 169** ■ Installation Tab Settings

Setting	Description
<b>Server</b>	To install the selected COM+ application on other machines, select this check box.
<b>Destination (Server)</b>	<p>The default destination location for COM+ applications is:</p> <p>[ProgramFilesFolder]COMPlus Applications\{UID}</p> <p>To install the COM+ files to a different location, select the target destination. If the destination that you want to specify is not available in the list, select the <b>Browse, create, or modify a directory entry</b> option.</p>
<b>Condition (Server)</b>	Specify a condition for the COM+ server application if appropriate.
<b>Install user identities with roles</b>	To install the selected COM+ application with the user identities and roles that are configured for the COM+ application on your local machine, select this check box.
<b>Refresh the COM+ settings from the client machine at build</b>	<p>The Component Services view shows COM+ settings that are available in Component Services on the local machine.</p> <p>To refresh the COM+ settings that are displayed in your project with the settings that are available from Component Services on the local machine, select this check box. InstallShield refreshes the settings each time that you build a release.</p>
<b>Install after InstallFinalize action</b>	If the selected COM+ application contains .NET assemblies that need to be installed to the global assembly cache (GAC), select this check box. If you select this check box, the ISComponentServiceFinalize action installs the selected COM+ application after the InstallFinalize action. Windows Installer does not commit changes made in the in-script session to the GAC until InstallFinalize.
<b>Proxy</b>	To install the selected COM+ application as an application proxy, select this check box. A COM+ application proxy consists of a subset of the attributes of the server application, and it enables remote access from a client machine to the machine where the application resides.
<b>Destination (Proxy)</b>	<p>The default destination location for COM+ applications is:</p> <p>[ProgramFilesFolder]COMPlus Applications\{UID}</p> <p>To install the COM+ files to a different location, select the target destination. If the destination that you want to specify is not available in the list, select the <b>Browse, create, or modify a directory entry</b> option.</p>
<b>Condition (Proxy)</b>	Specify a condition for the proxy server support if appropriate.

**Table 169** ■ Installation Tab Settings (cont.)

Setting	Description
<b>Remote Server Name</b>	<p>Specify the name of the remote server computer where the application resides. You can type the exact name or use the default [REMOTESERVERNAME] property, which is automatically created when you select the Proxy check box for a COM+ application in your installation.</p>  <p><b>Note</b> ■ The default value for the [REMOTESERVERNAME] property is the name of the machine used to add the COM+ application to the installation project in InstallShield. To change the value of the [REMOTESERVERNAME] property, use the Property Manager view.</p> <p>If you would like the end user to be able to specify the remote server, add a Remote Server edit field control to an end-user dialog in the Dialogs view. Set the Property value of this control to REMOTESERVERNAME.</p>
<b>Enable distributed COM on the client machine</b>	<p>Select this check box if appropriate. Clear this check box if you know that distributed component object model (DCOM) is already enabled on all client machines and you will not have administrative privileges on them.</p> <p>If you select this check box, Y is written at installation time to the EnableDCOM entry of the HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Ole registry key to enable DCOM.</p>  <p><b>Note</b> ■ End users can enable or disable DCOM on their machines using the Component Services administrative tool in the Control Panel. However, the application proxy will not work on a client machine if DCOM is disabled on that machine. For this reason, you may want to select the <b>Enable distributed COM on the client machine</b> check box.</p> <p>If an end user uninstalls the application proxy support, the EnableDCOM registry entry is not changed, even if the installation process involved changing this registry entry to Y on the target machine.</p>
<b>Features</b>	<p>Select the feature that should contain the selected COM+ application. To add the COM+ application to a new feature, first create a feature in the Features view, and then select its check box in this list.</p>

## SQL Scripts View

**Project** ■ The SQL Scripts view is available in the following project types:

- Basic MSI
- DIM

- *InstallScript*
- *InstallScript MSI*

The SQL Scripts view provides a central location for managing and organizing all SQL scripts by server connections and settings. This view provides support for Microsoft SQL Server, Microsoft Windows Azure, MySQL, and Oracle. You can perform most of the following major functions to configure your SQL servers from the SQL Scripts view. Some limitations apply to certain server types.

- Connect to SQL servers.
- Import catalog schema and/or data.
- Associate SQL scripts with features.
- Set required SQL server/script properties (server name, database name, authentication method, etc.).
- Set SQL script for execution during installation or uninstallation.
- Edit SQL scripts.
- Require and/or target specific versions of Windows Azure SQL, SQL Server, MySQL, or Oracle.
- Define SQL script text replacement.
- Open scripts in Microsoft SQL Server Management Studio or Microsoft SQL Server Query Analyzer.

**Note** ■ The import database functionality applies to the Microsoft SQL Server Database. Oracle users should refer to the Oracle Web page on [Oracle Database Utilities](#) for information on utilities that may work in conjunction with InstallShield.

If you have Microsoft SQL Server Management Studio or Microsoft SQL Server 2000 SQL Query Analyzer installed on your system, you can open a new SQL script that you have added to your project to test, edit, and syntax-check the script. To launch one of those tools and open your script from within InstallShield, right-click the script file in the SQL Scripts view and then click *Open Script* in Microsoft SQL Server Management Studio. InstallShield searches your system for the following tools in order and launches the first one that it finds:

1. Microsoft SQL Server 2008 Management Studio (any edition, including Express; `ssms.exe`)
2. Microsoft SQL Server 2005 Management Studio (`Sq1wb.exe`)
3. Microsoft SQL Server 2005 Management Studio Express (`ssmsee.exe`)
4. Microsoft SQL Server 2000 Query Analyzer (`isqlw.exe`)

## SQL Connections

In the SQL Scripts view, scripts are organized by connection, since no script can run on a server until a connection has been established. Furthermore, the grouping of connections with corresponding scripts facilitates the sharing of connection settings to different scripts.

When you create or select a SQL connection in the SQL Scripts view, the following tabs are available:

- **General Tab**
- **Requirements Tab**
- **Advanced Tab**

# General Tab

**Project** ▪ The SQL Scripts view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

You can configure the following settings on the General tab for a SQL connection in the SQL Scripts view.

**Table 170** ▪ General Tab Settings for a SQL Connection

Setting	Description
Catalog Name	<div></div> <p><b>Note</b> ▪ Creating a new application catalog based on Oracle database settings is equivalent to creating a new database based on SQL Server settings in InstallShield. However, terminology is slightly different in reference to Oracle. In Oracle, the catalog is equivalent to the schema being used for every new application catalog. Therefore, note the semantic differences between “catalog” and “database” when understanding the differences between SQL Server and Oracle support in the documentation.</p> <p>Enter the name of the SQL catalog to which you want to create a connection during the installation.</p> <p>If you leave this setting blank, the installation attempts to connect to the default catalog during the connection test phase at run time. If the catalog you specify is not found at that time, the installation still creates the specified catalog upon connection verification. This is because the Create Catalog If Absent option is selected in InstallShield by default.</p>

**Table 170** ▪ General Tab Settings for a SQL Connection (cont.)

Setting	Description
<b>Create Catalog If Absent</b>	<p>This option is selected by default. If this option is selected, the installation creates the specified catalog upon connection verification at the SQLLogin dialog at run time.</p> <p>You should note that when the <b>Create Catalog If Absent</b> option is selected, different SQL commands are issued for the various supported server types.</p> <p>For Microsoft SQL Server, Microsoft Windows Azure SQL, and MySQL, selecting this option results in the following:</p> <pre>CREATE DATABASE <i>CataLogName</i></pre> <p><i>CataLogName</i> is the value that you specify in the Catalog Name box on the General tab for a connection in the SQL Scripts view.</p> <p>For Oracle, selecting the <b>Create Catalog If Absent</b> option results in the following:</p> <pre>CREATE USER CatalogName IDENTIFIED BY CatalogName DEFAULT TABLESPACE USERS QUOTA UNLIMITED on USERSGRANT CONNECT TO CatalogNameGRANT DBA TO CatalogNameALTER USER CatalogName DEFAULT ROLE ALL</pre> <p>Therefore, you should note that for Oracle, the schema name serves as the user name and password for the selected catalog by default.</p>

**Table 170** ▪ General Tab Settings for a SQL Connection (cont.)

Setting	Description
<b>Create Catalog If Absent (cont.)</b>	<p>If you do not wish to use the <b>Create Catalog If Absent</b> option to create a catalog, you can run a customized script to create a catalog. When you run a custom script, you can use the Runtime tab for the script in the SQL Scripts view to schedule the execution of the script during login.</p> <p>For more information about running a customized script, see the following instructions:</p> <ul style="list-style-type: none"> <li>● <a href="#">Creating a Sample Installation that Creates a SQL Server Database by Running Customized SQL Script</a></li> <li>● <a href="#">Creating a Sample Installation that Creates an Oracle Schema by Running Customized SQL Script</a></li> </ul> <p></p> <p><b>Project</b> ▪ In the case where the <b>Create Catalog If Absent</b> option is cleared during installation design and the catalog is not found at run time, the installation behavior slightly differs for the following project types at run time.</p> <ul style="list-style-type: none"> <li>● For Basic MSI, DIM, and InstallScript MSI projects—The installation connects to the default catalog at the SQLLogin dialog during run time to test the connection. This enables the installation to run custom code during the InstallExecuteSequence. However, the presence of the catalog needs to be guaranteed when the SQL scripts that are specified in your project are executed. The run time re-establishes the connection with the specified catalog to run the scripts. If the catalog is absent at this point, the connection fails.</li> <li>● For InstallScript projects—The catalog needs to be present at the SQLLogin dialog since the run time holds the connection until the installation ends, once the connection is established. In this scenario, you can run custom InstallScript code to create the catalog before the SQLLogin dialog shows up to override the default behavior.</li> </ul>

**Table 170** ▪ General Tab Settings for a SQL Connection (cont.)

Setting	Description
<b>Default Target Server Name</b>	<p>For Microsoft SQL Server and MySQL, you can enter the machine name of the target SQL Server here. This setting is optional.</p> <p>For Microsoft Windows Azure SQL, enter a fully qualified server name in the following format:</p> <pre>tcp:ServerName.database.windows.net</pre> <p>Following is an example:</p> <pre>tcp:wbzdh64drd.database.windows.net</pre> <p>For Oracle client machines with Oracle 11g client software installed, enter a SQL connection URL string in the following format:</p> <pre>//host: [port] [/service name]</pre> <p>The following is an example of what you would type to connect to a specified remote Oracle machine:</p> <pre>//sch01jsmithrxp.installshield.com:1521/ORCL</pre> <p>You can also specify a local net service name if you have tnsnames.ora configured on the client machine. For more details, consult the <a href="#">Oracle Support Web site</a>.</p>
<b>Connect using</b>	Select the type of authentication you want to use to connect to the specified catalog. For SQL Server Authentication, enter login and password information for the targeted server.
<b>Comments</b>	Enter comments about this connection. These comments are not displayed to the end user.

## Requirements Tab

**Project** ▪ The SQL Scripts view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

On the Requirements tab, you can select a database server and specify version requirements for the type of server that the installation should target at run time. You have the option to add, delete, or edit existing version requirements that are associated with a particular database server.

**Task*****To select a database server and specify version requirements for the type of server that the installation will target at run time:***

1. In the **Database Servers** list, select the check box for the appropriate database server, and then highlight that server type.

If you select more than one database server, at run time, the installation establishes a connection and performs the specified requirement checks on the selected server types based on the sequence of the server types as they appear in the table. That is, if the installation finds a match after checking requirements against the first database server in the table, a connection and a check is not done on any selected subsequent database types in the table. The SQL scripts that are associated with the connection are installed to that first database server that is verified.

2. Click the **Add** button. The New Version Requirement dialog box for the type of database server that you highlighted opens.
3. Specify version requirements for the type of server that the installation should target at run time.
4. Click **OK**.

InstallShield adds a new database server entry and its appropriate version information to the table next to the Database Servers list.

**Task*****To delete or edit an entry in the Database Servers table:***

1. Select the database server that the installation is targeting at run time.
2. Select the version requirement that you want to delete or edit.
3. Click **Delete** or **Edit**. When you click **Edit**, either the Edit Version Requirement dialog box for the appropriate database server type opens.
4. Update the settings and click **OK**.

**Note** - Multiselection of items in the version requirements section of the table applies only to the Delete operation.

## Allow installation to continue when minimum requirements are not met

If you want to allow the installation to continue if the minimum database server requirements are not met, select this check box.

If you select this check box and the minimum requirements are not met, the installation skips the SQL connection and all of its SQL scripts, and continues with the rest of the installation.

If you clear this check box and the minimum requirements are not met, the installation does not allow the end user to continue with the rest of the installation.

This check box is cleared by default.

## Allow installation to Microsoft SQL Server Desktop Engine/SQL Server Express

Select this check box if it is true. Clear this check box if you want to prohibit installation to SQL Server Desktop Engine and SQL Server Express.

## Choose SQL Driver for Database Server

In InstallShield 2019 R3 and later, you can now choose a different provider from a list of drivers for your database server. The Connection string properties (present in the ISSQLDBMetaData table) are automatically updated based on the provider selection.

By default, the Microsoft OLE DB Driver for SQL Server (MSOLEDBSQL) will appear for your new SQL connection. The following prerequisites are automatically added to your project configuration when MSOLEDBSQL is selected:

- Microsoft OLE DB Driver for SQL Server 18.2.2.0 (x86).prq
- Microsoft OLE DB Driver for SQL Server 18.2.2.0 (x64).prq

Select the **Redistributables** view to download or configure required prerequisites.

## Advanced Tab

**Project** ▪ The SQL Scripts view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

The Advanced tab provides advanced settings that should be set only by expert users to expand and customize the default functionality that is available in InstallShield.

**Table 171** ▪ Advanced Tab Settings for a SQL Connection

Setting	Project Type	Description
<b>Command Timeout (seconds)</b>	Basic MSI, DIM, InstallScript, InstallScript MSI	Specify the command timeout period. The default is 30 seconds. The valid range of this value is 0 to 2147483647. A value of 0 indicates no limit. Once this period of time has elapsed without completing the command, an error occurs and ADO cancels the command.

**Table 171** ■ Advanced Tab Settings for a SQL Connection (cont.)

Setting	Project Type	Description
<b>Batch Separator</b>	Basic MSI, DIM, InstallScript, InstallScript MSI	<p>Specify the appropriate batch separator for the selected connection. The batch separator is used for all SQL scripts that are associated with this connection.</p> <p>The default value is <b>GO</b>, which is the same default that is used in Microsoft products. Oracle utilities use a slash (/) as the default value.</p> <p>A batch separator is a command that is recognized by SQL utilities such as osql, isql, and Microsoft SQL Server Management Studio, as well as InstallShield. The run time interprets a batch separator as a signal that it should send the current batch of SQL statements to a database server.</p> <p></p> <p><b>Note</b> ■ A semicolon (;) is the only batch separator that does not need to be on a separate new line by itself. All other batch separators must be on a separate line. For example, if you specify a slash as a batch separator and you have the following SQL script, the installation sends <b>some statement</b> to a SQL server as a batch first; then it sends <b>another statement</b> as another batch:</p> <pre>some statement / another statement /</pre> <p>If you have the following script, the installation sends all of the lines, including the slashes at the end of lines, as a batch:</p> <pre>some statement/ another statement/</pre>

**Table 171** ■ Advanced Tab Settings for a SQL Connection (cont.)

Setting	Project Type	Description
<b>Target Server Property Name</b>	Basic MSI, DIM, InstallScript MSI	<p>Select the property that identifies one of the following, depending on the type of database server that the installation is targeting:</p> <ul style="list-style-type: none"> <li>• The name of the target server instance (for Microsoft SQL Server and MySQL)</li> <li>• The fully qualified server name (for Microsoft Windows Azure SQL)</li> <li>• The connect URL string or local net service name (for Oracle)</li> </ul> <p>The default property is <code>IS_SQLSERVER_SERVER</code>.</p> <p>If your project contains more than one SQL connection and you want to be able to use different properties for each connection, you can do so. For more information, see <a href="#">Specifying Whether New SQL Connections Should Share the Same Windows Installer Properties</a>.</p>
<b>Target Catalog Property Name</b>	Basic MSI, DIM, InstallScript MSI	<p>This setting enables you to select a property that identifies the name of the SQL catalog to which you want to create a connection during the installation. The default property is <code>IS_SQLSERVER_DATABASE</code>.</p> <p>If your project contains more than one SQL connection and you want to be able to use different properties for each connection, you can do so. For more information, see <a href="#">Specifying Whether New SQL Connections Should Share the Same Windows Installer Properties</a>.</p>
<b>Authentication Type Property Name</b>	Basic MSI, DIM, InstallScript MSI	<p>This setting enables you to select a property that identifies the type of authentication that you want to use to connect to the specified catalog. The default property is <code>IS_SQLSERVER_AUTHENTICATION</code>. The following numbers are valid property values:</p> <ul style="list-style-type: none"> <li>• <b>0</b>—Windows authentication credential of the current user</li> <li>• <b>1</b>—Server authentication</li> </ul> <p>If your project contains more than one SQL connection and you want to be able to use different properties for each connection, you can do so. For more information, see <a href="#">Specifying Whether New SQL Connections Should Share the Same Windows Installer Properties</a>.</p>

**Table 171** ▪ Advanced Tab Settings for a SQL Connection (cont.)

Setting	Project Type	Description
<b>Server Authentication Login ID Property Name</b>	Basic MSI, DIM, InstallScript MSI	<p>This setting enables you to select a property that identifies the login ID that should be used for server authentication. The default property is <code>IS_SQLSERVER_USERNAME</code>.</p> <p>If your project contains more than one SQL connection and you want to be able to use different properties for each connection, you can do so. For more information, see <a href="#">Specifying Whether New SQL Connections Should Share the Same Windows Installer Properties</a>.</p>
<b>Server Authentication Password Property Name</b>	Basic MSI, DIM, InstallScript MSI	<p>This setting enables you to select a property that identifies the password that should be used for server authentication. The default property is <code>IS_SQLSERVER_PASSWORD</code>.</p> <p>If your project contains more than one SQL connection and you want to be able to use different properties for each connection, you can do so. For more information, see <a href="#">Specifying Whether New SQL Connections Should Share the Same Windows Installer Properties</a>.</p>

**Project** ▪ If you change any of the SQL properties on the Advanced tab of a SQL connection in a Basic MSI project, the corresponding properties are not automatically updated in the SQLLogin dialog in the Dialogs view. Therefore, you must manually change the properties in the dialog to match the properties that selected on the Advanced tab of the SQL connection.

## SQL Script Level

**Project** ▪ The SQL Scripts view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

When you click a SQL script in the SQL Scripts view, the following tabs are available:

- General tab
- Script tab
- Runtime tab
- Database Import tab
- Text Replacement tab

**Note** ▪ If you have Microsoft SQL Server Management Studio or Microsoft SQL Server 2000 SQL Query Analyzer installed on your system, you can open a new SQL script that you have added to your project to test, edit, and syntax-check the script. To launch one of those tools and open your script from within InstallShield, right-click the script file in the SQL Scripts view and then click *Open Script* in Microsoft SQL Server Management Studio. InstallShield searches your system for the following tools in order and launches the first one that it finds:

1. Microsoft SQL Server 2008 Management Studio (any edition, including Express; `ssms.exe`)
2. Microsoft SQL Server 2005 Management Studio (`Sqlwb.exe`)
3. Microsoft SQL Server 2005 Management Studio Express (`ssmsee.exe`)
4. Microsoft SQL Server 2000 Query Analyzer (`isqlw.exe`)

## General Tab

**Project** ▪ The SQL Scripts view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

You can configure the following settings on the General tab for a SQL script in the SQL Scripts view.

**Table 172** ▪ General Tab Settings for a SQL Script

Setting	Description
<b>SQL Script File Name</b>	Click the ellipsis button (...) next to this setting to browse to the SQL script that your installation will execute at run time.
<b>Select Features the SQL Script Belongs to</b>	<p>Select or clear the check boxes for one or more features that you want to contain the SQL script.</p> <div data-bbox="625 1381 672 1425" data-label="Image"> </div> <p><b>Project</b> ▪ For DIM projects—The <i>Merged Feature</i> check box in this pane is selected and disabled when you select a SQL script in this view. When you add a DIM to an installation project, you specify the feature that should contain that DIM.</p>
<b>Component Name</b>	This setting shows the name of the component that contains the SQL script. To move to the Components view and see the component that contains this SQL script, click the hyperlink.

**Table 172** ▪ General Tab Settings for a SQL Script (cont.)

Setting	Description
<b>Schema Version</b>	Specify a version number to enable script versioning. For more information on this setting, see <a href="#">Specifying a Version Number for a SQL Script File</a> .
	 <p><b>Tip</b> ▪ When you specify a number for the Schema Version setting and InstallShield adds the custom InstallShield table for storing the schema version number on the target database, the data is not automatically removed upon uninstallation. Therefore, if you want the installation to be able to roll back the changes, you need to create a custom script upon uninstallation to drop the InstallShield table.</p>
<b>Comments</b>	Enter comments about this SQL script. These comments are not displayed to the end user.

## Script Tab

**Project** ▪ The SQL Scripts view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

The Script tab is intended for advanced users. To create a script from an existing database with step-by-step instructions, use the Database Import Wizard.

**Note** ▪ This functionality applies to the Microsoft SQL Server Database.

## Runtime Tab

**Project** ▪ The SQL Scripts view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

You can configure the following settings on the Runtime tab for a SQL script in the SQL Scripts view.

**Table 173** ▪ Runtime Tab Settings for a SQL Script

Setting	Project Type	Description
<b>Script Execution</b>	Basic MSI, DIM, InstallScript, InstallScript MSI	<p>To indicate when you want the installation to execute a SQL script, select the appropriate check box. Available options are:</p> <ul style="list-style-type: none"> <li> <b>Run Script During Install</b>—This option enables you to run a custom script during installation. This option is also associated with component state because each script is associated in with a feature. Therefore, in Basic MSI, DIM, and InstallScript MSI projects, you can specify conditional statements in conjunction with this setting in the Script Condition area of this tab. <p>In Basic MSI, DIM, and InstallScript MSI projects, the <b>ISSQLServerInstall</b> action is associated with this option.</p> <p>In InstallScript projects, the InstallScript function <b>SQLRTComponentInstall</b> is associated with this option.</p> </li> <li> <b>Run Script During Uninstall</b>—This option enables you to run a custom script during uninstallation. This option is also associated with component state because each script is tied in with a feature by design. Therefore, you can specify conditional statements in conjunction with this setting in the Script Condition (only available for Basic MSI and InstallScript MSI projects) section of this tab. <p>In Basic MSI, DIM, and InstallScript MSI projects, the <b>ISSQLServerUninstall</b> action is associated with this option.</p> <p>In InstallScript projects, the InstallScript function <b>SQLRTComponentUninstall</b> is associated with this option.</p> </li> </ul>

**Table 173** ▪ Runtime Tab Settings for a SQL Script (cont.)

Setting	Project Type	Description
<b>Script Execution (cont.)</b>		<ul style="list-style-type: none"> <li>● <b>Run Script During Rollback</b>—This option enables you to run a custom script during rollback. InstallShield does not roll back the changes automatically. You will have to run a custom script allowing rollback when you select the Run Script During Rollback option.  In Basic MSI, DIM, and InstallScript MSI projects, the ISSQLServerRollback action is associated with this option.</li> <li>● <b>Run Script During Login</b>—This option enables you to run your script during login. Note that there are some limitations with this option. For example, note that the script changes are irreversible once the end user clicks the Next button on the SQLLogin dialog at run time. If the end user attempts to cancel the installation before clicking the Install button on the ReadyToInstall dialog, the script changes are not rolled back.  Also note that the script is executed after credentials and requirements are verified and before a connection has been made to the catalog. Therefore, any schema version requirements that you set for the script during installation design will not have taken place at run time.  In Basic MSI, and DIM projects, the ISSQLServerValidate action is associated with this option.  In InstallScript MSI projects, the InstallScript function <b>SQLRTServerValidate</b> is associated with this option.  In InstallScript projects, the InstallScript function <b>SQLRTConnect</b> is associated with this option.</li> </ul>
<b>Script Error Handling</b>	Basic MSI, DIM, InstallScript, InstallScript MSI	<p>Specify how you want SQL script errors to be handled at run time. Available options are:</p> <ul style="list-style-type: none"> <li>● On Error, Go to Next Script</li> <li>● On Error, Go to Next Statement</li> <li>● On Error, Abort Installation</li> </ul>
<b>Script Condition</b>	Basic MSI, DIM, InstallScript MSI	<p>If you want to specify a condition that Windows Installer must evaluate before the SQL script is run during installation or uninstallation, select the check box and type the conditional statement in the text box. The SQL script is not run if the condition evaluates to false.</p> <p>As an alternative to manually entering a statement, you can click the ellipsis button (...) to launch the Condition Builder dialog box, which simplifies the process of creating a condition.</p>

## Database Import Tab

**Project** ▪ The SQL Scripts view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

**Tip** ▪ The Database Import functionality currently is only available for Microsoft SQL Server. Oracle users should refer to the Oracle Web page on [Oracle Database Utilities](#) for information on utilities that may work in conjunction with InstallShield.

You can run the Database Import Wizard from this tab to view and modify your import settings. The wizard will walk you through the process of generating a SQL script that re-creates part or all of an existing Microsoft SQL Database. Once you complete the wizard, you can click the Regenerate button on this tab to refresh your script.

The **Regenerate SQL Script at Build** option lets you indicate whether the script should be regenerated each time that you build a release. Regenerating a script every time you build your release can slow down the build process.

## Text Replacement Tab

**Project** ▪ The SQL Scripts view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

The Text Replacement tab lets you specify strings to replace in your SQL script at run time. You should replace text only if it is unique and will not cause any script syntax errors. At run time, the installation replaces the text according to the parameters that you specify.

To add a new search-and-replace entry, click the Add button. To modify an existing search-and-replace entry, select that entry and then click the Edit button. In both cases, the [Find and Replace dialog box](#) opens, enabling you to specify search-and-replace parameters.

To delete an existing search-and-replace entry, select that entry and then click the Delete button.

## Behavior and Logic View

**Project** ▪ The Behavior and Logic view is available in the following project types:

- Advanced UI
- Basic MSI

- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Suite/Advanced UI*
- *Transform*

By adding custom actions; sequencing actions and dialogs; adding support files; using InstallScript; searching the target system for required files, folders, or other elements; or configuring Windows Installer properties, you can design any custom functionality that your installation requires.

## InstallScript

---

**Project** ▪ *The InstallScript view is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *Suite/Advanced UI*

InstallScript is an installation authoring language that is similar to the C programming language. The InstallScript view provides you with a script editor pane in which you can create and edit your scripts.

## Custom Actions and Sequences

---

**Project** ▪ *The Custom Actions and Sequences view is available in the following project types:*

- *Basic MSI*
- *InstallScript MSI*
- *MSI Database*
- *Transform*

Sequences direct all the actions that are performed during installation, from file transfer to displaying the user interface. Use the Custom Actions and Sequences view to sequence the actions and dialogs in your project.

If Windows Installer does not directly support functionality that is required by your installation program, you can extend your installation program through the use of custom actions in the Custom Actions and Sequences view.

## Custom Actions

---

**Project** ▪ *The Custom Actions view is available in the following project types:*

- DIM
- Merge Module
- MSM Database

Although merge modules do support the use of custom actions, sequences are not defined through a dedicated view in merge module projects.

**Tip** ▪ You can control the launch of custom actions in a merge module by modifying the `ModuleInstallExecuteSequence` table in the *Direct Editor*. When you add the merge module to your installation project, all custom actions and dialogs included in the merge module are available for you to insert in the installation's sequences via the *Custom Actions and Sequences* view.

## Support Files/Billboards

**Project** ▪ The *Support Files* view is available in the following project types:

- Advanced UI
- Basic MSI
- InstallScript Object
- Suite/Advanced UI

The *Support Files/Billboards* view is available in the following project types:

- InstallScript
- InstallScript MSI

### Support Files

The *Support Files* view lets you add, sort, and delete support files—files that are required by your installation project *only* during the installation process.

### Billboards

The *Billboards* area in the *Support Files/Billboards* view lets you add billboards to your project. Billboards are images that are displayed for a specified amount of time while your installation runs. You can use billboards to provide information about the product being installed or to entertain the end user during the installation process.

## System Search

**Project** ▪ The *System Search* view is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database

- *Transform*

Use the System Search view to search for a particular file, folder, registry key, or .ini value on the target system prior to an installation.

## Property Manager

---

**Project** ▪ *The Property Manager view is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *DIM*
- *InstallScript MSI*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Suite/Advanced UI*
- *Transform*

In Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, and Transform projects, the Property Manager view enables you to edit the Property table from within the InstallShield interface. Windows Installer properties give you access to many machine-specific variables such as the user's name or company.

In Advanced UI and Suite/Advanced UI projects, the Property Manager view lets you set Advanced UI or Suite/Advanced UI properties that you want to be available to the Advanced UI or Suite/Advanced UI installation at run time.

## InstallScript View

---

**Project** ▪ *The InstallScript view is available in the following project types:*

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *Suite/Advanced UI*

The InstallScript view enables you to customize your setup script using the InstallScript language.

## Files, Functions, Properties, and Methods Folders

The InstallScript explorer in the center pane of the InstallScript view contains the following folders:

**Table 174** ■ Folders in the InstallScript View

Folder	Project Type	Description
<b>Files</b>	Basic MSI, Merge Module, InstallScript MSI, InstallScript, InstallScript Object, Suite/Advanced UI	<p>The Files folder lists all of your script (.ru1) files. Click a script file to display its contents in the script editor.</p> <p>Your setup script must be named Setup.ru1. You can include files with different names, but they must be included in Setup.ru1 with the #include preprocessor statement.</p>
<b>Functions</b>	Basic MSI, Merge Module, InstallScript MSI, InstallScript, InstallScript Object, Suite/Advanced UI	<p>The Functions folder contains a list of the InstallScript functions in all of the script files of your project. Click a function to display that function in the script editor.</p>  <p><b>Note</b> ■ If auto completion for local variables is disabled in the script editor, the Functions folder does not list any functions from your script files. To learn how to enable auto completion for local variables, see <a href="#">Enabling or Disabling Auto Completion in the Script Editors</a>.</p>
<b>Properties</b>	InstallScript, InstallScript Object	<p>The Properties folder contains a list of the InstallScript properties in all of the script files of your project. Click a property to display that property's declaration in the script editor. (The property's procedures are listed in the Functions folder.)</p>  <p><b>Note</b> ■ If auto completion for local variables is disabled in the script editor, the Properties folder does not list any properties from your script files. To learn how to enable auto completion for local variables, see <a href="#">Enabling or Disabling Auto Completion in the Script Editors</a>.</p>
<b>Methods</b>	InstallScript Object	<p>The Methods folder contains a list of the InstallScript methods in all of the script files of your project. Click a method to display that method in the script editor.</p>  <p><b>Note</b> ■ If auto completion for local variables is disabled in the script editor, the Methods folder does not list any methods from your script files. To learn how to enable auto completion for local variables, see <a href="#">Enabling or Disabling Auto Completion in the Script Editors</a>.</p>

## Script Editor

Clicking an item under any of the folders in the InstallScript view displays the script editor in the right pane in the InstallShield interface. To learn more, see [Script Editor in the InstallScript View](#).

### Script Editor in the InstallScript View

**Project** ▪ The script editor is available in the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- Suite/Advanced UI

The script editor displays the text of the selected InstallScript file. You can modify or edit the script using commands from the Edit and Tools menus.

### The Script Toolbar in the Script Editor

**Project** ▪ The script toolbar is available in the following project types:

- InstallScript
- InstallScript MSI
- InstallScript Object

*Basic MSI and Merge Module projects use custom actions instead of event handlers to run InstallScript code; Suite/Advanced UI projects use actions instead of event handlers to run InstallScript code.*

The script toolbar is displayed across the top of the script editor in the InstallScript view; it contains an event category list box, as well as an event list box. The script toolbar lets you paste installation event handler function blocks in your script files. Event handlers in your script files override the default actions that are associated with installation events. You can modify the event handler code to change the actions performed during the installation.

#### Event Categories (list box, on the left)

Select the category containing the installation event whose event handler function block you want to paste in a script file. Events in the selected category are displayed in the Events list box.

#### Events (list box, on the right)

Select the installation event whose event handler function block you want to paste in a script file. If you select a feature event, its event handler is pasted in `FeatureEvents.ru1`. If this file does not exist in your project, selecting a feature event automatically creates the file. If you select some other type of installation event, its event handler is pasted in `Setup.ru1`.

If you change the default feature event handler code in `FeatureEvents.ru1`, you must put the following statement in `Setup.ru1` to include your changes in the installation:

```
#include "FeatureEvents.ru1"
```

## Custom Actions and Sequences View (or Custom Actions View)

**Project** ▪ The Custom Actions and Sequences view is available in the following project types:

- Basic MSI
- InstallScript MSI
- MSI Database
- Transform

This view is called the Custom Actions view in the following project types:

- DIM
- Merge Module
- MSM Database

The Custom Actions and Sequences view has three separate areas: a Custom Actions area, an Action Text area, and a Sequences area. The Custom Actions view has the Custom Actions area.

### Custom Actions

Microsoft enables you to add flexibility to your installation that is not directly supported by Windows Installer. This additional functionality is achieved through the use of custom actions.

InstallShield supports the use of custom actions to run InstallScript, VBScript, or JavaScript code; call DLL functions; run executable files; call a managed method in a managed assembly; set a property or a directory; trigger an error and end the installation; run PowerShell scripts; terminate a process; or run other installation packages.

The Custom Actions explorer in the Custom Actions and Sequences view behaves the same way as the Custom Actions explorer in the Custom Actions view. For descriptions of each type of custom action, see [Custom Action Types](#). For a description of each custom action setting, see [Custom Action Settings](#).

### Action Text

To keep end users informed, installations commonly display text on the progress dialog to describe the installation's current activity. This usually accompanies the progress bar as a means of installation status. As each standard action and custom action is encountered, a message about the action is displayed on the progress dialog. This may be especially useful for actions that take a long time to execute. The same action text is also written to a log file if one is created at run time.

The Action Text explorer in the Custom Actions and Sequences view (for Basic MSI, InstallScript MSI, MSI Database, and Transform projects) lets you specify the action text for any action in your project. For a description of each action text setting, see [Action Text Settings](#).

**Important** • The names of the action text items under the Action Text explorer should match the names of standard and custom actions that are in your project. If you change the name of a custom action, you must also change the name of its action text item; otherwise, the action's text is not displayed at run time or written to the installation's log file.

## Sequences

Sequences direct all of the actions that are performed during the installation process—from file transfer to user interface display (for Basic MSI, MSI Database, and Transform projects). These actions are given a number in the sequence, which then executes from the lowest number to the highest. Rather than having to manually provide a numeric value for every action, you can use the Custom Actions and Sequences view to insert actions into a sequence, or edit the sequence timeline.

**Project** • In InstallScript MSI projects, the installation's user interface is generated through the script; the dialogs are not inserted into sequences in the Custom Actions and Sequences view.

If you are creating a custom action or custom dialog in a DIM project or a Merge Module project, you need to first import that DIM or module into an installation project and then add it to a sequence through the Custom Actions and Sequences view of that installation project.

There are three main sequences into which you can insert your dialogs (in Basic MSI, MSI Database, and Transform projects) and custom actions.

- [Installation Sequence](#)
- [Advertisement Sequence](#)
- [Administration Sequence](#)

Each of these sequences plays a different role. The Installation sequence is run during a normal installation. The Advertisement sequence runs when an application is being advertised rather than installed. The Administration sequence is run during an administrative installation.

## Modifying Sequences, Actions, and Dialogs

The Custom Actions and Sequences view supports drag-and-drop editing and copying. The context menus in this view provide additional editing methods.

- To sequence a new custom action, drag it from the Custom Actions explorer to the appropriate location in a sequence under the Sequences explorer. When you drop it, drop it onto the item that should be directly before it in the sequence.
- To move a dialog, standard action, or custom action to a different point in a sequence (or from one sequence to another), drag it from the old location and drop it onto the item that should be directly before it in the sequence.
- To copy a custom action from one sequence to another, press and hold CTRL while dragging the custom action from one sequence to another sequence, and drop it onto the action or dialog that should be directly before it.
- When you select a dialog or standard action in the Sequences explorer, the Sequence tab on the right enables you to change the sequence number and add or modify the associated conditions.

- When you select a custom action in the Sequences explorer, more than one tab is displayed on the right:
  - Sequence tab—Use this tab to change the sequence number and to add or modify any conditions for the action.
  - Action tab—Use this tab to change any settings for the custom action.
  - Script tab—This tab is displayed for VBScript and JScript custom actions. It has a script editor that lets you edit your VBScript or JScript code.
- To edit the layout or behavior of a dialog, right-click the dialog in the Sequences explorer and then click Edit Behavior or Edit Layout.

**Note** ■ A custom action cannot be called twice in the same sequence, since the custom action name is the key in the CustomAction table. Therefore, you cannot move or copy a custom action to a sequence that already contains that custom action.

Dialogs and standard actions cannot be moved to a different type of sequence through a drag-and-drop operation.

## Script Editor in the Custom Actions View for Basic MSI Projects

A PowerShell script editor is available on the **Script** tab of the **Custom Actions and Sequences > Custom Actions** view for Basic MSI projects.

## Custom Action Types

**Project** ■ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

Note that some custom action types are not available in some project types. Project-specific differences are noted where appropriate.

InstallShield includes support for several kinds of custom actions:

**Table 175** ■ Custom Actions Supported in InstallShield

Icon	Action Type	Project Type	Custom Action Behavior
	<b>InstallScript</b>	Basic MSI, InstallScript MSI, Merge Module	Run InstallScript code.

**Table 175** ■ Custom Actions Supported in InstallShield (cont.)

Icon	Action Type	Project Type	Custom Action Behavior
	<b>EXE</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Launch an executable file.
	<b>Standard DLL</b>	Basic MSI, InstallScript MSI	Call a function in a standard DLL.
	<b>MSI DLL</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Call a function in a DLL that was written specifically for Windows Installer.</p> <p>The entry point of the .dll file must have a predefined parameter and return value.</p>
	<b>Managed Code</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	<p>Call a public method in a managed assembly that is written in managed code such as Visual Basic .NET or C#.</p> <p>For more information, see <a href="#">Calling a Public Method in a Managed Assembly</a>.</p>
	<b>Set Property</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Set a property in the Property table.</p> <p>This is useful if you need to get information from the end user and store it so that it can be used later in your installation.</p>
	<b>Set Directory</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Set a directory in the Directory table at run time.</p> <p>For example, if you want to create a temp directory that is a subdirectory of the installation directory selected by the end user, you can use this option to set that new temp directory for use later in the installation.</p>

**Table 175** ■ Custom Actions Supported in InstallShield (cont.)

Icon	Action Type	Project Type	Custom Action Behavior
	<b>Nested MSI</b>	Basic MSI, InstallScript MSI, MSI Database, Transform	<p>Launch another .msi package. This is also known as a nested installation.</p>  <p><b>Important</b> - Nested installations is a deprecated feature of the Windows Installer. Applications installed with nested installations sometimes fail because they are difficult for end users to service correctly. Microsoft Corporation recommends that you avoid using nested installations and nested-installation custom actions to install products that are intended to be released to the public. To learn more, see <a href="#">Concurrent Installations</a> in the Windows Installer Help Library.</p>
	<b>VBScript</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Run 32-bit or 64-bit VBScript code.
	<b>JScript</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	Run 32-bit or 64-bit JScript code.
	<b>Error</b>	Basic MSI, DIM, InstallScript MSI, Merge Module, MSI Database, MSM Database, Transform	<p>Display a specified error message, return failure, and end the installation.</p> <p>For example, you may want to add an error custom action to your project to handle scenarios where an end user tries to install the current version of your product over a future major version. For more information, see <a href="#">Preventing the Current Installation from Overwriting a Future Major Version of the Same Product</a>.</p>
	<b>Kill Process</b>	Basic MSI, InstallScript MSI, Transform	Terminate a process at run time. For more information, see <a href="#">Calling a Kill-Process Custom Action</a> .
	<b>PowerShell</b>	Basic MSI, InstallScript MSI	Run a PowerShell script to perform system configuration tasks at installation run time. For target , as well as other information about this type of custom action, see <a href="#">Calling a PowerShell Custom Action</a> .

**Table 175** ▪ Custom Actions Supported in InstallShield (cont.)

Icon	Action Type	Project Type	Custom Action Behavior
	<b>WiseScript</b>	Basic MSI	 <p><b>Edition</b> ▪ This custom action type is available in the version of InstallShield that is included in certain editions of AdminStudio.</p> <p>Runs a WiseScript executable file.</p> <p>This type of action includes a wrapper MSI DLL that gets and sets Windows Installer properties and evaluates Windows Installer conditions.</p>

To help you differentiate between immediate, deferred, commit, and rollback custom actions in your project, InstallShield adds color-coded dots to some of the action's icons. The dots are displayed on the icons for actions that are listed under the Custom Actions explorer in the Custom Actions and Sequences view or the Custom Actions view. The following table shows the icon for the executable file custom action.

**Table 176** ▪ Determining the In-Script Execution of a Custom Action by Viewing Its Icon

Icon	Description
	<p>If a custom action does not have a dot, it indicates that the In-Script Execution setting is not applicable to that type of custom action, or one of the following values is selected:</p> <ul style="list-style-type: none"> <li>• Immediate Execution</li> <li>• Immediate Execution (Terminal Service Aware)</li> </ul>
	<p>If a custom action has a blue dot, one of the following values is selected for the action's In-Script Execution setting:</p> <ul style="list-style-type: none"> <li>• Deferred Execution</li> <li>• Deferred Execution (Terminal Service Aware)</li> <li>• Deferred Execution in System Context</li> </ul>
	<p>If a custom action has a green dot, one of the following values is selected for the action's In-Script Execution setting:</p> <ul style="list-style-type: none"> <li>• Commit Execution</li> <li>• Commit Execution (Terminal Service Aware)</li> <li>• Commit Execution in System Context</li> </ul>

**Table 176** ■ Determining the In-Script Execution of a Custom Action by Viewing Its Icon (cont.)

Icon	Description
	<p>If a custom action has a red dot, one of the following values is selected for the action's In-Script Execution setting:</p> <ul style="list-style-type: none"> <li>● Rollback Execution</li> <li>● Rollback Execution (Terminal Service Aware)</li> <li>● Rollback Execution in System Context</li> </ul>

For details about each of the InstallShield custom actions that are added automatically to InstallShield projects to support different functionality, see [InstallShield Custom Action Reference](#).

**Windows Logo** ■ If you are applying for the Windows logo, any custom actions in your installation must follow best practices guidelines for custom action creation. You can use the InstallShield validation suites and the Full MSI Validation Suite to verify whether your installation package meets most of the custom action-related logo requirements. However, some of the requirements cannot be verified through the validation suite. To learn more, see [Guidelines for Creating Custom Actions that Meet Requirements of the Windows Logo Program](#).

## Custom Action Settings

**Project** ■ Use the Custom Actions and Sequences view to configure custom action settings in the following project types:

- Basic MSI
- InstallScript MSI
- MSI Database
- Transform

Use the Custom Actions view to configure custom action settings in the following project types:

- DIM
- Merge Module
- MSM Database

Note that some custom action types are not available in some project types.

The settings in the Custom Actions and Sequences view (or Custom Actions view) are organized into the following categories:

- [Action area settings](#)
- [Sequence area settings](#)

To learn about displaying action information on the progress dialog and in the installation's log file, see [Using Action Text](#).

## Action Area Settings

The following custom action settings are available in the Action area.

**Table 177** ▪ Custom Action Settings in the Action Area

Setting	Description
<b>Function Name</b>	 <p><b>Note</b> ▪ This setting applies to InstallScript custom actions.</p> <p>In the list of functions that are included in the project's InstallScript files, select the InstallScript function that you want to call.</p>
<b>DLL File Name</b>	 <p><b>Note</b> ▪ This setting applies to standard DLL custom actions that are stored in the Binary table or located in the target system's search path. This setting also applies to MSI DLL custom actions that are stored in the Binary table.</p> <p>For the Binary table location: Enter the path to the DLL file that you would like to use for your custom action. As an alternative, you can select it from the list of available DLL files in the Binary table, or click the ellipsis button (...) to browse to it.</p> <p>For the target system's search path location: Enter the name of the DLL file that you would like to use for your custom action. As an alternative, you can click the ellipsis button (...) to browse to it. Only the file name is needed, since the custom action searches in the target system's search path to find this DLL.</p> <p>If the custom action type is an MSI DLL, the DLL file must comply with the required Windows Installer function signature. To learn more, see <a href="#">Calling Functions in Windows Installer DLL Files</a>.</p>
<b>DLL Filekey</b>	 <p><b>Note</b> ▪ This setting applies to standard and MSI DLL custom actions that are installed with the product.</p> <p>In the list of DLL files that are included in your project, select the DLL file that you would like to use for your custom action.</p>
<b>Function Signature</b>	 <p><b>Note</b> ▪ This setting applies to standard DLL custom actions.</p> <p>To specify the parameters for the entry-point function in your DLL file, click the ellipsis button (...) in this setting. This opens the Function Signature dialog box, which has various settings that let you specify the function name, arguments, return type, and return property for the entry point function in your standard DLL.</p>

**Table 177** ■ Custom Action Settings in the Action Area (cont.)

Setting	Description
<b>Function Name</b>	 <p><b>Note</b> ■ This setting applies to MSI DLL custom actions.</p> <p>Enter the name of the function in the MSI DLL that you would like to call.</p>
<b>Executable File Name</b>	 <p><b>Note</b> ■ This setting applies to executable file custom actions that are stored in the Binary table.</p> <p>Enter the path to the executable file that you would like to use for your custom action. As an alternative, you can select it from the list of available executable files in the Binary table, or click the ellipsis button (...) to browse to it.</p>
<b>Executable Filekey</b>	 <p><b>Note</b> ■ This setting applies to executable file custom actions that are installed with the product.</p> <p>In the list of executable files that are included in your project, select the executable file that you would like to use for your custom action.</p>
<b>Working Directory</b>	 <p><b>Note</b> ■ This setting applies to executable file custom actions that are located in a path that references a directory.</p> <p>Enter the working directory name for the executable file that you would like to use for your custom action, or select it from the list of available directories.</p>
<b>File Name &amp; Command Line</b>	 <p><b>Note</b> ■ This setting applies to executable file custom actions that are located in a path that references a directory.</p> <p>Enter path and name of the executable file that you would like to use for your custom action. If appropriate, you can include any command-line parameters that should be passed to the executable file. Use quotation marks around long file names. For example:</p> <ul style="list-style-type: none"> <li>• "[INSTALLDIR]subdirectory1\filename.exe"</li> <li>• "[WindowsFolder]Notepad.exe"</li> <li>• "[SUPPORTDIR]\fileFromSupportFilesView.exe"</li> </ul> <p>Note that the path is optional only if the executable file is already present in the operating system search path (that is, WindowsFolder or SystemFolder).</p>

**Table 177** ■ Custom Action Settings in the Action Area (cont.)

Setting	Description
<b>Executable Property</b>	 <p><b>Note</b> ■ This setting applies to executable file custom actions that are located in a path that is identified by a property.</p> <p>Enter the name of the property that identifies the full path to your executable file, or select the property from the list of properties in your project.</p>
<b>Command Line</b>	 <p><b>Note</b> ■ This setting applies to executable file custom actions that are stored in the Binary table, installed with the product, or located in a path that is identified by a property.</p> <p>Enter any command-line parameters that you would like to pass to your executable file. Enclose long file names within quotation marks.</p>
<b>Assembly File</b>	 <p><b>Note</b> ■ This setting applies to custom actions that use a managed assembly whose location is set to Binary table.</p> <p>Specify the .NET assembly file that you want to use for your managed-code custom action. You can select the <b>Browse to file</b> option to specify the file, or select the file from the list of DLL and .exe files that will be stored in the Binary file.</p> <p>At build time, InstallShield adds the managed assembly to a C++ Windows Installer wrapper DLL and adds the wrapper DLL to the Binary table of your .msi package. The wrapper DLL contains the information that is required to mediate, load, and run your assembly.</p>
<b>Assembly Filekey</b>	 <p><b>Note</b> ■ This setting applies to custom actions that use a managed assembly installed with the product.</p> <p>To specify the managed assembly that you want to use for your custom action, select the file from the list of DLLs and .exe files that are included in your project.</p>

**Table 177** ▪ Custom Action Settings in the Action Area (cont.)

Setting	Description
<b>Assembly Property</b>	 <p><b>Note</b> ▪ This setting applies to custom actions that use a managed assembly whose path references a property or a directory in the Directory table.</p> <p>To specify the managed assembly that you want to use for your custom action, do one of the following:</p> <ul style="list-style-type: none"> <li>• Select a Windows Installer property in the list.</li> <li>• Type the name of a new property.</li> <li>• Type the name of a directory in the Directory table.</li> </ul> <p>The property or directory name must be enclosed within square brackets ([]). You can add a string after the property if appropriate. The resulting path should indicate the location of the assembly file.</p>
<b>Method Signature</b>	 <p><b>Note</b> ▪ This setting applies to custom actions that use a managed assembly.</p> <p>Click the ellipsis button (...) to launch the <a href="#">Method Signature dialog box</a>, which is where you specify arguments and return values for the managed method. When you have specified signature information on this dialog box, InstallShield uses it as the value of the Method Signature setting.</p> <p>To learn more, see <a href="#">Specifying the Signature for a Managed Method in an Assembly Custom Action</a>.</p>
<b>Error Message</b>	 <p><b>Note</b> ▪ This setting applies to custom actions that trigger an error message.</p> <p>Type the error message text that should be displayed when the custom action's conditions are met on the target system.</p> <p>As an alternative, you can type a property name whose value contains the error text. The property name must be enclosed within square brackets ([]).</p>

**Table 177** ■ Custom Action Settings in the Action Area (cont.)

Setting	Description
<b>Function Name</b>	 <p><b>Note</b> ■ This setting applies to kill-process custom actions.</p> <p>Select the appropriate function:</p> <ul style="list-style-type: none"> <li>● <b>KillProcess</b>—If you selected one of the immediate options in the In-Script Execution setting and you want to kill a process that has a particular name, select this option.</li> <li>● <b>KillProcessByID</b>—If you selected one of the immediate options in the In-Script Execution setting and you want to kill a process that has a particular process identifier (PID), select this option.</li> <li>● <b>KillProcessDeferred</b>—If you selected one of the deferred, commit, or rollback options in the In-Script Execution setting and you want to kill a process that has a particular name, select this option.</li> <li>● <b>KillProcessByIDDeferred</b>—If you selected one of the deferred, commit, or rollback options in the In-Script Execution setting and you want to kill a process that has a particular PID, select this option.</li> </ul> <p>For information on configuring this type of custom action, see <a href="#">Calling a Kill-Process Custom Action</a>.</p>
<b>PowerShell File Name</b>	 <p><b>Note</b> ■ This setting applies to PowerShell custom actions that are stored in the Binary table.</p> <p>Select the PowerShell script file (.ps1) in the list of files that are stored in the Binary table or that are included in your project. If the location that you specified is stored in the Binary table, you can click this ellipsis button (...) in this setting to browse to the file.</p> <p>For target , as well as other information about this type of custom action, see <a href="#">Calling a PowerShell Custom Action</a>.</p>
<b>PowerShell Script FileKey</b>	 <p><b>Note</b> ■ This setting applies to PowerShell custom actions that use a PowerShell script that is installed with the product.</p> <p>To specify the PowerShell script file (.ps1) that you want to use for your custom action, select the file from the list of PowerShell files that are included in your project.</p> <p>For target , as well as other information about this type of custom action, see <a href="#">Calling a PowerShell Custom Action</a>.</p>

**Table 177** ▪ Custom Action Settings in the Action Area (cont.)

Setting	Description
<b>WiseScript Executable</b>	 <p><b>Note</b> ▪ This setting applies to WiseScript custom actions.</p> <p> <b>Edition</b> ▪ This custom action type is available in the version of InstallShield that is included in certain editions of AdminStudio.</p> <p>Enter the path to the WiseScript executable file that you would like to use for your custom action. As an alternative, you can click the ellipsis button (...) to browse to it.</p>
<b>Processes</b>	 <p><b>Note</b> ▪ This setting applies to kill-process custom actions.</p> <p>Enter executable file names or PIDs of the processes that you want to terminate before proceeding with the installation. Separate multiple processes by semicolons.</p> <ul style="list-style-type: none"> <li>● If <b>Function Name</b> is <b>KillProcess</b> or <b>KillProcessDeferred</b>, then specify executable file names in the <b>Processes</b> setting.</li> <li>● If <b>Function Name</b> is <b>KillProcessByID</b> or <b>KillProcessByIDDeferred</b>, then specify PIDs in the <b>Processes</b> setting.</li> </ul> <p>For information on configuring this type of custom action, see <a href="#">Calling a Kill-Process Custom Action</a>.</p>
<b>Return Processing</b>	<p>Specify how the custom action thread should be processed. Valid options are:</p> <ul style="list-style-type: none"> <li>● Asynchronous (No wait for completion)</li> <li>● Asynchronous (Wait for exit code)</li> <li>● Synchronous (Check exit code)</li> <li>● Synchronous (Ignore exit code)</li> </ul> <p>These flags are used to specify that the main and custom action threads run synchronously (the installer waits for the custom action thread to complete before resuming the main installation thread) or asynchronously (the installer runs the custom action simultaneously as the main installation continues).</p> <p>Note that some options are not applicable to some types of custom actions. Only options that pertain to the selected type of custom action are available in this list.</p>
<b>In-Script Execution</b>	<p>Select which iteration of the sequence will trigger your action. For details about each option, see <a href="#">In-Script Execution</a>.</p> <p>These options copy the action code into the execution, rollback, or commit script. If you select a Terminal Server Aware option, the custom action impersonates the user during per-machine installations on terminal server machines.</p>

**Table 177** ■ Custom Action Settings in the Action Area (cont.)

Setting	Description
<b>Execution Scheduling</b>	<p>Specify how many times you want the action to run. For example, if an action is listed in both the user interface and execute sequences, it can be set to run both times, or it can run only once. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Always execute</b>—The action runs every time it is encountered. Therefore, it could run in the user interface sequence and again in the execute sequence.</li> <li>● <b>Execute only if running on client after UI sequence</b>—The action runs only if the execute sequence is run after the user interface sequence.</li> <li>● <b>Execute only once</b>—The action runs only once—even if it exists in both the user interface and execute sequences. The action is skipped in the execute sequence if the user interface sequence has run.</li> <li>● <b>Execute only once per process</b>—The action runs once per process if it exists in both the user interface and execute sequences. If the execute sequence runs in the same process as the user interface sequence, the installation skips this action in the execute sequence. This scheduling lets you avoid rerunning actions that modify session state such as properties.</li> </ul> <p>If you selected anything other than Immediate execution in the In-Script Execution setting, the Execution Scheduling setting is not available and is set to Always execute.</p> <div>  <p><b>Project</b> ■ The <b>Execute only once</b> option does not work for InstallScript MSI projects. If your custom action exists in both the user interface and execute sequences, it is executed twice. This is because—in an InstallScript MSI project—the InstallScript engine executes the user interface sequence and Windows Installer executes the execute sequence.</p> </div>
<b>Silent Mode</b>	<div>  <p><b>Note</b> ■ This setting applies to standard DLL custom actions.</p> </div> <p>Specify whether you want the installation to suppress a warning message if the custom action fails to load the DLL file and call the function.</p>
<b>MSI Type Number</b>	<p>This read-only setting identifies the Windows Installer numeric value for the selected custom action. For more information about basic custom action types, see <a href="#">Custom Action Type Overview</a>.</p>
<b>Comments</b>	<p>Enter any internal comments that you want to record for this custom action. These comments are for your reference only and are not displayed to end users.</p>

**Table 177** ■ Custom Action Settings in the Action Area (cont.)

Setting	Description
<b>Help File Path</b>	<p>Click the ellipsis button (...) to browse to the file that describes the behavior of the custom action. The file should be a text-based file such as a .txt, .htm, or .rtf file.</p> <p>At build time for Basic MSI, DIM, InstallScript MSI, and Merge Module projects, InstallShield streams the contents of this file into the Description column of the ISCustomActionReference table.</p> <p>If you are working on a project in Direct Edit mode, InstallShield streams the contents of the file that you select into the Description column of the ISCustomActionReference table as soon as you select the help file. In addition, InstallShield makes this setting read-only and displays [Text Data] as the value for this setting.</p>  <p><b>Windows Logo</b> ■ <i>The intended behavior of each custom action must be documented for the Windows logo program. This is especially helpful if system administrators deploy your product to enterprise environments; they sometimes need to know what the custom actions do. If you validate your installation package but you have not specified a value for the Help File Path setting, InstallShield generates validation error ISICE10. For more information, see <a href="#">ISICE10</a>.</i></p> <p>For any built-in InstallShield custom actions, InstallShield makes this setting read-only and displays InstallShield Custom Action as the value.</p>

**Table 177** ▪ Custom Action Settings in the Action Area (cont.)

Setting	Description
<b>Run During Patch Uninstall</b>	 <p><b>Project</b> ▪ If you are working on a project in Direct Edit mode, this setting is not applicable unless the database schema is a minimum of 405 (for Windows Installer 4.5 or later).</p> <p>Specify whether Windows Installer should run the custom action only when a patch is being uninstalled. You can select Yes for a custom action in an .msi package. You can also select Yes for a new custom action that is added by a patch. However, Yes should not be selected for a custom action that is being added or removed by a patch to an existing custom action. The default value for this setting is No.</p> <p>When Windows Installer 4.5 runs the patch uninstall custom action, it uses the custom action in the patch that is being uninstalled.</p>  <p><b>Note</b> ▪ Windows Installer 4.5 includes support for this setting, but Windows Installer 4.0 and earlier do not. Therefore, if you select Yes for this setting and some target systems may have Windows Installer 4.0 or earlier, add a condition to this custom action to prevent Windows Installer 4.0 and earlier from running it. Otherwise, Windows Installer 4.0 and earlier would call the custom action during the installation, repair, or update of the package.</p> <p>For the condition, use the MSIPATCHREMOVE property. For more information, see <a href="#">MSIPATCHREMOVE</a> in the Windows Installer Help Library.</p>

## Sequence Area Settings

The following custom action settings are available in the Sequence area.

**Table 178** ▪ Custom Action Settings in the Sequence Area

Setting	Description
<b>Install UI Sequence</b>	<p>To schedule this custom action during the user interface sequence of the installation mode, select the appropriate option. To leave this custom action out of the sequence, select <b>&lt;Absent from sequence&gt;</b>.</p> <p>As an alternative, you can schedule an action by dragging it from the Custom Actions explorer to the appropriate location in a sequence under the Sequences explorer. When you drop it, drop it onto the item that should be directly before it in the sequence. To move it to a different point in a sequence (or from one sequence to another), drag it from the old location and drop it onto the item that should be directly before it in the sequence.</p>

**Table 178** ■ Custom Action Settings in the Sequence Area (cont.)

Setting	Description
<b>Install UI Condition</b>	<p>If you want to specify a condition that Windows Installer must evaluate before running the custom action during this sequence on target systems, enter the conditional statement in this setting. The custom action does not run if the condition evaluates to false.</p> <p>As an alternative to manually entering a statement, you can click the ellipsis button (...) in this setting to launch the Condition Builder dialog box, which simplifies the process of creating a condition.</p> <p>For more information, see <a href="#">Building Conditional Statements</a>.</p>
<b>Install Exec Sequence</b>	<p>To schedule this custom action during the execute sequence of the installation mode, select the appropriate option. To leave this custom action out of the sequence, select <b>&lt;Absent from sequence&gt;</b>.</p> <p>As an alternative, you can schedule an action by dragging it from the Custom Actions explorer to the appropriate location in a sequence under the Sequences explorer. When you drop it, drop it onto the item that should be directly before it in the sequence. To move it to a different point in a sequence (or from one sequence to another), drag it from the old location and drop it onto the item that should be directly before it in the sequence.</p>
<b>Install Exec Condition</b>	<p>If you want to specify a condition that Windows Installer must evaluate before running the custom action during this sequence on target systems, enter the conditional statement in this setting. The custom action does not run if the condition evaluates to false.</p> <p>As an alternative to manually entering a statement, you can click the ellipsis button (...) in this setting to launch the Condition Builder dialog box, which simplifies the process of creating a condition.</p> <p>For more information, see <a href="#">Building Conditional Statements</a>.</p>
<b>Advertise Exec Sequence</b>	<p>To schedule this custom action during the execute sequence of the advertisement mode, select the appropriate option. To leave this custom action out of the sequence, select <b>&lt;Absent from sequence&gt;</b>.</p> <p>As an alternative, you can schedule an action by dragging it from the Custom Actions explorer to the appropriate location in a sequence under the Sequences explorer. When you drop it, drop it onto the item that should be directly before it in the sequence. To move it to a different point in a sequence (or from one sequence to another), drag it from the old location and drop it onto the item that should be directly before it in the sequence.</p>

**Table 178** ▪ Custom Action Settings in the Sequence Area (cont.)

Setting	Description
<b>Advertise Exec Condition</b>	<p>If you want to specify a condition that Windows Installer must evaluate before running the custom action during this sequence on target systems, enter the conditional statement in this setting. The custom action does not run if the condition evaluates to false.</p> <p>As an alternative to manually entering a statement, you can click the ellipsis button (...) in this setting to launch the Condition Builder dialog box, which simplifies the process of creating a condition.</p> <p>For more information, see <a href="#">Building Conditional Statements</a>.</p>
<b>Admin UI Sequence</b>	<p>To schedule this custom action during the user interface sequence of the administration mode, select the appropriate option. To leave this custom action out of the sequence, select <b>&lt;Absent from sequence&gt;</b>.</p> <p>As an alternative, you can schedule an action by dragging it from the Custom Actions explorer to the appropriate location in a sequence under the Sequences explorer. When you drop it, drop it onto the item that should be directly before it in the sequence. To move it to a different point in a sequence (or from one sequence to another), drag it from the old location and drop it onto the item that should be directly before it in the sequence.</p>
<b>Admin UI Condition</b>	<p>If you want to specify a condition that Windows Installer must evaluate before running the custom action during this sequence on target systems, enter the conditional statement in this setting. The custom action does not run if the condition evaluates to false.</p> <p>As an alternative to manually entering a statement, you can click the ellipsis button (...) in this setting to launch the Condition Builder dialog box, which simplifies the process of creating a condition.</p> <p>For more information, see <a href="#">Building Conditional Statements</a>.</p>
<b>Admin Exec Sequence</b>	<p>To schedule this custom action during the execute sequence of the administration mode, select the appropriate option. To leave this custom action out of the sequence, select <b>&lt;Absent from sequence&gt;</b>.</p> <p>As an alternative, you can schedule an action by dragging it from the Custom Actions explorer to the appropriate location in a sequence under the Sequences explorer. When you drop it, drop it onto the item that should be directly before it in the sequence. To move it to a different point in a sequence (or from one sequence to another), drag it from the old location and drop it onto the item that should be directly before it in the sequence.</p>

**Table 178** ■ Custom Action Settings in the Sequence Area (cont.)

Setting	Description
<b>Admin Exec Condition</b>	<p>If you want to specify a condition that Windows Installer must evaluate before running the custom action during this sequence on target systems, enter the conditional statement in this setting. The custom action does not run if the condition evaluates to false.</p> <p>As an alternative to manually entering a statement, you can click the ellipsis button (...) in this setting to launch the Condition Builder dialog box, which simplifies the process of creating a condition.</p> <p>For more information, see <a href="#">Building Conditional Statements</a>.</p>

For more information about these settings, see [CustomAction Table](#) in the Windows Installer Help Library.

## Action Text Settings

**Project** ■ Use the Custom Actions and Sequences view to configure action text settings in the following project types:

- *Basic MSI*
- *InstallScript MSI*
- *MSI Database*
- *Transform*

To keep end users informed, installations commonly display text on the progress dialog to describe the installation's current activity. This usually accompanies the progress bar as a means of installation status. As each standard action and custom action is encountered, a message about the action is displayed on the progress dialog. This may be especially useful for actions that take a long time to execute. The same action text is also written to the installation's log file if one is created.

The Action Text explorer in the Custom Actions and Sequences view lets you specify the action text for any action in your project.

When you click a custom action item or a standard action item in the Action Text area of the Custom Actions and Sequences view, the following settings are available.

**Table 179** ■ Action Text Settings

Setting	Description
<b>Description</b>	<p>Enter text that describes the selected action. For example, the default description for the InstallFiles action is:</p> <p>Copying new files</p> <p>When the Windows Installer launches this action, the text that you enter is displayed on the progress dialog. For more information, see <a href="#">Displaying Action Descriptions on the Progress Dialog</a>.</p> <p>If a log file is created at run time, this description is written to the log file when the Windows Installer launches this action.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

**Table 179** ▪ Action Text Settings (cont.)

Setting	Description
<b>Template</b>	<p>Enter the template that should be used to format action data records. For example, the default template for the InstallFiles action is:</p> <p>File: [1], Directory: [9], Size: [6]</p> <p>When the Windows Installer launches this action, the action details may be displayed on the progress dialog. For the aforementioned InstallFiles example, the [1] property is replaced with the names of files as they are transferred to the target system. The [9] property is replaced with the directory that contains the file, and the [6] property is replaced with the file's size in bytes.</p> <p>Note that by default, the action data is not displayed on the progress dialog. For more information, see <a href="#">Displaying Action Data on the Progress Dialog</a>.</p> <p>If a template is not specified for the selected action, no data is displayed when the action is launched. In addition, the installation must be run with a full user interface; if the installation is run silently or with a reduced or basic user interface, the action data is not shown.</p> <p>To find out what data fields are available for use in the Template setting value of a particular standard action, see <a href="#">Standard Actions Reference</a> in the Windows Installer Help Library, and then refer to the help for the specific action.</p> <hr/> <p> <b>Project</b> ▪ InstallScript MSI installations cannot display action data on the status dialog. However, the template is written to the installation's log file.</p> <hr/> <p> <b>Note</b> ▪ The value of this setting must always be [1] for several standard actions:</p> <ul style="list-style-type: none"> <li>• <i>GenerateScript</i></li> <li>• <i>Rollback</i></li> <li>• <i>RollbackCleanup</i></li> </ul> <p>Therefore, the Template setting is disabled for these actions.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

## Support Files View (Advanced UI, Basic MSI, InstallScript Object, and Suite/Advanced UI Projects)

**Project** ▪ This information applies to the following project types:

- *Advanced UI*

- *Basic MSI*
- *InstallScript Object*
- *Suite/Advanced UI*

The Support Files view is where you can add support files to your project, and—in Basic MSI projects—add files to disk image folders.

The Support Files view contains the following main areas:

## Support Files

The Support Files area lets you add, sort, and delete support files—files that are required by your installation only during the installation process. The installation removes the support files when the installation is complete. Add any language-dependent files to the appropriate language-specific area. Add language-independent files to the Language Independent area.

## Splash Screen

---

**Project** ▪ *The Splash Screen area is available for Basic MSI projects.*

The Splash Screen area lets you add to your project a startup graphic—the graphic that is displayed when the end user begins the installation. The graphic file must be a bitmap file (.bmp). Add the file to the appropriate language-specific or language-independent folder.

---

**Note** ▪ *In a single-language installation, the splash screen that is specified for the single language (or the language-independent splash screen if no splash screen is specified for the single language) is displayed.*

*In a multilanguage installation, the splash screen for the language in which the installation is running is displayed. If no splash screen is specified for the language in which the installation is running, the language-independent splash screen is used.*

*Only one splash screen is displayed to the end user during the installation. If you have more than one splash screen file in the language-independent area or for a specific language, the first file in the list is displayed at run time.*

## Advanced Files

---

**Project** ▪ *The Advanced Files area is available for Basic MSI projects.*

The Disk1 item in the Advanced Files area enables you to indicate files and folders that you want to go on Disk1 of your installation media. These files and folders are not automatically installed to the target system when your installation is run. Rather, you can link to the installation media from your application or from the installation. For example, you might include a large redistributable file with your application that you do not want included in the application installation. This file should be placed in the Disk1 folder.

## Support Files/Billboards View (InstallScript and InstallScript MSI Projects)

**Project** ▪ This information applies to the following project types:

- *InstallScript*
- *InstallScript MSI*

The Support Files/Billboards view is where you can add support files and billboard files to your project, and add files to disk image folders.

The Support Files/Billboards view contains the following main areas:

### Support Files

The Support Files area lets you add, sort, and delete support files—files that are required by your installation project only during the installation process. Add any language-dependent files and folders to the appropriate language-specific area. Add language-independent files and folders to the Language Independent area.

In your InstallScript code, support files are uncompressed into a temporary directory and then deleted when the installation is complete.

### Billboards

The Billboards item enables you to specify files that you want to display to the end user during the installation process. The billboards can be used to communicate, advertise, educate, and entertain end users. To learn more, see [Displaying Billboards in InstallScript and InstallScript MSI Installations](#).

### Splash Screen

**Project** ▪ In *InstallScript* projects, you can use *.bmp* and *.gif* files as splash screen files. In *InstallScript MSI* projects, only *.bmp* files can be used as splash screen files.

The Splash Screen area lets you add to your project a startup graphic—the graphic that is displayed when the end user begins the installation. Add the file to the appropriate language-specific or language-independent folder.

**Note** ▪ In a single-language installation, the splash screen that is specified for the single language (or the language-independent splash screen if no splash screen is specified for the single language) is displayed.

In a multilanguage installation, the splash screen for the language in which the installation is running is displayed. If no splash screen is specified for the language in which the installation is running, the language-independent splash screen is used.

Only one splash screen is displayed to the end user during the installation. If you have more than one splash screen file in the language-independent area or for a specific language, the first file in the list is displayed at run time.

**Project** ▪ In an InstallScript project, the splash screen file must be named Setup.bmp or Setup.gif. This file name requirement does not apply to InstallScript MSI projects.

## Advanced Files

The Advanced Files item enables you to indicate files and folders that you want to go on a disk of your installation media. These files and folders are not automatically installed to the target system when your installation program is run. Rather, you can link to the installation media from your application or from the installation. For example, you might include a large redistributable file with your application that you do not want included in the application installation.

**Table 180** ▪ Advanced File Items

Item	Description
<b>Disk1</b>	Add files and folders that you want to go on the first disk of your installation media.
<b>Last Disk</b>	Add files and folders that you want to go on the last disk of your installation media.
	 <p><b>Project</b> ▪ This applies to InstallScript projects.</p>
<b>Other</b>	Add files and folders that you want to go on a specific disk of your installation media; you specify the disk at build time in the General Options panel of the Release Wizard.
	 <p><b>Project</b> ▪ This applies to InstallScript projects.</p>

## System Search View

**Project** ▪ The System Search view is available in the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

The System Search view provides the Windows Installer capability to search for a particular file, folder, registry key, .ini file value, or .xml file value on a target system prior to installation. This functionality lets you perform application, version, and configuration data searches.

The System Search view displays a grid listing each search that you want to conduct on the target system. You can use this view to add a predefined system search—whether it is a search that is included with InstallShield or one that is stored in a repository—to your project. You can also use the System Search view to customize any predefined searches or define your own system searches for your project.

Whenever you define your own search, the [System Search Wizard](#) is launched. From there, you can select from a list of search options and specify search details, such as the number of subfolder levels to search. When you modify an existing search, you can alter your initial selections in the System Search Wizard.

## Property Manager View

---

**Project** • The Property Manager view is available in the following Windows Installer–based projects:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- Transform

*This view is also available in Advanced UI and Suite/Advanced UI projects.*

*Note that some differences between the Property Manager view in Windows Installer–based projects and that in Advanced UI and Suite/Advanced UI projects exist; these differences are noted where appropriate.*

The Windows Installer engine and the Advanced UI and Suite/Advanced UI engine maintain global information using properties. The Property Manager view displays a list of installation properties that are used by the Windows Installer engine or the Advanced UI and Suite/Advanced UI engine at run time. You can modify, create, and delete installer properties in the Property Manager view. At build time, InstallShield writes the properties in the Property Manager view to installation that it creates.

Following is a list of some of the tasks that you can perform in this view:

- View the properties that are defined in your project.
- Add, modify, and delete properties.
- Filter the properties that are shown in the view to hide ones that do not contain a specific string.
- Resize and reorder the columns in the view.
- Sort the rows in the view by any column by clicking the column heading.
- Drag and drop column headings on to the group box area (the area below the view's buttons) to organize the rows in the view in a hierarchical format.
- Windows Installer–based projects: Make a property localizable so that it can have different values based on the language that your installation uses.

**Project** - In Windows Installer-based projects, properties that appear in all uppercase letters are called public properties, and they can be changed by the end user on the command line at run time. All others must be set before the release is built or—at run time—through a custom action or dialog's behavior.

## Working with the Property Manager View

The Property Manager view consists of the following elements:

- A row of buttons and other controls
- A group box area (below the row of buttons)
- A spreadsheetlike table

Each row in the table represents a property in your project.

The following table describes all of the buttons and other controls that are displayed in the Property Manager view.

**Table 181** - Controls in the Property Manager View

Name of Control	Icon	Description
<b>New Property</b>		<p>Adds a new property to your project.</p> <p></p> <p><b>Project</b> - In Windows Installer-based projects: To create a localizable property, you can click the arrow next to this button, and then click Localizable Property. To learn more, see <a href="#">Creating a Localizable Property</a>.</p>
<b>Delete Selected Properties</b>		Deletes the selected row or rows.
<b>Clear Selected Properties</b>		Deletes the value of the selected properties.
<b>Make Selected Properties Localizable</b>		<p></p> <p><b>Project</b> - This button is available in Windows Installer-based projects.</p> <p>Adds a string identifier to the value of the selected properties, enabling you to set a different property value for every language that your project supports. To learn more, see <a href="#">Making an Existing Property Localizable</a>.</p>
<b>Expand All Groups</b>		Shows all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.

**Table 181** ▪ Controls in the Property Manager View (cont.)

Name of Control	Icon	Description
<b>Collapse All Groups</b>		Hides all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.
<b>Search Grid</b>		Dynamically filters the properties that are displayed in the Property Manager view according to the string that you specify in this search box. As you type a string in this box, InstallShield hides all of the rows that do not contain it.
<b>Property Manager Help</b>		Displays the help for the Property Manager view.
<b>Drag a column header here to group that column</b>		<p>Use this group box area to group rows in the view. The view supports multiple levels of grouping simply by dragging the column headings and dropping them onto the group box. InstallShield displays the rows in the view hierarchically according to column arrangement in the group box.</p> <p>To learn more, see <a href="#">Working with the Group Box Area in Various Views</a>.</p>

The following table describes each of the columns in the Property Manager view.

**Table 182** ▪ Columns in the Property Manager View

Column	Description
<b>Name</b>	This column shows the name of the Windows Installer or Advanced UI and Suite/Advanced UI property.
<b>Value</b>	<p>This column shows the value of the property.</p>  <p><b>Project</b> ▪ In Windows Installer-based projects: If the property is configured to be localizable, this column shows the string identifier in curly brackets before the string value.</p>
<b>Comments</b>	This column contains an internal note about the properties. The comments are not displayed at run time.

**Table 182** ■ Columns in the Property Manager View (cont.)

Column	Description
Formatted	 <p><b>Project</b> ■ This column is available in the following project types:</p> <ul style="list-style-type: none"> <li>● Advanced UI</li> <li>● Suite/Advanced UI</li> </ul> <p>This column contains a check box that lets you indicate whether the value in the Value column is a formatted expression that contains property names, environment variable references, or other special strings that you want to be resolved at run time. The run-time resolution occurs early at run time, before the installation executes the actions in the OnBegin event.</p> <p>To leave the property value as is at run time, clear this check box. Square brackets and other characters have no special meaning.</p> <p>To replace the formatted expressions at run time, select this check box.</p> <p>To learn about the syntax that is available for formatted expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p>

## Events View

**Project** ■ The Events view is available in Suite/Advanced UI projects.

**Edition** ■ The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The Events view enables you to create your own actions and add them to your Suite/Advanced UI project. You can also use this view to schedule an action to occur during one or more run-time events, or you can use the Packages view to schedule an action to occur immediately before or after a specific package in your installation is run.

**Tip** ■ Optionally, you can associate actions with wizard interface elements of the Suite/Advanced UI installation. To learn more, see [Configuring an Action for an Element in the Wizard Interface](#).

The Events view has two separate area: an Actions tab and an Events area.

## Actions

Use the Actions explorer in the Events view to define and configure actions in your project. You can create actions that run executable files, call DLL functions, run PowerShell scripts, set a Suite/Advanced UI property, run InstallScript code, or call a public method in a managed assembly.

For a description of each action setting, see [Events View Settings](#).

## Events

Events direct all of the actions that are performed during install mode, maintenance mode, and stage-only mode. The Suite/Advanced UI engine executes actions that are scheduled for an event in the order that they are listed in this view. For descriptions of each type of event, see [Types of Events in a Suite/Advanced UI Installation](#).

## Events View Settings

---

**Project** ▪ The Events view is available in Suite/Advanced UI projects.

---

**Edition** ▪ The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The settings in the Events view are organized into the following categories:

- [Action area settings on the Action tab](#)
- [Return Process Handling area settings on the Action tab for an .exe action](#)
- [Events area settings](#)

If you select a PowerShell action in the Actions explorer or the Events explorer, InstallShield displays a PowerShell Script tab on the right; you can use this tab to edit your script.

## Action Area Settings on the Action Tab

The following action settings are available in the Actions area on the Action tab.

**Table 183** ▪ Action Settings in the Action Area on the Action Tab

Setting	Description
<b>File</b>	 <p><b>Note</b> ▪ <i>This setting applies to .exe, DLL, and managed-code actions.</i></p> <p>Enter the run-time path to the file that you want to use for your action. As an alternative, if the file is not present on target systems at run time, and if none of the packages in your Suite/Advanced UI installation are going to install it, you can click the ellipsis button (...) in this setting to browse to it.</p> <p>If you browse to the file, InstallShield adds it to your project as a support file in the Support Files view of your Suite/Advanced UI project. At run time, the file is available on the target system only during your product's installation process.</p>
<b>Source Path</b>	 <p><b>Note</b> ▪ <i>This setting applies to PowerShell actions.</i></p> <p>Enter the source path to the PowerShell script (.ps1) that you want to use for your action. As an alternative, you can click the ellipsis button (...) in this setting to browse to it.</p> <p>When you browse to the file, InstallShield adds it to your project as a support file in the Support Files view of your Suite/Advanced UI project. At run time, the file is available on the target system only during your product's installation process.</p> <p>Instead of hard-coding a location, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value.</p>  <p><b>Tip</b> ▪ <i>Use the PowerShell Script tab in this view to edit the code for this action.</i></p>
<b>Arguments</b>	 <p><b>Note</b> ▪ <i>This setting applies to .exe actions.</i></p> <p>If appropriate, specify the command-line parameters that should be used with the action. Separate multiple parameters with spaces.</p>

**Table 183** ■ Action Settings in the Action Area on the Action Tab (cont.)

Setting	Description
<b>Function Name</b>	 <p><b>Note</b> ■ This setting applies to DLL and InstallScript actions.</p> <p>For a DLL action: Enter the name of the function in the DLL that you would like to call.</p> <p>For an InstallScript action: In the list of functions that are included in the project's InstallScript files, select the InstallScript function that you want to call.</p>
<b>Class</b>	 <p><b>Note</b> ■ This setting applies to managed-code actions.</p> <p>Enter the name of the class for the managed method that you want the selected action to call.</p> <p>To learn more, see <a href="#">Working with a Managed-Code Action in a Suite/Advanced UI Installation</a>.</p>
<b>Method</b>	 <p><b>Note</b> ■ This setting applies to managed-code actions.</p> <p>Enter the public method that you want the selected action to call.</p> <p>To learn more, see <a href="#">Working with a Managed-Code Action in a Suite/Advanced UI Installation</a>.</p>
<b>Requires Administrative Privileges</b>	 <p><b>Note</b> ■ This setting applies to .exe, DLL, PowerShell, InstallScript, and managed-code actions.</p> <p>Specify whether this action requires administrative privileges on systems that have Windows Vista or later or Windows Server 2008 or later.</p> <p>To learn more, see <a href="#">Minimizing the Number of User Account Control Prompts During Advanced UI and Suite/Advanced UI Installations</a>.</p>

**Table 183** ▪ Action Settings in the Action Area on the Action Tab (cont.)

Setting	Description
Verb	 <p><b>Note</b> ▪ This setting applies to .exe actions.</p> <p>Specify the verb that should be used with the selected action's file, or select the appropriate verb from the list.</p> <p>If you leave this setting blank, the verb that is the default one on the target system for this file is used. If the default verb is not available, the <i>open</i> verb is used. If neither verb is available, the first verb that is listed in the registry is used.</p> <p>The use of the <i>runas</i> verb is not recommended. If the action requires administrative privileges, select Yes for the action's Requires Administrative Privileges setting. For more information, see <a href="#">Minimizing the Number of User Account Control Prompts During Advanced UI and Suite/Advanced UI Installations</a>.</p>
Window	 <p><b>Note</b> ▪ This setting applies to .exe actions.</p> <p>Select the initial window state of the .exe action when it is launched. Available options are:</p> <ul style="list-style-type: none"> <li>• <b>Show</b>—Display the window in its current size and position.</li> <li>• <b>Hide</b>—Hide the window.</li> <li>• <b>Minimize</b>—Display the window as minimized.</li> <li>• <b>Maximize</b>—Display the window as maximized.</li> <li>• <b>Normal</b>—Display the window in its original size and position.</li> </ul>
Wait for Exit	 <p><b>Note</b> ▪ This setting applies to .exe actions.</p> <p>Specify whether you want the installation to wait for the action to complete before proceeding with the next part of the installation. Available options are:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The installation waits for the action to complete before resuming. This is the default option.</li> <li>• <b>No</b>—The installation runs the action simultaneously as the next part of the installation proceeds.</li> </ul> <p>If you select Yes for this setting, you can use the settings in the Return Process Handling area to specify the various codes that the action may return.</p>

**Table 183** ▪ Action Settings in the Action Area on the Action Tab (cont.)

Setting	Description
<b>Property Name</b>	 <p><b>Note</b> ▪ <i>This setting applies to actions that set a property.</i></p> <p>Enter the property name, or select it from the list of available properties.</p> <p>The property names that are displayed in the list are the ones in the Property Manager view. You can enter any other property name and it will be available at run time. If you want to explicitly create a new property, you can do so from the Property Manager view.</p>
<b>Property Value</b>	 <p><b>Note</b> ▪ <i>This setting applies to actions that set a property.</i></p> <p>Enter the value of the property.</p> <p>If you select Yes for the Format Property Value setting, the value that you enter can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p>
<b>Format Property Value</b>	 <p><b>Note</b> ▪ <i>This setting applies to actions that set a property.</i></p> <p>Specify whether the value that you enter in the Value setting is a formatted expression that contains property names, environment variable references, or other special strings that you want to be resolved at run time. Available options are:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—Replace the formatted expressions at run time.</li> <li>• <b>No</b>—Leave the property value as is at run time. The value that you are entering does not include formatted expressions.</li> </ul> <p>To learn about the syntax that is available for these expressions, see <a href="#">Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time</a>.</p>

## Return Process Handling Area Settings on the Action Tab for an .exe Action

The following action settings are available in the Return Process Handling area on the Action tab for an .exe action.

**Table 184** ▪ Return Process Handling Settings in the Action Area on the Action Tab for an .exe Action

Setting	Description
Ignore Code	 <p><b>Note</b> ▪ This setting applies to .exe actions.</p> <p>Specify a comma-delimited list of the codes that the action could return when the installation should proceed with the next part of the installation.</p> <p>This setting is available if you select Yes in the action's Wait for Exit setting.</p>
Abort Code	 <p><b>Note</b> ▪ This setting applies to .exe actions.</p> <p>Specify a comma-delimited list of the codes that the action could return when the installation should be aborted. Note that if the action cannot be launched or loaded, the installation is aborted.</p> <p>This setting is available if you select Yes in the action's Wait for Exit setting.</p>
Reboot Code	 <p><b>Note</b> ▪ This setting applies to .exe actions.</p> <p>Specify a comma-delimited list of the codes that the action could return when the target system should be restarted.</p> <p>This setting is available if you select Yes in the action's Wait for Exit setting.</p>
Cancel Code	 <p><b>Note</b> ▪ This setting applies to .exe actions.</p> <p>Specify a comma-delimited list of the codes that the action could return when the installation should be cancelled.</p> <p>This setting is available if you select Yes in the action's Wait for Exit setting.</p>

**Table 184** ▪ Return Process Handling Settings in the Action Area on the Action Tab for an .exe Action (cont.)

Setting	Description
<b>Default Response</b>	 <p><b>Note</b> ▪ This setting applies to .exe actions.</p> <p>Select the option that describes how you want the installation to respond if the code that the action returns is not specified for any of the other settings in the Return Process Handling area. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Ignore</b>—The installation proceeds with the next part of the installation. This is the default option.</li> <li>● <b>Abort</b>—The installation is aborted.</li> <li>● <b>Reboot</b>—The target system is restarted.</li> <li>● <b>Cancel</b>—The installation is cancelled.</li> </ul> <p>This setting is available if you select Yes in the action's Wait for Exit setting.</p>

## Event Area Settings

The following action settings are available in the Events area.

**Table 185** ▪ Action Settings in the Events Area

Setting	Description
<b>Condition</b>	<p>This setting lets you specify one or more conditions that the Suite/Advanced UI installation should use to evaluate whether the action should be run. For example, if the action should be run only on certain platforms, you can create a platform requirement in a condition for this action; the Suite/Advanced UI would launch the action only on appropriate platforms.</p> <p>To add one or more new action conditions, click the New Condition button in this setting. InstallShield adds a new row under the Condition setting. Select the appropriate option—All, Any, or None—from the list in this row. Then in this row, click the New Condition button, and select the appropriate option to continue building the conditional statement.</p>  <p><b>Tip</b> ▪ If you define a Feature Operation condition or a Package Operation condition for an action, the earliest event for which you can schedule the action is OnStaging.</p> <p>For more information, see <a href="#">Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects</a>.</p> <p>If one or more conditional statements are configured, the Condition setting says <b>(Condition)</b>. If none are configured, the Condition setting says <b>(Empty)</b>.</p>

**Table 185** ▪ Action Settings in the Events Area (cont.)

Setting	Description
Display Text	 <p><b>Note</b> ▪ This setting applies to .exe, DLL, PowerShell, InstallScript, and managed-code actions.</p> <p>Enter text that describes the selected action. For example, if the action is running a script that configures the target system, you could enter the following string:</p> <p>Configuring the system</p> <p>If the installation launches the action when the InstallationProgress wizard page is displayed, the text that you enter is displayed on the wizard page.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

## User Interface View

**Project** ▪ The User Interface view is available in the following project types:

- Advanced UI
- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database
- Suite/Advanced UI
- Transform

The appearance of your installation is one of the main aspects that differentiates your product from that of your competition. You can easily customize the way your installation looks through the views listed below.

### Dialogs

**Project** ▪ The Dialogs view is available in the following project types:

- Basic MSI

- *DIM*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *Transform*

In the Dialogs view, you can select dialogs to display at run time. The way in which you control a dialog's behavior depends on which engine controls the user interface: the Windows Installer engine displays the dialogs for Basic MSI projects, and the InstallScript engine displays the dialogs for InstallScript and InstallScript MSI projects. For more information, see:

- [Dialogs View \(InstallScript, InstallScript MSI, and InstallScript Object Projects\)](#)
- [Dialogs View \(Basic MSI and Other Windows Installer–Based Projects\)](#)

## Wizard Interface

---

**Project** ▪ This information applies to the following project types:

- *Advanced UI*
- *Suite/Advanced UI*

---

**Edition** ▪ The *Advanced UI* project type is available in the InstallShield. The *Suite/Advanced UI* project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

Use the Wizard Interface view to customize the user interface of your Advanced UI or Suite/Advanced UI installation. This view lets you add wizard pages to and remove wizard pages from the default list of pages, as well as customize the layout and behavior of each page.

## Billboards

---

**Project** ▪ The Billboards view is available in Basic MSI projects.

For information about billboard support in InstallScript or InstallScript MSI projects, see [Support Files/Billboards View \(InstallScript and InstallScript MSI Projects\)](#).

Billboards are images or Adobe Flash application files that are displayed for a specified amount of time during the file transfer portion of your installation. The billboards can be used to communicate, advertise, educate, and entertain end users. For example, billboards can present overviews on new features of the product being installed or other products from your company. Each billboard is a file that you or your company's graphics department creates for complete control over the look and feel of the file transfer.

## String Editor

**Project** ▪ The String Editor view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

To help streamline the process of localizing a project, all of the text strings that may be displayed at run time during the installation process are available in one consolidated view: the String Editor view. You can use this view to edit the strings for everything from button text to feature descriptions. You can also use this view to export each language's string entries to a file, translate the values that are listed in the file, and then import the translated file into your project.

## Dialogs View (InstallScript, InstallScript MSI, and InstallScript Object Projects)

**Project** ▪ This information applies to the following project types:

- InstallScript
- InstallScript MSI
- InstallScript Object

The Dialogs view contains a list of the standard end-user dialogs. The dialogs are identified by their function names. Click a dialog in this view to view a sample dialog in the right pane.

The dialog names in the list are *ghosted* until you edit the layout. A ghosted name means that the default dialog (from `isres.dll`) will be used in the user interface. If you edit the layout of a dialog, its name appears in bold in the list, and the dialog is pulled from `isuser.dll` at run time.

If your installation project supports additional languages, those languages appear as nodes beneath the edited dialog. You can edit the layout for each language separately.

**Tip** ▪ Selecting and editing a dialog in the Dialog Editor does not automatically place the dialog in the end-user interface. In order for a dialog to be displayed at run time, it needs to be included in the InstallScript code. For example, code for the dialogs that are displayed during a first-time installation are part of the **OnFirstUIBefore** and **OnFirstUIAfter** event handlers. To learn more, see [Displaying Dialogs During InstallScript and InstallScript MSI Installations](#).

## Dialog Resource Files

By default, all dialogs in InstallScript and InstallScript MSI projects are kept in a resource .dll file called `_IsRes.dll`. This .dll file is built into your distribution package when you build the installation. There is a separate `_IsRes.dll` for every supported language; they are located in the InstallShield folder's Redist folder (for example, *InstallShield Program Files Folder\Redist*). None of the `_IsRes.dll` files should ever be modified.

When you edit a dialog in the Dialog Editor, InstallShield makes a copy of the dialog from the original `_IsRes.dll` file. This copy is stored in your project file. When your project is built, all edited dialogs (and any new dialogs you have created) are built into a resource .dll file called `_IsUser{CurrentLanguage}.dll`. For English, a .dll file called `_IsUser1033.dll`. `_IsUser{LanguageID}.dll` is then built into your distribution package.

At run time, the engine that displays the dialogs first looks for a dialog in `_IsUser{LangId}.dll`. If the dialog is not found, it then looks for the default version in `_IsRes.dll`. The engine looks for dialogs based on their resource identifier. You can see the resource identifier of a dialog by going to the Dialog table in the [Direct Editor](#).

## Dialogs View (Basic MSI and Other Windows Installer–Based Projects)

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- Merge Module
- MSI Database
- MSM Database
- Transform

The Dialogs view contains a Dialogs explorer. The Dialogs explorer contains two main folders: Themes and All Dialogs.

### Themes

The Themes folder contains a list of all of the dialog themes that you can use for the dialogs in your project. A dialog theme is a predefined set of images that give your end-user dialogs a unified and distinctive look.

### All Dialogs

The All Dialogs folder contains a list of the dialogs in your project. Each dialog item in the Dialogs explorer contains a Behavior item, which enables you to configure the behavior that is associated with a dialog, and at least one language item, which displays the dialog in the Dialog Editor of the selected language. The Dialog Editor enables you to edit the layout for each language separately.

When you create a new Basic MSI project, InstallShield provides a series of default dialogs for the two User Interface sequences in which a Windows Installer package typically displays dialogs: the Installation sequence (which runs when the installation is launched in the default mode, for example, by double-clicking an .msi file)—with separate dialogs depending on whether the package is being installed for the first time, reinstalled, or uninstalled—and the Administration sequence (the list of actions that are executed when you launch the installation with the `/a` command-line option). (End-user dialogs are not usually displayed in the Advertisement sequence, which contains the list of actions that are executed when you launch the installation with the `/j` command-line option.)

**Project** - Although you can create dialogs in DIM and Merge Module projects, you cannot add them to a sequence until you add the DIM or merge module to an installation project. Then, all the dialogs included in your module are available to be included.

## Wizard Interface View

**Project** - This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** - The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The Wizard Interface view contains a Wizard Interface explorer. The Wizard Interface explorer contains the following main areas: Styles, Brushes, Control Themes, Wizard Pages, Secondary Windows, and Minimal Wizard Pages.

### Styles

The Styles area of the Wizard Interface view lets you configure sets of formatting characteristics that you can apply to one or more parts of the wizard interface to quickly change its appearance. The Styles area lets you define the following types of styles:

- **Font sets**—A font set is a collection of fonts (including attributes such as font name, size, and weight). For each font in a font set, you can specify to which language the font is applicable. This enables you to select a different font for each language that your project supports.
- **Text styles**—A text style defines text attributes such as text color, as well as font name, style, and size. Text styles are typically applied to the text that is displayed in the Advanced UI or Suite/Advanced UI wizard interface.

Font sets work in conjunction with text styles. Text styles reference a font set but can optionally override various font attributes that are defined at the font set level.

To add a style to your project, right-click the Styles node and then click the appropriate command, depending on the type of style that you want to add.

To learn more, see the following:

- [Defining a Custom Style for the Wizard Interface](#)
- [Applying a Text Style to Text in the Wizard Interface](#)

### Brushes

A brush defines a solid color, a gradient, or an image for various elements of the wizard interface, such as the background of wizard pages and controls.

To add a brush to your project, right-click the Brushes node and then click Add Brush.

To learn more, see the following:

- [Defining a Custom Brush for the Wizard Interface](#)
- [Specifying the Background Brush for the Header, Body, and Navigation Areas of the Wizard Interface](#)
- [Overriding the Default Background Brushes for a Wizard Page or Secondary Window](#)

## Control Themes

A control theme is a collection of colors for various parts of controls—text color, background color, and border color—and for various states of controls—such as clicked and hovered. You can specify the control theme that you want to use for all of the controls in your user interface by default. You can also override the theme for specific controls on wizard pages and windows in your user interface. Control themes give buttons and other items in your installation's user interface a flat look (without three-dimensional effects) that is reminiscent of the style of Windows Store apps.

To add a control theme to your project, right-click the Control Themes node and then click Add Control Theme.

To learn more, see the following:

- [Defining a Custom Control Theme for the Wizard Interface](#)
- [Applying a Theme to a Control in the Wizard Interface](#)

## Wizard Pages

The main type of window that is displayed to end users of an Advanced UI or Suite/Advanced UI installation is a wizard page. The Wizard Pages area of the Wizard Interface view lets you view, edit, add, and remove wizard pages in your Advanced UI or Suite/Advanced UI project.

To configure and edit settings that apply to all of the wizard pages in your Advanced UI or Suite/Advanced UI project, click the Wizard Pages node. The settings that are displayed for this node let you specify dimensions, the caption that is used in the title bar of the wizard pages, and more.

The specific wizard page subnodes under the Wizard Pages node let you preview, sequence, and remove pages as needed; these subnodes also let you modify the layout of each wizard page—adding, moving, and removing a variety of different kinds of controls. To change the run-time order of the wizard pages, click a page that you want to resequence, and then press CTRL+UP ARROW or CTRL+DOWN ARROW until the page reaches the appropriate place under the Wizard Pages node.

To add a wizard page to your project, right-click the Wizard Pages node and then click the appropriate command, depending on the type of page that you want to add.

## Secondary Windows

A secondary window in an Advanced UI or Suite/Advanced UI installation is a pop-up window that lets end users perform a command, asks end users a question, or provides end users with information. One example of a secondary window is a FilesInUse window, which informs end users about one or more applications that are open and locking files that need to be updated by the installation. The specific window subnodes under the Secondary Windows node let you preview and remove pages as needed; these subnodes also let you modify the layout of each window, just as you can edit the layout of wizard pages.

To add a secondary window to your project, right-click the Secondary Windows node and then click Add Blank Window.

## Minimal Wizard Pages

Minimal Wizard Pages provide modern installation\uninstallation experience to end users using frameless wizard screens.

Minimum supported versions for Minimal Wizard Pages are Windows 8.1 and Windows Server 2012 R2. Minimal Wizard Setups will work on other older operating systems provided if .Net 4.0 and above is present.

### Choosing Minimal Wizard Pages

To choose Minimal Wizard Pages installation for your setup, click the Wizard Pages node. The settings that are displayed for this node lets you choose Installation Type as Minimal.

To learn more, see the following:

- [Customizing Minimal Wizard Pages](#)

## Settings for the Wizard Interface

For information about various settings for each area in the Wizard Interface view, see the help panes that are displayed when you click any setting in this view.

## Wizard Interface View Toolbar

**Project** - This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** - The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

If you select a wizard page or secondary window in the Wizard Interface view, the toolbar that InstallShield shows directly above the wizard interface preview pane includes several different buttons and other controls that let you modify the layout of the selected page or window. InstallShield also displays this toolbar in the Wizard Interface view if you select one or more controls on a wizard page or a secondary window.

**Table 186** - Wizard Interface View Toolbar

Name of Control	Icons	Description
<b>New Control</b>		Lets you add a control to the selected wizard page or secondary window. Select one of the control buttons, or the control types that are listed in the drop-down list next to the control buttons.

**Table 186** ▪ Wizard Interface View Toolbar (cont.)

Name of Control	Icons	Description
<b>New Control (cont.)</b>		<p>The control types that are available from the drop-down list next to the Label button are:</p> <ul style="list-style-type: none"> <li>● <b>Label</b>—The Label control displays text. Use this type of control for labels that you want to position next to other controls—such as a text box control—and for instructions or information that you want to include on a wizard page or secondary window.</li> <li>● <b>Hyperlink</b>—The hyperlink control displays an HTML link; clicking the link at run time opens a page in the default browser on the target system.</li> <li>● <b>Group Box</b>—A group box can be used to enclose various controls in one area. A group box also provides a label that you can use to express the relationship between the controls that are contained within it.</li> <li>● <b>Frame</b>—A frame control lets you draw the outline of a box.</li> <li>● <b>Image</b>—An image control displays an image.</li> <li>● <b>Billboard</b>—A billboard control displays one or more images that can be updated in response to a property such as the <code>ISInstallProgress</code> property, or configured to display for a predetermined duration. You can add billboards to your projects to display information to end users during the installation process. The billboards can be used to communicate, advertise, educate, and entertain end users.</li> <li>● <b>Progress Bar</b>—A progress bar is a dynamic bar that fills up in response to a property such as the <code>ISInstallProgress</code> property.</li> <li>● <b>Progress Circle</b>—A progress circle is a pair of dynamic circles that fill up in response to two properties: a property such as <code>ISParcelProgress</code>, which indicates the completion percentage of the current package, and a property such as <code>ISInstallProgress</code>, which indicates the completion percentage of the overall entire installation. The outside progress circle typically shows the overall progress, and the inside progress bar typically shows the progress of the entire package.</li> </ul>

**Table 186** ▪ Wizard Interface View Toolbar (cont.)

Name of Control	Icons	Description
<b>New Control (cont.)</b>		<p>The control types that are available from the drop-down list next to the Text Box button are:</p> <ul style="list-style-type: none"> <li>• <b>Text Box</b>—A text box control is a field in which end users can enter text and numbers.</li> <li>• <b>Password Box</b>—A password box control is a field in which end users can enter a password.</li> <li>• <b>Rich Text Box</b>—A rich text box is a read-only control that displays text from an .rtf file. This type of control is often used on license agreement or readme wizard pages.</li> </ul>
<b>New Control (cont.)</b>		<p>The control types that are available from the drop-down list next to the Button button are:</p> <ul style="list-style-type: none"> <li>• <b>Button</b>—A button control is a control that carries out a command when an end user clicks it.</li> <li>• <b>Command Link</b>—A command link control offers a set of mutually exclusive options, similar to radio buttons. Each option includes an icon, a command link label next to the icon, and an optional supplemental explanation about the option.</li> <li>• <b>Check Box</b>—A check box control displays a check box that an end user can select or clear to toggle on or off an option.</li> <li>• <b>Radio Button</b>—A radio button control is one of two or more mutually exclusive options that end users can select. A radio button must be inserted into a group box control; it functions as part of that control.</li> <li>• <b>Image Button</b>—An image button control displays an image, and it carries out a command when an end user clicks it.</li> </ul>

**Table 186** ▪ Wizard Interface View Toolbar (cont.)

Name of Control	Icons	Description
<b>New Control (cont.)</b>		<p>The control types that are available from the drop-down list next to the Combo Box button are:</p> <ul style="list-style-type: none"> <li>• <b>Combo Box</b>—A combo box control is a box that contains a drop-down list of predefined values. The box is also a text box that lets end users enter a custom value.  To change this control to a drop-down list without the text box (that is, if end users should be able to select a predefined value but not enter a custom value), set the CBS_DROPDOWNLIST style for this control to True.</li> <li>• <b>List Box</b>—A list box control is a standard list box that lets end users select a single option from a list of predetermined options.</li> <li>• <b>Checked List Box</b>—A checked list box is a list box in which each of the predefined values is associated with a check box. A checked list box lets end users select one or more options, or leave all of the options unselected.</li> <li>• <b>Feature Selection Tree</b>—A feature selection tree control is a special tree view control that contains a hierarchically organized collection of the Advanced UI or Suite/Advanced UI installation's features; it lets end users select one or more features to install.</li> </ul>
<b>Position Controls</b>		Lets you change the position of two or more selected controls.
<b>Position Controls (cont.)</b>		<p>The position change options that are available from the drop-down list next to the Align Left button are:</p> <ul style="list-style-type: none"> <li>• <b>Align Left</b>—Align the left edges of two or more selected controls with the left edge of the control that was selected last.</li> <li>• <b>Align Center</b>—Align the center of two or more selected controls with the center of the control that was selected last.</li> <li>• <b>Align Right</b>—Align the right edges of two or more selected controls with the right edge of the control that was selected last.</li> <li>• <b>Align Top</b>—Align the top edges of two or more selected controls with the top edge of the control that was selected last.</li> <li>• <b>Align Middle</b>—Align the middle of two or more selected controls with the middle of the control that was selected last.</li> <li>• <b>Align Bottom</b>—Align the two or more selected controls with the bottom of the control that was selected last.</li> <li>• <b>Distribute Horizontally</b>—Position three or more selected controls so that they are an equal distance from each other horizontally.</li> <li>• <b>Distribute Vertically</b>—Position three or more selected controls so that they are an equal distance from each other vertically.</li> </ul>

**Table 186** ■ Wizard Interface View Toolbar (cont.)

Name of Control	Icons	Description
<b>Position Controls (cont.)</b>		<p>The position change options that are available from the drop-down list next to the Make Same Width button are:</p> <ul style="list-style-type: none"> <li>● <b>Make Same Width</b>—Increase or decrease the width of each of the selected controls so that each width matches that of the control that was selected last.</li> <li>● <b>Make Same Height</b>—Increase or decrease the height of each of the selected controls so that each height matches that of the control that was selected last.</li> <li>● <b>Make Same Size</b>—Increase or decrease the dimensions of each of the selected controls so that each control's dimensions match that of the control that was selected last.</li> </ul>
<b>Default Language</b>		<p>Lets you switch the strings that InstallShield displays on the wizard pages and secondary windows in this view to those in a different language in your project. The available language options are the ones that are selected in the Setup Languages setting in the General Information view.</p> <p>This setting also lets you change the default language for the project.</p>

## Billboards View

**Project** ■ The Billboards view is available in Basic MSI projects.

For information about billboard support in InstallScript or InstallScript MSI projects, see [Support Files/Billboards View \(InstallScript and InstallScript MSI Projects\)](#).

You can add billboards to your projects to display information to end users during the installation process. The billboards can be used to communicate, advertise, educate, and entertain end users. For example, billboards can present overviews on new features of the product being installed or other products from your company. Each billboard is a file that you or your company's graphics department creates for complete control over the look and feel of the file transfer.

If you add one or more billboards to your project, the billboards are displayed at run time as the SetupProgress dialog reports the modifications that Windows Installer is making to the system. You can control the length of time the billboard is shown and its position by [configuring its settings](#) in the Billboards view.

To learn about the settings in the Billboards view, see:

- **Billboard Settings**—These are project-wide billboard settings.
- **Settings for Adobe Flash Application File Billboards and Image Billboards**—These settings are displayed in the right pane in the Billboards view when you click a Flash billboard or image billboard in the center pane.

## Billboard Settings

**Project** ▪ The Billboards view is available in Basic MSI projects.

When you click the Billboards explorer in the center pane of the Billboards view, InstallShield displays the following settings in the right pane. These are project-wide settings for billboards.

**Table 187** ▪ Billboard Settings

Setting	Description
<b>Billboard Type</b>	<p>Select the type of billboard that you want to use for your installation. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Fullscreen with Small progress (displayed in lower right)</b>—When the installation displays the standard end-user dialogs, it also displays a full-screen background. During file transfer, the installation shows full-screen backgrounds, with billboards in the foreground, and a small progress box in the lower-right corner of the screen.</li> <li>● <b>Windowed with Standard progress</b>—During file transfer, the installation displays a standard-size dialog that shows the billboards. The bottom of this dialog shows the progress bar. The installation does not display a background for this style.</li> <li>● <b>Windowed with Small (displayed in lower right, no billboards)</b>—The installation displays a small progress box in the lower-right corner of the screen during file transfer, but it does not display any billboards or a background.</li> </ul> <p>For more information, including sample screen shots of each billboard type, see <a href="#">Types of Billboards for Basic MSI Projects</a>.</p>
<b>Loop Billboards</b>	<p>Specify whether you want your installation to continuously loop the image billboards until the file transfer completes and the installation shows the appropriate SetupComplete dialog.</p> <p>If you select No for this setting and the file transfer takes more time than you have allocated for the billboards, the installation continues displaying the last image billboard until the file transfer ends.</p> <p>If you select Yes for this setting and the file transfer takes more time than you have allocated for the billboards, the installation restarts the display of billboards from the beginning. The loop continues, if necessary, until the file transfer ends.</p> <p>The default value for this setting is No.</p> <p>This setting has no effect on Adobe Flash application file billboards.</p>

# Settings for Adobe Flash Application File Billboards and Image Billboards

**Project** ▪ The Billboards view is available in Basic MSI projects.

A Flash or image billboard’s settings determine which file is shown, how long it is displayed, and its position on the screen. To access these settings, open the Billboards view, and in the Billboards explorer, select the billboard that you want to configure.

**Table 188** ▪ Settings for Adobe Flash Application File Billboards and Image Billboards

Setting	Description
File Name	<p>Do one of the following:</p> <ul style="list-style-type: none"><li>● <b>For an Adobe Flash application file billboard</b>—Enter the path to the Flash application file (.swf) that you would like to use for the selected billboard, or click the ellipsis button (...) to browse to the file.</li></ul> <p>Flash application files can consist of videos, movies, sounds, interactive interfaces, games, text, and more—anything that is supported by the .swf type of file. It is recommended that files such as Flash video files (.flv) and MP3 audio files be embedded in the .swf file so that they are available locally on the target system during file transfer. Although .swf files can reference external files that you can post on a Web site, this external implementation would require that end users have an Internet connection.</p> <ul style="list-style-type: none"><li>● <b>For an image billboard</b>—Enter the path to the image file (.bmp, .gif, .jpg, or .jpeg) that you would like to use for the selected billboard, or click the ellipsis button (...) to browse to the file.</li></ul> <p>Note that animated .gif files are not supported. If you want to use animation in a billboard, consider using an Adobe Flash application file billboard.</p> <div></div> <p><b>Note</b> ▪ If the version of Flash or other tool that you use to create your .swf file is newer than the version of the Flash Player that is installed on a target system, it is possible that some of the Flash features may not work as expected on that target system.</p>
Duration	<p>Enter the amount of time, in seconds, that this billboard should be displayed. The number that you enter must be from 1 to 32767 (which is a little more than 9 hours).</p> <p>The effect that the duration has on the run-time behavior depends on whether the installation is displaying a Flash billboard or image billboards. To learn more, see <a href="#">Run-Time Behavior of a Basic MSI Installation that Includes Billboards</a>.</p>

**Table 188** ■ Settings for Adobe Flash Application File Billboards and Image Billboards (cont.)

Setting	Description
<b>Origin</b>	<p>Select where on the screen you want your billboard to be anchored. Available options are:</p> <ul style="list-style-type: none"> <li>● Upper Right</li> <li>● Upper Left</li> <li>● Lower Right</li> <li>● Lower Left</li> <li>● Centered</li> </ul> <p>The X and Y coordinates are measured from this point.</p>  <p><b>Note</b> ■ This setting is used only if the <b>Fullscreen with Small progress (displayed in lower right)</b> option is selected for the <b>Billboard Type</b> setting.</p>
<b>X Coordinate</b>	<p>To change the horizontal location of your billboard relative to the location you selected for the Origin setting, enter the distance, in pixels. For example, if the billboard's origin is Lower Left, an X Coordinate value of 100 places the left side of the billboard 100 pixels from the left side of the screen.</p>  <p><b>Note</b> ■ This setting is used only if the <b>Fullscreen with Small progress (displayed in lower right)</b> option is selected for the <b>Billboard Type</b> setting.</p>
<b>Y Coordinate</b>	<p>To change the vertical location of your billboard relative to the location you selected for the Origin setting, enter the distance, in pixels. For example, if the billboard's origin is Lower Left, a Y Coordinate value of 100 places the bottom of the billboard 100 pixels from the bottom of the screen.</p>  <p><b>Note</b> ■ This setting is used only if the <b>Fullscreen with Small progress (displayed in lower right)</b> option is selected for the <b>Billboard Type</b> setting.</p>
<b>Effect</b>	<p>Select the transition effect for this billboard. Rather than just appearing on the screen and disappearing after an allotted amount of time, a transition effect makes the change between billboards much smoother.</p>  <p><b>Note</b> ■ This setting applies to image billboards, but not to Adobe Flash application file billboards.</p> <p>In addition, this setting is used only if the <b>Windowed with Standard Progress</b> option or the <b>Fullscreen with Small progress (displayed in lower right)</b> option is selected for the <b>Billboard Type</b> setting.</p>

**Table 188** ■ Settings for Adobe Flash Application File Billboards and Image Billboards (cont.)

Setting	Description
<b>Background Color</b>	<p>This setting displays the currently selected background color for your billboard. To change this color, click the ellipsis button (...). InstallShield displays the Color dialog box, which lets you select a predefined color or define a custom color for the background.</p>  <p><b>Note</b> ■ This setting is used only if the <b>Fullscreen with Small progress (displayed in lower right)</b> option is selected for the <a href="#">Billboard Type setting</a>.</p>
<b>Title</b>	<p>Enter the title of this billboard, as you want it to appear in the upper-left corner of the background.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>  <p><b>Tip</b> ■ The maximum number of characters that the installation can display for the title at run time varies, depending on the font, the font size, the font attributes, and the length of the title string that you specify for this setting. It also depends on the screen resolution on the target system. Therefore, if you specify a long title, preview the billboard using different screen resolutions to test whether the entire title will be displayed at run time.</p>  <p><b>Note</b> ■ This setting is used only if the <b>Fullscreen with Small progress (displayed in lower right)</b> option is selected for the <a href="#">Billboard Type setting</a>.</p>
<b>Background Style</b>	<p>Select the style of background that you would like to use. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Gradient</b>—The background fades from dark to light.</li> <li>● <b>Solid</b>—The background is displayed as one solid color.</li> </ul>  <p><b>Note</b> ■ This setting is used only if the <b>Fullscreen with Small progress (displayed in lower right)</b> option is selected for the <a href="#">Billboard Type setting</a>.</p>

**Table 188** ■ Settings for Adobe Flash Application File Billboards and Image Billboards (cont.)

Setting	Description
<b>Font</b>	Click the ellipsis (...) button to select the font that you want to use for the title in the selected billboard's background. If the target machine does not have the font you selected, a default system font is used instead.
	
	<b>Note</b> ■ This setting is used only if the <b>Fullscreen with Small progress (displayed in lower right)</b> option is selected for the <b>Billboard Type</b> setting.

## String Editor View

**Project** ■ The String Editor view is available in the following project types:

- Advanced UI
- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- Suite/Advanced UI

In the String Editor view, you have complete and centralized control over the localizable text strings that are displayed at run time during the installation process. You can use this view to edit the strings for everything from button text to feature descriptions.

The String Editor view shows the collection of language-independent identifiers and corresponding language-specific values for your project. Following is a list of some of the tasks that you can perform in this view:

- View all of the strings in your project.
- Add, modify, and delete strings.
- Filter the strings that are shown to hide ones that do not contain a specific string.
- Resize and reorder the columns in the view.
- Sort the rows in the view by any column by clicking the column heading.
- Drag and drop column headings on to the group box area (the area below the view's buttons) to organize the rows in the view in a hierarchical format.
- Export all of the string identifiers and their corresponding values into a text file (.txt).
- Import the translated strings from a .txt file into the project.
- Search the project to identify all of the instances in which a specific string identifier is used. Find out if a string is not used anywhere within a project.

## Working with the String Editor View

The String Editor view consists of the following elements:

- A row of buttons and other controls
- A group box area (below the row of buttons)
- A spreadsheetlike table

Each row in the table represents a string entry in your project.

The following table describes all of the buttons and other controls that are displayed in the String Editor view.

**Table 189** ■ Controls in the String Editor View

Name of Control	Icon	Description
<b>New String Entry</b>		Displays the String Entry dialog box, which lets you add a new string entry.
<b>Edit Selected String</b>		Displays the String Entry dialog box, which lets you edit the selected string entry.
<b>Delete Selected Strings</b>		Deletes the selected row or rows.
<b>Expand All Groups</b>		Shows all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.
<b>Collapse All Groups</b>		Hides all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.
<b>Find String</b>		Displays the Find dialog box, which lets you search for instances of a string. This dialog box lets you specify criteria such as whether you want to match the case.
<b>Find Next</b>		Searches for the next occurrence of the specified string.
<b>Find and Replace</b>		Displays the Replace dialog box, which lets you search for instances of a string and replace them with a new string. This dialog box lets you specify criteria such as whether you want to find or ignore a string with specific capitalization.
<b>Search for Selected Strings in Project</b>		Searches the entire project for all instances of the string whose row is selected, and shows the search results in the Output window.
<b>Export Strings</b>		Lets you export all of the strings for a particular language to a text file (.txt). You can provide that .txt file to a translator who can update the file with translated text.

**Table 189** ■ Controls in the String Editor View (cont.)

Name of Control	Icon	Description
<b>Import Strings</b>		Lets you select the text file (.txt) that contains the strings that you want to import into your project. Also lets you specify the language for those strings.
<b>Search Grid</b>		Dynamically filters the strings that are displayed in the String Editor view according to the string that you specify in this search box. As you type a string in this box, InstallShield hides all of the rows that do not contain it.
<b>Default Language</b>		Lets you view and change the default language for the project.
<b>String Editor Help</b>		Displays the help for the String Editor view.
<b>Drag a column header here to group that column</b>		<p>Use this group box area to group rows in the view. The view supports multiple levels of grouping simply by dragging the column headings and dropping them onto the group box. InstallShield displays the rows in the view hierarchically according to column arrangement in the group box.</p> <p>To learn more, see <a href="#">Working with the Group Box Area in Various Views</a>.</p>

The following table describes each of the columns in the String Editor view.

**Table 190** ■ Columns in the String Editor View

Column	Description
<b>Language</b>	This column shows the language of the string entry.
<b>Identifier</b>	This column contains the language-independent ID for the string. Each string identifier in a project is linked to one or more values.
<b>Value</b>	<p>This column shows the run-time string.</p> <p></p> <p><b>Project</b> ■ In Basic MSI, InstallScript MSI, and Merge Module projects, some of the string values contain Windows Installer properties inside square brackets—for example, <b>Install [ProductName]</b>. At run time, the property and brackets are replaced by the property value.</p> <p>String values in these same project types may also contain font information in curly brackets—for example, <b>{&amp;MSSansBold8}OK</b>. The font information indicates style details that should be used to display the strings at run time.</p>

**Table 190** ■ Columns in the String Editor View (cont.)

Column	Description
<b>Comments</b>	This column contains an internal note about the string entries. The comments are not displayed at run time.
<b>Modified</b>	This column lists the date and time that the string entry was last modified.

## Media View

**Project** ■ The Media view is available in the following project types:

- Advanced UI
- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- Suite/Advanced UI

The final step in creating your installation project is to build and test your installation. InstallShield provides you with many different media types to choose from, as well as the ability to test your installation from within InstallShield.

## Path Variables

**Project** ■ The Path Variables view is available in the following project types:

- Advanced UI
- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- QuickPatch
- Suite/Advanced UI
- MSIX

With path variables, you can define commonly used paths in a central location so that you do not need to change every source file's path each time you move the project or change the directory structure.

## Upgrades

**Project** ▪ The Upgrades view is available in the following project types:

- Basic MSI
- InstallScript MSI
- MSI Database
- Transform

The Upgrades view provides a visual, integrated method for adding and authoring settings within the Upgrade table of your .msi database.

## Releases

**Project** ▪ The Releases view is available in the following project types:

- Advanced UI
- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- Suite/Advanced UI

The Releases view enables you to build different configurations of your installation, test the user interface, or launch your installation for a trial run.

## Patch Design

**Project** ▪ The Patch Design view is available in the following project types:

- Basic MSI
- InstallScript MSI

In the Patch Design view, you can create a Windows Installer patch package (.psp) to update your application on an end user's system.

## Path Variables View

**Project** ▪ The Path Variables view is available in the following project types:

- Advanced UI
- Basic MSI
- DIM

- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*
- *Merge Module*
- *QuickPatch*
- *Suite/Advanced UI*
- *MSIX*
- *MSIX Modification Package*

The traditional way to link to source files in an installation project is to create a reference to that file using a hard-coded path. For example, you might have a source file called **Program.exe** located at **C:\Work\Files** that you want to include in your installation.

## Using Hard-Coded Paths

If you use hard-coded paths, you have to enter the entire path every time you want to associate a source file from that directory. If you move the file to another directory, you have to change the hard-coded path as it appears in your installation project. If your installation consisted of a small number of source files, this might not be a problem. Unfortunately, some installations contain thousands of files that all need to be remapped if you change the folder structure or migrate the project to a different machine.

## Using Path Variables

With path variables, you can define commonly used paths in a central location so that you do not need to change every source file's path each time you move the project or change the directory structure. In the previous example, if you keep all of your application's source files in various subfolders under **C:\Work\Files**, you could create one variable that points to the Files folder—**<MyFiles>**. If you want to include a file that is in **C:\Work\Files\Images**, you enter **<MyFiles>\Images**. If you move your files to **D:\Work\Files**, you can go to one place, your variable **<MyFiles>**, and change the folder that it points to.

All path variables can be viewed and modified in the Path Variables view. You can use path variables in almost any location in InstallShield where you link to source files, such as in the Dialog Editor, dynamic file links, and the release location. Instead of entering the path variables yourself, you can have InstallShield recommend them whenever you browse to a path.

---

**Note** - Path variables are used during the development of your installation project. These paths do not apply to the target machines where the application is being installed. Rather, they are used to link to source files for your installation project. When the project is built, those links are evaluated and the files they point to will be built into the installation.

## Path Variables Types

There are four types of path variables that you can use. Each type functions somewhat differently from the others. Regardless of the path variable type you use, the variable name is provided in the same manner throughout InstallShield.

**Table 191** ▪ Types of Path Variables

Variable Type	Description
	Predefined path variables are path variables that point to some of the most commonly used folders. Unlike other types of path variables, these values cannot be edited in InstallShield. For more information, see <a href="#">Predefined Path Variables</a> .
	The values of registry-based path variables are derived from the registry keys you created. After creating the registry key, you need to set a path variable to this key. For more information, see <a href="#">Registry Path Variables</a> .
	Environment path variables are based on the values of your system's environment variables. You can set an environment path variable to an existing environment variable. For more information, see <a href="#">Environment Path Variables</a> .
	Standard, or user-defined, path variables are defined through InstallShield. You can specify a path variable such as <MyFiles> with a value of C:\Work\Files. These variables do not rely on any outside sources, such as the registry or system paths. For more information, see <a href="#">Standard Path Variables</a> .

You also have the option of converting existing static links to path variables with the [Convert Source Paths Wizard](#). This wizard scans your installation project for static links and changes those links to path variables, which makes your project more easily portable.

## Working with the Path Variables View

The Path Variables view consists of the following elements:

- A row of buttons and other controls
- A group box area (below the row of buttons)
- A list of path variables that are defined in your project

The following table describes all of the buttons and other controls that are displayed in the Path Variables view.

**Table 192** ▪ Controls in the Path Variables View

Name of Control	Icon	Description
<b>New Path Variable</b>		<p>Adds a new standard path variable to your project.</p> <p>To create a registry path variable or an environment variable, you can click the arrow next to this button, and then click the appropriate command. To learn more, see <a href="#">Creating and Defining a Custom Path Variable</a>.</p>

**Table 192** ▪ Controls in the Path Variables View (cont.)

Name of Control	Icon	Description
<b>Delete Selected Path Variables</b>		Deletes the selected variable or variables.
<b>Refresh</b>		Refreshes the list of variables in the view.
<b>Expand All Groups</b>		Shows all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.
<b>Collapse All Groups</b>		Hides all of the rows in the groups if you are using groups to organize the rows in a hierarchical format.
<b>Show Group Box</b>		Shows or hides the group box area below the row of buttons in this view.
<b>Search Grid</b>		Dynamically filters the path variables that are displayed in the Path Variables view according to the string that you specify in this search box. As you type a string in this box, InstallShield hides all of the rows that do not contain it.
<b>Path Variables View Help</b>		Displays the help for the Path Variables view.
<b>Drag a column header here to group that column</b>		<p>Use this group box area to group rows in the view. The view supports multiple levels of grouping simply by dragging the column headings and dropping them onto the group box. InstallShield displays the rows in the view hierarchically according to column arrangement in the group box.</p> <p>To learn more, see <a href="#">Working with the Group Box Area in Various Views</a>.</p>

The following table describes each of the columns in the Path Variables view.

**Table 193** ▪ Columns in the Path Variables View

Column	Description
<b>Name</b>	<p>In this column, enter the name of your variable. You do not need to enter angle brackets, but the path variable is displayed in angle brackets whenever it is used in a path.</p> <p>For example, if your variable is named <i>MyRegVar</i> and a component's files are <a href="#">linked</a> to the folder contained in its value, the component's Link To folder shows <b>&lt;MyRegVar&gt;</b>.</p>

**Table 193** ■ Columns in the Path Variables View (cont.)

Column	Description
<b>Defined Value</b>	<p>In this column, define the value of the path variable.</p> <p><b>For Standard Path Variables</b></p> <p>For standard variables, enter the directory to which you would like your variable to point.</p>  <p><b>Note</b> ■ You can also refer to other path variables in the defined value by enclosing the referenced path variable name in angled brackets. For example, if you have a path variable called <i>MyRoot</i> with a value of <i>C:\</i>, you can refer to it in a path variable definition for another variable, such as <i>Games</i>. The actual path for the <i>Games</i> variable might be <i>C:\Programs\GameFiles</i>, but you can define <i>Games</i> as <i>&lt;MyRoot&gt;\Programs\GameFiles</i>. However, if you attempt to self-reference a path variable, the literal string is used instead. For example, defining <i>Games</i> as <i>&lt;MyRoot&gt;\Programs\&lt;Games&gt;</i> actually results in <i>Games</i> defined as <i>C:\Programs\&lt;Games&gt;</i>.</p> <p><b>For Registry Path Variables</b></p> <p>Enter the complete registry key, with the final “subkey” being the name of the value whose data contains the folder. For example, define <i>MyRegVar</i> as follows:</p> <pre>HKEY_LOCAL_MACHINE\SOFTWARE\TestKey\TestValue</pre> <p>Assume that <i>TestKey</i> has the following subkey and values:</p> <pre>[HKEY_LOCAL_MACHINE\SOFTWARE\TestKey] @="C:\\MyPath1" "TestValue"="C:\\MyPath2" [HKEY_LOCAL_MACHINE\Software\TestKey\TestValue] @="C:\\MyPath3"</pre> <p>Even though <i>HKEY_LOCAL_MACHINE\SOFTWARE\TestKey</i> has a subkey called <i>TestValue</i>, <i>MyRegVar</i> points to the value <i>TestValue</i>, and the current value will be <i>C:\\MyPath2</i>. (Note, however, that if a value named <i>TestValue</i> does not exist, <i>InstallShield</i> reads the default value (<i>C:\\MyPath3</i>) of the subkey <i>HKEY_LOCAL_MACHINE\SOFTWARE\TestKey\TestValue</i>.)</p> <p><b>For Environment Path Variables</b></p> <p>For environment path variables, enter the name of the variable as it appears on the Environment dialog box.</p>
<b>Current Value</b>	<p>This is a read-only column that contains the actual path that the variable points to. This is a useful reference for environment and registry path variables, since they are defined outside <i>InstallShield</i>.</p>

**Table 193** ■ Columns in the Path Variables View (cont.)

Column	Description
<b>Test Value</b>	 <p><b>Project</b> ■ This column applies to the following project types:</p> <ul style="list-style-type: none"> <li>● Basic MSI</li> <li>● DIM</li> <li>● InstallScript MSI</li> <li>● Merge Module</li> </ul> <p>This column enables you to enter a hard-coded path that can be used when the registry path variable is resolved. To use test values in your release, you must select the <b>Use path variable test values</b> option on the <b>Advanced Settings</b> panel of the Release Wizard. This option is deselected by default. When this option is selected, the test value is used for all registry path variables. Otherwise, the test value is not used at all.</p>
<b>Type</b>	<p>This column shows the type of variable (predefined, standard, environment, or registry).</p> <p>Click a field in this column to change from one type of path variable to another. Note that you cannot change the type of a predefined path variable.</p>

**Tip** ■ To override the value of a custom standard path variable, an environment path variable, or a registry path value for a particular release at build time, use the Path Variable Overrides setting on the Build tab for that release. To learn more, see [Overriding the Value of a Custom Path Variable for a Release](#).

## Upgrades View

**Project** ■ The Upgrades view is available in the following project types:

- Basic MSI
- InstallScript MSI
- MSI Database
- Transform

*Project-specific differences are noted where appropriate.*

The Upgrades view provides a visual, integrated method for adding and authoring settings within the Upgrade table of an .msi database.

To add an upgrade item, right-click the Upgrade Windows Installer Setup node. The available options are:

**Table 194** ■ Upgrades View Options

Option	Description
<b>Major Upgrade Item</b>	<p>A major upgrade effectively uninstalls the existing installation of a product, and then installs the latest product version. A major upgrade is appropriate for substantial installation architecture changes that may or may not change the major version number of the product (such as upgrading version 1.1.0 to version 2.0.0). A major upgrade is required if any of the following are true:</p> <ul style="list-style-type: none"> <li>● An existing component's component code has changed, or a component has been removed from the product tree.</li> <li>● The key file of an existing component has changed.</li> <li>● An existing feature has been moved in the product tree, or deleted from the product tree.</li> <li>● The name of the .msi file has changed.</li> </ul> <p>For more information, see <a href="#">Creating Major Upgrades</a>.</p>
<b>Minor Upgrade Item</b>	<p>Small updates and minor upgrades are functionally identical except the product version changes for a minor upgrade, but not a small update. A minor upgrade installs over an existing application while a major upgrade effectively uninstalls the existing installation of a product, and then installs the newer product version.</p> <p>The functionality that is required to install a minor upgrade is in the Setup.exe launcher. For more information, see <a href="#">Run-Time Behavior for Minor Upgrades</a>.</p> <p>For more information, see <a href="#">Creating Minor Upgrades</a>.</p>
<b>Automatic Upgrade Item</b>	 <p><b>Note</b> ■ The Automatic Upgrade Item option takes into account potential future changes in the product code and handles both major and minor upgrades. If you do not know the difference between upgrade types and/or do not care, consider choosing this upgrade option.</p> <p>When you add an automatic upgrade item, the build engine determines which settings need to be populated into your installation to perform a successful upgrade of your previous installation. This option does not require any additional authoring of advanced settings on your part. For more information, see <a href="#">Configuring InstallShield to Automatically Determine the Upgrade Type</a>.</p>

**Table 194** ▪ Upgrades View Options (cont.)

Option	Description
<b>Validate All Items</b>	<p>This option enables you to perform validation on the latest release or browse for a particular package to validate against a different release. For more information, see <a href="#">Validating Upgrades, Patches, and QuickPatch Packages</a>.</p>  <p><b>Note</b> ▪ To validate a specific built upgrade item on demand, right-click the item and then click <i>Validate Item</i>.</p>  <p><b>Tip</b> ▪ Whenever you make changes in the Upgrades view, remember to rebuild your package before performing validation.</p>

## Common Tab

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI
- MSI Database
- Transform

*Project-specific differences are noted where appropriate.*

The Common tab for the Upgrade Windows Installer Setup item in the Upgrades view contains global settings for both major and minor upgrades.

### Small/Minor Upgrade Settings

Small updates and minor upgrades are functionally identical except the product version changes for a minor upgrade, but not a small update. A minor upgrade installs over an existing application while a major upgrade effectively uninstalls the existing installation of a product, and then installs the newer product version.

The functionality that is required to install a minor upgrade is in the Setup.exe launcher. For more information, see [Run-Time Behavior for Minor Upgrades](#). To specify the behavior that should occur when Setup.exe detects that an earlier version of the product is present at run time on a target system, select the appropriate option:

**Table 195** ▪ Small and Minor Upgrade Options

Option	Description
<b>Disable</b>	When you choose this option, you are required to detect the upgrade scenario and ensure that the latest version of your setup is running in upgrade mode.

**Table 195** ▪ Small and Minor Upgrade Options (cont.)

Option	Description
<b>Don't prompt the user; just install the upgrade</b>	This option automatically starts the setup in minor upgrade mode.
<b>Prompt</b>	Choosing this option will prompt the “do you want to continue dialog.” If you choose yes, the setup will begin in upgrade mode. If you choose no, you will cancel the setup in upgrade mode.

## Major Upgrade Settings

When you are performing a major upgrade, you can select how you want the upgrade to proceed. You can choose from the following options:

**Table 196** ▪ Options for Performing a Major Upgrade

Option	Description
<b>Completely uninstall old setup before installing new setup</b>	This is the most reliable setting, however, it is the least efficient. It will first remove all the files, registry entries, shortcuts, and settings of the old setup. Then it will apply new data from the latest version of your setup.
<b>Install setup then remove unneeded files</b>	<p>This is the most efficient setting, but it requires that you follow certain authoring rules. This option will first install the setup, and then remove all unnecessary files, registry entries, shortcuts, and settings after installing the latest version of your setup.</p> <p></p> <p><b>Caution</b> ▪ The removal of unnecessary resources relies on component reference counts being accurate. Keep in mind that reference counts occur at the component level. Therefore, you should be careful when you delete a component and move the associated resource to a different component. You do not want to choose this option if you have moved existing resources to different components.</p>
<b>Rollback all changes if removal of old files fails</b>	In the event of upgrade failure, the machine will be returned to its previous good state. This option will undo the changes made by the uninstallation of a previous version and the installation of the latest version.

**Note** ▪ This setting controls the sequencing of the `RemoveExistingProducts` action in the `Install Execute Sequence`. For more details, see [RemoveExistingProducts](#) in the Windows Installer Help Library.

## Advanced Tab

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI
- MSI Database
- Transform

*Project-specific differences are noted where appropriate.*

The Advanced tab presents specific settings for major and minor upgrades in addition to some shared settings.

**Table 197** ▪ Advanced Settings for the Upgrade Windows Installer Setup Item in the Upgrades View

Property	Description
<b>Upgrade Code</b>	<p>This setting indicates the GUID that uniquely identifies the product family to which this product belongs. The upgrade code should be consistent across different versions and languages of a family of related products so that Windows Installer can use it to search for related versions of the product that are already installed.</p> <p>For more information on configuring this setting, see <a href="#">Setting the Upgrade Code</a>.</p> <p>For more information on how the upgrade code is used in upgrades, see <a href="#">Major Upgrade vs. Minor Upgrade vs. Small Update</a>.</p>
<b>On Upgrade</b>	<p>Specify the behavior that you want to occur if Setup.exe detects that an earlier version of your product is present on a target system. Available options are:</p> <ul style="list-style-type: none"> <li>• <b>Disable</b>—If an earlier version is present, Setup.exe does not display a message box to inform end users that an upgrade will occur. In addition, Setup.exe does not set the REINSTALLMODE and REINSTALL properties; therefore, these properties must be set through other methods. Otherwise, Windows Installer uses the cached copy of the .msi database and ignores the changes that are present in the newer version.</li> <li>• <b>Don't prompt the user; just install the upgrade</b>—If an earlier version is present, Setup.exe sets the REINSTALLMODE to <b>voums</b> and the REINSTALL property to <b>ALL</b>; as a result, the installation runs in upgrade mode. If an earlier version is not present, the installation behaves as a first-time installation.</li> <li>• <b>Prompt</b>—If an earlier version is present, Setup.exe displays a message box to inform end users that an upgrade will occur; the message box enables them to proceed with the upgrade or exit without upgrading. If an end user chooses to proceed, Setup.exe sets the REINSTALLMODE to <b>voums</b> and the REINSTALL property to <b>ALL</b>, and the installation runs in upgrade mode. This is the default value.</li> </ul>

**Table 197** ■ Advanced Settings for the Upgrade Windows Installer Setup Item in the Upgrades View (cont.)

Property	Description
<b>Style</b>	<p>Specify how you want your major upgrade to proceed if the installation detects that an earlier version of your product is present on a target system. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Complete Uninstall Then Reinstall</b>—This is the most reliable setting; however, it is the least efficient. This option first removes all the files, registry entries, shortcuts, and settings of the old installation. Then it applies new data from the latest version of your installation.</li> <li>● <b>Install Then Remove Unused Files</b>—This is the most efficient setting, but it requires that you follow certain authoring rules. This option first installs the new version; then it removes all unnecessary files, registry entries, shortcuts, and settings that are not part of the new version.</li> <li>● <b>Install Then Remove Unused Files, with Rollback</b>—This is the most efficient setting, but it requires that you follow certain authoring rules. This option first installs the new version; then it removes all unnecessary files, registry entries, shortcuts, and settings that are not part of the new version.</li> </ul> <p>If the upgrade fails, the Rollback option returns the target system to its previous good state. This option undoes the changes that were made by the uninstallation of the earlier version and the installation of the latest version.</p>
	 <p><b>Caution</b> ■ Note for both of the options that first install and then removed unused resources: The removal of unnecessary resources relies on component reference counts being accurate. Reference counts occur at the component level. Therefore, you should be careful when you delete a component and move the associated resource to a different component. If you have moved existing resources to different components, do not choose either of these install-then-remove options.</p>

## Major Upgrade Item: Common Tab

**Project** ■ This information applies to the following project types:

- Basic MSI
- InstallScript MSI
- MSI Database
- Transform

A major upgrade is required when the product code for an installation differs from the product code of the installation that it needs to upgrade. For help in determining whether you need to change the product code, see [Major Upgrade vs. Minor Upgrade vs. Small Update](#).

At run time, a major upgrade effectively uninstalls the previous version of your application before installing the newest version of your application.

The Common tab contains the most frequently used settings of a major upgrade item. For more detailed settings, use the Advanced tab.

## Major Upgrade

Major upgrades use an upgrade code to detect previous versions of an application. The upgrade code for an installation groups that installation into a specific product family. If you want to target specific installations within that product family, you can configure the product version attribute of this upgrade item.

**Table 198** ▪ Options for Major Upgrade Items

Option	Description
<b>Products Sharing My Upgrade Code</b>	If you select this option for your major upgrade item, InstallShield sets the value of this setting on the Advanced tab to the placeholder value of <b>{00000000-0000-0000-0000-000000000000}</b> . InstallShield uses the appropriate upgrade code value instead of the placeholder value in the .msi package that it generates at build time.
<b>Products Having Another Upgrade Code</b>	If you select this option for your major upgrade item, you can either specify the upgrade code of the base package that this major upgrade item will target, or you can click the ellipsis button (...) to browse to the package. If you browse to the package, InstallShield identifies the upgrade code of the package that you select and uses it in this setting.

## Product Version

Choose a particular product version to target or define a range. You can choose from the following selections:

**Table 199** ▪ Options Associated with Product Version

Option	Description
<b>Any earlier version</b>	<p>To update the product on target systems if its version number is earlier than the product version of the currently open project, select this option.</p> <p>If you select this option for your major upgrade item, InstallShield sets the value of the Maximum Version setting on the Advanced tab to the placeholder value of <b>***ALL_VERSIONS***</b>. InstallShield uses the product version of the currently open project instead of the placeholder value in the .msi package that it generates at build time.</p>

**Table 199** ▪ Options Associated with Product Version (cont.)

Option	Description
<b>Within a specific range of versions (Minimum Version - Maximum Version)</b>	<p>To specify a range of product versions that you want the upgrade to target, select this option. Then, specify the minimum version in the left box, and the maximum version in the right box. The Version Range Inclusive check box lets you optionally include or exclude the specified version numbers in the range of target versions.</p> <p>For example, a minimum version of 1.00 and a maximum version of 4.00 results in an installation that upgrades any existing installation in the specified product family that has a version number between 1.00 and 4.00. If you select the Version Range Inclusive check box, the version search also checks for version 1.00 and version 4.00, and upgrades those versions if they are present.</p>
<b>Version Range Inclusive</b>	<p>To include both the minimum and maximum version numbers in the range of versions that the upgrade targets (instead of just the version numbers within the specified minimum-to-maximum range), select this check box.</p> <p>For example, a minimum version of 1.00 and a maximum version of 4.00 results in an installation that upgrades any existing installation in the specified product family that has a version number between 1.00 and 4.00. If you select the Version Range Inclusive check box, the version search also checks for version 1.00 and version 4.00, and upgrades those versions if they are present.</p> <p>To include only the minimum version number or only the maximum version number, but not both, use the Include Minimum Version setting or the Include Maximum Version setting on the Advanced tab.</p> <p>This check box is available if the <b>Within a specific range of versions</b> option is selected.</p>
<b>With a specific version</b>	<p>To target only a single previous version of the product, select this option, and then enter the appropriate version number.</p>

## Major Upgrade Item: Advanced Tab

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI
- MSI Database
- Transform

The Advanced tab exposes more advanced level configurations, in addition to the settings in the Common tab. Click on each setting in the properties grid to configure the following settings.

**Table 200** ▪ Advanced Properties for Major Upgrade Items

Property	Description
<b>Upgrade Code</b>	<p>This setting indicates the GUID that uniquely identifies the product family to which this product belongs. The upgrade code should be consistent across different versions and languages of a family of related products so that Windows Installer can use it to search for related versions of the product that are already installed.</p> <p>If you select the <b>Products sharing my Upgrade Code</b> option on the Common tab for your major upgrade item, InstallShield sets the value of this setting on the Advanced tab to the placeholder value of <b>{00000000-0000-0000-0000-000000000000}</b>. InstallShield uses the appropriate upgrade code value instead of the placeholder value in the .msi package that it generates at build time.</p> <p>For more information on configuring this setting, see <a href="#">Setting the Upgrade Code</a>.</p> <p>For more information on how the upgrade code is used in upgrades, see <a href="#">Major Upgrade vs. Minor Upgrade vs. Small Update</a>.</p>
<b>Minimum Version</b>	<p>Enter the minimum product version that this upgrade should update. Version numbers should be in the format <i>aaa.bbb.ccccc</i>, where <i>aaa</i> represents the major version number, <i>bbb</i> represents the minor version number, and <i>cccc</i> represents the build number. The maximum value for the <i>aaa</i> and <i>bbb</i> portions is 255. The maximum value for <i>cccc</i> is 65,535.</p> <p></p> <p><b>Note</b> ▪ Only the first three version fields are used when making product version comparisons. Windows Installer is unable to distinguish between product versions that differ only in their fourth field. To learn more, see <a href="#">Specifying the Product Version</a>.</p> <p>By default, each project includes an ISPreventDowngrade major upgrade item, which enables you to prevent end users from being able to install the current version of your product over a future major version of the same product. For this default major upgrade item, the default entry in the Minimum Version setting is the following placeholder value:</p> <p><b>***ALL_VERSIONS***</b></p> <p>InstallShield uses the product version of the currently open project instead of the aforementioned placeholder value in the .msi package that it generates at build time. To learn more about the ISPreventDowngrade support, see <a href="#">Preventing the Current Installation from Overwriting a Future Major Version of the Same Product</a>.</p>

**Table 200** ▪ Advanced Properties for Major Upgrade Items (cont.)

Property	Description
<b>Include Minimum Version</b>	This setting is useful when you are specifying upper and lower bounds for a range of product versions that your upgrade supports. To include the minimum version number in the range, select Yes.
<b>Maximum Version</b>	<p>Enter the maximum product version that this upgrade should update. Version numbers should be in the format <i>aaa.bbb.ccccc</i>, where <i>aaa</i> represents the major version number, <i>bbb</i> represents the minor version number, and <i>cccc</i> represents the build number. The maximum value for the <i>aaa</i> and <i>bbb</i> portions is 255. The maximum value for <i>cccc</i> is 65,535.</p>  <p><b>Note</b> - Only the first three version fields are used when making product version comparisons. Windows Installer is unable to distinguish between product versions that differ only in their fourth field. To learn more, see <a href="#">Specifying the Product Version</a>.</p> <p>If you select the <b>Any earlier version</b> option on the Common tab for your major upgrade item, InstallShield sets the value of this setting on the Advanced tab to the following placeholder value:</p> <p><b>***ALL_VERSIONS***</b></p> <p>InstallShield uses the product version of the currently open project instead of the placeholder value in the .msi package that it generates at build time.</p>
<b>Include Maximum Version</b>	This setting is useful when you are specifying upper and lower bounds for a range of product versions that your upgrade supports. To include the minimum version number in the range, select Yes.
<b>Language</b>	<p>Specify a comma-separated list of languages that you want the upgrade to target or avoid targeting, and then use the Exclude Specified Languages setting to specify whether you want to exclude the languages that are configured in this setting.</p> <p>The language identifiers should be specified in decimal format. For example, specify <b>1033</b> for English (United States).</p>
<b>Exclude Specified Languages</b>	<p>Specify whether you want the installation to target or avoid targeting the languages that are identified in the Languages setting. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>No</b>—If the language of the product on the target system matches one of the languages that are specified in the Language setting, and if the other requirements such as the version number are met, the installation performs an upgrade.</li> <li>● <b>Yes</b>—If the language of the product on the target system does not match any of the languages that are specified in the Language setting, and if the other requirements such as the version number are met, the installation performs an upgrade.</li> </ul>

**Table 200** ▪ Advanced Properties for Major Upgrade Items (cont.)

Property	Description
<b>Detect Only</b>	<p>Specify whether you want the installation to detect that an upgrade needs to occur without actually performing the upgrade. The default value is No.</p> <p>If Windows Installer determines that a related product is installed on the target system, it adds the product code of that related product to the property that is specified in the Detect Property setting.</p>
<b>Detect Property</b>	<p>If Windows Installer determines that a related product is installed on the target system, it adds the product code of that related product to the property that you specify in this setting.</p> <p>You can use the property that you specify in conditional statements to control the flow of the installation or even stop the installation altogether.</p> <p>Windows Installer sets this property when the FindRelatedProducts action runs in the installation sequences.</p>
<b>Only Remove Specified Features</b>	<p>If you want the installation to remove the entire earlier version of the product from target systems, leave this setting blank.</p> <p>If you want the installation to remove only some features of the earlier version of the product from target systems instead of removing the entire product, specify a comma-delimited list of the names of the features to be removed. Note that the installation does not remove any features if you specify formatted text that evaluates to an empty string.</p> <div data-bbox="651 1125 696 1169" data-label="Image"> </div> <p><b>Caution</b> ▪ <i>If you specify a value in this setting, the installation will not completely uninstall the earlier version of the product. Therefore, you will be left with two entries in Add or Remove Programs.</i></p>
<b>Continue On Failure</b>	<p>Specify whether you want to proceed with the installation even if the uninstallation of the earlier version fails. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—The installation of the new version occurs, regardless of whether the uninstallation of the earlier version is successful.</li> <li>● <b>No</b>—The installation of the new version occurs only if the uninstallation of the earlier version is successful. This is the default value.</li> </ul>
<b>Migrate Feature States</b>	<p>Specify whether you want the installation to detect the feature states of the currently installed product and use these same states when applying the upgrade.</p> <p>This functionality may be useful if the feature tree in the new version of the product has not changed much from the original.</p>

## Minor Upgrade/Small Update Item Settings

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Minor and small upgrades are fundamentally the same except with minor upgrades, the product version changes.

You need to apply a small/minor upgrade any time you are upgrading a setup that has the same product code as the latest version of your setup. You are not required to change the product code of a setup unless you delete a component from a feature or you delete a feature from a setup.

**Note** ▪ If you move a component from one feature to another, you are essentially deleting that component from the first feature and therefore must change the product code.

For upgrade scenarios in which the setup's product code has changed, you must apply a major upgrade.

This tab exposes the following settings:

**Table 201** ▪ Options for Minor and Small Upgrade Items

Option	Description
<b>Setup to Upgrade</b>	The functionality required to install a minor upgrade is in Setup.exe, which you must include in order for a minor upgrade to work properly. The setup specified at build time will also be used to perform upgrade validation. The build will also verify that the referenced setup can be updated using a minor upgrade. Note that the build will warn you if you do not include setup.exe when you build your release.
<b>Release Flags</b>	Specify release flags to include and exclude features depending on the type of release.

## Automatic Upgrade Item Settings

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

**Note** ▪ This is the preferred method for configuring upgrade settings. This option takes into account any potential future changes in the product code and handles both major and minor upgrades. If you do not know the difference between upgrade types and/or do not care, then choose this upgrade option.

When you add an automatic upgrade item, the build engine determines which settings need to be populated into your setup to perform a successful upgrade of your previous setup. This option does not require any additional authoring of advanced settings on your part.

You can configure the following options for an automatic upgrade item in the Upgrades view:

**Table 202** ▪ Options for Automatic Upgrade Items

Option	Description
<b>Setup to Upgrade</b>	Enter the path to the setup project that needs to be upgraded or click the browse button to browse for it.
<b>Release Flags</b>	Associating a release flag with the automatic upgrade item will allow you to optionally exclude it from the build on a per release basis.

## Releases View

**Project** ▪ The Releases view is available in the following project types:

- Advanced UI
- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- Suite/Advanced UI
- MSIX

After you have completely designed your project in InstallShield, you are ready to build a release for testing and, ultimately, distribution to end users. The Releases view contains settings that indicate how InstallShield should build your release.

When you build a release, InstallShield takes all of the information from your project and compiles it into a Windows Installer installation package (.msi file), merge module (.msm file), or an executable file and related files, depending on the project type, that are capable of installing your product onto any supported Windows platform.

**Tip** ▪ In some project types, you can also use the [Release Wizard](#) to configure the settings for your release.

## Product Configuration Settings

**Project** ▪ Product configurations are available in the following project types:

- Basic MSI

- *InstallScript MSI*
- *Merge Module*

For Basic MSI, InstallScript MSI, and Merge Module projects, every release that you build belongs to a product configuration. A product configuration provides a means for grouping together releases that share similar properties, such as the product name, product code, and package code.

Each product configuration has two tabs:

- **General tab** (available for Basic MSI, InstallScript MSI, and Merge Module projects)
- **Multiple Instances tab** (available for Basic MSI projects)

## General Tab for a Product Configuration

**Project** ▪ The General tab for a product configuration is available in the following project types:

- *Basic MSI*
- *InstallScript MSI*
- *Merge Module*

The General tab of each product configuration has the following settings, primarily for overriding other settings in the resulting releases:

**Table 203** ▪ Product Configuration Settings

Setting	Project Type	Description
<b>Product Name</b>	Basic MSI, InstallScript MSI, Merge Module	<p>To override the product name in each release that you build under this product configuration, enter a new name.</p> <p>For information on how the product name is used, see <a href="#">Specifying a Product Name</a>.</p> <p>Changing the product name in this setting does not affect any built releases. You must rebuild each release to see the changes reflected in the product name and in the project's folders and files.</p>

**Table 203** ■ Product Configuration Settings (cont.)

Setting	Project Type	Description
<b>Product Version</b>	Basic MSI, InstallScript MSI, Merge Module	<p>To override the product version in each release that you build under this product configuration, enter the version number. The version must contain only numbers. It is typically in the format <i>aaa.bbb.ccccc</i> or <i>aaa.bbb.ccccc.ddddd</i>, where <i>aaa</i> represents the major version number, <i>bbb</i> represents the minor version number, <i>cccc</i> represents the build number, and <i>dddd</i> represents the revision number. The maximum value for the <i>aaa</i> and <i>bbb</i> portions is 255. The maximum value for <i>cccc</i> and <i>dddd</i> is 65,535.</p> <p>Note that although you can include the fourth field (<i>dddd</i>), the installation does not use this part of the product version to distinguish between different product versions. To learn more, see <a href="#">Specifying the Product Version</a>.</p> <p>If your release includes a Setup.exe file, the product version that you specify is displayed on the Properties dialog box for Setup.exe. For more information, see <a href="#">Customizing File Properties for the Setup Launcher</a>.</p>
<b>Package Code</b>	Basic MSI, InstallScript MSI, Merge Module	<p>To override the package code that is entered in the General Information view, enter a new GUID. To have InstallShield generate a different GUID for you, click the <b>Generate a new GUID</b> button ({...}) in this setting.</p> <div data-bbox="878 1199 915 1241" data-label="Image"> </div> <p><b>Note</b> ■ This package code is ignored if Yes is selected for the Generate Package Code setting.</p>

**Table 203** ■ Product Configuration Settings (cont.)

Setting	Project Type	Description
<b>Generate Package Code</b>	Basic MSI, InstallScript MSI, Merge Module	<p>Specify whether you want InstallShield to generate a new package code every time that a release under this product configuration is built:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—InstallShield generates a new package code at build time and includes it in the .msi package. The package code that is displayed in the Package Code setting in the General Information view does not change.</li> <li>● <b>No</b>—InstallShield does not generate a new package code at build time. If you enter a package code for the product configuration, that package code is used. If you do not specify a package code for the product configuration, InstallShield uses the package code that is set in the General Information view.</li> </ul>
<b>Product Configuration Flags</b>	Basic MSI, InstallScript MSI, Merge Module	<p>Enter the release flags for the features, InstallShield prerequisites, and chained .msi packages that you would like to include in the releases that are associated with this product configuration. Separate multiple flags with a comma.</p> <p>Product configuration flags enable you to customize your installation by including or excluding certain features, InstallShield prerequisites, and chained .msi packages in each release that you build under this product configuration. Note that you can also specify release flags at the release level.</p> <p>For more information on filtering features, InstallShield prerequisites, and chained .msi packages, see <a href="#">Release Flags</a>.</p>

**Table 203** ■ Product Configuration Settings (cont.)

Setting	Project Type	Description
<b>Subject</b>	Basic MSI, InstallScript MSI, Merge Module	<p>To override the value of the Subject setting in the General Information view for every release you build under this product configuration, enter the name of the product.</p> <p>The value that you enter is used on the Summary tab of the Properties dialog box that is displayed if you right-click the Windows Installer database and then click Properties.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Title</b>	Basic MSI, InstallScript MSI, Merge Module	<p>To override the value of the Title setting in the General Information view for every release you build under this product configuration, enter a new title.</p> <p>The value that you enter is used on the Summary tab of the Properties dialog box that is displayed if you right-click the Windows Installer database and then click Properties.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>

**Table 203** ■ Product Configuration Settings (cont.)

Setting	Project Type	Description
<b>Template Summary</b>	Basic MSI, InstallScript MSI, Merge Module	<p>To override the Template Summary setting in the General Information view for a specific product configuration, specify the processor type and default language that your installation supports. List the processor type first, followed by your installation's default language, and separate them with a semicolon. If you have multiple entries in the language category, separate them with a comma.</p> <p>For example, if your installation runs only on Intel processors and English-based systems, enter <b>Intel1;1033</b>. If your product runs on x64 processors and supports English and German, enter <b>x64;1033,1031</b>. For the language portion of this setting, use the number 0 if your installation is language neutral.</p> <p>Valid processor values include:</p> <ul style="list-style-type: none"> <li>● Intel</li> <li>● Intel64</li> <li>● x64</li> </ul> <p>Note that you can specify only one processor value.</p> <p>For more information, see <a href="#">Using the Template Summary Property</a>.</p> <p>If the target machine does not meet the requirements that you specify for this setting, an error message is displayed and the installation exits.</p>

**Table 203** ■ Product Configuration Settings (cont.)

Setting	Project Type	Description
<b>Architecture Validation</b>	Basic MSI, Merge Module	<p>Select the type of architecture validation that you want to use at build time. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Lenient</b>—This type of validation lets you build x86 and x64 .msi packages (as indicated by the Template Summary property), and mix x86 and x64 product files and custom action files in both of those types of packages.</li> </ul> <p>Lenient architecture validation does not trigger build errors or warnings if the architecture that the Template Summary property specifies does not match the architecture for one or more of the product files or the custom action files that are being included in the release.</p> <p>At build time, the ISRedistPlatformDependentFolder and ISRedistPlatformDependentExpressFolder path variables point to the x86 locations that contain x86 InstallShield custom action DLLs. InstallShield includes these x86 custom action DLLs in the build if your project includes support that requires these custom actions.</p> <p>Lenient is the default option.</p>

**Table 203** ■ Product Configuration Settings (cont.)

Setting	Project Type	Description
<b>Architecture Validation (cont.)</b>		<ul style="list-style-type: none"> <li>● <b>Strict</b>—With this type of validation, InstallShield attempts to build a pure x86 or pure x64 .msi package, depending on whether the Template Summary property specifies Intel (for x86) or x64.</li> </ul> <p>Strict validation may trigger build errors if the architecture that the Template Summary property specifies does not match the architecture for one or more of the custom action files that are being included in the release. This type of validation may also trigger build warnings if the architecture that the Template Summary property specifies does not match the architecture for one or more of the product files that are being included in the release.</p> <p>If the Template Summary property specifies Intel, the ISRedistPlatformDependentFolder and ISRedistPlatformDependentExpressFolder path variables point to the x86 locations that contain x86 InstallShield custom action DLLs. However, if the Template Summary property specifies x64 and you are using strict validation, these path variables point to the x64 locations that contain x64 InstallShield custom action DLLs. If your project includes support that requires any of these custom actions, InstallShield adds the appropriate x86 or x64 versions of the DLLs.</p> <p>To learn more, see <a href="#">Selecting the Appropriate Type of Architecture Validation for Builds</a>.</p>

**Table 203** ■ Product Configuration Settings (cont.)

Setting	Project Type	Description
<b>Comments</b>	Basic MSI, InstallScript MSI, Merge Module	<p>To override the Summary Information Stream Comments setting in the General Information view for a specific product configuration, enter any comments about your product. A typical value for this setting is as follows:</p> <p><b>This installer database contains the logic and data required to install MyProduct.</b></p> <p>The value that you enter is used on the Summary tab of the Properties dialog box that is displayed if you right-click the Windows Installer database and then click Properties.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>
<b>Schema</b>	Basic MSI, InstallScript MSI, Merge Module	<p>The schema version is an integer that identifies the minimum Windows Installer version that is required for the installation package.</p> <p>To override the Schema setting in the General Information view for a specific product configuration, enter the appropriate integer.</p> <p>For a minimum of Windows Installer 2.0, enter <b>200</b>. For a minimum of Windows Installer 3.0, enter <b>300</b>. For a minimum of Windows Installer 3.1, enter <b>301</b>. For a minimum of Windows Installer 4.5, enter <b>405</b>.</p> <p>If the end user's system has a Windows Installer version earlier than the minimum requirement that you specify for the Schema setting—for example, if you specify a schema value of 405 because your installation uses Windows Installer 4.5 features, but an end user has Windows Installer 3.1—the installation displays an error message and exits.</p> <p>The value that you enter for the Schema setting is used for the <a href="#">Page Count Summary property</a> of your Windows Installer database.</p>

**Table 203** ■ Product Configuration Settings (cont.)

Setting	Project Type	Description
<b>Product Code</b>	Basic MSI, InstallScript MSI	<p>To override the Product Code setting in the General Information view for a specific product configuration, enter a GUID that uniquely identifies this product. To have InstallShield generate a different GUID for you, click the <b>Generate a new GUID</b> button ({...}) in this setting.</p> <p>Since this code uniquely identifies your product, changing the product code after you have already distributed your release is not recommended.</p> <p>For more information, see <a href="#">Setting the Product Code in a Windows Installer-Based Project</a>.</p>
<b>Upgrade Code</b>	Basic MSI, InstallScript MSI	<p>To override the Upgrade Code setting in the General Information view for a specific product configuration, enter a GUID that can be used for your product's upgrade code. To have InstallShield generate a different GUID for you, click the <b>Generate a new GUID</b> button ({...}) in this setting.</p> <p>The upgrade code is a GUID that identifies a related set of products. The Windows Installer uses a product's upgrade code when performing major upgrades of an installed product. The upgrade code, stored in the UpgradeCode property, should remain the same for all versions of a product.</p> <p>For more information, see <a href="#">Setting the Upgrade Code</a>.</p>

**Table 203** ■ Product Configuration Settings (cont.)

Setting	Project Type	Description
<b>Preprocessor Defines</b>	Basic MSI, InstallScript MSI	<p>To override the Preprocessor Defines setting on the <b>Compile/Link</b> tab of the Settings dialog box for a specific product configuration, specify any preprocessor definitions.</p> <p>Use the following format, with no spaces before or after equal signs or commas:</p> <pre>MYVARIABLE1=123,MYVARIABLE2=456</pre> <p>You can test those types of constants in your script by using <code>#if</code> and <code>#ifdef</code> statements that control the flow of the script. For example, type MYVARIABLE in this box, and the code in the following <code>#ifdef</code> loop will be executed:</p> <pre>#ifdef MYVARIABLE     // Commands #endif</pre> <p>After you add or change a preprocessor definition in this box, you must compile your script for the addition or change to take effect.</p> <div data-bbox="878 1052 915 1098" data-label="Image"></div> <p><b>Note</b> ■ Many Windows API functions are declared in the header file <code>ISRTWindows.h</code>, which is automatically included when you include <code>Ifx.h</code> in your script. You can prevent the automatic definition of Windows APIs by placing the preprocessor constant <code>ISINCLUDE_NO_WINAPI_H</code> in the Preprocessor Defines box on the <b>Compile/Link</b> tab of the <b>Settings dialog box</b>.</p>

**Table 203** ■ Product Configuration Settings (cont.)

Setting	Project Type	Description
<b>MSI Package File Name</b>	Basic MSI, InstallScript MSI	<p>Specify the file name—without the period or the file extension—that InstallShield should use for the .msi file and—if applicable—the package definition file that it generates at build time. If this setting is blank, the product name is used.</p> <p>You can also include the value of a property from the Property Table in this field, as described in <a href="#">Setup File Name</a>.</p>  <p><b>Important</b> ■ <i>If you want to be able to release minor upgrades or small updates to update your product, the previous and latest versions of your installation must have the same .msi package name. Attempting to perform a minor upgrade or a small update when the .msi file name has changed can lead to Windows Installer run-time error 1316.</i></p>
<b>Setup File Name</b>	Basic MSI, InstallScript MSI	<p>Specify the file name—without the .exe file extension—that InstallShield should use for the setup launcher file that it generates at build time. If this setting is blank, InstallShield uses the default value of <i>Setup</i>, and the setup launcher file is called <i>Setup.exe</i>.</p> <p>You have the ability to customize the original file name property which is located in (Right Click&gt;Properties&gt;Details) for <i>setup.exe</i>.</p> <p>You can also include the value of a property from the Property Table in this field. For example, you could enter any of the following properties:</p> <pre> setup[ProductVersion] setup[CustomVersion] setup[ProductCode] setup[ProductCode][ProductVersion] </pre> <p>If you entered <b>setup[ProductVersion]</b>, it would result in a setup named <i>setup14.10.1234.exe</i>, for example.</p>

**Table 203** ■ Product Configuration Settings (cont.)

Setting	Project Type	Description
<b>64-Bit Setup Launcher</b>	Basic MSI	<p>Specify whether you want to build a 64-Bit Setup Launcher or a 32-Bit Setup Launcher.</p> <p>Select Yes to build the 64-Bit setup launcher. InstallScript custom actions are not supported with 64-Bit setup launcher.</p> <p>Select No to build the 32-Bit setup launcher. For more detail, see <a href="#">Building 64-Bit Setup Launcher</a>.</p>
<b>Include Custom Action Help</b>	Basic MSI, InstallScript MSI, Merge Module	<p>Specify whether InstallShield should stream the contents of each of the custom action help files into the .msi file every time that a release in the selected product configuration is built. The path to a custom action's help file is indicated in the Help File Path setting in the Custom Actions and Sequences view (in Basic MSI and InstallScript MSI projects) or the Custom Actions view (in Merge Module projects).</p> <p>Selecting Yes is helpful if system administrators deploy your product to enterprise environments; they sometimes need to know what the custom actions do. If you select Yes, the following tasks occur at build time:</p> <ul style="list-style-type: none"> <li>● InstallShield adds the ISCustomActionReference table to the .msi file that is being built. The contents of all of custom actions' help files that are specified in the Custom Actions and Sequences view are streamed into the Description column of this table.</li> <li>● If your project includes any merge modules that contain custom actions, the contents of the help files that are specified in the Custom Actions view of the merge module projects are also included in the ISCustomActionReference table.</li> </ul> <p>For more information, see <a href="#">Documenting the Behavior of Custom Actions</a>.</p>

## Multiple Instances Tab for a Product Configuration

**Project** ■ The Multiple Instances tab for a product configuration is available in Basic MSI projects.

For information on multiple-instance support for InstallScript projects, see [Running an InstallScript Installation Multiple Times](#).

Windows Installer allows only one instance of a product code to be installed in the machine context and only one instance to be installed in each user context. Windows Installer 3.x and later includes support for a product code-changing transform. This type of transform—called an instance transform—enables the same .msi package to be used to install multiple instances of the same product in the same context because it changes the product code for each instance.

To create an installation that lets end users install multiple instances of your product, use the Multiple Instances tab. This tab is where you define different instances of your product and configure the properties that are associated with each instance. At build time, InstallShield creates an instance transform for each instance and streams the instance transforms into the .msi package. At run time, the installation typically displays an instance selection dialog that lets end users specify whether they want to install a new instance or maintain an existing one.

**Caution** ▪ *Creating an installation that lets end users install multiple instances of a product on the same machine and in the same context requires sophisticated authoring and serious commitment on the part of the installation developer. This functionality is recommended for only advanced installation developers.*

## Release Settings

The settings for a release are organized by category on several different tabs in the Releases view:

- **Build Tab for a Release** (available for Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, and Suite/Advanced UI projects)
- **Setup.exe Tab for a Release** (available for Advanced UI, Basic MSI, InstallScript, InstallScript MSI, and Suite/Advanced UI projects)
- **Signing Tab for a Release** (available for Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, and Suite/Advanced UI projects)
- **Internet Tab for a Release** (available for Basic MSI, InstallScript, and InstallScript MSI projects)
- **Events Tab for a Release** (available for Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, and Suite/Advanced UI projects)
- **Appx/MSIX Tab for a Release** (available for Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, and Suite/Advanced UI projects)
- **Updates Tab for a Release** (available for Advanced UI and Suite/Advanced UI projects)
- **General Tab for MSIX Release** (available for MSIX projects)

### Build Tab for a Release

**Project** ▪ *The Build tab is available in the following project types:*

- *Advanced UI*
- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*

- *InstallScript Object*
- *Merge Module*
- *Suite/Advanced UI*

The Build tab is where you configure how InstallShield should package your release.

**Table 204** ■ Settings on the Build Tab

Setting	Project Type	Description
<b>Release Location</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	Enter the path to the top-level directory where your release will start to be built, or click the ellipsis button (...) to browse to the location.
<b>Build Location</b>	Advanced UI, Suite/Advanced UI	Enter the path to the top-level directory where your release will start to be built, or click the ellipsis button (...) to browse to the location.
<b>Product Name</b>	Advanced UI, Suite/Advanced UI	<p>To override the product name that was specified in the General Information view with a new value for the selected release, enter the appropriate name.</p> <p>For information on how the product name is used, see <a href="#">Specifying a Product Name</a>.</p>
<b>Product Version</b>	Advanced UI, Suite/Advanced UI	<p>To override the product version that was specified in the General Information view with a new value for the selected release, enter the appropriate version number. The version must contain only numbers. It is typically in the format <i>aaa.bbb.ccccc</i> or <i>aaa.bbb.ccccc.ddddd</i>, where <i>aaa</i> represents the major version number, <i>bbb</i> represents the minor version number, <i>cccc</i> represents the build number, and <i>dddd</i> represents the revision number. The maximum value for the <i>aaa</i> and <i>bbb</i> portions is 255. The maximum value for <i>cccc</i> and <i>dddd</i> is 65,535.</p> <p>Note that although you can include the fourth field (<i>dddd</i>), the installation does not use this part of the product version to distinguish between different product versions. To learn more, see <a href="#">Specifying the Product Version</a>.</p> <p>The product version that you specify is displayed on the Properties dialog box for Setup.exe. For more information, see <a href="#">Customizing File Properties for the Setup Launcher</a>.</p>

**Table 204** ■ Settings on the Build Tab (cont.)

Setting	Project Type	Description
<b>Suite GUID</b>	Advanced UI, Suite/Advanced UI	<p>To override the GUID that was specified in the General Information view with a new value for the selected release, enter the appropriate GUID. The Suite GUID uniquely identifies the Advanced UI or Suite/Advanced UI installation. To have InstallShield generate a different GUID for you, click the <b>Generate a new GUID</b> button ({...}) in this setting.</p> <p>Since this code uniquely identifies your Advanced UI or Suite/Advanced UI installation, changing the Suite GUID after you have already distributed your release is not recommended.</p>
<b>Media Format</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>This read-only setting enables you to view the type of media selected for this release. You can set the media type only through the Release Wizard's Media Type panel; for InstallScript object projects, you cannot set the media type.</p>

**Table 204** ■ Settings on the Build Tab (cont.)

Setting	Project Type	Description
<b>Compression</b>	Basic MSI, InstallScript MSI, Merge Module	<p>Specify whether the release should be compressed:</p> <ul style="list-style-type: none"> <li>● <b>Compressed</b>—InstallShield compresses all of your product's data files into .cab files.</li> <li>● <b>Uncompressed</b>—InstallShield does not compress your product's files into .cab files.</li> </ul> <p>As an alternative, you can use a custom compression method, which enables you to compress only the files that are associated with one or more features into .cab files. To set custom compression options, you must use the <a href="#">Release Configuration panel</a> and the <a href="#">Custom Compression Settings panel</a> in the Release Wizard.</p> <p>Note that when you use the Release Wizard to configure custom compression, InstallShield changes the Compression setting in the Releases view to a read-only value of <b>Custom (One Cab per Feature)</b> or <b>Custom (One Cab per Component)</b>. To change the compression from a custom method to the standard compressed method or the uncompressed method, you must use the Release Wizard again; you cannot do this from the Compression setting in the Releases view.</p> <div data-bbox="716 993 751 1035" data-label="Image"></div> <p><b>Note</b> ■ The output of the build process depends on the media type that you are building (such as CD-ROM, DVD-5, or Network Image), whether compression is used (as specified in the Compression setting), whether you are including a setup launcher (as specified in the Setup Launcher setting on the Setup.exe tab), and whether you are using disk spanning (as specified in the Disk Spanning setting, which is applicable to CD-ROM, DVD, and Custom media types).</p> <p>For example, if you select <b>Compressed</b> for the Compression setting, you select <b>Yes</b> for the Setup Launcher setting, and you are building a Network Image release, your data files are compressed into .cab files, and the .cab files are streamed into your Setup.exe file. If you select <b>Uncompressed</b> for the Compression setting, you select <b>No</b> for the Setup Launcher setting, and you are building a CD-ROM release that fits on one CD-ROM and uses automatic disk spanning, your data files are left uncompressed in a subfolder of the folder that contains the .msi file.</p>

**Table 204** ■ Settings on the Build Tab (cont.)

Setting	Project Type	Description
<b>Cab Optimization Type</b>	Basic MSI, InstallScript MSI, Merge Module	<p>If Compressed or one of the custom options is selected for the Compression setting, specify the type of compression that InstallShield should use when building this release's .cab files. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>LZX</b>—InstallShield uses LZX compression to compress your product's data files into .cab files. This option results in the smallest .cab files; however, it also takes the most time to extract the data from these .cab files at run time.</li> <li>● <b>MSZIP</b>—InstallShield uses MSZIP compression to compress your product's data files into .cab files. This is the default option.</li> <li>● <b>None</b>—InstallShield does not use any compression when creating the .cab files.</li> </ul> <p></p> <p><b>Important</b> ■ <i>Using compression generally decreases the size of your compressed files, but the build process may take more time to complete. Depending on the number and size of the files being compressed, the LZX compression and the build may take hours to complete. Therefore, if you select the LZX option, it is recommended that your build machine have the latest hardware to minimize the time that it takes for the build to complete.</i></p>
<b>Compress Script</b>	InstallScript, InstallScript Object	Specify whether the compiled script file (.inx file) is placed in a cabinet file (Yes), or it is placed uncompressed in the Disk1 disk image folder (No).

**Table 204** ■ Settings on the Build Tab (cont.)

Setting	Project Type	Description
<b>Compiler Preprocessor Defines</b>	InstallScript, InstallScript Object, Suite/ Advanced UI	<p>Optionally specify any preprocessor variable definitions. Preprocessor variable definitions that are specified here apply only to the current release; they are not used when compiling the script for other releases. Use the following format, with no spaces before or after equals signs or commas:</p> <pre>MYVARIABLE1=123,MYVARIABLE2</pre> <p>Such variables can be tested in the script by <code>#if</code> and <code>#ifdef</code> statements that control the flow of the script. If you are creating an InstallScript object, enter <code>IFX_OBJECTS</code>.</p> <p>Entering the name of a preprocessor variable for this setting defines the variable. For example if you enter <b>MYVARIABLE</b> for this setting, the script commands in the following <code>#ifdef</code> loop are executed:</p> <pre>#ifdef MYVARIABLE     // Commands #endif</pre> <p>After you add or change a preprocessor variable definition for this setting, you must compile your installation for the addition or change to take effect.</p>
<b>Disk Spanning</b>	Basic MSI, InstallScript MSI	<p>This read-only setting indicates how your installation is spread across different disks. You can select a different option through the Disk Spanning Options panel in the Release Wizard. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Automatic</b>—InstallShield automatically splits your release files over as many disks as necessary.</li> <li>● <b>Custom - Enforce disk size</b>—InstallShield displays a warning and aborts the build if any feature's files are larger than the disk size.</li> <li>● <b>Custom - Do not enforce disk size</b>—InstallShield builds the release to span as many disks as necessary.</li> </ul> <p>This setting applies to the CD-ROM, DVD, and Custom media types.</p> <div data-bbox="716 1472 751 1518">  </div> <p><b>Important</b> ■ Multi-disk installations cannot be run from a non-removable media (for example, from a hard drive). If you want to test an installation that spans disks, you need to put the installation on your target media. If you do not, the installation will fail because of a limitation of the Windows Installer.</p>

**Table 204** ■ Settings on the Build Tab (cont.)

Setting	Project Type	Description
<b>File Name Format</b>	Basic MSI, InstallScript MSI, Merge Module	<p>Select the file name format that should be used to determine how the paths of your files are stored in the .msi package. InstallShield stores the option that you specify in your .msi package's Summary Information Stream.</p> <p>If your installation will be distributed on media that does not support long file names, such as a UNIX server, select the Short File Names option.</p>
<b>Platform(s)</b>	InstallScript, InstallScript Object	<p>If the release is specific to one or more platforms, use this setting to indicate the platforms: click the value of this setting, and then click the ellipsis (...) button to specify the appropriate platforms.</p> <p>If the platform specified for a component does not match one of the platforms that is selected for this setting, the component is not included in the release.</p> <p>The default value for this setting is Use Project Settings. This value indicates that the release supports the platforms that are specified at the project level.</p>
<b>Layout</b>	InstallScript	<p>This read-only setting indicates whether the project's files are stored in cabinet files or placed uncompressed in the disk image. You can modify this setting through the <a href="#">Media Layout panel</a> in the Release Wizard. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Cabinet File(s)</b>—InstallShield places all data files in one or more data cabinet files at build time.</li> <li>● <b>CD-ROM Folder(s)</b>—InstallShield places all data files in one or more CDROM folders at build time.</li> <li>● <b>Custom</b>—InstallShield places some data files in one or more CD-ROM folders and some in one or more data cabinet files at build time.</li> </ul>
<b>Data Languages</b>	Basic MSI, InstallScript MSI, Merge Module	<p>If you want to include certain components and exclude others based on the language that is selected for each component, click the ellipsis button (...) in this setting and specify the appropriate languages. If the language specified for a component does not match one of the languages that is selected for this setting, InstallShield does not include the component in the release.</p> <p>By default, releases are language independent; that is, none of the project's components are excluded from the release.</p>

**Table 204** ■ Settings on the Build Tab (cont.)

Setting	Project Type	Description
<b>UI Languages</b>	Advanced UI, Basic MSI, InstallScript MSI, Merge Module, Suite/ Advanced UI	<p>This setting lets you specify which user interface languages you want to include in a release. To select the appropriate languages, click the ellipsis button (...) in this setting.</p> <p>Note that if a language is not selected in the Setup Languages setting in the General Information view of the project, it is not listed as one of the available languages for the UI Languages setting.</p>
<b>Language(s)</b>	InstallScript, InstallScript Object	<p>Use this setting if you want to include certain components and exclude others based on the language that is selected for each component. This setting also lets you specify which user interface languages you want to include in a release. If the language specified for a component does not match one of the languages that is selected for this setting, InstallShield does not include the component in the release. In addition, if a UI language that is included in the project does not match one of the languages that is selected for this setting, InstallShield does not include the UI strings in the release.</p> <p>By default, releases are language independent; that is, none of the project's components or UI strings are excluded from the release.</p> <p>Note that if a language is not selected in the General Information view of a project, it is not listed as one of the available languages for the Language(s) setting.</p>
<b>Default Language</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Suite/ Advanced UI	<p>To override the release's default project language that is configured in the General Information view or the String Editor view, select the appropriate default user interface language for your installation.</p> <p>For more information, see <a href="#">Setting the Default Project Language</a>.</p>
<b>Languages Dialog</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Suite/ Advanced UI	<p>Specify whether you want your installation to display the language selection dialog when the installation is run with a full user interface.</p> <div>  <p><b>Tip</b> ■ For Basic MSI projects—If you want the language selection dialog to be displayed, a Setup.exe setup launcher is required. To learn more, see <a href="#">Creating a Setup Launcher</a>.</p> </div>

**Table 204** ■ Settings on the Build Tab (cont.)

Setting	Project Type	Description
<b>Build UTF-8 Database</b>	Basic MSI, InstallScript MSI, Merge Module	<p>Specify whether you want the Windows Installer database, along with any instance or language transforms, to be built using the UTF-8 encoding.</p> <p>The UTF-8 encoding supports characters from all languages simultaneously, enabling you to mix and match, for example, Japanese and German, or Russian and Polish, both in text shown to end users and in file names and registry keys. These mixed languages work correctly regardless of the current language of the target system.</p>  <p><b>Important</b> ■ As documented in <a href="#">Microsoft KB 979849</a> the Windows Installer does not fully support UTF-8 databases; therefore, some scenarios result in user interface issues. For example, if an end user runs the installation with a basic user interface (by using the /qb command-line option) or uninstalls the product from Add or Remove Programs, the Windows Installer uses very small fonts to display the user interface text in a UTF-8 database.</p> <p>If you specify No, InstallShield creates an ANSI database when you build your release. This option does not let you mix characters from languages in different code pages.</p> <p>The default value for this setting is No.</p>
<b>Previous Package</b>	Basic MSI, InstallScript MSI, Merge Module	<p>Enter the fully qualified path to a previous release (.msi file for an installation project, or .msm file for a merge module project) to minimize the size of future patch packages.</p> <p>This setting corresponds to the <a href="#">Patch Optimization setting</a> in the Release Wizard.</p>  <p><b>Note</b> ■ If your package uses dynamic file linking, it is recommended that you specify a previous package in this setting so that the file keys are consistent across releases.</p> <p>For more information, see <a href="#">Upgrade Considerations</a>.</p>

**Table 204** ■ Settings on the Build Tab (cont.)

Setting	Project Type	Description
<b>Generate File Hash Values</b>	Basic MSI, InstallScript MSI, Merge Module	<p>Indicate whether you want InstallShield to populate the <b>MsiFileHash</b> table for every unversioned file in your build. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—InstallShield populates the <b>MsiFileHash</b> table for every unversioned file in your build.</li> <li>● <b>No</b>—InstallShield does not populate the <b>MsiFileHash</b> table. If you select No, InstallShield builds any entries that are found in the project's <b>MsiFileHash</b> table (populated using the Direct Editor).</li> </ul> <p>If you have already populated the <b>MsiFileHash</b> table for a particular file, the build uses that information instead of generating the information at build time.</p> <p>For more information, see <a href="#">MsiFileHash Table</a> in the Windows Installer Help Library.</p>
<b>Shallow Folder Structure</b>	Basic MSI, InstallScript MSI	<p>If you want InstallShield to create the .msi file and related files directly in the location that is specified in the Release Location setting, without any of the subfolders, select Yes.</p> <p>To build the release if the release location is in &lt;ISProjectDataFolder&gt; or &lt;ISProjectFolder&gt;, click Build Tables &amp; Refresh Files on the Build menu.</p>
<b>Generate Autorun.inf</b>	Basic MSI, InstallScript MSI	<p>Select Yes if you are distributing your installation on a CD-ROM or DVD-ROM and you want to support the AutoPlay feature. InstallShield creates a text file called Autorun.inf, which contains the instructions to autoplay your installation, in the root of your disk images folder.</p> <p>You can edit this file to add additional AutoPlay options or to pass command-line parameters to MsiExec.exe, Setup.exe, or Update.exe.</p>

**Table 204** ■ Settings on the Build Tab (cont.)

Setting	Project Type	Description
<b>Release Flags</b>	Advanced UI Basic MSI, InstallScript MSI, Suite/ Advanced UI	<p>Release flags enable you to customize your installation by including or excluding certain items in each release. Enter the flags that you would like to include in this release. Separate multiple flags with a comma.</p>  <p><b>Project</b> ■ For Basic MSI and InstallScript MSI projects—Once you have assigned release flags to your features, InstallShield prerequisites, and chained .msi packages, you can create a release that includes features, InstallShield prerequisites, and chained .msi packages based on those flags. By default, all features, InstallShield prerequisites, and chained .msi packages are included in a release. Once you specify a flag in either the Releases view or the Release Wizard, only unflagged items and items that contain the specified release flag are included in your installation.</p> <p>For Advanced UI and Suite/Advanced UI projects—Once you have assigned release flags to features and packages in the Advanced UI or Suite/Advanced UI project, you can create a release that includes features and packages based on those flags. By default, all features and packages are included in a release. Once you specify a flag in the Releases view, only unflagged items and items that contain the specified release flag are included in your installation.</p>  <p><b>Note</b> ■ If a release does not have release flags, it will include all applicable items that have release flags. To include only unflagged items, specify a flag that does not exist. For example, you might use <b>NoFlags</b>. This way, only unflagged items are built into a release.</p> <p>For Basic MSI and InstallScript MSI projects—Note that you can also specify release flags at the product configuration level. For more information, see <a href="#">Product Configuration Flags vs. Release Flags</a>.</p>
<b>Use Path Variable Test Values</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>If you used test values for any of your <a href="#">path variables</a>, select Yes to set those variables to their actual values at this time.</p>

**Table 204** ■ Settings on the Build Tab (cont.)

Setting	Project Type	Description
<b>Path Variable Overrides</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI	<p>To override a path variable in your project at build time for the selected release, click the ellipsis button (...) in this setting, which launches the Path Variable Overrides dialog box. This dialog box lets you select one or more path variables that you want to override. InstallShield adds a new path variable setting for each path variable that you select. Configure each path variable setting as necessary.</p> <p>Note that you can override user-defined path variables, environment variables, and registry variables that are configured in the Path Variables view; however, you cannot override predefined path variables such as <code>&lt;WindowsFolder&gt;</code>.</p> <p>To learn more, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Overriding the Value of a Custom Path Variable for a Release</a></li> <li>• <a href="#">Using Path Variables</a></li> </ul>
<b>Path Variable Overrides Item</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI	<p>Specify the new value of the path variable that you want InstallShield to use at build time for the selected release. The default value is the setting that is configured in the Path Variables view. InstallShield uses the new value that you specify in this setting to override the value that is set in the Path Variables view.</p> <p>To delete the path variable override, click the Delete button in this setting.</p>  <p><b>Tip</b> ■ You can refer to other path variables in the defined value by enclosing the referenced path variable name in angled brackets. For example, if you have a path variable called <i>MyRoot</i> with a value of <i>C:\</i>, you can refer to it in a path variable definition for another variable, such as <i>Games</i>. The actual path for the <i>Games</i> variable might be <i>C:\Programs\GameFiles</i>, but you can define <i>Games</i> as <i>&lt;MyRoot&gt;\Programs\GameFiles</i>. However, if you attempt to self-reference a path variable, the literal string is used instead. For example, defining <i>Games</i> as <i>&lt;MyRoot&gt;\Programs\&lt;Games&gt;</i> actually results in <i>Games</i> defined as <i>C:\Programs\&lt;Games&gt;</i>.</p> <p>To learn more, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Overriding the Value of a Custom Path Variable for a Release</a></li> <li>• <a href="#">Using Path Variables</a></li> </ul>

**Table 204** ■ Settings on the Build Tab (cont.)

Setting	Project Type	Description
<b>Features</b>	InstallScript, InstallScript Object	<p>This read-only setting indicates which features are included in the built release. You can modify the value of this setting from the Features panel in the Release Wizard.</p> <ul style="list-style-type: none"> <li>● <b>Use the “Include in Build” feature property</b>—If this option is selected, each feature whose Include In Build setting is set to Yes is included in the built release, and each feature whose Include In Build setting is set to No is not included.</li> <li>● <b>Specify the features to be included directly</b>—Specify for each feature whether the feature is included in the built release.</li> </ul>
<b>Specify Skin</b>	InstallScript	<p>Select the <b>dialog skin</b> that is applied to this release. The default value, &lt;Use Project Setting&gt;, uses the skin that is selected in the Skins folder of the Dialogs view; selecting any other value for this setting overrides the Skins folder selection.</p>
<b>Differential Media</b>	InstallScript	<p>Specify whether the current release (the release that is selected in the Releases view) is a differential release—that is, a release that contains only those files that were absent from one or more of a specified set of existing releases—or a full release, which contains all your product’s files, so that your product can be installed on a system on which no version of your product is currently installed.</p> <p>For more information, see <a href="#">Differential vs. Full Releases</a>.</p>
<b>Support Version(s)</b>	InstallScript	<p>This setting is applicable only if No is selected for the Differential Media setting.</p> <p>Optionally enter a semicolon-delimited list of version numbers (for example, 1.2.3;1.2.4) of the earlier versions of your product to which this release can be applied as an update. If you leave this setting blank, the installation can be run on a system on which any earlier version, or no version, of your product is currently installed.</p>
<b>Object Difference</b>	InstallScript	<p>This setting is applicable only if Yes is selected for the Differential Media setting. Select the conditions for including InstallShield objects in your differential release.</p> <ul style="list-style-type: none"> <li>● <b>Include All</b>—The differential release includes all objects that would be included in the equivalent full update release.</li> <li>● <b>Exclude All</b>—The differential release does not include any objects.</li> <li>● <b>Include If Changed</b>—The differential release includes those objects that would be included in the equivalent full update release and that are not found in, or are different from, the corresponding object in at least one of the comparison releases.</li> </ul>

**Table 204** ■ Settings on the Build Tab (cont.)

Setting	Project Type	Description
<b>Keep Unused Directories</b>	Basic MSI, InstallScript MSI, Merge Module	<p>Specify whether you want InstallShield to remove unused directories from the Directory table of the .msi file when you build this release. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>No</b>—If a directory that is listed in the Directory column of the Directory table is not referenced in any known location in the .msi file, InstallShield removes it from the Directory table of the .msi file that it creates at build time. For Basic MSI and InstallScript MSI projects, this occurs after any merge modules are merged, but only directories that are present in the .msi file are removed; therefore, if a merge module contains new unused directories in its Directory table, the new unused directories are added to the installation.</li> <li>● <b>Yes</b>—InstallShield does not remove any directories from the Directory table of the .msi file that it creates at build time.</li> </ul> <p>The default value is No.</p>  <p><b>Note</b> ■ Under some conditions, predefined directories cannot be resolved, causing an installation to fail. Removing unused directories from the Directory table enables you to avoid unnecessary failures. Therefore, it is recommended that you select No for this setting.</p>
<b>Hide Add/Remove Panel Entry</b>	InstallScript MSI	<p>Specify whether you want to hide your product's entry in Add or Remove Programs in the Control Panel:</p> <ul style="list-style-type: none"> <li>● <b>No</b>—Your product's entry is displayed on the target machine in Add or Remove Programs.</li> <li>● <b>Yes</b>—Your product's entry is not displayed on the target machine in Add or Remove Programs. The end user cannot use Add or Remove Programs to remove, modify, or view support information for your product.</li> </ul> <p>To learn about how to indicate which information should be displayed for your product—including how to hide buttons in the Add or Remove Programs—see <a href="#">General Information View Settings</a>.</p>

## Setup.exe Tab for a Release

**Project** ■ The Setup.exe tab is available in the following project types:

- Advanced UI
- Basic MSI
- InstallScript

- *InstallScript MSI*
- *Suite/Advanced UI*

For more information on including Windows Installer redistributables in installations, see [Adding Windows Installer Redistributables to Projects](#).

The Setup.exe tab is where you configure settings about your Setup.exe file. It is also where you specify whether you want to include redistributables for Windows Installer 3.1 or earlier. For more information on Windows Installer redistributables, see [Adding Windows Installer Redistributables to Projects](#).

**Table 205** ■ Settings on the Setup.exe Tab

Setting	Project Type	Description
<b>Setup Launcher</b>	Basic MSI, InstallScript MSI	Specify whether you want to create a Setup.exe setup launcher.  To learn about scenarios that require a setup launcher, see <a href="#">Creating a Setup Launcher</a> .
<b>Executable File Name</b>	Advanced UI, Suite/Advanced UI	Specify the file name—without the .exe file extension—that InstallShield should use for the setup launcher file that it generates at build time. If this setting is blank, InstallShield uses the default value of <i>Setup</i> , and the setup launcher file is called Setup.exe.
<b>Show Suite Loading Screen</b>	Advanced UI, Suite/Advanced UI	Use this option to control whether or not the Suite Loading Screen is displayed during installation. To hide the Suite Loading Screen for your Advanced UI or Suite/Advanced UI setup launcher, set this property to <b>No</b> .
<b>Suite Loading Screen Message</b>	Advanced UI, Suite/Advanced UI	Use this option, to add a message to the Suite Loading Screen for your Advanced UI or Suite/Advanced UI setup launcher.
<b>Suite Loading Screen Image</b>	Advanced UI, Suite/Advanced UI	Use this option to select the image to the Suite Loading Screen for your Advanced UI or Suite/Advanced UI setup launcher.  If the application supports scaling, insert the customized images of scales 100 and 150 under scale-150 and/or scale-200 folders of <b>Support Files</b> .  The name of the image should be same in the folders of the <b>Support Files</b> as given in the <b>Suite Loading Screen Image</b> field.
<b>Single .exe File Name</b>	InstallScript	If you want InstallShield to build a self-extracting executable file that runs your installation, specify its file name (including the file extension).  If you specify a file name, InstallShield creates a self-extracting executable file and adds it to the Package subfolder of the folder that is specified in the Release Location setting on the Build tab for this release.  If you leave this setting empty, InstallShield does not create a self-extracting executable file at build time.

**Table 205** ■ Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
<b>Setup.exe Icon File</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, Suite/ Advanced UI	<p>To use your own icon for the Setup.exe file, specify the fully qualified name of the file that contains the icon. To specify a file, type an absolute path or a path that is relative to a path variable, or click the ellipsis button (...) to browse to the file from within the Change Icon dialog box.</p> <p>By default, the icon with index 0 is used; to specify a different icon, either select an icon in the Change Icon dialog box or append the icon's index or resource ID (preceded by a minus sign) to the file name. For example, <b>C:\Temp\MyLibrary.dll,2</b> indicates the icon with an index of 2, and <b>C:\Temp\MyLibrary.dll,-100</b> indicates the icon with a resource ID of 100.</p> <p>If you leave this setting blank, InstallShield uses a default icon for your Setup.exe file.</p>
<b>64-Bit Setup Launcher</b>	Advanced UI, Suite/Advanced UI	<p>Specify whether you want to build a 64-Bit Setup Launcher or a 32-Bit Setup Launcher.</p> <p>Select Yes to build the 64-Bit setup launcher. InstallScript custom actions are not supported with 64-Bit setup launcher. 32-bit Extension DLLs are not supported.</p> <p>Select No to build the 32-Bit setup launcher. For more detail, see <a href="#">Building 64-bit Setup Exe</a>.</p>
<b>MSI Command-Line Arguments</b>	Basic MSI, InstallScript MSI	<p>Indicate any command-line arguments that you want to pass from the setup launcher to Windows Installer. InstallShield writes the value that you enter in the Setup.ini file.</p> <p>[Startup]</p> <p>CmdLine=Your Value</p>  <p><b>Tip</b> ■ To set a property, enter MYPROPERTY="My Value" for this setting.</p>
<b>Setup Command Line</b>	InstallScript	Enter any command-line parameters that you want to pass to Setup.exe when end users launch the installation.
<b>Generate Package Definition File</b>	Basic MSI, InstallScript MSI	Specify whether you want InstallShield to create a package definition file (.pdf) that enables end users to run your installation as an SMS job. If you select Yes, InstallShield creates a version 2.0 .pdf.

**Table 205** ■ Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
<b>Required Execution Level</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, Suite/ Advanced UI	<p>Use the Required Execution Level setting to specify the minimum level that is required by your project's Setup.exe file for running on Windows Vista and later platforms. The available options are:</p> <ul style="list-style-type: none"> <li>● <b>Administrator</b>—Setup.exe requires administrative privileges to run. Administrators must authorize it; non-administrators must authenticate as an administrator.</li> <li>● <b>Highest available</b>—Setup.exe prefers administrative privileges. Administrators must authorize it; non-administrators run it without administrative privileges. This is the default option for InstallScript and InstallScript MSI projects.</li> <li>● <b>Invoker</b>—Setup.exe does not require administrative privileges, and all users can run it without administrative privileges. Setup.exe does not display any UAC messages prompting for credentials or for consent. This is the default option for Advanced UI, Basic MSI, and Suite/Advanced UI projects.</li> </ul> <p>For Advanced UI, InstallScript, InstallScript MSI, and Suite/Advanced UI projects, and for Basic MSI projects if Yes is selected for the Setup Launcher setting, InstallShield embeds an application manifest in the Setup.exe launcher. This manifest specifies the selected execution level. Operating systems earlier than Windows Vista ignore the required execution level.</p> <p>If No is selected for the Setup Launcher setting for a Basic MSI project, InstallShield does not embed the Windows application manifest in a Setup.exe launcher.</p>

**Table 205** ■ Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
<b>Required Execution Level (cont.)</b>		<p>The benefit of elevating the required execution level in Basic MSI projects is that privileges can be elevated only once if necessary to run Setup.exe, and that these privileges can be carried over to all of the installation's InstallShield prerequisites and the Execute sequence of the .msi package without requiring multiple prompts for approval. Thus, if two of your InstallShield prerequisites require administrative privileges, for example, you can change this setting to Administrator, and then end users are prompted only once during the installation, before Windows Installer runs the Setup.exe file.</p> <p>A similar benefit exists for Advanced UI and Suite/Advanced UI projects, where privileges can be elevated only once if necessary to run Setup.exe, and that these privileges can be carried over to all of the installation's Advanced UI or Suite/Advanced UI packages without requiring multiple prompts for approval.</p> <p>Note, however, that if you elevate the privileges and also launch the application at the end of the installation, the elevated privileges are carried over to the application. In most cases, running an application with elevated privileges on Windows Vista and later platforms is discouraged.</p> <p>For more information, see <a href="#">Minimizing the Number of User Account Control Prompts During Installation</a>.</p>
<b>Uninstallation Order</b>	Suite/Advanced UI	<p>Use this setting to specify the uninstall order of the packages in a suite project. The available options are:</p> <ul style="list-style-type: none"> <li>● <b>Same as Packages Order</b>—Uninstall the packages in the same order that packages were installed (as defined in the project).</li> <li>● <b>Reverse of Packages Order</b>—Uninstall the packages in the reverse order that packages were installed (as defined in the project).</li> </ul>

**Table 205** ■ Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
<b>Advertise If Prerequisites Are Elevated</b>	Basic MSI, InstallScript MSI	<p>In the following common scenario, you may want to advertise your .msi file to help end users avoid a second User Account Control (UAC) prompt during your product's installation on Windows Vista and later systems:</p> <ul style="list-style-type: none"> <li>• Your installation includes one or more InstallShield prerequisites that require elevation.</li> <li>• In addition, your .msi file requires elevation. (That is, the Require Administrative Privileges setting in the General Information view is set to the default value of Yes.)</li> </ul> <p>If this scenario does not apply to your installation, it is recommended that you leave the default value of No for the Advertise If Prerequisites Are Elevated setting because setting it to Yes would not avoid a second UAC prompt.</p> <p>The Advertise If Prerequisites Are Elevated setting applies to installations that are run on Windows Vista and later systems. Installations that are run on earlier versions of Windows ignore this setting. Valid options are:</p> <ul style="list-style-type: none"> <li>• <b>Advertise: Silent</b>—Indicates that if InstallShield prerequisites in the installation are successfully installed with elevated privileges, the .msi file should be advertised and run silently (without a user interface). Then the main part of the installation does not require an additional UAC prompt for consent or credentials.</li> <li>• <b>Advertise: Full UI</b>—Indicates that if InstallShield prerequisites in the installation are successfully installed with elevated privileges, the .msi file should be advertised and run with a full user interface. Then the main part of the installation does not require an additional UAC prompt.</li> </ul>

**Table 205** ■ Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
(cont.)		<ul style="list-style-type: none"> <li>● <b>No</b>—Indicates that the .msi file should not be advertised. When end users run the installation, one or more UAC prompts may be displayed to install the InstallShield prerequisites. If the .msi file also requires elevation, an additional UAC prompt may be displayed before the main part of the installation occurs.</li> </ul> <div>  <p><b>Note</b> ■ The package must support advertisement in order for either of the advertise options to work. Advertisement is not instantaneous, and it adds extra delays to the installation. In addition, unexpected behavior may occur if the end user clicks Cancel after advertisement but before the main part of the installation has finished. For example, advertised shortcuts for your product may appear on the desktop before the main installation begins, and a confused user canceling the main installation may leave your package advertised but not fully installed. Therefore, in some cases, it may be better to leave this setting as No to allow the second UAC prompt and avoid product advertisement.</p> <p>In some cases, the .msi file is not advertised, and as a result, the second UAC prompt is displayed. For more information, see <a href="#">Specifying Whether a Product Should Be Advertised If Its InstallShield Prerequisites Are Run with Elevated Privileges</a>.</p> </div>
<b>Include MSI Engine</b>	Basic MSI, InstallScript MSI	<p>Specify whether you want to include redistributables for Windows Installer 3.1earlier.</p> <div>  <p><b>Note</b> ■ This setting applies to redistributables for Windows Installer 3.1. For information on different methods of adding various versions of Windows Installer redistributables to a project, see <a href="#">Adding Windows Installer Redistributables to Projects</a>.</p> </div>

**Table 205** ■ Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
<b>MSI Engine Location</b>	Basic MSI, InstallScript MSI	 <p><b>Note</b> ■ This setting applies to redistributables for Windows Installer 3.1. For information on different methods of adding various versions of Windows Installer redistributables to a project, see <a href="#">Adding Windows Installer Redistributables to Projects</a>.</p> <p>Specify where the Windows Installer engine installers should be located. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Copy from Source Media</b>—Leave the selected Windows Installer engine installers on the root of the source media. This option is not available for Web media types or Network Image media types with all of your files compressed into Setup.exe.</li> <li>● <b>Extract Engine from Setup.exe</b>—Compress the selected Windows Installer engine installers into Setup.exe, to be extracted at run time.</li> <li>● <b>Download Engine from the Web</b>—Download the Windows Installer engine installer (if necessary) from a URL that you specify. If you select this setting, be sure to set the engine URL settings to the appropriate Web locations, or leave the default value.</li> </ul>
<b>MSI 3.1 Engine URL</b>	Basic MSI, InstallScript MSI	<p>This setting specifies the location from which the setup launcher downloads the Windows Installer 3.1 engine, if needed. This setting is ignored unless the MSI Engine Location setting for the current release is set to Download Engine from the Web. Do not specify the file name in the URL.</p>  <p><b>Note</b> ■ The default URL (<a href="http://www.installengine.com/Msiengine30">http://www.installengine.com/Msiengine30</a>) is a site maintained by Revenera for your convenience. The 3.1 engine is available for download from this location.</p>

**Table 205** ■ Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
<b>Delay MSI Engine Reboot</b>	Basic MSI, InstallScript MSI	 <p><b>Note</b> ■ This setting applies to redistributables for Windows Installer 3.1 and earlier. For information on different methods of adding various versions of Windows Installer redistributables to a project, see <a href="#">Adding Windows Installer Redistributables to Projects</a>.</p> <p>Specify whether you want to postpone any reboot associated with installing or updating the Windows Installer engine on the target system until after your installation has completed.</p> <p>Select Yes to postpone the reboot, if one is necessary. Select No to allow the system to reboot, if necessary, immediately after the Windows Installer engine has been installed or updated and before performing your installation.</p>
<b>Cache MSI Locally</b>	Basic MSI, InstallScript MSI	<p>Specify whether the .msi file and other installation files for the current build should be cached on the target system.</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—Cache the .msi file and other installation files on the target system for use with application maintenance and repair. The Cache Path setting for the current release specifies where files should be cached.</li> <li>● <b>No</b>—Do not cache the .msi file and other installation files on the target system.</li> </ul>  <p><b>Note</b> ■ This setting is enabled for releases that do not have the .msi file available in the same folder as the Setup.exe file on the target system.</p>
<b>Cache Path</b>	Basic MSI, InstallScript MSI	<p>Specify where the cached .msi file and other cached installation files should be stored on the end users's system. You can enter a hard-coded value such as <b>C:\CachedFiles</b>, but it is recommended that you cache files in a path using a destination variable selected from the list. The default value is <b>[LocalAppDataFolder]Downloaded Installations</b>.</p>  <p><b>Note</b> ■ This setting is used only if the Cache MSI Locally setting for the current release is set to Yes.</p>
<b>Media Password</b>	InstallScript	<p>Enter the password that end users must enter in order to run the installation. Leave this setting empty if you do not want to password-protect your installation.</p>

**Table 205** ■ Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
<b>Show Password Dialog</b>	InstallScript	<p>This setting is applicable only if you specify a non-null password in the Media Password setting.</p> <p>Select Yes to set the <code>SHOW_PASSWORD_DIALOG</code> system variable to a non-zero value, which executes the password-checking code in the <code>OnCheckMediaPassword</code> event handler function's default code.</p> <p>If you select No, you must enter your own code in the script to request the password from the end user and check it by calling <b>FeatureValidate</b>.</p>
<b>Small Initialization Dialog</b>	Basic MSI, InstallScript, InstallScript MSI	<p>Specify whether you want to display a small initialization dialog when end users run this release.</p> <p>When the installation initializes, by default, an initialization dialog is displayed. The standard initialization dialog is the same size as the Welcome dialog and contains initialization text, a progress bar, and a Cancel button. The small initialization dialog contains initialization text, progress and a Cancel button; however, it is smaller, it does not contain a bitmap image, and its background is the window color of the end user's system.</p>
<b>Init Dialog Product Name</b>	InstallScript	<p>Optionally enter the product name to display in the setup initialization dialog. If you leave this setting empty, InstallShield uses the product name that you specify in the General Information view.</p>
<b>Minimum Initialization Time</b>	Basic MSI, InstallScript, InstallScript MSI	<p>Specify the minimum number of seconds that the installation should display the initialization dialog when end users run this release.</p> <p>InstallShield uses the value that you specify for this setting as the value of the <code>SplashTime</code> keyname in the <code>Setup.ini</code> file.</p> <p>When the installation initializes, by default, an initialization dialog is displayed. The splash screen, if provided, is also shown at this time. If you specify a minimum initialization time in this setting, the initialization dialog and splash screen are shown for at least the specified number of seconds. If initialization takes longer than the time specified, the dialog and splash screen are still displayed until the installation completes initialization. If initialization takes less time than the time specified, the installation continues to display the dialog and splash screen until the specified time has elapsed, and then the installation continues.</p>

**Table 205** ■ Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
<b>Password Protect Launcher</b>	Advanced UI, Basic MSI, InstallScript MSI, Suite/ Advanced UI	<p>To password-protect your installation, select Yes, and then type a password for the Launcher Password setting.</p>  <p><b>Project</b> ■ In Basic MSI and InstallScript MSI projects, this setting is available only if you select Yes for the Setup Launcher setting.</p>
<b>Launcher Password</b>	Advanced UI, Basic MSI, InstallScript MSI, Suite/ Advanced UI	<p>Type a password to protect your installation. Passwords are case-sensitive.</p> <p>This setting is used only if you select Yes for the Password Protect Launcher setting.</p>  <p><b>Project</b> ■ In Basic MSI and InstallScript MSI projects, this setting is available only if you select Yes for the Setup Launcher setting.</p>
<b>Use Custom Version Properties</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, Suite/ Advanced UI	<p>Specify whether you want to override the default copyright notice and file description for Setup.exe with your own copyright notice and file description. If you select Yes, enter your own information in the Launcher Copyright setting and the File Description setting.</p> <p>The copyright and description are displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Setup Launcher</a>.</p>
<b>Launcher Copyright</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, Suite/ Advanced UI	<p>If you want to override the default copyright notice for Setup.exe with your product's copyright notice, enter your product's copyright notice. Note that you must also select Yes in the Use Custom Version Properties setting.</p> <p>The copyright is displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Setup Launcher</a>.</p>
<b>File Description</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, Suite/ Advanced UI	<p>If you want to override the default file description for Setup.exe with your own description, enter the appropriate description. Note that you must also select Yes in the Use Custom Version Properties setting.</p> <p>The description is displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Setup Launcher</a>.</p>

**Table 205** ■ Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
<b>File Version</b>	Basic MSI, InstallScript MSI, InstallScript	<p>If you want to override the default file version for Setup.exe with your own file version, enter the appropriate file version. Note that you must also select Yes in the Use Custom Version Properties setting.</p> <p>The file version is displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Setup Launcher</a>.</p>
<b>Version</b>	Advanced UI, Suite/Advanced UI	<p>If you want to override the default product version and file version for Setup.exe with your own version number, enter the appropriate version number. Note that you must also select Yes in the Use Custom Version Properties setting.</p> <p>The product version and file version are displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties.</p> <p>Note that the file version always contains four fields. If you specify fewer than four fields for your product version, the remaining fields are filled with zeros. For example, if you specify a product version of 1.1, the file version that is used in the version resources of Setup.exe is 1.1.0.0.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Setup Launcher</a>.</p>
<b>Company</b>	Advanced UI, Suite/Advanced UI	<p>If you want to override the default company name for Setup.exe with your own company name, enter the appropriate name. Note that you must also select Yes in the Use Custom Version Properties setting.</p> <p>The company name is displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Setup Launcher</a>.</p>

**Table 205** ■ Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
<b>InstallShield Prerequisites Location</b>	Basic MSI, InstallScript, InstallScript MSI	Specify where the InstallShield prerequisites that are selected in the Redistributables view (in Basic MSI and InstallScript MSI projects) or in the Prerequisites view (in InstallScript projects) should be located.
 <p><b>Project</b> ■ The available options differ, depending on which project type you are using.</p> <ul style="list-style-type: none"> <li> <b>Follow Individual Selections</b>—Use the locations that are specified for each individual InstallShield prerequisite's properties in the Redistributables or Prerequisites view. <p>This option is available for Basic MSI, InstallScript, and InstallScript MSI projects.</p> </li> <li> <b>Download From The Web</b>—Download all of the InstallShield prerequisite files included in your project (if necessary) from the URL specified in the InstallShield prerequisite (.prq) file for each prerequisite. This option overrides the locations that are specified in the Redistributables or Prerequisites view for each InstallShield prerequisite's properties. <p>This option is recommended if your installation will be downloaded from the Internet and you want to minimize the package size and download time. An InstallShield prerequisite will not be downloaded if the correct version is already present on the target machine.</p> <p>This option is available for Basic MSI, InstallScript, and InstallScript MSI projects.</p> </li> <li> <b>Extract From Setup.exe</b>—Compress the InstallShield prerequisite files into Setup.exe, to be extracted at run time, if necessary. This option overrides the locations that are specified in the Redistributables view for each InstallShield prerequisite's properties. <p>Select this option if the entire installation must be self-contained in Setup.exe. Note that the Download From The Web option results in smaller installations and shorter download time; however, the Extract From Setup.exe option provides for a completely self-contained installation.</p> <p>This option is available for Basic MSI and InstallScript MSI projects.</p> </li> </ul>		

**Table 205** ■ Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
InstallShield Prerequisites Location (cont.)		<ul style="list-style-type: none"> <li>● <b>Copy From Source Media</b>—Store the InstallShield prerequisite files on the source media. This option overrides the locations that are specified in the Redistributables view for each InstallShield prerequisite's properties.  Use this option if the installation will be run uncompressed from fixed media—CD, DVD, or local network.  This option is available for Basic MSI and InstallScript MSI projects.</li> <li>● <b>Include with Media</b>—Store the InstallShield prerequisite files on the source media or in Setup.exe, depending on how you configure the settings for the release. This option overrides the locations that are specified in the Prerequisites view for each InstallShield prerequisite's properties.  This option is available for InstallScript projects.</li> </ul> <p>Note that if an InstallShield prerequisite is added to a project as a dependency of another prerequisite, the location for the prerequisite dependency follows the location setting of the prerequisite that requires it.</p> <div>  <p><b>Tip</b> ■ If you select the <i>Extract From Setup.exe</i> option, the <i>Copy From Source Media</i> option, or the <i>Include with Media</i> option and then build a release that includes an InstallShield prerequisite that is not available on your computer, one or more build errors are generated for every file that the prerequisite requires. To avoid these build errors, use the <i>Redistributables</i> view or the <i>Prerequisites</i> view to either download the InstallShield prerequisite from the Internet to your computer or remove it from your project before building the release.</p> <p>To learn more, see <a href="#">Specifying the Run-Time Location for InstallShield Prerequisites at the Release Level</a>.</p> </div>

**Table 205** ■ Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
<b>Package Location</b>	Advanced UI, Suite/Advanced UI	<p>Specify the run-time location for the packages that are configured in the Packages view. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Copy From Source Media</b>—Store the packages on the source media. This option overrides the run-time locations that are specified for each individual package's Location setting in the Packages view.</li> </ul> <p>If the Advanced UI or Suite/Advanced UI installation will be run uncompressed from fixed media—CD, DVD, or local network—select this option.</p> <ul style="list-style-type: none"> <li>● <b>Extract From Setup.exe</b>—Compress the packages into Setup.exe, to be extracted at run time, if necessary. This option overrides the run-time locations that are specified for each individual package's Location setting in the Packages view.</li> </ul> <p>If the entire installation must be self-contained in Setup.exe, select this option. Note that the <b>Download from the Web</b> option results in smaller installations and shorter download time; however, the <b>Extract from Setup.exe</b> option provides for a completely self-contained installation.</p> <ul style="list-style-type: none"> <li>● <b>Download from the Web</b>—Download all of the packages that are included in your project (if necessary) from the URLs that are specified for each package in the Packages view. This option overrides the run-time locations that are specified for each individual package's Location setting in the Packages view.</li> </ul> <p>This option is recommended if your Advanced UI or Suite/Advanced UI installation will be downloaded from the Internet and you want to minimize the installation size and download time. A package will not be downloaded if the correct version is already present on the target system.</p> <ul style="list-style-type: none"> <li>● <b>Follow Individual Selections</b>—Use the locations that are specified for each individual package's the Location setting in the Packages view.</li> </ul> <p>To learn more, see <a href="#">Specifying the Run-Time Location for Advanced UI or Suite/Advanced UI Packages at the Release Level</a>.</p>

**Table 205** ■ Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
<b>Cache Packages Locally</b>	Advanced UI, Suite/Advanced UI	<p>Specify whether you want to cache the Advanced UI or Suite/Advanced UI packages that are run on a target system in the location that is defined for each package in the Packages view. The default value is Yes.</p> <p>If you are building an uncompressed release, you may want to select No for this setting.</p>  <p><b>Note</b> ■ For exe package, it is required to <b>specify Cache Packages Locally</b> to Yes to do successful uninstallation.</p>
<b>Custom Return Code</b>	Basic MSI, InstallScript, InstallScript MSI	<p>Specify whether you want to override the return code of Setup.exe with your own custom values during the runtime. The default value is No.</p> <p>Select Yes to specify the values for a successful, failed or aborted installation.</p> <p>The supported values ranges from 0 to 32767 for successful, failed and aborted installation.</p>  <p><b>Important</b> ■ If the field is blank, the actual error code is returned during Cancel/Abort.</p>
<b>Expiration Date</b>	Basic MSI, InstallScript MSI	<p>To prevent end users from being able to run Setup.exe on or after a certain date, enter the expiration date, or click the arrow in this setting to select the date from a calendar.</p> <p>To remove the expiration date, click the Delete button in this setting.</p> <p>If you specify an expiration date in this setting, use the Expiration Date setting to specify the message that you want to be displayed at run time if an end user tries to launch Setup.exe on or after the expiration date.</p>
<b>Expiration Message</b>	Basic MSI, InstallScript MSI	<p>Enter the message that you want to be displayed at run time if an end user tries to launch Setup.exe on or after the expiration date that is configured in the Expiration Date setting.</p>
<b>Always Create Debug Log</b>	Advanced UI, Suite/Advanced UI	<p>If you want to create debug logs for your Advanced UI or Suite/Advanced UI setup launcher, select <b>Yes</b>.</p> <p>You can also use the CreateDebugLog method in the automation interface to specify the <b>Always Create Debug Log</b> setting. Set CreateDebugLog to True to create debug logs. The default value is False.</p>

**Table 205** ■ Settings on the Setup.exe Tab (cont.)

Setting	Project Type	Description
<b>Log File Name</b>	Advanced UI, Suite/Advanced UI	<p>The default <b>Log File Name</b> is InstallShield.log.</p> <p>You can also customize the <b>Log File Name</b>,</p> <ul style="list-style-type: none"> <li>to any given name of your choice.</li> <li>with any absolute path and relative path to the installer location. For example: C:\abc\xyz.log or ..\xyz.log. If the folder does not exist in the given location, a folder will be created.</li> <li>with any environment variable. For example: %TEMP%\xyz.log.</li> </ul> <p></p> <p><b>Note</b> ■ If the installer doesn't have access to the directory, it falls back to installer location with the name provided.</p>
<b>Setup File Name</b>	Basic MSI, InstallScript, InstallScript MSI Suite/Advanced UI	<p>Specify the file name - without the .exe file extension - that InstallShield should use for the setup launcher file that it generates during the build time.</p> <p>If this setting is blank, InstallShield uses the default value of Setup, and the setup launcher file is called setup.exe.</p>

## Signing Tab for a Release

**Project** ■ The Signing tab is available in the following project types:

- Advanced UI
- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- Suite/Advanced UI

The Signing tab is where you specify the digital signature information—including the digital certificate files that a certification authority granted to you—that InstallShield should use to sign your files. It is also where you specify which files in your installation should be digitally signed at build time.

**Table 206** ■ Settings on the Signing Tab

Setting	Project Type	Description
<b>Sign Setup.exe File</b>	Advanced UI, Suite/Advanced UI	Specify whether you want to sign the Advanced UI or Suite/Advanced UI installation.

**Table 206** ■ Settings on the Signing Tab (cont.)

Setting	Project Type	Description
<b>Certificate URL</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI	Type a fully qualified URL—for example, <a href="http://www.mydomain.com">http://www.mydomain.com</a> . This URL is used in your digital signature to link to a site that you would like end users to visit to learn more about your product, organization, or company.
<b>Digital Certificate Information</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI	<p>To specify the digital certificate that you want to use to sign your release, click the ellipsis button (...) in this setting. The Certificate Selection dialog box opens, enabling you to specify either the location of the .pfx file or information about the certificate store that contains the certificate.</p> <p>To learn more, see <a href="#">Certificate Selection Dialog Box</a>.</p> <p>After specifying the digital certificate, the below will be displayed:</p> <ul style="list-style-type: none"> <li>● Certificate Thumbprint - This read-only setting displays the certificate thumbprint.</li> <li>● Issued By - This read-only setting displays the certificate issuer information.</li> <li>● Expiration Date - This read-only setting displays the certificate's expiration date.</li> </ul>
<b>Certificate Password</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/ Advanced UI	<p>If the .pfx file that you are using has a password, enter it. InstallShield encrypts the password and stores it in your project file (.ism).</p> <p>At build time, InstallShield uses the password to sign files with a .pfx file. If your certificate is protected by a password but you do not enter it in this setting, signing with a .pfx file fails.</p> <p>Note that if you configure your project to use a certificate that was imported with password protection into a store, Windows prompts for the password at build time when InstallShield is attempting to sign your project's files. The strong key protection that Windows uses does not permit InstallShield to provide the password to the cryptographic provider.</p>

**Table 206** ■ Settings on the Signing Tab (cont.)

Setting	Project Type	Description
<b>Sign Output Files</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>Specify which files you want to be signed. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Media Header</b>—To sign only your media header file (Data1.hdr), select this option. This option is available for InstallScript projects.</li> <li>● <b>None</b>—To avoid signing your installation, select this option. This option is available for Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, and Merge Module projects.</li> <li>● <b>Setup.exe</b>—To sign your Setup.exe file, select this option. This option is available for Basic MSI, InstallScript, and InstallScript MSI projects.</li> <li>● <b>Setup.exe and Media Header</b>—To sign your Setup.exe file and your media header file (Data1.hdr), select this option. This option is available for InstallScript projects.</li> <li>● <b>Setup.exe and Windows Installer Package</b>—To sign your Setup.exe file and your Windows Installer package (.msi), select this option. This option is available for Basic MSI and InstallScript MSI projects.</li> <li>● <b>Windows Installer Package</b>—To sign your Windows Installer package (.msi or .msm), select this option. This option is available for Basic MSI, InstallScript MSI, and Merge Module projects.</li> </ul>
<b>Signature Description</b>	Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI	<p>Specify the signature description that you want to use for files that are specified in the Sign Output Files setting. The description that you specify is displayed on the User Account Control (UAC) box to the right of the “Program Name:” label. The UAC dialog box opens when an end user launches the signed file and elevated privileges are required.</p> <p>If you leave this setting blank, InstallShield uses the name of the file without its extension as the description to the right of the “Program Name:” label on the UAC dialog box. Note that if you use the Sign Files in Package setting and its subsettings to sign the files in your package, InstallShield does not use this signature description for the UAC dialog box of the files in your package that are signed at build time.</p>

**Table 206** ■ Settings on the Signing Tab (cont.)

Setting	Project Type	Description
<b>Sign Files in Package</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>Specify whether you want to sign any of the files in your release.</p> <p>If you select Yes, use the Include Patterns and Files setting and the Exclude Patterns and Files setting to indicate which files should be signed.</p>  <p><b>Windows Logo</b> ■ All executable files (including .exe, .dll, .ocx, .sys, .cpl, .drv, and .scr files) in an installation must be digitally signed for the Windows logo program.</p>
<b>Sign Files That Are Already Signed</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>If any of the files in your project are already digitally signed, determine whether you want InstallShield to replace those existing digital signatures with the digital signature that you specify on the Signing tab. Note that this affects only files that meet the requirements that are specified in the Include Patterns and Files setting and the Exclude Patterns and Files setting.</p> <ul style="list-style-type: none"> <li>● To use the digital signature information that you are providing on the Signing tab to sign a file instead of any existing digital signature information that is already included with the file, select Yes.</li> <li>● To leave the existing digital signature information intact for any files that are already signed, select No.</li> </ul> <p>The default value is No.</p>
<b>Sign Files in Their Original Location</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>Determine whether you want InstallShield to sign your original files or just the files that are built into the release:</p> <ul style="list-style-type: none"> <li>● If you want InstallShield to sign a temporary copy of each file and then use that signed temporary copy to build a release, select No. Note that if you select No, InstallShield will not modify or sign your original files.</li> <li>● If you want InstallShield to sign your original files, select Yes.</li> </ul> <p>The default value is No.</p>

**Table 206** ■ Settings on the Signing Tab (cont.)

Setting	Project Type	Description
<b>Include Patterns and Files</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>To specify the files and file patterns that you want to be digitally signed at build time, do one of the following:</p> <ul style="list-style-type: none"> <li>To select one or more file names or file patterns from a list of all of the static files that are currently in your project, as well as file patterns such as *.dll, click the ellipsis button (...) in this setting. The <a href="#">Browse for file dialog box</a> opens, enabling you to select one or more patterns and files. When you are done selecting items, InstallShield adds one or more new Include settings under the Include Patterns and Files setting.</li> <li>To type a file name or pattern manually, click the Add button in this setting. InstallShield adds a new Include setting under the Include Patterns and Files setting; use this new setting to specify the file name or pattern.</li> </ul>
<b>Include</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>Specify the file or file pattern that you want to be digitally signed at build time. Note the following guidelines:</p> <ul style="list-style-type: none"> <li>To indicate a wild-card character, use an asterisk (*). For example, if you want to sign all .exe files, specify the following: <b>*.exe</b> Using wild-card characters is especially helpful if you include dynamically linked files in your project and you want to sign all files that match a certain pattern.</li> <li>Note that the files and file patterns that should not be signed override any files and file patterns that should be signed. For example, if you specify <b>*.exe</b> in an Include setting and in an Exclude setting, InstallShield does not sign any .exe files.</li> </ul> <p>To delete the file or file pattern, click the Delete button in this setting.</p> <p>To add another file or file pattern, use the Include Patterns and Files setting.</p>

**Table 206** ■ Settings on the Signing Tab (cont.)

Setting	Project Type	Description
<b>Exclude Patterns and Files</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>To specify the files and file patterns that you do not want to be digitally signed at build time, do one of the following:</p> <ul style="list-style-type: none"> <li>To select one or more file names or file patterns from a list of all of the static files that are currently in your project, as well as file patterns such as *.dll, click the ellipsis button (...) in this setting. The <a href="#">Browse for file dialog box</a> opens, enabling you to select one or more patterns and files. When you are done selecting items, InstallShield adds one or more new Exclude settings under the Exclude Patterns and Files setting.</li> <li>To type a file name or pattern manually, click the Add button in this setting. InstallShield adds a new Exclude setting under the Exclude Patterns and Files setting; use this new setting to specify the file name or pattern.</li> </ul>
<b>Exclude</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>Specify the file or file pattern that you do not want to be digitally signed at build time. Note the following guidelines:</p> <ul style="list-style-type: none"> <li>To indicate a wild-card character, use an asterisk (*). For example, if you do not want to sign any .drv files, specify the following: <b>*.drv</b> Using wild-card characters is especially helpful if you include dynamically linked files in your project and you want to avoid signing all files that match a certain pattern.</li> <li>Note that the files and file patterns that should not be signed override any files and file patterns that should be signed. For example, if you specify <b>*.exe</b> in an Include setting and in an Exclude setting, InstallShield does not sign any .exe files.</li> </ul> <p>To delete the file or file pattern, click the Delete button in this setting.</p> <p>To add another file or file pattern, use the Exclude Patterns and Files setting.</p>

## Internet Tab for a Release

**Project** ■ The Internet tab is available in the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

The Internet tab is where you specify Web-related information.

**Table 207** ■ Settings on the Internet Tab

Setting	Project Type	Description
<b>Web Type</b>	Basic MSI, InstallScript MSI	<p>Select the configuration of your Web installation package. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>One Executable</b>—Build this release as a single self-extracting Setup.exe file. This Web type is ideal for a package that is to be downloaded from many Web or FTP sites, since the installation package is self-contained. Note, however, that the entire installation package is downloaded, so the download time is longer than with the Install from the Web type that is described below.</li> <li>● <b>Downloader</b>—Build this release as a combination of Setup.exe and your .msi package, where the end user downloads and launches Setup.exe, which in turn downloads and runs the .msi database, which contains all of your files.</li> <li>● <b>Install from the Web</b>—Build this release as a combination of Setup.exe, your .msi database, and external cabinet files (.cab). The end user downloads and run Setup.exe, which in turn downloads and runs the .msi database; based on the end user's setup type and feature selections, only the requested .cab files are downloaded and installed, which minimizes download time.</li> </ul> <p>For the Downloader and Install from the Web types, application maintenance and repair uses the URL that you specify in the URL for Your Files setting as the installation source.</p>
<b>URL for Your Files</b>	Basic MSI, InstallScript MSI	<p>Specify the directory that contains the data cabinet files that will be downloaded. This setting accepts a URL in the form <b>http://www.yourcompany.com/download</b>.</p> <p>This setting is used only if the Web Type setting for the current release is set to Install from the Web or Downloader.</p>
<b>IFTW .cab Size (KB)</b>	Basic MSI, InstallScript MSI	<p>Specify the size, in kilobytes, of the cabinet files (.cab) for the Web media type. Specify the value 0 (zero) to build a separate .cab file for each component.</p> <p>This setting is used only if the value of the Web Type setting for the current release is Install from the Web.</p>

**Table 207** ■ Settings on the Internet Tab (cont.)

Setting	Project Type	Description
<b>Generate One-Click Install</b>	Basic MSI, InstallScript, InstallScript MSI	<p>Specify whether to create a One-Click Install, which is an installation program whose initial user interface is an HTML page. When an end user visits your Web page and clicks an Install button on it, the installation files are downloaded to the target system and then launched.</p>  <p><b>Project</b> ■ For Basic MSI and InstallScript MSI projects: What files are downloaded to the end user's system depends on the option that is selected for the Web Type setting for the current release. If you select Yes for the Generate One-Click Install setting, you must specify file names in the One-Click HTML Base Name setting and the One-Click .cab Base Name setting for this release. This setting is used only if you select Web for the release's Media Format setting.</p> <p>For InstallScript projects: If you select Yes for this setting, InstallShield includes with your installation an external setup player (Setup.ocx file) that downloads and then launches the Setup.exe file with the appropriate command line. For details, see <a href="#">One-Click Install Installations in InstallScript Projects</a>.</p>
<b>One-Click HTML Base Name</b>	Basic MSI, InstallScript MSI	<p>Specify the base file name of the HTML file that InstallShield should generate at build time. The .htm file name extension is appended to the base name that you specify, and the generated file is created in the Disk1 folder of the current release location.</p> <p>This setting is used only if the value of the Generate One-Click Install setting is Yes.</p>
<b>One-Click .cab Base Name</b>	Basic MSI, InstallScript MSI	<p>Specify the base file name for the cabinet file (.cab) that is generated by the build process for a One-Click Install installation.</p> <p>The .cab file name extension is appended to the name that you specify here. The generated files are created in the Disk1 folder for the current release.</p> <p>The name that you specify for this setting is displayed at run time in the Digital Certificate when you digitally sign your installation.</p> <p>This setting is used only if the value of the Generate One-Click Install setting is Yes.</p>
<b>Create Default Web Page</b>	InstallScript	<p>Specify whether you want InstallShield to create a default Web page (.htm file) and place it in the Disk1 folder.</p>

**Table 207** ■ Settings on the Internet Tab (cont.)

Setting	Project Type	Description
<b>Web Page URL</b>	InstallScript	<p>Do one of the following to indicate what URL should be launched if you click the Run From Web command on the Build menu:</p> <ul style="list-style-type: none"> <li>To launch the Setup.htm file that InstallShield creates at build time and places in the Disk1 folder, leave this box blank.</li> <li>To launch a different Web page, type the URL in this box or click the browse button to select the Web file.</li> </ul> <p></p> <p><b>Tip</b> ■ If you enter a URL, do not include the name of the page, and do not include an ending forward slash. For example, if the full URL for the Setup.htm file is <b>http://www.mypages.com/setup/Setup.htm</b>, enter the following as the Web page URL: <b>http://www.mypages.com/setup</b></p> <p>When you click the Run from Web command on the Build menu, InstallShield launches the appropriate URL (<b>http://www.mypages.com/setup/Setup.htm</b>, in the aforementioned example).</p>

## Events Tab for a Release

**Project** ■ The Events tab is available in the following project types:

- Advanced UI
- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- Suite/Advanced UI

Additional project-specific differences are noted where applicable.

The Events tab lets you configure settings for various tasks that you want InstallShield to perform before, during, or after builds.

The Events tab settings are organized into the following main categories:

- **Commands**
- **Publishing**
- **Distribution**
- **Virtual Machine** (This area is available in the Premier edition of InstallShield.)

## Commands Settings

Use the Commands area on the Events tab to specify commands that you want to be run at various stages of the build process.

**Table 208** ■ Commands Settings on the Events Tab

Setting	Project Type	Description
<b>Prebuild Event</b>	Basic MSI, InstallScript, InstallScript MSI, Merge Module, Suite/Advanced UI	 <p><b>Edition</b> ■ This setting is available in the Premier edition of InstallShield.</p> <p>Specify the command that you want to be run before InstallShield starts building the release. This event runs after InstallShield creates the release folder and log file, but before InstallShield starts building the release.</p> <p>To specify more than one command, click the ellipsis button (...) in this setting, which opens the Prebuild Event dialog box. Enter each command on a separate line in this dialog box. At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.</p> <p>When you are entering a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see <a href="#">Specifying Commands that Run Before, During, and After Builds</a>.</p>
<b>Precompression Event</b>	Basic MSI, InstallScript MSI	 <p><b>Edition</b> ■ This setting is available in the Premier edition of InstallShield.</p> <p>Specify the command that you want to be run after InstallShield has built the .msi package and the .cab files (if your product's data files are to be stored in .cab files). Note that this event occurs after .cab files are streamed into the .msi package, but before the .msi package has been digitally signed and streamed into the Setup.exe file.</p> <p>To specify more than one command, click the ellipsis button (...) in this setting, which opens the Precompression Event dialog box. Enter each command on a separate line in this dialog box. At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.</p> <p>When you are entering a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see <a href="#">Specifying Commands that Run Before, During, and After Builds</a>.</p>

**Table 208** ■ Commands Settings on the Events Tab (cont.)

Setting	Project Type	Description
<b>Execute Batch File</b>	InstallScript, InstallScript Object	<p>To launch a batch file (.bat) or executable file (.exe) after the release has been built, enter the path to the file, or click the ellipsis button (...) to browse to the file. You can use path variables, enclosed within angle brackets (&lt;&gt;), as part of the path.</p> <p>If you specify a file for this, InstallShield sets environment variables with the same names (including the angle brackets) and values as the project's build variables. InstallShield also sets the environment variable &lt;ISMEDIADIR&gt;, whose value is the path to the folder in which the release's Disk Images, Log Files, and Report Files folders are created. You can refer to the value of an environment variable in a batch file by surrounding the variable name with percent signs (%); for example:</p> <pre>set PATH = %&lt;ISPROJECTDIR&gt;%;%PATH%</pre> <p>When the file is finished, InstallShield deletes the environment variables that it set.</p>
<b>Postbuild Event</b>	Basic MSI, InstallScript, InstallScript MSI, Merge Module, Suite/ Advanced UI	 <p><b>Edition</b> ■ This setting is available in the Premier edition of InstallShield.</p> <p>Specify the command that you want to be run after InstallShield has built and signed the release.</p> <p>To specify more than one command, click the ellipsis button (...) in this setting, which opens the Postbuild Event dialog box. Enter each command on a separate line in this dialog box. At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.</p> <p>When you are entering a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see <a href="#">Specifying Commands that Run Before, During, and After Builds</a>.</p>

## Publishing Settings

The Publishing settings that are displayed depend on what project type you are using; they also depend on whether you are using the version of InstallShield that ships by itself, or the one that is included in AdminStudio.

## Publishing Settings in the Version of InstallShield that Ships By Itself (Without AdminStudio)

For the version of InstallShield that ships by itself (without AdminStudio), the settings in the Publishing area on the Events tab are available in merge module projects. Use these settings to specify information such as whether you want the merge module to be available in the Merge Modules folder or a repository after each successful build of the release.

**Table 209** ■ Publishing Settings on the Events Tab—for InstallShield Without AdminStudio

Setting	Project Type	Description
<b>Publish Merge Module</b>	Merge Module	<p>Specify whether you want the merge module to be available in the Merge Modules folder or a repository after each successful build of the selected release. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Publish to repository</b>—InstallShield publishes the merge module to the repository that is specified in the Repository Name setting whenever you successfully build the release. Note that this option is available only if one or more repositories have been configured. (To configure a repository, on the Tools menu, click Options, and then click the Repository tab. Use this tab to configure a repository.)</li> <li>● <b>Copy to Merge Modules folder</b>—InstallShield updates the Merge Modules folder with this new merge module whenever you successfully build the release.</li> <li>● <b>Do not publish</b>—InstallShield does not publish the merge module to a repository or copy it to the Merge Modules folder when you build the release.</li> </ul> <p>To learn more, see <a href="#">Using a Repository to Share Project Elements</a>.</p>
<b>Repository Name</b>	Merge Module	<p>Select the repository where the merge module that you are building should be published when the release is successfully built.</p> <p>Note that this option is available only if one or more repositories have been configured. (To configure a repository, on the Tools menu, click Options, and then click the Repository tab. Use this tab to configure a repository.)</p>
<b>Display Name</b>	Merge Module	<p>Specify a display name for the merge module that you are publishing to the repository.</p> <p>When you select this merge module in the Redistributables view after it has been published to the repository, the display name is available in the details pane.</p>

**Table 209** ■ Publishing Settings on the Events Tab—for InstallShield Without AdminStudio (cont.)

Setting	Project Type	Description
<b>Publisher</b>	Merge Module	<p>Type the name of the person publishing this merge module to the repository. This name will be displayed in the description pane when you select this merge module in the Redistributables view.</p> <p>When you select this merge module in the Redistributables view after it has been published to the repository, the publisher name is available in the details pane.</p>
<b>Description</b>	Merge Module	<p>Type the description that should be displayed for this merge module.</p> <p>When you select this merge module in the Redistributables view after it has been published to the repository, the description is available in the details pane.</p>

### Publishing Settings in the Version of InstallShield that Ships as Part of AdminStudio

For the version of InstallShield that ships as part of AdminStudio, the settings in the Publishing area on the Events tab are available in Basic MSI projects. Use these settings to specify information such as whether you want the Windows Installer package that you are building to be published to the software repository.

**Table 210** ■ Publishing Settings on the Events Tab—for InstallShield with AdminStudio

Setting	Project Type	Description
<b>Publish to AdminStudio Repository</b>	Basic MSI	<p>Specify whether you want the Windows Installer package that you are building to be published to the software repository.</p> <p>If you use the software repository to manage a Windows Installer package, the .msi file and all of its other associated files and subfolders are stored in a subfolder of the software repository location that is identified for the package's Application Catalog.</p>
<b>Group</b>	Basic MSI	<p>If you select Yes for the Publish to AdminStudio Repository setting and you want to associate the Windows Installer package with one or more groups in the Application Catalog, click the ellipsis button (...) in this setting. The Select Application Manager Groups dialog box opens. Select the check box for each group that you want to contain the Windows Installer package.</p>

**Table 210** ■ Publishing Settings on the Events Tab—for InstallShield with AdminStudio (cont.)

Setting	Project Type	Description
<b>Update Option</b>	Basic MSI	<p>Specify how you want to handle the importing of the Windows Installer package that is built for the selected release into the Application Catalog. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>New Package Version</b>—A new build is treated as a new package in the Application Catalog.</li> <li>● <b>Overwrite Existing Version</b>—A new build overwrites the existing version in the Application Catalog.</li> <li>● <b>New Package History Version</b>—A new build is treated as a new version of the package that exists in the Application Catalog.</li> <li>● <b>Ignore if Exists</b>—A new build is imported only if it does not already exist in the Application Catalog.</li> </ul>

## Distribution

Use the Distribution area on the Events tab to configure settings for distributing releases to a folder or FTP site automatically at build time.

**Table 211** ▪ Distribution Settings on the Events Tab

Setting	Project Type	Description
<b>Copy to Folder</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>If you want to be able to automatically distribute your release to a folder, specify location. Existing folders with the same names as copied folders are overwritten, but no folders are deleted. Specify the folder path by entering the path in this setting, or click the ellipsis button (...) to browse to the location.</p> <p>If the media format of the selected release is a network image, which creates only one disk image folder, the contents of the disk image folder, rather than the folder itself, are copied. If you chose to create a self-extracting executable file, the executable file, rather than the disk image folders, is copied.</p> <div data-bbox="711 856 756 898" data-label="Image"> </div> <p><b>Project</b> ▪ For InstallScript and InstallScript Object projects, InstallShield automatically copies the release to the folder that you specify on the Events tab every time that you build the release.</p> <p>For any of the following project types, InstallShield copies all of the relevant files for your release to the specified folder whenever you right-click the release in the Releases view and then click <i>Distribute</i>:</p> <ul style="list-style-type: none"> <li>• Basic MSI</li> <li>• InstallScript MSI</li> <li>• Merge Module</li> </ul> <p>If you want the build engine to copy your release to the specified folder after every build in a Basic MSI, InstallScript MSI, or Merge Module project, select <i>Yes</i> for the <i>Distribute After Build</i> setting.</p> <div data-bbox="711 1398 756 1440" data-label="Image"> </div> <p><b>Note</b> ▪ If you specify a folder for this setting and you also specify an FTP location on the Events tab, InstallShield copies the release to only the FTP location.</p>

**Table 211** ■ Distribution Settings on the Events Tab (cont.)

Setting	Project Type	Description
<b>FTP Location</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>If you want to be able to automatically distribute your release to an FTP server, specify the FTP URL for the location. Each release in your project can have a different FTP location.</p>  <p><b>Note</b> ■ If you need to distribute your release to a path outside the FTP default folder, use a double slash (/). For example, to distribute your release to a root-level folder called <b>myproduct</b>, where the URL of the FTP server is <b>ftp://ftp.mydomain.com</b>, enter <b>ftp://ftp.mydomain.com/myproduct</b> for the FTP location.</p>  <p><b>Project</b> ■ For InstallScript and InstallScript Object projects, InstallShield automatically copies the release to the FTP location that you specify on the Events tab every time that you build the release.</p> <p>For any of the following project types, InstallShield copies all of the relevant files for your release to the specified FTP location whenever you right-click the release in the Releases view and then click <b>Distribute</b>:</p> <ul style="list-style-type: none"> <li>● Basic MSI</li> <li>● InstallScript MSI</li> <li>● Merge Module</li> </ul> <p>If you want the build engine to copy your release to the specified location after every build in a Basic MSI, InstallScript MSI, or Merge Module project, select <b>Yes</b> for the <b>Distribute After Build</b> setting.</p>
<b>FTP Site User Name</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>If a user name is required to upload to the FTP location that you are specifying, enter the user name.</p>  <p><b>Project</b> ■ If you enter a user name for one of the releases in a Basic MSI, InstallScript MSI, or Merge Module project, that same user name is used for other releases in the same project and in other Basic MSI, InstallScript MSI, and Merge Module projects.</p>
<b>FTP Site Password</b>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module	<p>If a password is required to upload to the FTP location that you are specifying, enter the password.</p>  <p><b>Project</b> ■ If you enter a password for one of the releases in a Basic MSI, InstallScript MSI, or Merge Module project, that same password is used for other releases in the same project and in other Basic MSI, InstallScript MSI, and Merge Module projects.</p>

**Table 211** ▪ Distribution Settings on the Events Tab (cont.)

Setting	Project Type	Description
<b>Distribute After Build</b>	Basic MSI, InstallScript MSI, Merge Module	Specify whether you want the build engine to automatically distribute your release after each build to the location that you specified. 
<b>Tip</b> ▪ To quickly distribute your release on demand, instead of after each build, right-click the release and click <i>Distribute</i> . Note that the <i>Distribute</i> command is available only if the release has been built at least once.		

## Virtual Machine Settings

**Edition** ▪ The Virtual Machine area is available in the Premier edition of InstallShield.

Use the Virtual Machine area on the Events tab to configure settings for distributing the selected release to a virtual machine (VM) at build time or on demand. To learn more, see [Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand](#).

**Table 212** ▪ Virtual Machine Settings on the Events Tab

Setting	Project Type	Description
<b>Configuration</b>	Basic MSI, InstallScript, InstallScript MSI, Suite/Advanced UI	<p>This setting shows the name of the group of VM configuration settings that you want to use when distributing the selected release to a VM.</p> <p>To specify an existing VM configuration, select it in this setting.</p> <p>To create a new VM configuration, click the ellipsis button (...) in this setting.</p> <p>To edit an existing VM configuration, select it in this setting and then click the ellipsis button (...).</p> <p>To override the selected VM configuration's details (such as the destination on the VM where you want the installation to be distributed) for the selected release, configure the subsettings under this setting.</p> <p>To learn more about VM distribution, see <a href="#">Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand</a>.</p> <p>For information on how to share VM configurations with other machines, see <a href="#">Sharing Virtual Machine Settings for Distribution of Releases</a>.</p>

**Table 212** ▪ Virtual Machine Settings on the Events Tab (cont.)

Setting	Project Type	Description
<b>Snapshot</b>	Basic MSI, InstallScript, InstallScript MSI, Suite/ Advanced UI	<p>Optionally specify the name of the snapshot that you want to use for distributing the release.</p> <p>If a snapshot is specified for the VM configuration that is selected in the Configuration setting, the name of that snapshot is considered to be the default value for this setting and displayed in gray text. To override the snapshot for the selected release, enter it in this setting.</p> <p>If no snapshot is specified for the VM configuration, InstallShield does not revert to a specific snapshot. InstallShield powers on the VM without reverting it to a specific snapshot, and copies your installation to the VM.</p> <p>To learn more about VM distribution, see <a href="#">Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand</a>.</p>
<b>User Name</b>	Basic MSI, InstallScript, InstallScript MSI, Suite/ Advanced UI	<p>If a user name is specified for the VM configuration that is selected in the Configuration setting, that user name is considered to be the default value for this setting and displayed in gray text. To override the user name for the selected release, enter it in this setting.</p> <p>To learn more about VM distribution, see <a href="#">Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand</a>.</p>
<b>Password</b>	Basic MSI, InstallScript, InstallScript MSI, Suite/ Advanced UI	<p>If a password is specified for the VM configuration that is selected in the Configuration setting, that password is considered to be the default value for this setting and displayed in gray text. To override the password for the selected release, enter it in this setting.</p> <p>To learn more about VM distribution, see <a href="#">Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand</a>.</p>
<b>Destination Path</b>	Basic MSI, InstallScript, InstallScript MSI, Suite/ Advanced UI	<p>The destination path identifies the location on the VM where the release is to be distributed. The last subfolder in the path can be a path that InstallShield creates on the VM; the other folders in the path must already exist.</p> <p>If a destination path is specified for the VM configuration that is selected in the Configuration setting, that destination path is considered to be the default value for this setting and displayed in gray text. To override the destination path for the selected release, enter it in this setting.</p> <p>To learn more about VM distribution, see <a href="#">Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand</a>.</p>

**Table 212** ▪ Virtual Machine Settings on the Events Tab (cont.)

Setting	Project Type	Description
<b>Distribute After Build</b>	Basic MSI, InstallScript, InstallScript MSI, Suite/Advanced UI	<p>Specify whether you want InstallShield to automatically distribute the selected release each time that it is successfully built. Distributing the release to the VM involves the following tasks:</p> <ol style="list-style-type: none"> <li>1. Revert the VM to the designated snapshot (if one is specified).</li> <li>2. Power on the VM.</li> <li>3. Copy the built release to the VM to make it available for testing.</li> </ol> <p>As an alternative to automatically distributing the release at build time to the VM, you can distribute the release on demand: right-click the release and then click Distribute to VM.</p> <p>To learn more about VM distribution, see <a href="#">Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand</a>.</p>

## Appx/MSIX Tab for a Release

**Project** ▪ The Appx/MSIX tab is available in Basic MSI projects.

Windows app package (.appx/.msix) creation is enabled in the per-release tab titled Appx/MSIX tab. Here, some core settings can be specified that impact the Windows app package build process.

The Appx/MSIX tab settings are organized into the following main categories:

- [General](#)
- [App Installer Settings](#)
- [Package Identity Overrides](#)
- [Display Properties](#)

## General Settings

Use the General area on the Appx/MSIX tab to specify whether a Windows app package (.appx) will be built as part of building the release and to specify other core settings that impact the build process such as choosing whether to include desktop extensions or server extensions.

**Table 213** ▪ General Settings on the Appx/MSIX Tab

Setting	Project Type	Description
<b>Build Windows App Package</b>	Basic MSI	<p>Specify whether you want a Windows app package (.appx/.msix) to be built as part of building this release.</p> <p>Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Yes</b>—Build the Windows app package (.appx/.msix). Choose <b>Yes</b> if you want to: <ul style="list-style-type: none"> <li>● Distribute your app through the Windows Store.</li> <li>● Target Windows Server Nano.</li> <li>● Sideload a Appx/MSIX that leverages the Universal Windows Platform.</li> </ul> </li> <li>● <b>No</b>—Do not build the Windows app package. If you select <b>No</b>, only the .msi will be built.</li> </ul>
<b>Package Type</b>	Basic MSI	<p>Choose a package type. This setting converts your Windows desktop application to the modern Windows app packaging format. The available drop-down options are:</p> <ul style="list-style-type: none"> <li>● APPX - Build the Windows App Package</li> <li>● MSIX - MSIX is the next generation software deployment model for Windows platform, bringing in the best of MSI, AppX and App-V - together in a single package. MSIX has the capability to run a traditional Win32 app in a container, achieving application isolation, ease of deployment, fully clean uninstallation and seamless software updates all at the same time.</li> <li>● Both - Builds both .appx and .msix packages.</li> </ul>

**Table 213** ▪ General Settings on the Appx/MSIX Tab (cont.)

Setting	Project Type	Description
<b>Distribution Method</b>	Basic MSI	<p>Choose a distribution method for your Windows app package. This setting directs which set of warnings are issued for potential problems related to Windows Store policies or requirements related to sideloading. Available drop-down options are:</p> <ul style="list-style-type: none"> <li>● <b>Direct Distribution (Sideload)</b>—Distribute a Windows app package without having it downloaded from the Windows Store. Sideloaded apps have not been certified by the Windows Store. A common example of a sideloaded app is one that is distributed to an enterprise environment and is internal to a company only. If a package will be sideloaded, you will typically need to sign it, unless your customer wishes to sign it themselves.</li> <li>● <b>Windows Store</b>—Distribute a Windows app package through the Windows Store. When this option is selected, additional warnings will be issued for items that are known to be rejected by Windows Store policy despite the build being valid in a sideloading scenario. If a package will be distributed through the Windows Store, it is subject to additional policies that limit its contents. This type of app doesn't need to be signed before it is uploaded to Microsoft because Microsoft signs the package.</li> </ul>
<b>Include Desktop Extensions</b>	Basic MSI	<p>Choose whether to include "full trust" apps and other Desktop Bridge extensions as part of the core Windows App package (.appx/.msixWindows App) format. If you want to enable your desktop apps to start leveraging Universal Windows Platform (UWP) APIs, you should enable desktop extensions.</p> <p>If you select <b>No</b>, warnings are issued for any such items that cannot be represented.</p> <p>If you select <b>Yes</b>, additional subsettings can be configured as needed to specify a minimum Windows version and maximum tested Windows version supported by the included apps and desktop extensions.</p> <p></p> <p><b>Tip</b> ▪ When using InstallShield to create a Windows App package, choose to include either desktop extensions or server extensions, but not both. Although a Windows App package can contain both desktop and server extensions, targeting one set over the other is a more likely scenario.</p>

**Table 213** ▪ General Settings on the Appx/MSIX Tab (cont.)

Setting	Project Type	Description
<b>Minimum Version</b> (under Include Desktop Extensions)	Basic MSI	<p>Optionally, specify the app's minimum supported Windows version number. If you leave this blank, the minimum version number of Windows 10 Anniversary Update is assumed.</p> <p>The version must contain only numbers and it requires four parts using the following format (with values in each part ranging from 0 to 65535): <i>majorversion.minorversion.buildnumber.revisionnumber</i>, such as:</p> <p>1.0.0.60325</p> <p>Use as few characters as possible. For example, do not use unnecessary leading zeros; instead of entering 14.00.25.1, enter the following:</p> <p>14.0.25.1</p>
<b>Tested Version</b> (under Include Desktop Extensions)	Basic MSI	<p>Optionally, specify the app's maximum supported tested Windows version number. If you leave this blank, this setting defaults to match the Minimum Version (or the minimum version number of Windows 10 Anniversary Update if nothing is specified for Minimum Version).</p> <p>The version must contain only numbers and it requires four parts using the following format (with values in each part ranging from 0 to 65535): <i>majorversion.minorversion.buildnumber.revisionnumber</i>, such as:</p> <p>1.0.0.60325</p> <p>Use as few characters as possible. For example, do not use unnecessary leading zeros; instead of entering 14.00.25.1, enter the following:</p> <p>14.0.25.1</p>

**Table 213** ▪ General Settings on the Appx/MSIX Tab (cont.)

Setting	Project Type	Description
<b>Include Server Extensions</b>	Basic MSI	<p>Choose whether to include Windows Server extensions as part of the core Windows App package (.appx/.msixWindows App) format, thus creating a Windows Server App. If you want to target Windows Server Nano's installation package format and deploy a service, WMI provider, event source, or performance counter, you should enable server extensions.</p> <p>If you select <b>No</b>, warnings are issued for any items that cannot be represented.</p> <p>If you select <b>Yes</b>, additional subsettings can be configured as needed to specify the minimum Windows Server operating system and maximum tested Windows Server operating system supported by the included apps.</p> <div>  <p><b>Tip</b> ▪ When using InstallShield to create a Windows App package, choose to include either desktop extensions or server extensions, but not both. Although a Windows App package can contain both desktop and server extensions, targeting one set over the other is a more likely scenario.</p> </div>

**Table 213** ■ General Settings on the Appx/MSIX Tab (cont.)

Setting	Project Type	Description
<b>Include MSIX Core Extensions</b>	Basic MSI	<p>The MSIX Core enables the installation of MSIX apps on previous versions of Windows, provided the apps are already built to work on those versions of Windows.</p> <p>The MSIX Core is built for the following Windows versions that do not currently support MSIX:</p> <ul style="list-style-type: none"> <li>• Windows 7 SP1- 6.1.7601.0</li> <li>• Windows 8.1 Update 1- 6.3.9600.0</li> <li>• Windows 10 2015 LTSB (1507)- 10.0.10240.0</li> <li>• Windows 10 2016 LTSB (1607)- 10.0.14393.0</li> <li>• Windows Server 2008 R2 - 6.1.7601.0</li> <li>• Windows Server 2012- 6.2.9200.0</li> <li>• Windows Server 2012 R2 - 6.3.9600.0</li> <li>• Windows Server 2016 - 10.0.14393.0</li> </ul> <p>By default, the <b>No</b> option is selected. The possible options are:</p> <ul style="list-style-type: none"> <li>• <b>No</b> - When you select this option, the MSIX Core entry will not be added to the manifest file.</li> <li>• <b>Yes</b> - When you select this option, the MSIX Core entry will be added to the manifest file along with the specified minimum Windows version and maximum tested Windows version.</li> </ul> <p></p> <p><b>Tip</b> ■ The MSIX Core package needs MSIX pre-requisite to be installed on the older package.</p>
<b>Minimum Version</b> (under Include Server Extensions)	Basic MSI	<p>Optionally, specify the app's minimum supported Windows version number. If you leave this blank, the minimum version number of Windows 7 SP1 Update (6.1.7601.0) is assumed.</p> <p>The version must contain only numbers and it requires four parts using the format of <i>majorversion.minorversion.buildnumber.revisionnumber</i> (with values in each part ranging from 0 to 6553).</p>
<b>Tested Version</b> (under Include Server Extensions)	Basic MSI	<p>Optionally, specify the app's maximum supported tested Windows version number. If you leave this blank, this setting defaults to match the maximum MSIX core supported version number 10.0.14393.0 (Windows 10 2016 LTSB - 1607).</p> <p>The version must contain only numbers and it requires four parts using the format of <i>majorversion.minorversion.buildnumber.revisionnumber</i> (with values in each part ranging from 0 to 65535).</p>

**Table 213** ▪ General Settings on the Appx/MSIX Tab (cont.)

Setting	Project Type	Description
<b>Framework Dependencies</b>	Basic MSI	<p>Select the retail or debug build of the C++ runtime that matches the one used in your product.</p>  <p><b>Note</b> ▪ This setting does not cause the dependency packages to be installed in sideload scenarios. For those scenarios, the dependency may have to be delivered manually. Also, the debug versions of the of the C++ runtime are only useful for internal testing and cannot be uploaded to the Windows Store. For local testing or sideload, you may also have to deploy the framework package that is included in the Windows 10 SDK.</p>
<b>Merge Dependencies</b>	Basic MSI	 <p><b>Edition</b> ▪ This setting is available in the Premier edition of InstallShield.</p> <p>Specify a list of Windows App packages to merge into the resulting package. Click the ellipsis button (...) to browse for a Windows App package (.appx/.msixWindows App), or type one or more paths directly in this setting, separated by semicolons.</p> <p>Registry data and files from the VFS are copied into this package, but any duplicates of data already in the package are omitted.</p>

## App Installer Settings

Use the App Installer Settings area on the Appx/MSIX tab to generate an App Installer file and configure package update capabilities.

An App Installer file is an XML document (\*.appinstaller) that contains set of attributes for defining the package properties and the location where it has been deployed. The App Installer file is introduced as of Windows 10 Version 1709. It specifies where your app package is located and how to update it. If you choose to use this method of app distribution, you must share with your users the App Installer file, instead of the actual app package. The user must then click on the App Installer file. At this point the familiar App Installer UI will appear and guide the user through the installation. Once the user has installed the application using these steps, the application is associated with the App Installer file.

Later, when you have an update to the application, you only update the App Installer (.appinstaller) file. When you update the file, the new version of the application is pushed to the user automatically based on settings configured 'Update Settings' section below.

Refer [App Installer File Schema](#) for more information.

**Table 214** ■ App Installer Settings on the Appx/MSIX Tab

Setting	Project Type	Description
<b>AppInstaller File URL</b>	Basic MSI	<p>Specify App Installer file location.</p> <p>The App Installer file can be hosted in a shared location like a HTTP endpoint or a UNC shared folder or a local file share, and includes the path to find the MSIX packages to be installed. Users install the app from the shared location or from the web and enable periodic checks for new updates.</p>
<b>AppInstaller Version</b>	Basic MSI	Specify the version of App Installer file. A version string in quad notation, 'Major.Minor.Build.Revision', such as 1.0.0.60325.
<b>Main Package URL</b>	Basic MSI	<p>Specify the Uri to the app package location. The Uri specified for <b>AppInstaller File URL</b> will be considered if this option is empty. Other information of the MainPackage element, which includes name, publisher, and version can be changed using <b>Package Identity Overrides</b> section mentioned in this page. Information provided in <b>Package Identity Overrides</b> will be considered during build time for both MSIX package and App Installer file as all these information must match with the information included in the manifest of the MSIX application package.</p>
<b>Update Settings</b>	Basic MSI	Use the <b>Update Settings</b> category to configure the auto update capabilities of MSIX package using App Installer file.
<b>Update Settings on App Launch</b>	Basic MSI	Specify whether you want to configure update settings for this package during app launch. This behavior during OnLaunch shows the UI and is further configurable with the support of HoursBetweenUpdateChecks, ShowPrompt, and UpdateBlocksActivation child attributes as explained below.
<b>Hours Between Update Checks</b>	Basic MSI	<p>The HoursBetweenUpdateChecks option specifies the frequency with which the deployment service will check for an update to the App Installer file.</p> <p>When HoursBetweenUpdateChecks is set to 0, the deployment service will check for updates every time the application is launched. For other values, the deployment service will check for updates when the application is launched only if it hasn't previously checked within the last number of hours specified by HoursBetweenUpdateChecks.</p> <p>For example, if HoursBetweenUpdateChecks is set to 10, the deployments service will check for updates when the application is launched only if it hasn't already checked for updates in the previous 10 hours. The Windows deployment service will automatically download it if there is a new update available and install the update once the application is closed.</p>

Setting	Project Type	Description
<b>Show Prompt</b>	Basic MSI	Specify whether deployment will show a prompt or not, informing the user about the update. Available in Windows 10, version 1903 and later.  For latest updates, refer to Microsoft documentation.
<b>Update Blocks Activation</b>	Basic MSI	Choosing <b>Yes</b> will stop the user from launching the application until the update has been applied. This option allows the user to only take the update or close the app. Should only be used if ShowPrompt option is chosen as it needs the UI to show the options. This option will help to deliver critical updates where app must be launched with some important fixes.
<b>Automatic Background Task</b>	Basic MSI	Specify whether or not to check for updates in the background regardless the app is launched or not. A check is made every 8 hours independently of whether the user launched the app. This type of update cannot show UI. Choose 'Update Settings on App Launch' for displaying the interactive UI before update process gets triggered. Available in Windows 10, version 1803 and later.
<b>Force Update From Any Version</b>	Basic MSI	Specify whether the app's version to be incremented or decremented based on the requirement. Without this element, the app can only be updated to a higher version and Windows deployment service will not allow downgrade to older version. This option is useful to perform rollbacks to older app package versions. Available starting in Windows 10, version 1809 and later.

## Package Identity Overrides Settings

Use the Package Identity Overrides area on the Appx/MSIX tab to uniquely identify a package to Windows. These fields are typically not shown to an end user. Also, because the settings are overridden, the fields are not expanded by default.

**Note** - Architecture is also part of a Windows App package's identity. Use the Template Summary setting in the Product Configuration, or in General Information, to specify the architecture of your Windows App package.

**Table 215** - Package Identity Overrides Settings on the Appx/MSIX Tab

Setting	Project Type	Description
<b>Name</b>	Basic MSI	Specify a unique alphanumeric string that identifies your Windows App package to Windows. If this is left blank, InstallShield generates a name based on the <b>Product Name</b> setting in the Product Configuration or General Information.

**Table 215** ■ Package Identity Overrides Settings on the Appx/MSIX Tab

Setting	Project Type	Description
<b>Publisher</b>	Basic MSI	<p>To override the actual value of the certificate if one is specified on the Signing tab, specify the Subject name (name of the owner) of the certificate that will be used to sign the package. For example:</p> <p>CN=Revenera, O=Revenera, L=Itasca, S=Illinois, C=US</p> <p>If a package will be distributed through the Windows Store, it doesn't need to be signed before it's uploaded to Microsoft, in which case a signing certificate may be skipped. If a package will be sideloaded, it may or may not need to be signed, depending on how your customers expect to handle the package:</p> <ul style="list-style-type: none"> <li>● If the customer prefers to sign the package themselves, they may need a specific publisher defined in the <b>Publisher</b> override setting that matches their certificate.</li> <li>● If the customer merely wants to deploy the package, they may expect it to be signed with a trusted Authenticode Certificate. The requirements on this are equivalent to those for a trusted UAC prompt.</li> <li>● Sideloaded requires that the Sideloaded setting in Windows is enabled. Sideloaded is enabled by default in the Windows 10 Anniversary Update.</li> </ul> <p></p> <p><b>Tip</b> ■ The following settings on the Signing tab of the Releases view also influence the built package by controlling whether and how the Windows App package is signed: <b>Digital Certificate Information</b>, <b>Certificate Password</b>, and <b>Sign Output Files</b>.</p>
<b>Version</b>	Basic MSI	<p>Enter a version number for the Windows App package to which the certificate conforms. If nothing is specified, the version number is copied from the <b>Product Version</b> setting in General Information or Product Configuration.</p> <p>The version must contain only numbers and requires four parts using the following format (with values in each part ranging from 0 to 65535): <i>majorversion.minorversion.buildnumber.revisionnumber</i>, such as:</p> <p>1.0.0.60325</p> <p>Use as few characters as possible. For example, do not use unnecessary leading zeros; instead of entering 14.00.25.1, enter the following:</p> <p>14.0.25.1</p>

## Display Properties

Use the four fields in the Display Properties area on the Appx/MSIX tab to identify a package to an end user..

**Table 216** ▪ Display Properties Settings on the Appx/MSIX Tab

Setting	Project Type	Description
<b>Display Name</b>	Basic MSI	<p>Specify the string that users will recognize as the name of the package. This is typically the name of the application. If nothing is specified, the Display Name is copied from the <b>Product Name</b> setting in General Information or Product Configuration.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>  <p><b>Note</b> ▪ Localization of Windows App packages requires the Windows 10 SDK be installed on the same machine as InstallShield. If it is not present, InstallShield will build a Windows App package containing only the default language.</p>
<b>Publisher Display Name</b>	Basic MSI	<p>Specify the string that users will recognize as the publisher's name. For example:</p> <p>Reverera</p> <p>If nothing is specified, the Display Name is copied from the <b>Publisher</b> setting in General Information or Product Configuration.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>  <p><b>Note</b> ▪ Localization of Windows App packages requires the Windows 10 SDK be installed on the same machine as InstallShield. If it is not present, InstallShield will build a Windows App package containing only the default language.</p>

**Table 216** ▪ Display Properties Settings on the Appx/MSIX Tab (cont.)

Setting	Project Type	Description
<b>Description</b>	Basic MSI	<p>Optionally, specify a description to help distinguish the package to an end user.</p> <p>When you type a value for this setting, you are creating a string entry and setting its initial value for all of the languages that are currently in the project. As an alternative to typing a new value, you can click the ellipsis button (...) in this setting to select an existing string. For more information, see <a href="#">Using String Entries in InstallShield</a>.</p>  <p><b>Note</b> ▪ Localization of Windows App packages requires the Windows 10 SDK be installed on the same machine as InstallShield. If it is not present, InstallShield will build a Windows App package containing only the default language.</p>
<b>Logo</b>	Basic MSI	Specify the image used to represent the package. This is typically a 50x50 logo. If no logo is specified, it is created from the <b>Display Icon</b> setting in General Information.

## Updates Tab for a Release

**Project** ▪ The Update tab is available in the following project type:

- Suite/Advanced UI

Additional project-specific differences are noted where applicable.

The Updates tab lets you configure settings for various tasks that you want InstallShield to perform before, during, or after builds.

The Updates tab settings are organized into the following main categories:

- [Enabling Downloadable Update Support](#)
- [Configuring a Newer Version of Downloadable Updates](#)
- [Configuring a Prompt Message](#)
- [Adding Downloadable Update Support](#)

Setting	Project Type	Description
<b>Enable Updates</b>	Suite/Advanced UI	Enable the downloadable update support for your Advanced UI or Suite/Advanced UI setup launcher.

Setting	Project Type	Description
<b>Prompt User</b>	Suite/Advanced UI	The end users receive an option to either download a newer version or skip and proceed with the current installation process.
<b>Force Install</b>	Suite/Advanced UI	The end users can forcibly download and install the new version of the Suite package (if available).
<b>Prompt Message</b>	Suite/Advanced UI	Enter the message you want to show the end users to download a newer version or skip and proceed with the current installation process.
<b>Update URL</b>	Suite/Advanced UI	<p>If you want to make updates available for your Advanced UI or Suite/Advanced UI setup launcher for download; Specify the absolute path, including the file name.</p> <p>For more information about updates for your Advanced UI or Suite/Advanced UI installation, including requirements for the update, see <a href="#">Supporting Downloadable Updates for an Advanced UI or Suite/Advanced UI Installation</a>.</p>

## General Tab for MSIX Release

**Project** ▪ The General tab is available in the following project types:

- MSIX
- MSIX Modification Package

The General tab has the following settings, primarily for overriding other settings in the resulting releases:

**Table 217** ▪ General Tab for MSIX Release

Setting	Project Type	Description
<b>General</b>	MSIX, MSIX Modification Package	Use the Settings view on the General tab to specify core settings that impact the build process such as including desktop extensions or server extensions and signing details.
<b>Release Location</b>	MSIX, MSIX Modification Package	Enter the path to the top-level directory where your release will start to be built, or click the ellipsis button (...) to browse to the location.

**Table 217** ■ General Tab for MSIX Release

Setting	Project Type	Description
<b>Package Architectures</b>	MSIX, MSIX Modification Package	<p>Describes the architecture of the code contained in the package. A package that includes executable code must include this attribute.</p> <p>The available codes are given below:</p> <ul style="list-style-type: none"> <li>● <b>x86</b></li> <li>● <b>x64</b></li> <li>● <b>ARM</b></li> <li>● <b>ARM64</b></li> <li>● <b>Neutral</b></li> </ul>
<b>Distribution Method</b>	MSIX, MSIX Modification Package	<p>Choose a distribution method for your MSIX package. This setting directs which set of warnings are issued for potential problems related to Windows Store policies or requirements related to sideloading. Available drop-down options are:</p> <ul style="list-style-type: none"> <li>● <b>Direct Distribution (Sideload)</b>— Distribute a MSIX package without having it downloaded from the Windows Store. Sideloaded apps have not been certified by the Windows Store. A common example of a sideloaded app is one that is distributed to an enterprise environment and is internal to a company only. If a package will be sideloaded, you will typically need to sign it, unless your customer wishes to sign it themselves.</li> <li>● <b>Windows Store</b>— Distribute a MSIX package through the Windows Store. When this option is selected, additional warnings will be issued for items that are known to be rejected by Windows Store policy despite the build being valid in a sideloading scenario. If a package will be distributed through the Windows Store, it is subject to additional policies that limit its contents. This type of app doesn't need to be signed before it is uploaded to Microsoft because Microsoft signs the package.</li> </ul>

**Table 217** ▪ General Tab for MSIX Release

Setting	Project Type	Description
<b>Include Universal Extensions</b>	MSIX, MSIX Modification Package	<p>Choose whether to include Universal device extensions as part of the core UWP app package format. If you want to enable your apps to start leveraging Universal Windows Platform (UWP) APIs, you should enable Universal extensions.</p> <p>If you select,</p> <ul style="list-style-type: none"> <li>● <b>No</b>— The warnings are issued for any such items that cannot be represented.</li> <li>● <b>Yes</b>— The additional subsettings can be configured as needed to specify a minimum Windows version and maximum tested Windows version supported by the included apps and Universal extensions.</li> </ul>
<b>Include Desktop Extensions</b>	MSIX, MSIX Modification Package	<p>Choose whether to include "full trust" apps and other Desktop Bridge extensions as part of the core UWP app package format. If you want to enable your desktop apps to start leveraging Universal Windows Platform (UWP) APIs, you should enable desktop extensions.</p> <p>If you select,</p> <ul style="list-style-type: none"> <li>● <b>No</b>— The warnings are issued for any such items that cannot be represented.</li> <li>● <b>Yes</b>— The additional subsettings can be configured as needed to specify a minimum Windows version and maximum tested Windows version supported by the included apps and desktop extensions.</li> </ul> <div>  <p><b>Important</b> ▪ When using InstallShield to create a UWP app package, choose to include either desktop extensions or server extensions, but not both. Although a UWP app package can contain both desktop and server extensions, targeting one set over the other is a more likely scenario.</p> </div>

**Table 217** ▪ General Tab for MSIX Release

Setting	Project Type	Description
<b>Minimum Version</b>	MSIX, MSIX Modification Package	<p>Optionally, specify the app's minimum supported Windows version number. If you leave this blank, the minimum version number of Windows 10 Anniversary Update is assumed.</p> <p>The version must contain only numbers and it requires four parts using the following format (with values in each part ranging from 0 to 65535): majorversion.minorversion.buildnumber.revisionnumber, such as:</p> <ul style="list-style-type: none"> <li>● <b>1.0.0.60325</b></li> </ul> <p>Use as few characters as possible. For example, do not use unnecessary leading zeros; instead of entering 14.00.25.1, enter the following:</p> <ul style="list-style-type: none"> <li>● <b>14.0.25.1</b></li> </ul>
<b>Tested Version</b>	MSIX, MSIX Modification Package	<p>Optionally, specify the app's maximum supported tested Windows version number. If you leave this blank, this setting defaults to match the Minimum Version (or the minimum version number of Windows 10 Anniversary Update if nothing is specified for Minimum Version).</p> <p>The version must contain only numbers and it requires four parts using the following format (with values in each part ranging from 0 to 65535): majorversion.minorversion.buildnumber.revisionnumber such as:</p> <ul style="list-style-type: none"> <li>● <b>1.0.0.60325</b></li> </ul> <p>Use as few characters as possible. For example, do not use unnecessary leading zeros; instead of entering 14.00.25.1, enter the following:</p> <ul style="list-style-type: none"> <li>● <b>14.0.25.1</b></li> </ul>

**Table 217** ▪ General Tab for MSIX Release

Setting	Project Type	Description
<b>Include Server Extensions</b>	MSIX, MSIX Modification Package	<p>Choose whether to include Windows Server extensions as part of the core UWP app package format, thus creating a Windows Server App. If you want to target Windows Server Nano's installation package format and deploy a service, WMI provider, event source, or performance counter, you should enable server extensions.</p> <p>If you select,</p> <ul style="list-style-type: none"> <li>● <b>No</b>— The warnings are issued for any such items that cannot be represented.</li> <li>● <b>Yes</b>— The additional subsettings can be configured as needed to specify a minimum Windows Server operating system and maximum tested Windows Server operating system supported by the included apps.</li> </ul> <div data-bbox="878 911 915 953" data-label="Image"></div> <p><b>Important</b> ▪ When using InstallShield to create a UWP app package, choose to include either desktop extensions or server extensions, but not both. Although a UWP app package can contain both desktop and server extensions, targeting one set over the other is a more likely scenario.</p>

**Table 217** ▪ General Tab for MSIX Release

Setting	Project Type	Description
<b>Include MSIX Core Extensions</b>	MSIX, MSIX Modification Package	<p>The MSIX Core enables the installation of MSIX apps on previous versions of Windows, provided the apps are already built to work on those versions of Windows.</p> <p>The MSIX Core is built for the following Windows versions that do not currently support MSIX:</p> <ul style="list-style-type: none"> <li>• Windows 7 SP1- 6.1.7601.0</li> <li>• Windows 8.1 Update 1- 6.3.9600.0</li> <li>• Windows 10 2015 LTSC (1507)- 10.0.10240.0</li> <li>• Windows 10 2016 LTSC (1607)- 10.0.14393.0</li> <li>• Windows Server 2008 R2 - 6.1.7601.0</li> <li>• Windows Server 2012- 6.2.9200.0</li> <li>• Windows Server 2012 R2 - 6.3.9600.0</li> <li>• Windows Server 2016 - 10.0.14393.0</li> </ul> <p>By default, the <b>No</b> option is selected. The possible options are:</p> <ul style="list-style-type: none"> <li>• <b>No</b> - When you select this option, the MSIX Core entry will not be added to the manifest file.</li> <li>• <b>Yes</b> - When you select this option, the MSIX Core entry will be added to the manifest file along with the specified minimum Windows version and maximum tested Windows version.</li> </ul> <p></p> <p><b>Tip</b> ▪ The MSIX Core package needs MSIX pre-requisite to be installed on the older package.</p>
<b>Minimum Version</b>	MSIX, MSIX Modification Package	<p>Optionally, specify the app's minimum supported Windows version number. If you leave this blank, the minimum version number of Windows 7 SP1 Update (6.1.7601.0) is assumed.</p> <p>The version must contain only numbers and it requires four parts using the format of <i>majorversion.minorversion.buildnumber.revisionnumber</i> (with values in each part ranging from 0 to 6553).</p>

**Table 217** ■ General Tab for MSIX Release

Setting	Project Type	Description
<b>Tested Version</b>	MSIX, MSIX Modification Package	<p>Optionally, specify the app's maximum supported tested Windows version number. If you leave this blank, this setting defaults to match the maximum MSIX core supported version number 10.0.14393.0 (Windows 10 2016 LTSC - 1607).</p> <p>The version must contain only numbers and it requires four parts using the format of <i>majorversion.minorversion.buildnumber.revisionnumber</i> (with values in each part ranging from 0 to 65535).</p>
<b>Framework Dependencies</b>	MSIX, MSIX Modification Package	<p>Select the retail or debug build of the C++ runtime that matches the one used in your product.</p>  <p><b>Important</b> ■ This setting does not cause the dependency packages to be installed in sideloading scenarios. For those scenarios, the dependency may have to be delivered manually. Also, the debug versions of the C++ runtime are only useful for internal testing and cannot be uploaded to the Windows Store. For local testing or sideloading, you may also have to deploy the framework package that is included in the Windows 10 SDK.</p> <p>To customize the Framework Dependencies,</p> <p>You can use the <code>Msix.xml</code> file, which is installed to the following location:</p> <p><i>InstallShield Program Files folder\System</i></p> <p>An example is given below:</p> <pre>&lt;VC140 Name="Microsoft.VCLibs.140.00.UWPDesktop" MinVersion="14.0.24217.0" Publisher="CN=Microsoft Corporation, O=Microsoft Corporation, L=Redmond, S=Washington, C=US"&gt;Microsoft Visual C++ 2015 Runtime&lt;/VC140&gt;</pre>
<b>Signing</b>	MSIX, MSIX Modification Package	The Signing category is where you specify the digital signature information—including the digital certificate files that a certification authority granted to you—that InstallShield should use to sign your files.
<b>Sign MSIX Package</b>	MSIX, MSIX Modification Package	Specify whether or not you want to sign msix package.

**Table 217** ▪ General Tab for MSIX Release

Setting	Project Type	Description
<b>Certificate URL</b>	MSIX, MSIX Modification Package	Type a fully qualified URL - for example, http://www.mydomain.com. This URL is used in your digital signature to link to a site that you would like end users to visit to learn more about your product, organization, or company.
<b>Digital Certificate Information</b>	MSIX, MSIX Modification Package	To specify the digital certificate that you want to use to sign your release, click the ellipsis button (...) in this setting. The Certificate Selection dialog box opens, enabling you to specify either the location of the .pfx file, or information about the certificate store that contains the certificate.
<b>Certificate Thumbprint</b>	MSIX, MSIX Modification Package	This read-only setting displays the certificate thumbprint.
<b>Issued By</b>	MSIX, MSIX Modification Package	This read-only setting displays the certificate's issuer information.
<b>Expiration Date</b>	MSIX, MSIX Modification Package	This read-only setting displays the certificate's expiry date.
<b>Certificate Password</b>	MSIX, MSIX Modification Package	<p>If the .pfx file that you are using has a password, enter it. InstallShield encrypts the password and stores it in your project file (.isl).</p> <p>At build time, InstallShield uses the password to sign files with a .pfx file. If your certificate is protected by a password but you do not enter it in this setting, signing with a .pfx file fails.</p>  <p><b>Important</b> ▪ If you configure your project to use a certificate that was imported with password protection into a store, Windows prompts for the password at build time when InstallShield is attempting to sign your project's files. The strong key protection that Windows uses does not permit InstallShield to provide the password to the cryptographic provider.</p>

**Table 217** ■ General Tab for MSIX Release

Setting	Project Type	Description
<b>Signature Description</b>	MSIX, MSIX Modification Package	<p>Specify the signature description that you want to use for files that are specified in the Sign Output Files setting. The description that you specify is displayed on the User Account Control (UAC) box to the right of the “Program Name:” label. The UAC dialog box opens when an end user launches the signed file and elevated privileges are required.</p> <p>If you leave this setting blank, InstallShield uses the name of the file without its extension as the description to the right of the “Program Name:” label on the UAC dialog box. Note that if you use the Sign Files in Package setting and its subsettings to sign the files in your package, InstallShield does not use this signature description for the UAC dialog box of the files in your package that are signed at build time.</p>
<b>Package Identity Overrides</b>	MSIX, MSIX Modification Package	Use the Package Identity Overrides area on the General tab to uniquely identify a package to Windows. These fields are typically not shown to an end user.
<b>Name</b>	MSIX, MSIX Modification Package	Specify a unique alphanumeric string that identifies your UWP app package to Windows. If this is left blank, InstallShield generates a name based on the <b>Package Name</b> setting in the General Information.

**Table 217** ■ General Tab for MSIX Release

Setting	Project Type	Description
<b>Publisher</b>	MSIX, MSIX Modification Package	<p>To override the actual value of the certificate if one is specified on the General tab, specify the Subject name (name of the owner) of the certificate that will be used to sign the package. For example:</p> <p>CN=Revenera, O=Revenera, L=Itasca, S=Illinois, C=US</p> <p>If a package will be distributed through the Windows Store, it doesn't need to be signed before it's uploaded to Microsoft, in which case a signing certificate may be skipped. If a package will be sideloaded, it may or may not need to be signed, depending on how your customers expect to handle the package:</p> <ul style="list-style-type: none"> <li>● If your customer prefers to sign the package themselves, they may need a specific publisher defined in the <b>Publisher</b> override setting that matches their certificate.</li> <li>● If your customer merely wants to deploy the package, they may expect it to be signed with a trusted Authenticode Certificate. The requirements on this are equivalent to those for a trusted UAC prompt.</li> <li>● Sideloaded requires that the Sideloaded setting in Windows is enabled. Sideloaded is enabled by default in the Windows 10 Anniversary Update.</li> </ul> <p>The following settings on the General tab of the Releases view also influence the built package by controlling whether and how the UWP app package is signed:</p> <ul style="list-style-type: none"> <li>● Digital Certificate Information</li> <li>● Certificate Password</li> <li>● Sign Output Files</li> </ul>
<b>Publisher Display Name</b>	MSIX, MSIX Modification Package	<p>Specify the string that users will recognize as the publisher's name. For example:</p> <p>Revenera</p> <p>If your customer prefers to sign the package themselves and If nothing is specified, the Display Name is copied from the <b>Publisher</b> setting in General tab.</p>

**Table 217** ▪ General Tab for MSIX Release

Setting	Project Type	Description
<b>Version</b>	MSIX, MSIX Modification Package	<p>Enter a version number for the UWP app package to which the certificate conforms. If nothing is specified, the version number is copied from the <b>Product Version</b> setting in General Information.</p> <p>The version must contain only numbers and it requires four parts using the following format (with values in each part ranging from 0 to 65535): majorversion.minorversion.buildnumber.revisionnumber, such as:</p> <ul style="list-style-type: none"> <li>● <b>1.0.0.60325</b></li> </ul> <p>Use as few characters as possible. For example, do not use unnecessary leading zeros; instead of entering 14.00.25.1, enter the following:</p> <ul style="list-style-type: none"> <li>● <b>14.0.25.1</b></li> </ul>

### App Installer Tab for MSIX Release

**Project** ▪ *The App Installer tab is available in MSIX project.*

Windows app package creation is enabled in the per-release tab titled App Installer tab. Here, some core settings can be specified that impact the Windows app package build process.

**Table 218** ■ App Installer Tab Settings for MSIX Release

Setting	Project Type	Description
<b>App Installer Settings</b>	MSIX	<p>Use the App Installer Settings area on the App Installer tab to generate App Installer file and configure package update capabilities.</p> <p>An App Installer file is an XML document (*.appinstaller) that contains set of attributes for defining the package properties and the location where it has been deployed. The App Installer file is introduced as of Windows 10 Version 1709. It specifies where your app package is located and how to update it. If you choose to use this method of app distribution, you must share with your users the App Installer file, instead of the actual app package. The user must then click on the App Installer file. At this point the familiar App Installer UI will appear and guide the user through the installation. Once the user has installed the application using these steps, the application is associated with the App Installer file.</p> <p>Later, when you have an update to the application, you only update the App Installer (.appinstaller) file. When you update the file, the new version of the application is pushed to the user automatically based on settings configured 'Update Settings' section below.</p> <p>Refer <a href="#">App Installer File Schema</a> for more information.</p>
<b>AppInstaller File URL</b>	MSIX	<p>Specify App Installer file location.</p> <p>The App Installer file can be hosted in a shared location like a HTTP endpoint or a UNC shared folder or a local file share, and includes the path to find the MSIX packages to be installed. Users install the app from the shared location or from the web and enable periodic checks for new updates.</p>
<b>AppInstaller Version</b>	MSIX	Specify the version of App Installer file. A version string in quad notation, 'Major.Minor.Build.Revision', such as 1.0.0.60325.
<b>Main Package URL</b>	MSIX	Specify the Uri to the app package location. The Uri specified for <b>AppInstaller File URL</b> will be considered if this option is empty. Other information of the MainPackage element, which includes name, publisher, and version can be changed using <b>Package Identity Overrides</b> section mentioned in this page. Information provided in <b>Package Identity Overrides</b> will be considered during build time for both MSIX package and App Installer file as all these information must match with the information included in the manifest of the MSIX application package.
<b>Update Settings</b>	MSIX	Use the <b>Update Settings</b> category to configure the auto update capabilities of MSIX package using App Installer file.

Setting	Project Type	Description
<b>Update Settings on App Launch</b>	MSIX	Specify whether you want to configure update settings for this package during app launch. This behavior during OnLaunch shows the UI and is further configurable with the support of HoursBetweenUpdateChecks, ShowPrompt, and UpdateBlocksActivation child attributes as explained below.
<b>Hours Between Update Checks</b>	MSIX	<p>The HoursBetweenUpdateChecks option specifies the frequency with which the deployment service will check for an update to the App Installer file.</p> <p>When HoursBetweenUpdateChecks is set to 0, the deployment service will check for updates every time the application is launched. For other values, the deployment service will check for updates when the application is launched only if it hasn't previously checked within the last number of hours specified by HoursBetweenUpdateChecks.</p> <p>For example, if HoursBetweenUpdateChecks is set to 10, the deployments service will check for updates when the application is launched only if it hasn't already checked for updates in the previous 10 hours. The Windows deployment service will automatically download it if there is a new update available and install the update once the application is closed.</p>
<b>Show Prompt</b>	MSIX	<p>Specify whether deployment will show a prompt or not, informing the user about the update. Available in Windows 10, version 1903 and later.</p> <p>For latest updates, refer to Microsoft documentation.</p>
<b>Update Blocks Activation</b>	MSIX	Choosing <b>Yes</b> will stop the user from launching the application until the update has been applied. This option allows the user to only take the update or close the app. Should only be used if ShowPrompt option is chosen as it needs the UI to show the options. This option will help to deliver critical updates where app must be launched with some important fixes.
<b>Automatic Background Task</b>	MSIX	Specify whether or not to check for updates in the background regardless the app is launched or not. A check is made every 8 hours independently of whether the user launched the app. This type of update cannot show UI. Choose 'Update Settings on App Launch' for displaying the interactive UI before update process gets triggered. Available in Windows 10, version 1803 and later.
<b>Force Update From Any Version</b>	MSIX	Specify whether the app's version to be incremented or decremented based on the requirement. Without this element, the app can only be updated to a higher version and Windows deployment service will not allow downgrade to older version. This option is useful to perform rollbacks to older app package versions. Available starting in Windows 10, version 1809 and later.

## Chained .msi Package Settings

---

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Windows Installer 4.5 includes support for installing multiple packages using transaction processing. The packages are chained together and processed as a single transaction. If one or more of the packages in the transaction cannot be installed successfully or if the end user cancels the installation, the Windows Installer initiates rollback for all packages to restore the system to its earlier state.

The Chained .msi Packages area in the Releases view is where you identify .msi packages that you want InstallShield to include in your installation as chained packages. This area is also where you configure settings such as the properties that should be passed to the chained packages.

The Windows Installer chaining functionality supports any packages that can be installed through **MsiInstallProduct**; it does not support the chaining of InstallScript MSI packages.

Windows Installer 4.0 and earlier versions do not install any chained .msi packages.

---

**Tip** ▪ To learn how to add Windows Installer 4.5 redistributables, see [Adding Windows Installer Redistributables to Projects](#).

The following table describes the settings for chained .msi packages.

**Table 219** • Chained .msi Package Settings

Setting	Description
<b>Installation (run-time path)</b>	<p>Specify the name of the Windows Installer package (.msi file), or click the Browse button to browse to it.</p> <p>If you click the Browse button, InstallShield automatically enters the product code for you. InstallShield also prompts you to specify whether you want to stream the .msi package—and its uncompressed files, if the .msi package is not compressed—into your product's main .msi package:</p> <ul style="list-style-type: none"> <li>• If you specify that you want InstallShield to stream the files, InstallShield adds the name of the .msi package to the <b>Installation (run-time path)</b> setting. InstallShield also automatically adds either the file name (if it is a compressed .msi package) or the entry *.* (if it is an uncompressed .msi package) to the <b>Streamed files</b> box. For the *.* entry, InstallShield streams in the .msi package, all of the files in the same folder as the .msi package, and all of the subfolders and their files.</li> </ul> <p>The value that you use for this setting is relative to a temporary extraction path. That is, you could add a streamed supporting file as <b>Support\File.ext</b>, and refer to it in the chained package as <b>[SourceDir]Support\File.ext</b>.</p> <ul style="list-style-type: none"> <li>• If you specify that you do not want InstallShield to stream the files, InstallShield adds the following path to the <b>Installation (run-time path)</b> setting:</li> </ul> <pre>[SourceDir]FileName.msi</pre> <p>You can change this path if appropriate. For example, you may want to use a path such as the following one, and also clear the <b>Delete streamed files after installation</b> check box:</p> <pre>[LocalAppDataFolder]{ProductCodeGUID}\FileName.msi</pre> <p>In this example, the .msi package is cached on the local system, and it is available for maintenance.</p> <div>  <p><b>Tip</b> • You may not want to stream many or large files in the .msi package, since the Windows Installer has limitations for the file size of .msi packages.</p> </div>

**Table 219** ■ Chained .msi Package Settings (cont.)

Setting	Description
<b>Product code</b>	<p>This setting indicates the product code of the .msi package that is being chained to your main installation. The product code is used for uninstalling the chained package when appropriate.</p> <p>InstallShield automatically adds the product code for this setting if you use the Browse button for the <b>Installation (run-time path)</b> setting to select the .msi package.</p>
<b>UI level</b>	<p>Specify the user interface (UI) level that you want to be used for the chained .msi package. Valid options are:</p> <ul style="list-style-type: none"> <li>● <b>Basic UI (/qb)</b>—Display the built-in small progress dialog.</li> <li>● <b>Full UI (/qf)</b>—Display the modal and modeless dialogs that are available in the .msi package.</li> <li>● <b>No UI (/qn)</b>—Run the installation silently.</li> <li>● <b>Reduced UI (/qr)</b>—Display only modeless dialogs, such as the full-size progress dialog.</li> </ul>

Table 219 ■ Chained .msi Package Settings (cont.)

Setting	Description
Install condition	<p>Enter any installation condition that you want to use for the chained .msi package. If the condition evaluates to True at run time, the Windows Installer launches the chained .msi package if the chained package's product has not already been installed.</p> <p>The default condition is:</p> <p><b>Not Installed</b></p> <p>You can modify this if necessary. For example, if you are adding the chained .msi package to a minor upgrade and you want the Windows Installer to launch the chained .msi package during a first-time installation and during an upgrade, consider adding a condition such as the following one:</p> <p><b>Not Installed OR REINSTALL&gt;&lt;"FeatureName"</b></p> <p>In this example, <b>FeatureName</b> is the name of a feature that will be updated if the main installation is running in upgrade mode. It will also be updated during a repair.</p> <div></div> <p><b>Note</b> ■ At run time, the installation evaluates the install condition; if it evaluates to False, the installation evaluates the removal condition. If the install condition always evaluates to True (even during uninstallation of the main product), the removal condition is never evaluated, and the chained .msi package is never uninstalled. Therefore, you may want to avoid specifying an install condition that will always evaluate to True.</p> <p>For information on condition syntax, see <a href="#">Conditional Statement Syntax</a> in the Windows Installer Help Library.</p>
Install properties	<p>To pass one or more properties from the main installation to this chained .msi package during the installation, enter the properties and their corresponding values.</p> <p>For example, to install a specific feature of a chained package to a subfolder of the main installation's INSTALLDIR location, you could enter the following string for this setting:</p> <p><b>INSTALLDIR="[INSTALLDIR]Subfolder\" ADDLOCAL=Feature1</b></p>

**Table 219** ■ Chained .msi Package Settings (cont.)

Setting	Description
<b>Removal condition</b>	<p>Enter any uninstallation condition that you want to use for the chained .msi package. If the Install condition evaluates to False and the Removal condition evaluates to True, Windows Installer removes the chained package's product if it is present.</p> <p>The default condition is:</p> <p><b>REMOVE="ALL"</b></p> <p>For information on condition syntax, see <a href="#">Conditional Statement Syntax</a> in the Windows Installer Help Library.</p>
<b>Removal properties</b>	<p>To pass one or more properties from the main installation to this chained .msi package during the uninstallation, enter the properties and their corresponding values.</p> <p>This setting is often left blank.</p>
<b>Release flags</b>	<p>You can assign one or more release flags to a chained .msi package that you want to include in only certain builds. For example, if you have a chained .msi package that should be included only in a special edition of your product that contains a special add-on that requires the chained .msi package, you can flag that chained package and include it only when it is needed.</p> <p>If you want to assign a release flag to this chained .msi package, enter it for this setting. The string that you enter can be any combination of letters or numbers. To have more than one flag on a chained package, use a comma to separate the flags.</p>
<b>Streamed files</b>	<p>This box indicates the files for the chained .msi package that are being streamed into the main installation's package.</p> <p>Use the Add File and Add Folder buttons to add more files or entire folders to the list of streamed files.</p> <p>To specify an alternate extraction location, edit the entry's <b>Run-time path</b> value by selecting and then clicking it again. InstallShield highlights the entry's text, enabling you to edit it. The files are extracted to a temporary folder by default.</p> <p>To remove an entry in this box, select it and then click the Remove button.</p>

**Table 219** ▪ Chained .msi Package Settings (cont.)

Setting	Description
<b>Delete streamed files after installation</b>	<p>If you want the installation to delete the streamed files after installation, select this check box. If the streamed files should remain on the target system, clear this check box.</p> <p>It is generally most useful to let the files remain on the system only if you have extracted them to a non-temporary location, such as <b>[LocalAppDataFolder]{PackageCode}\*.*</b>, to cache an extracted package locally.</p> <p>This check box is selected by default for chained .msi packages that included one or more streamed files. This check box is disabled for chained .msi packages that do not include any streamed files.</p>

## Patch Design View

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Once you have added an upgrade item in the Upgrades view, you can use the Patch Design view to create a patch configuration for that upgrade so that you can deliver it as a patch. The patch can be applied to target systems that have an earlier version of the product.

You can create multiple patch configurations in the Patch Design view. Each patch configuration contains the settings and data required to build a patch. Each patch configuration must contain at least one latest setup and one previous setup. With these minimal settings, you can create a patch.

## Patch Configuration

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

To create a patch, you begin by right-clicking the Patch Design explorer in the Patch Design view and then clicking Add New Patch Configuration. A patch configuration consists of one latest setup and one or more previous setups. Before you specify the latest and previous setups, you can specify overall patch properties on the following tabs for your patch configuration:

- Common
- Identification

- [Digital Signature](#)
- [Sequence](#)
- [Advanced](#)

## Common Tab

**Project** ▪ This information applies to the following project types:

- *Basic MSI*
- *InstallScript MSI*

When you click a patch configuration in the Patch Design view, InstallShield displays several tabs. The Common tab for a patch configuration exposes frequently used patch settings.

## Patch Output Location

Specify where you want your patch file built or browse for an existing folder. InstallShield appends the following subdirectories to your output location:

`\PatchConfigName\Patch`

**Note** ▪ InstallShield also adds a folder called *Interim* to your output directory. The *Interim* folder contains the following files after you build a patch:

- *.log*—contains output from the patch creation process; this usually contains information that is useful for troubleshooting
- *.pcp*—patch creation properties file; this contains all of the settings necessary to generate a patch package

## Launcher Settings

In this area, you can configure the following launcher settings:

**Table 220** ▪ Configurable Launcher Settings

Setting	Description
<b>Create Update.exe</b>	<p>If you want to create an Update.exe update launcher for the current patch, select this check box.</p> <p>To learn when an Update.exe update launcher is required, see <a href="#">Patching Considerations</a>.</p>
<b>Include Windows Installer 3.1 Engine</b>	Select this check box to include the Windows Installer 3.1 engine with your patch package.
<b>Include .NET Framework</b>	Select this check box to include the .NET Framework with your patch package.

## Patch Creation Cache

In this area, you can set the following:

**Table 221** ■ Patch Creation Cache Settings

Setting	Description
<b>Enable</b>	When you select this check box, InstallShield creates intermediate files that are used in subsequent builds to improve performance speed. These intermediate files are left indefinitely on your system. Do not select this check box if you have limited disk space.

## Optimize Patch for Large Files

Select this check box to create small bit-level patches for all application files larger than 4 MB in your installation project.

## Allow Patch to be Uninstalled (Requires Windows Installer 3.0)

Select this check box if you would like the patch to be uninstallable without having to uninstall and reinstall the entire application and other patches. Note that uninstallation of patches works only under certain conditions. For example, versions of Windows Installer earlier than version 3.0 cannot remove just the patch from an application. For more information, see [Removing Patches](#) in the Windows Installer help.

**Project** ■ The uninstallable patch functionality is not available for InstallScript MSI projects if the InstallScript user interface (UI) style is the traditional style (which uses the InstallScript engine as an external UI handler).

This functionality is applicable to InstallScript MSI projects in which the InstallScript UI style is the new style (which uses the InstallScript engine as an embedded UI handler). To learn more, see [Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations](#).

## Build Patch

Click this button to build your patch after you have configured all of the appropriate settings.

**Note** ■ You can also build your patch from the Patch Design explorer. Right-click the appropriate patch configuration, and then click Build Patch.

## Identification Tab

**Project** ■ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

When you click a patch configuration in the Patch Design view, InstallShield displays several tabs. The Identification tab exposes settings for display strings. The display strings are used to populate information about the patch in Add or Remove Programs. It is also used by the Windows Installer 3.0 (and later) APIs that interrogate and catalog patches applied to a target machine.

**Tip** ▪ Every time that you change the latest setup for a patch configuration in the Patch Design view, InstallShield uses the Add or Remove Programs information from the latest setup as the values for the Identification tab settings. You can override the values on the Identification tab as needed.

**Table 222** ▪ Identification Tab Settings

Setting	Description
<b>Display name</b>	Specify the name of your patch.
<b>Support URL</b>	Specify the uniform resource locator (URL) that you would like your customers to visit for technical support.
<b>Description</b>	Specify a brief description of your patch.
<b>Manufacturer name</b>	Specify the name of the application's manufacturer.
<b>Target product name</b>	Specify the name of the application or the target application suite.
<b>Classification</b>	Specify the category of upgrade. Examples include Critical Update, Hotfix, and Service Pack.

## Digital Signature Tab

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

When you click a patch configuration in the Patch Design view, InstallShield displays several tabs. The Digital Signature tab is where you specify settings if you want to digitally sign your patch.

**Note** ▪ If you want to digitally sign the files—such as your application's executable files—in your patch, you can specify which files should be signed through the [Signing tab](#) in the Releases view.

**Table 223** ▪ Digital Signature Tab Settings

Setting	Description
<b>Sign the Patch Package</b>	To digitally sign your patch package, select this check box.

**Table 223** ■ Digital Signature Tab Settings (cont.)

Setting	Description
<b>Sign Update.exe</b>	To digitally sign the Update.exe file, select this check box.
<b>Certificate URL</b>	Type a fully qualified URL—for example, <b>http://www.mydomain.com</b> . This URL is used in your digital signature to link to a site that you would like end users to visit to learn more about your product, organization, or company.
<b>Digital Certificate Information</b>	<p>To specify the digital certificate that you want to use to sign your release, click the Browse button next to this setting. The Certificate Selection dialog box opens, enabling you to specify either the location of the .pfx file or information about the certificate store that contains the certificate.</p> <p>To learn more, see <a href="#">Certificate Selection Dialog Box</a>.</p>
<b>Password</b>	<p>If the .pfx file that you are using has a password, enter it. InstallShield encrypts the password and stores it in your project file (.ism).</p> <p>At build time, InstallShield uses the password to sign files with a .pfx file. If your certificate is protected by a password but you do not enter it in this setting, signing with a .pfx file fails.</p> <p>Note that if you configure your project to use a certificate that was imported with password protection into a store, Windows prompts for the password at build time when InstallShield is attempting to sign your project's files. The strong key protection that Windows uses does not permit InstallShield to provide the password to the cryptographic provider.</p>
<b>Signature Description</b>	<p>Specify the signature description that you want to use for the patch package and Update.exe file, if applicable. The description that you specify is displayed on the User Account Control (UAC) box to the right of the “Program Name:” label. The UAC dialog box opens when an end user launches the signed file and elevated privileges are required.</p> <p>If you leave this setting blank, InstallShield uses the name of the file without its extension as the description to the right of the “Program Name:” label on the UAC dialog box.</p>

## Sequence Tab

**Project** ■ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

When you click a patch configuration in the Patch Design view, InstallShield displays several tabs. The Sequence tab is where you specify the order that Windows Installer version 3.0 and later should apply patches to an installed product, regardless of the order in which they are provided to the target machine. For versions of Windows Installer earlier than version 3.0, the patch sequence is ignored, and any patches are applied to the product in the order that they are provided to the target machine.

### Use default patch sequencing

Select this check box if you want to use the default sequencing for the patches of your product. This default sequence accounts for obsolete patches, superseded patches, and patches that have already been applied to the product.

If you clear this check box, you can add your own custom sequence. If you clear this check box but do not add a sequence, no sequencing information is built into your patch.

### Advanced Tab

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

When you click a patch configuration in the Patch Design view, InstallShield displays several tabs. The Advanced tab for a patch configuration exposes a comprehensive set of build settings that you can configure for a patch.

### Patch Settings

In this area, you can configure the following settings for your patch:

**Table 224** ▪ Patch Configuration Settings

Property	Description
<b>Patch Output Location</b>	<p>Specify where you want your patch file built or browse for an existing folder. InstallShield appends the following subdirectories to your output location:</p> <p><code>\PatchConfigName\Patch.</code></p> <p></p> <p><b>Note</b> ▪ InstallShield also adds a folder called <i>Interim</i> to your output directory. The <i>Interim</i> folder contains the following files after you build a patch:</p> <ul style="list-style-type: none"><li>• <i>.log</i>—contains output from the patch creation process; this usually contains information that is useful for troubleshooting</li><li>• <i>.pcp</i>—patch creation properties file; this contains all of the settings necessary to generate a patch package</li></ul>
<b>Generate Patch GUID</b>	<p>Specify whether you want a new GUID generated each time that you build your patch. If you select No, the GUID listed for the Patch GUID property is used. The default setting is Yes.</p>

**Table 224** ▪ Patch Configuration Settings (cont.)

Property	Description
<b>Patch GUID</b>	The patch GUID is used to uniquely identify a patch package. InstallShield automatically generates a new GUID for this property every time you build the patch if the Generate Patch GUID property is set to Yes.
<b>Minimum Windows Installer Version</b>	Specify the minimum version of Windows Installer that is required by the patch. For example, for a minimum of Windows Installer 2.0, enter <b>200</b> . For a minimum of Windows Installer 3.0, enter <b>300</b> . For a minimum of Windows Installer 3.1, enter <b>301</b> .  
	<b>Note</b> ▪ If you specify an early version of Windows Installer, you will not be able to use any of the features that are supported by only the latest version of the Windows Installer engine.

## Build Settings

In this area, you can configure the following build settings for your patch:

**Table 225** ▪ Build Settings for a Patch

Property	Description
<b>Include Whole Files</b>	Specify whether to include whole files for every file included in the patch package.  
	<b>Note</b> ▪ You can override this setting on a file-by-file basis in the <a href="#">Latest Setup settings</a> .
<b>Validate at Build</b>	Specify whether you want to use the upgrading and patching validation every time you build a patch.
<b>Leave Patch Components Decompressed</b>	Select Yes to leave all .msp file information in a temporary folder. This information can be useful when troubleshooting. If you do not want this information stored, select No.
<b>Enable Patch Creation Caching</b>	Select Yes if you want InstallShield to create intermediate files that are used in subsequent builds to improve performance speed. These intermediate files are left indefinitely on your system. Select No if you have limited disk space. The Patch Cache Folder is where you specify where the intermediate files should be created.
<b>Patch Cache Folder</b>	Specify a directory where the temporary files from patch caching should be stored. These intermediate files are left indefinitely on your system.

**Table 225** ▪ Build Settings for a Patch (cont.)

Property	Description
<b>Generate MsiPatchOldAssembly tables</b>	Specify whether to automatically generate entries for the MsiPatchOldAssemblyFile and MsiPatchOldAssemblyName tables, which allow a patch package that is running under Windows Installer 3.0 or later to patch an assembly in the global assembly cache (GAC) without making a run-time request for the original installation source. For more information, see <a href="#">Patching Assemblies in the Global Assembly Cache</a> .

## Run-time Settings

In this area, you can configure the following run-time settings for your patch:

**Table 226** ▪ Run-time Settings for a Patch

Property	Description
<b>Allow Product Codes to Differ</b>	Specify whether you want the patch creation executable to suppress build-time prompts if product codes differ between the original and latest installations. For a major upgrade, be sure to select .
<b>Allow Product Versions to Differ</b>	Specify whether you want the patch creation executable to suppress build-time prompts if product versions differ between the original and latest installations.
<b>List of Patch GUIDs to Replace</b>	<p>To replace one or more earlier installed patches with the current patch, set this property to the patch GUIDs of those patches, and separate each with a comma. For example:</p> <pre>{C86838C9-DEDC-4451-B96F-94AFB9460F15},{C8633E5B-AC44-45d8-B487-C68B3B1F60D6}</pre> <p>Setting this property is typically <i>not</i> required, even if you have several patch configurations in the Patch Design view. However, if your patch does not overwrite files added in an earlier patch, it may be necessary to set this property.</p>  <p><b>Note</b> ▪ This property affects only the installation portion of the patch. It does not revert files back to their original versions.</p>
<b>List of Target Product Codes</b>	Specify the product codes that you want to target with this patch, and separate each with a comma. If you enter an asterisk (*) for this setting, InstallShield replaces it at build time by the product codes of the installations that are listed as previous images in this patch configuration.

**Table 226** ■ Run-time Settings for a Patch (cont.)

Property	Description
<b>Create Update.exe</b>	<p>Specify whether you want to create an Update.exe update launcher for the current patch.</p> <p>To learn when an Update.exe update launcher is required, see <a href="#">Patching Considerations</a>.</p>
<b>MSI Command-Line Arguments</b>	<p>Specify Windows Installer arguments to be written to Setup.ini.</p> <p>[Startup] CmdLine=Your Value</p> <p>The default value for this property is</p> <p>REINSTALLMODE=omus REINSTALL=ALL</p> <p>The REINSTALL property is a string that contains letters specifying the type of reinstallation to be performed. For more information, see <a href="#">REINSTALLMODE Property</a> in the Windows Installer Library.</p>
<b>Password Protect Launcher</b>	<p>To password-protect your patch, select Yes, and then type a password for the Launcher Password setting. When you password-protect your patch, any end user who wants to apply your patch must enter a case-sensitive password to launch your update.</p> <p>This setting is applicable only to patches that use an Update.exe file.</p>
<b>Launcher Password</b>	<p>Type a password to protect your application. You must select Yes for the Password Protect Launcher setting to activate password protection.</p> <p>When you password-protect your patch, any end user who wants to apply your patch must enter a case-sensitive password to launch your update.</p> <p>This setting is applicable only to patches that use an Update.exe file.</p>

**Table 226** ▪ Run-time Settings for a Patch (cont.)

Property	Description
<b>Minor Update to Target RTM Version (MSI 3.1 Required)</b>	<p>If you want your minor-upgrade patch to essentially remove all of the patches up to the release to manufacturing (RTM) version of the product (or the most recent major upgrade of the product, if one has been installed) before applying the current minor-upgrade patch, select Yes for this property. With this option, all patches (with or without sequencing data) are removed. You do not need to target additional baseline versions and thus increase the patch payload. All end users can successfully apply the patch without applying any intermediate patches.</p> <p>If you do not want your minor-upgrade patch to remove all of those earlier patches, select No. If you select this option, it may be necessary for your patch to contain the information needed to target each of the earlier minor upgrades that were created after the RTM (or the most recent major upgrade of the product, if one was created).</p> <p>For example, if you are creating a minor-upgrade patch for service pack 2 and you select No for this property, your patch needs to target the minor-upgrade patch for service pack 1. You could also optionally target other baselines (such as RTM); doing so would increase the patch payload. Note that if you do not target the RTM version, any end user who has the RTM version but not the service pack 1 minor-upgrade patch would need to install service pack 1 before service pack 2.</p> <p>Versions of Windows Installer earlier than 3.1 ignore this setting.</p>
<b>Optimized Install Mode (MSI 3.1 Required)</b>	<p>If you want Windows Installer 3.1 to optimize the patching process so that it reduces the time that is required to apply the current patch, select Yes. If the patch only modifies a select list of tables, Windows Installer 3.1 ignores the actions that are associated with all other tables. For more information, including the list of tables, see "Patch Optimization" in the Windows Installer Help Library.</p> <p>If you select Yes for this property, Microsoft Corporation recommends that you test your patch extensively to ensure that it behaves as expected.</p> <p>If you do not want Windows Installer 3.1 to optimize the patching process for the current patch, select No. Windows Installer will run a complete repair of the application when the patch is applied to the target machine.</p> <p>Versions of Windows Installer earlier than 3.1 ignore this property. Windows Installer 3.0 optimizes patches if the patch only modifies the select list of tables. To avoid patch optimization by Windows Installer 3.0, you must use the <a href="#">DisableFlyWeightPatching</a> policy. For more information, see <a href="#">DisableFlyWeightPatching</a> in the Windows Installer Help Library.</p> <p>Versions of Windows Installer earlier than 3.0 run a complete repair of the installation when a patch is applied.</p>

## Windows Installer Engine

In this area, you can configure the following settings for the Windows Installer engine:

**Table 227** ▪ Windows Installer Settings for a Patch

Property	Description
<b>Include MSI 3.1 Engine</b>	Specify whether the Windows Installer engine should be included with your patch package.
<b>Engine Location</b>	<p>Select one of the following options:</p> <ul style="list-style-type: none"> <li>● <b>Download Engine From The Web</b>—If the Windows Installer engine needs to be installed, it is downloaded at run time.</li> <li>● <b>Extract Engine From Update.exe</b>—The build streams the Windows Installer engine into the Update.exe file, giving you a single file to distribute to your customers. At run time, the engine is extracted from the Update.exe file and installed if required.</li> <li>● <b>Copy From Source Media</b>—The build copies the Windows Installer engine into the same directory as the Update.exe file.</li> </ul>
<b>Windows Installer 3.1 engine URL</b>	<p>Specify the URL for the location of the engine. This is the location that the Update.exe file uses at run time to download the engine. The default URL location is a live site maintained by Revenera for your convenience.</p>  <p><b>Note</b> ▪ The 3.1 engine is available for download from the default URL (<a href="http://www.installengine.com/Msiengine30">http://www.installengine.com/Msiengine30</a>).</p>

## Microsoft .NET Framework

In this area, you can configure the following settings for the Microsoft .NET Framework:

**Table 228** ▪ Microsoft .NET Framework Settings for a Patch

Property	Description
<b>Include in Build</b>	Specify whether to include the Microsoft .NET Framework in your patch. If you select Yes, the same version of the .NET Framework that was included in the latest release is included in this new patch.

**Table 228** ▪ Microsoft .NET Framework Settings for a Patch (cont.)

Property	Description
<b>Engine Location</b>	<p>Select one of the following options:</p> <ul style="list-style-type: none"> <li>● <b>Download Engine From The Web</b>—If the .NET Framework needs to be installed, it is downloaded at run time.</li> <li>● <b>Extract Engine From Update.exe</b>—The build streams the .NET Framework into the Update.exe file, giving you a single file to distribute to your customers. At run time, the engine is extracted from the Update.exe file and installed if required.</li> <li>● <b>Copy From Source Media</b>—The build copies the .NET Framework into the same directory as the Update.exe file.</li> </ul>
<b>Engine URL</b>	<p>Specify the URL for the location of the .NET Framework. This is the location that the Update.exe file uses at run time to download the .NET Framework. The default URL location is a live site maintained by Revenera for your convenience.</p>

## Update Launcher Settings

In this area, you can configure the following settings for the Update.exe launcher:

**Table 229** ▪ Update Launcher Settings for a Patch

Property	Description
<b>Company Name</b>	<p>If you want to override the default company name for Update.exe with your company name, enter your company name.</p> <p>The company name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</p>
<b>Product Name</b>	<p>If you want to override the default product name for Update.exe with your product name, enter your product name.</p> <p>The product name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</p>

**Table 229** ▪ Update Launcher Settings for a Patch (cont.)

Property	Description
<b>Product Version</b>	<p>If you want to override the default product version for Update.exe with your product version, enter your product version.</p> <p>The product version is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</p>
<b>Description</b>	<p>If you want to override the default description for Update.exe with your own description, enter the appropriate description.</p> <p>The description is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</p>
<b>Copyright</b>	<p>If you want to override the default copyright notice for Update.exe with your product's copyright notice, enter your product's copyright notice.</p> <p>The copyright notice is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</p>

**Table 229** ■ Update Launcher Settings for a Patch (cont.)

Property	Description
<b>Required Execution Level</b>	<p>Use the Required Execution Level setting to specify the minimum level that is required by your project's Update.exe file for running on Windows Vista and later platforms. The available options are:</p> <ul style="list-style-type: none"> <li>● <b>Administrator</b>—Update.exe requires administrative privileges to run. Administrators must authorize it; non-administrators must authenticate as an administrator.</li> <li>● <b>Highest available</b>—Update.exe prefers administrative privileges. Administrators must authorize it; non-administrators run it without administrative privileges.</li> <li>● <b>Invoker</b>—Update.exe does not require administrative privileges, and all users can run it without administrative privileges. Update.exe does not display any UAC messages prompting for credentials or for consent.</li> <li>● <b>Use Previous Setup Manifest</b>—The Update.exe manifest uses the same required execution level that was specified for the previous setup. This is the default option.</li> </ul> <p>For InstallScript MSI projects, and for Basic MSI projects if the Create Update.exe check box is selected, InstallShield embeds an application manifest in the Update.exe launcher. This manifest specifies the selected execution level. Operating systems earlier than Windows Vista ignore the required execution level.</p> <p>If the Create Update.exe check box is cleared for a Basic MSI project, InstallShield does not embed the Windows application manifest in an Update.exe launcher.</p> <p>For more information, see <a href="#">Minimizing the Number of User Account Control Prompts During Installation</a>.</p>
<b>Icon</b>	<p>To use your own icon for the Update.exe file, specify the fully qualified name of the file that contains the icon. To specify a file, type an absolute path or a path that is relative to a path variable, or click the ellipsis button (...) to browse to the file from within the Change Icon dialog box.</p> <p>By default, the icon with index 0 is used; to specify a different icon, either select an icon in the Change Icon dialog box or append the icon's index or resource ID (preceded by a minus sign) to the file name. For example, <b>C:\Temp\MyLibrary.dll,2</b> indicates the icon with an index of 2, and <b>C:\Temp\MyLibrary.dll,-100</b> indicates the icon with a resource ID of 100.</p> <p>If you leave this setting blank, InstallShield uses a default icon for your Update.exe file.</p>

## Latest Setup

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

The Latest Setup item for a patch configuration is where you specify settings for the latest version of your installation.

### Latest Setup Path

The latest setup should be the latest version of your installation for which you want to create a patch. The default setting, <ISLatestRelease>, resolves to the last full release that you build.

The release that you specify in this box should be an uncompressed release, ideally created with an administrative installation if the previous product versions were compressed.

### Include Whole Files

Select the files that you want to include as whole files in your patch rather than have the build perform a bit-level difference of the files.

**Note** ▪ To include all of your files as whole files, set the Include Whole Files property for the patch configuration to Yes.

## Previous Setups

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Each patch configuration in the Patch Design view must contain at least one latest setup and one previous setup in order for you to create a patch. If your patch will target multiple earlier versions of your product, ensure that each target image has its own previous setup item.

For example, if your company supports versions 1.0 and 1.1 of an application, you may want to create a patch that will upgrade both of these applications to version 2.0. To create a single patch to update both versions, you would add V1.0 and V1.1 as previous setups to the latest setup. Your latest setup would contain V2.0.

When you click a previous setup item in the Patch Design view, the following tabs are available:

- Common
- Advanced

## Common Tab

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

When you click a previous setup item in the Patch Design view, InstallShield displays different tabs. The Common tab exposes the basic previous setup configuration settings.

**Table 230** ▪ Common Settings for Previous Setup Configuration

Option	Description
<b>Previous Setup</b>	<p>Specify the installation (.msi file or Setup.exe file) that needs to be patched to update it to the latest version of your setup. Because the patch-creation process requires an uncompressed release, you will be prompted for a location to decompress the previous version, if necessary.</p> <div>  <p><b>Caution</b> ▪ Keep the following in mind when specifying paths. You cannot decompress setups that span multiple disks from a local or network drive. You will need to find an alternate method of decompressing the setup.</p> </div>
<b>Ignore Missing Files</b>	<p>If any files that are included in two separate versions cannot be found in a more recent version, then the files will be excluded from the patch package unless they have changed in the later version. The advantage of ignoring the files is that only the modified files need to be added to the package. A complete setup image is not required if you choose to ignore missing source files.</p>

## Advanced Tab

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

When you click a previous setup item in the Patch Design view, InstallShield displays different tabs. The Advanced tab contains the settings that are accessible on the Common tab, in addition to the following transform filter settings:

**Table 231** ■ Advanced Settings for Previous Setup Configuration

Option	Description
<b>Version Relationship</b>	Select the condition that describes the required relationship between the latest version of your product and the previous version whose settings you are specifying for the patch. InstallShield will create a transform between the selected previous setup and the latest setup only if the selected condition is met.
<b>Version to Check</b>	<p>Select what part or parts of the three-part version number should be used to determine whether a transform between the selected previous setup and the latest setup should be created, based on the option selected for the Version Relationship. Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Check Major, Minor, and Upgrade Versions</b>—If InstallShield should check all three parts of the previous setup's version number with all three parts of the latest setup's version number, select this option.</li> <li>● <b>Check Major and Minor Versions</b>—If InstallShield should check the first two parts of the previous setup's version number with first two parts of the latest setup's version number, select this option. The third part of the version number is ignored.</li> <li>● <b>Check Major Version Only</b>—If InstallShield should check the first part of the previous setup's version number with first part of the latest setup's version number, select this option. The second and third parts of the version number are ignored.</li> <li>● <b>Do Not Check Versions</b>—If InstallShield should create the transform regardless of the relationship between the previous setup version number and the latest setup version number, select this option.</li> </ul> <p>For example, if you select Check Major, Minor, and Upgrade Versions for this property and you select Previous Setup Version &lt;= Latest Setup Version for the Version Relationship property, InstallShield will create a transform for the differences between the previous setup and the latest setup if the previous setup version number is 1.2.3 and the latest setup version number is 1.2.4. However, InstallShield will not create the transform if the previous setup version number is 1.2.0 and the latest setup version number is 1.1.0. For a version number of 1.2.3, 1 represents the major version number, 2 represents the minor version number, and 3 represents the upgrade version number.</p>
<b>Match Product Code</b>	To create a transform only if the previous setup and the latest setup have the same product code, select Yes. If you select No, InstallShield will create a transform between the previous setup and the latest setup, regardless of the product code.
<b>Match Upgrade Code</b>	To create a transform only if the previous setup and the latest setup have the same upgrade code, select Yes. If you select No, InstallShield will create a transform between the previous setup and the latest setup, regardless of the upgrade code.

**Table 231** ▪ Advanced Settings for Previous Setup Configuration (cont.)

Option	Description
<b>Match Language</b>	To create a transform only if the previous setup and the latest setup have the same language, select Yes. If you select No, InstallShield will create a transform between the previous setup and the latest setup, regardless of the language.

## Additional External Files

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Patching an additional external file provides the ability to create a binary file patch against versions of an application file that have not been shipped as part of the previous installation.

For example, if one of your application files was potentially updated by another installation, you should reference that file version so that the file-level patch can be applied successfully at run time.

### External File

**Project** ▪ This information applies to the following project types:

- Basic MSI
- InstallScript MSI

When you click an external file that you added to the External File area in the Patch Design view, InstallShield displays two settings that need to be configured for that file.

For the first box, browse for the file key with which you want to associate the external file, or type the File table key for that file.

For the second box, browse for the external file to associate with the File key that you specified in the first box.

## Additional Tools View

**Project** ▪ The Additional Tools view is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object

- Merge Module
- MSI Database
- MSM Database
- QuickPatch
- Transform

The additional tools provide added functionality for your project. Not all of the items in this view apply to every project type. Click the following links to see the project types for which the items are available.

## Dependency Scanners

---

**Project** ▪ The Dependency Scanners view is available in the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

The Dependency Scanners view includes three different scanning tools that you can use to identify possible dependencies that you may need to add to your project. These scanners include a Visual Basic project scanner, a static scanner that scans files that are in your project, and a dynamic scanner that scans a running application for any dependencies.

## MSI Debugger

---

**Project** ▪ The MSI Debugger view is available in the following project types:

- Basic MSI
- MSI Database
- Transform

Debug your setup by setting breakpoints at any action or dialog in the User Interface sequence and watching and changing the Windows Installer properties at each step.

## Direct Editor

---

**Project** ▪ The Direct Editor is available in the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
- MSI Database
- MSM Database

- *QuickPatch*
- *Transform*

The Direct Editor is a view in InstallShield that lets you review all of the tables in your project file (.ism) or database file (.msi, .msm, or .mst). In some project types, this view also offers functionality for advanced users who are very familiar with the Windows Installer database format. The Direct Editor also includes a Reference Tracking pane that lets you easily visualize relationships between table records.

## Dependency Scanners

**Project** ▪ The Dependency Scanners view is available in the following project types:

- *Basic MSI*
- *InstallScript*
- *InstallScript MSI*
- *InstallScript Object*

A file often relies on functions in other files to perform a task. However, you may not be aware of all these other files—known as *dependencies*—when you include your application's files in your installation project. InstallShield offers the following scanning wizards to assist you in identifying and working with these files. You can access these scanners in the Dependency Scanners view.

**Table 232** ▪ Dependency Scanners

Scanning Option	Description
<b>Perform Static Scanning</b>	The <a href="#">Static Scanning Wizard</a> looks at portable executable files (for example, .exe, .ocx, .com, .tlb, .hlp, and .chm) in your project and checks for dependencies that they may require.
<b>Perform Dynamic Scanning</b>	The <a href="#">Dynamic Scanning Wizard</a> monitors your system while an executable file is running and checks for .dll or .ocx files that may be required by the executable file.

Any files that are added to a Basic MSI or InstallScript MSI project through one of these scanners are added in accordance with Setup Best Practices.

If you use the Static and Dynamic scanning wizards, you can specify files that you want to be included or excluded automatically any time that you perform a static or dynamic scan through InstallShield. For more information, see [Filtering Files in Dependency Scanners](#).

## MSI Debugger

**Project** ▪ The MSI Debugger view is available in the following project types:

- *Basic MSI*

- *MSI Database*
- *Transform*

When you debug a release in the MSI Debugger, you can view and set Windows Installer properties as you step through the package's User Interface and Execute sequences.

### Task

**Follow the steps below to begin going through a setup in the MSI Debugger:**

1. Build your release. However, there is one important restriction when you intend on debugging the release: You cannot debug a package that is compressed inside Setup.exe.
2. Go to the **MSI Debugger** view. The debugger lists every standard action and custom action in the User Interface and Execute sequences as well as every dialog in your project. You can also click the **Debug** button on the toolbar or choose **Debug** from the **Build** menu to launch the MSI Debugger.
3. Set a breakpoint on an action or dialog.
4. Start the debugger.

The MSI Debugger runs through each action and dialog until it reaches your breakpoint, at which point it halts execution. Now, you can view and set properties in the Watch window and the Variable window. Finally, you can step through each of the remaining actions, or you can stop the debugger.

**Note** ▪ The MSI Debugger supports deferred custom actions that delay the execution of a system change to the time when the installation script is executed.

Do not confuse the MSI Debugger with the InstallScript Debugger, since they have completely separate purposes. You cannot debug a setup package with the InstallScript Debugger, and you cannot debug an InstallScript custom action with the MSI Debugger.

**Tip** ▪ When InstallShield steps into one of the following types of custom actions (You can step into a custom action by pressing the F11 key.), it will give you the option to launch a registered debugger installed on a client machine. A dialog will appear allowing you to choose one of two options. Select Yes to launch a registered debugger. Select No to step over to the next action. The supported custom actions are as follows:

- *MSI DLL*
- *Standard DLL*

## Direct Editor

**Project** ▪ The Direct Editor is available in the following project types:

- *Basic MSI*
- *DIM*
- *InstallScript*
- *InstallScript MSI*

- *InstallScript Object*
- *Merge Module*
- *MSI Database*
- *MSM Database*
- *QuickPatch*
- *Transform*

*Note that the following information includes additional project-specific details.*

The Direct Editor is a view in InstallShield that lets you review all of the tables in your project file (.ism) or database file (.msi, .msm, or .mst). In some project types, this view also offers functionality for advanced users who are very familiar with the Windows Installer database format.

For Windows Installer-based projects, the Direct Editor can run in two different modes:

- **Project edit mode**—This mode lets you edit tables in the project file. The changes that are made in the Direct Editor are incorporated into the Windows Installer package that InstallShield creates at build time.

Any changes that you make in the other views within InstallShield are reflected in the Direct Editor; in addition, any changes that you make in the Direct Editor are also reflected in the other corresponding views (if available). For example, if you use the Features view to add a new feature to your project, InstallShield automatically adds that feature to the Feature table in the Direct Editor. If you use the Direct Editor view to add the feature, InstallShield automatically updates the Features view accordingly.

When you are working in any of the following Windows Installer-based project types, you are working in project edit mode: Basic MSI, DIM, InstallScript MSI, Merge Module, and QuickPatch.

- **Direct edit mode**—This mode lets you edit tables in the Windows Installer database (.msi, .msm, or .mst file). When you save the changes that you have made in the Direct Editor, InstallShield updates the Windows Installer database.

Many of the other standard InstallShield views are not available in direct edit mode, since they require build-time functionality that is not available when you are directly editing the Windows Installer database.

When you are working in any of the following Windows Installer-based project types, you are working in direct edit mode: MSI Database, MSM Database, and Transform.

## Using the Direct Editor in Any Project Type

The Direct Editor has a Tables explorer that lists each table in your project or database. When you select a table in this explorer, the right pane shows the following elements:

- A row of buttons and other controls
- A spreadsheetlike table

Each row in a table represents a record in your project or database. The parenthetical note in each column heading indicates the type and size of data that you enter in the column. For example, *S255* indicates a string with up to 255 characters; *I2* indicates a 2-byte integer.

The following table describes all of the buttons and other controls that are displayed when you select a table in the Direct Editor.

**Table 233** ▪ Controls in the Direct Editor View

Name of Control	Icon	Description
<b>New Record</b>		Displays the Add Record to Table dialog box, which lets you add a new row to the selected table.
<b>Edit Selected Record</b>		Displays the Edit Record in Table dialog box, which lets you edit the data in the selected row.
<b>Delete Selected Records</b>		Deletes the selected row or rows.
<b>Cut Selected Records</b>		Removes the currently selected rows and places them on the Clipboard.
<b>Copy Selected Records</b>		Copies the currently selected rows to the Clipboard.
<b>Paste Records</b>		Inserts the rows that are saved to the Clipboard.
<b>Find String</b>		Displays the Find dialog box, which lets you search for instances of a string. This dialog box lets you specify criteria such as whether you want to search in the selected table, or all tables.
<b>Find Next</b>		Searches for the next occurrence of the specified string.
<b>Find and Replace</b>		Displays the Replace dialog box, which lets you search for instances of a string and replace them with a new string. This dialog box lets you specify criteria such as whether you want to search in the selected table, or all tables.
<b>Show Reference Tracking</b>		Toggles the Reference Tracking pane below the Direct Editor. The Reference Tracking pane lets you easily visualize relationships between table records. For more information, see <a href="#">Table Record Reference Tracking</a> .
<b>Search Grid</b>		Dynamically filters the records that are displayed in the Direct Editor view according to the string that you specify in this search box. As you type a string in this box, InstallShield hides all of the rows that do not contain it.
<b>Direct Editor Help</b>		Displays the help for the Direct Editor view.

## Using the Direct Editor with Project Edit Mode in Windows Installer–Based Projects

In Basic MSI, DIM, InstallScript MSI, Merge Module, and QuickPatch projects, advanced users can use the Direct Editor to perform tasks such as the following:

- View all of the tables in the project file (.ism).
- Add and remove records from tables.
- Cut, copy, and paste records or fields.
- Edit individual fields in the tables.
- Add custom tables.
- Filter the table records that are shown to hide ones that do not contain a specific string.
- Search one table or all tables for a specific string and replace it if necessary.
- Resize and reorder the columns in a table.

**Tip** ▪ If you press F1 while a standard Windows Installer table is selected, the Windows Installer Help Library opens to provide information about that specific table.

Note the following details when using the Direct Editor with project edit mode in Windows Installer–based projects:

- The File table displays only static data. InstallShield may add additional information, such as dynamically linked files, to the File table in the Windows Installer database that it creates at build time.
- Unlike the corresponding tables in the Windows Installer database, tables such as the Binary, Icon, and Patch tables in the .ism file do not store binary data. Rather, they store links to build-source paths.
- Column attributes for both standard tables and InstallShield tables cannot be altered while in project edit mode. They can, however, be edited for custom tables. Note that column attributes can be edited in standard, InstallShield, and custom tables in direct edit mode.
- You cannot use localizable properties in the Directory table.

## Using the Direct Editor with Direct Edit Mode in Windows Installer–Based Projects

In MSI Database, MSM Database, and Transform projects, you can use the Direct Editor to essentially perform all of the tasks that are available in this view with direct edit mode. However, instead of working with tables in the .ism file, you are working directly with the Windows Installer database (.msi, .msm, or .mst).

## Using the Direct Editor in InstallScript and InstallScript Object Projects

The Direct Editor in InstallScript and InstallScript Object projects lets you see all of the tables in your .ism file; however, it is recommended that you use the other views in InstallShield to modify these types of projects.

Note that although InstallScript and InstallScript Object projects use many of the same tables that are available in Windows Installer–based projects, many of the common tables have different meanings. In addition, InstallShield ignores custom tables in InstallScript and InstallScript Object projects; custom tables are not available at run time.

## Direct Editor Table Insights

The Direct Editor in InstallShield includes several features that provide visual insights into tables, schema information, and validation errors designed to boost the productivity of setup authors or packagers who use the Direct Editor for troubleshooting to identify and resolve advanced problems. These features are described following:

- [Directory Table Psuedocolumn Displays Resolved Target Directory Path](#)
- [Column Header Schema Information Tooltips](#)
- [Table Record Reference Tracking](#)
- [Broken References Indicator](#)

### Directory Table Psuedocolumn Displays Resolved Target Directory Path

InstallShield includes a read-only, grayed out pseudocolumn to the Directory table that displays the resolved path of each row's directory location. A pseudocolumn behaves like a table column, but is not actually stored in the table. You can sort by the pseudocolumn's visible text, but you cannot insert, update, or delete its values.

### Column Header Schema Information Tooltips

InstallShield provides tooltips on column headers that display the column's schema information.

#### Examples

The **Directory** table receives the following schema tooltips:

Table 234 •

Column Header	Tooltip
<b>Directory (s72)</b>	Directory: char(72), required
<b>Directory_Parent (S72)</b>	Directory_Parent: char(72), nullable
<b>DefaultDir (I255)</b>	DefaultDir: char(72), localizable, required
<b>ISDescription (S255)</b>	ISDescription: char(255), nullable
<b>ISAttributes (I4)</b>	ISAttributes: long integer, nullable
<b>ISFolderName (S255)</b>	ISFolderName: char(255), nullable

The **Binary** table receives the following schema tooltips:

Table 235 •

Column Header	Tooltip
<b>Name (s72)</b>	Name: char(72), required
<b>Data (V0)</b>	Data: stream, nullable

Table 235 ▪

Column Header	Tooltip
<b>ISBuildSourcePath (\$255)</b>	ISBuildSourcePath: char(255), nullable

The **CustomAction** table receives the following schema tooltips:

Table 236 ▪

Column Header	Tooltip
<b>Action (s72)</b>	Action: char(72), required
<b>Type (i2)</b>	Type: short integer, required
<b>Source (\$64)</b>	Source: char(64), nullable
<b>Target (\$0)</b>	Target: char(0), nullable
<b>ExtendedType (i4)</b>	Extended Type: long integer, nullable
<b>ISComments (\$255)</b>	ISComments: char(255), nullable

### Table Record Reference Tracking

The Direct Editor includes a Reference Tracking pane that lets you easily visualize relationships between table records. A **Show Reference Tracking** button at the top of the Direct Editor provides a show/hide toggle of the pane.

Each record may reference one or more other records or be referenced by one or more other records. When a record is highlighted that refers to other records or is referred from other records, the Reference Tracking pane is populated with a **Reference Tables** section showing the tables in which the references reside and an additional section that displays the actual record references. The record references section includes arrow icons that indicate the direction of the reference, where:

- A green arrow pointing to the right indicates that the record that is selected in the Direct Editor table **references** the record displayed in the Reference Tracking pane.
- A blue arrow pointing to the left indicates that the record selected in the Direct Editor table is **referenced by** the record displayed in the Reference Tracking pane.
- Two arrows in both directions (a green arrow pointing right and a blue arrow pointing left) indicate that the record selected in the Direct Editor table **references and is referenced by** the record displayed in the Reference Tracking pane.

**Note ▪** When multiple Direct Editor records are selected, only the “focused” record’s references are shown. In addition, if multiple tables appear in the **Reference Tables** section, this indicates that the record selected in the Direct Editor table references or is referenced by records in multiple tables. You can click any table in the **Reference Tables** section to view the associated records references.

**Tip** ▪ In the Reference Tracking pane, you can quickly jump between record references by double-clicking within a cell.

### Broken References Indicator

There are instances where a Direct Editor table record might reference a foreign key record that no longer exists. InstallShield displays the cells of such broken references with a red fill color to call attention to the broken reference.

For example, if the **Directory\_** column in the Component table references a directory name that is not found in the Directory table, then the **Directory\_** column is filled in red.

**Note** ▪ The Direct Editor broken reference indicator is unrelated to the **Maintain referential integrity** check box on the **Preferences** tab of the Options dialog box. While the **Maintain referential integrity** setting is designed to update the foreign keys when you modify a primary key, the purpose of the broken reference indicator is to display broken references to help you easily identify orphaned records. Therefore, broken references are displayed regardless of the selection of the **Maintain referential integrity** setting.

## Windows Installer Table Reference

For information about Windows Installer tables, see [Database Tables](#) in the MSDN Library.

## InstallShield Table Reference

The following table lists some InstallShield tables that add specific functionality to your application. Click a link for more information about a specific table.

**Table 237** ▪ InstallShield Table Names and Descriptions

Table Name	Project Type	Description
<a href="#">ISAlias</a>	Basic MSI, InstallScript, InstallScript MSI, InstallScript Object	This table contains alias information used when an InstallShield Professional project is converted to a Windows Installer-based project or an InstallScript project in the latest version of InstallShield.
<a href="#">ISComCatalogAttribute</a>	Basic MSI, DIM, InstallScript MSI, Merge Module	This table contains information about COM+ catalog attributes. Each entry has a foreign key to a ISComCatalogObject table entry to which the attribute belongs.

**Table 237** ■ InstallShield Table Names and Descriptions (cont.)

Table Name	Project Type	Description
<b>ISComCatalogCollection</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	This table contains information about COM+ catalog collections. A COM+ catalog collection is a folder of a same type of COM+ catalog objects. For example, the COM+ applications item, the Components item, and the Legacy Components item in the Component Services view are the COM+ catalog collections. Each entry has a foreign key to a ISComCatalogObject table entry to which the collection belongs.
<b>ISComCatalogCollectionObject</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	This table contains information about COM+ catalog collections where COM+ catalog objects belong.
<b>ISComCatalogObject</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	This table contains information about COM+ catalog objects. A COM+ catalog object is an item that is contained within a COM+ catalog collection. Each entry has the display name.
<b>ISComPlusApplication</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	This table contains information about a COM+ application. A COM+ application is a COM+ catalog object with extra information. This table has application specific information and a foreign key to a ISComCatalogObject table entry which has the basic information.
<b>ISCustomActionReference</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	This table contains information about the behavior of each of the custom actions that are included in the installation.
<b>ISIISItem</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module	This table contains information about each IIS element (Web site, application, virtual directory, application pool, and Web service extension) that is configured in the Internet Information Services view.
<b>ISIISProperty</b>	Basic MSI, DIM, InstallScript, InstallScript MSI, Merge Module	This table contains values for settings that are configured in the Internet Information Services view.
<b>ISProductConfigurationInstance</b>	Basic MSI	This table provides support for installing multiple instances of a product in the same context on the same machine.

**Table 237** ■ InstallShield Table Names and Descriptions (cont.)

Table Name	Project Type	Description
<b>ISSelfReg</b>	Basic MSI, DIM, InstallScript MSI, Merge Module	If you have <a href="#">selected ISSelfReg as the self-registration method for COM servers</a> , and if your project contains any files (or dynamic links) marked as self-registered, InstallShield adds information about those files to the ISSelfReg table of your .msi database.

## ISAlias Table

**Project** ■ This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

If you upgrade a project that was created with InstallShield Professional to InstallShield 2021, InstallShield might add data to the ISAlias table.

In Windows Installer, identifiers cannot contain spaces and must contain only specified characters. Because of this, some of your component names, feature names, or script-defined folder names that you used in InstallShield Professional might not be valid in a project that you upgraded to a Windows Installer-based project. To address this issue, InstallShield uses aliasing to match the old name with a new identifier. (InstallShield does not perform a lexicon change for these names because they might be used as strings within your script.)

**Note** ■ If you upgrade to an InstallScript project, the only invalid characters in feature names or script-defined folder names are the following:

`\ / : * ? " ' < > |`

In component names, the preceding characters and the single quotation mark (') are invalid.

The ISAlias table contains the following information.

**Table 238** ■ ISAlias Table Information

Column Name	Information
<b>Alias</b>	Name string used in InstallShield Professional.
<b>Identifier</b>	String that is used by InstallShield to reference the alias.
<b>Table</b>	Name of the table that uses the alias (for example, Feature). This table is available in the Direct Editor.

## ISCOMCatalogAttribute Table

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISCOMCatalogAttribute table contains the information about COM+ catalog attributes. Each entry has a foreign key to a ISComCatalogObject table entry to which the attribute belongs.

### Columns

#### ISCatalogObject\_(primary key)

A foreign key into the ISCatalogObject table

#### ItemName (primary key)

The named attribute for a catalog object

#### ItemValue

A value associated with the attribute defined in ItemName

## ISCOMCatalogCollection Table

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISCOMCatalogCollection table contains information about COM+ catalog collections. A COM+ catalog collection is a folder of a same type of COM+ catalog objects. For example, COM+ application, Component and Legacy Component nodes in the Component Services view are the COM+ catalog collections. Each entry has a foreign key to a ISComCatalogObject table entry to which the collection belongs.

### Columns

#### ISCatalogCollection (primary key)

A unique key for the ISCatalogCollection table.

#### ISCatalogObject\_

A foreign key into the ISCatalogObject table. This is the catalog object that a catalog collection belongs to.

**Name**

A catalog collection name.

## ISCOMCatalogCollectionObject Table

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISCOMCatalogCollectionObject table contains information about COM+ catalog collections where COM+ catalog objects belong.

**Columns****ISCatalogCollection\_(primary key)**

A unique key for the ISCatalogCollection table

**ISCatalogObject\_(primary key)**

A foreign key into the ISCatalogObject table; This is the catalog object that a catalog collection contains.

## ISCOMCatalogObject Table

**Project** ▪ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISCOMCatalogObject table contains information about COM+ catalog objects. A COM+ catalog object is an item that is contained within a COM+ catalog collection. Each entry has the display name.

**Columns****ISCatalogObject (primary key)**

A unique key for the ISCatalogObject table

**DisplayName**

The display name of a catalog object

## ISCOMPlusApplication Table

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISCOMPlusApplication table contains information about a COM+ application. A COM+ application is a COM+ catalog object with extra information. This table has application specific information and a foreign key to an ISComCatalogObject table entry that has the basic information.

### Columns

#### ISCatalogObject\_(primary key)

A foreign key into the ISComCatalogObject table. This is the root level application object. All other data associated with this application can be derived through the ISComCatalogObject table.

#### ComputerName

If the ComponentService object was loaded from a remote machine, store the computer name here. This can be NULL for the local computer.

#### Component\_

A foreign key to the component table.

## ISCustomActionReference Table

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISCustomActionReference table contains information about the intended behavior of each custom action that is included in the project.

**Table 239** - ISCustomActionReference Table Information

Column	Type	Key	Nullable	Description
Action_	Identifier	Yes	No	Identifier that references an entry in the CustomAction table.

**Table 239** ■ ISCustomActionReference Table Information (cont.)

Column	Type	Key	Nullable	Description
<b>Description</b>	Text	No	No	Text that describes the behavior of the custom action.  When InstallShield builds a release of a Basic MSI, InstallScript MSI, or merge module project, it populates this column with the text in the file that is referenced in the ISCARReferenceFilePath column.  If you are working on a project in Direct Edit mode, InstallShield streams the contents of the file into this column as soon as you select the help file in the Custom Actions and Sequences view (or the Custom Actions view).
<b>FileType</b>	Text	No	No	The file type of the help file.
<b>ISCARReferenceFilePath</b>	Text	No	No	The full path, including the file name, for the file that describes the behavior of the custom action.  This column is included in the InstallShield project file (.ism), but not in the .msi file.

## ISIISItem Table

**Project** ■ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

The ISIISItem table contains information about IIS settings that are configured in the Internet Information Services view.

**Table 240** ■ ISIISItem Table Information

Column	Type	Key	Nullable	Description
<b>ISIISItem</b>	String	Yes	No	Primary key for table. This item identifies the Web site or other IIS item that is being created.

**Table 240** ■ ISIISItem Table Information (cont.)

Column	Type	Key	Nullable	Description
<b>ISIISItem_Parent</b>	String	No	Yes	Foreign key into the ISIISItem column. This item identifies the Web site or other IIS item that contains the current item.
<b>DisplayName</b>	Localizable string	No	Yes	An optional localized name for the Web site or other IIS item.
<b>Type</b>	Integer	No	No	Identifies the type of IIS item. Available options are: <ul style="list-style-type: none"> <li>• 1—Web site</li> <li>• 2—Application</li> <li>• 3—Virtual directory</li> <li>• 4—Application pool</li> <li>• 5—Web service extension</li> </ul>
<b>Component_</b>	String	No	Yes	Name of the component that contains the IIS item.

## ISIISProperty Table

**Project** ■ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

The ISIISProperty table contains information about IIS settings that are configured in the Internet Information Services view.

**Note** ▪ When you configure advanced settings for a Web site, application, or virtual directory in the Internet Information Services view, InstallShield configures the *MetaData\** fields in the *ISIISProperty* table automatically. For help on specific settings, see [IIS Metabase Properties](#) in the MSDN Help Library.

**Table 241** ▪ ISIISProperty Table Information

Column	Type	Key	Nullable	Description
<b>ISIISProperty</b>	String	Yes	No	Primary key for table.
<b>ISIISItem</b>	String	Yes	No	Primary key for table; foreign key into the <i>ISIISItem</i> table. This item identifies the Web site or other IIS item that this property is for.
<b>Schema</b>	String	No	Yes	This column is reserved for future use.
<b>FriendlyName</b>	String	No	Yes	This column is reserved for future use.
<b>MetaDataProp</b>	Integer	No	Yes	Equates to the <i>dwMDIdentifier</i> field of the <i>METADATA_RECORD</i> structure.
<b>MetaDataType</b>	Integer	No	Yes	Equates to the <i>dwMDDataType</i> field of the <i>METADATA_RECORD</i> structure.
 <p><b>Note</b> ▪ InstallShield supports the following values:</p> <ul style="list-style-type: none"> <li>• 1 (<i>DWORD_METADATA</i>)</li> <li>• 2 (<i>STRING_METADATA</i>)</li> <li>• 5 (<i>MULTISZ_METADATA</i>)</li> </ul>				
<b>MetaDataUserType</b>	Integer	No	Yes	Equates to the <i>dwMDUserType</i> field of the <i>METADATA_RECORD</i> structure. Available options, which are defined in the Windows SDK header <i>IIScnfg.h</i> , are: <ul style="list-style-type: none"> <li>• 1 (<i>IIS_MD_UT_SERVER</i>)</li> <li>• 2 (<i>IIS_MD_UT_FILE</i>)</li> <li>• 100 (<i>IIS_MD_UT_WAM</i>)</li> <li>• 101 (<i>ASP_MD_UT_APP</i>)</li> </ul>
<b>MetaDataAttributes</b>	Integer	No	Yes	Equates to the <i>pbMDAttributes</i> field of the <i>METADATA_RECORD</i> structure.

**Table 241** ▪ ISIISProperty Table Information (cont.)

Column	Type	Key	Nullable	Description
<b>MetaDataValue</b>	String	No	Yes	Equates to the pbMDDData field of the METADATA_RECORD structure.
<b>Order</b>	Integer	No	Yes	The order that you would like the property to be applied to the IIS item.
<b>ISAttributes</b>	Integer	No	Yes	<p>Indicates whether the IIS property is a standard property or an advanced property. Advanced properties are configurable through the Other IIS Properties setting in the Internet Information Services view.</p> <p>Available options are:</p> <ul style="list-style-type: none"> <li>● 0 (Standard property)</li> <li>● 1 (Advanced property)</li> </ul> <p>All other options are reserved for future use.</p>

## ISProductConfigurationInstance Table

**Project** ▪ This information applies to the following project types:

- Basic MSI

The ISProductConfigurationInstance table provides support for installing multiple instances of a product in the same context on the same machine. This table defines each of the property values for each instance that an installation supports. For more information, see [Setting Properties for an Instance](#).

**Caution** ▪ Creating an installation that lets end users install multiple instances of a product on the same machine and in the same context requires sophisticated authoring and serious commitment on the part of the installation developer. This functionality is recommended for only advanced installation developers.

**Table 242** ▪ ISProductConfigurationInstance Table Information

Column	Type	Key	Nullable	Comments
<b>ISProductConfiguration_</b>	Text	Yes	No	Identifies the product configuration to which this instance applies.
<b>InstanceId</b>	Integer	Yes	No	Identifies the instance number of this instance. This value is stored in the property InstanceId.

**Table 242** ■ ISProductConfigurationInstance Table Information (cont.)

Column	Type	Key	Nullable	Comments
<b>Property</b>	Identifier	Yes	No	Identifies the property to create for this instance.
<b>Value</b>	Text	Yes	No	Specifies the value for this property for this instance.

## ISSelfReg Table

**Project** ■ This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

If you have [selected ISSelfReg as the self-registration method for COM servers](#), and if your project contains any files (or dynamic links) marked as self-registered, InstallShield adds information about those files to the ISSelfReg table of your .msi database.

**Table 243** ■ ISSelfReg Table Information

Column Name	Description
<b>FileKey</b>	Foreign key into the File table, identifying the file (.dll, .ocx, .exe, .tlb, .olb) to be self-registered.
<b>Cost</b>	Reserved for future use.
<b>Order</b>	A nonnegative number identifying the order in which self-registration will occur. Any files with an Order value of 1 will be registered first, followed by files with an Order value of 2, and so forth. Finally, all files with an Order value of 0 will be registered.
<b>CmdLine</b>	<p>For self-registering .exe files, stores a command line to be passed to the executable when it is self-registered. By default the field is empty, and the InstallShield run-time engine registers the .exe file with the /regserver argument and unregisters it with the /unregserver argument.</p> <p>To specify different arguments to pass during registration and unregistration, separate the arguments with a vertical bar ( ), as in /hello/goodbye.</p>

## InstallShield Columns in Standard Windows Installer Tables

InstallShield extends some standard Windows Installer tables for increased functionality. Following is a listing of the tables affected, columns added, and descriptions of the data to be placed in the new fields.

**Table 244** ■ Additions to Standard MSI Tables

Table Name	Column Name	Description
<b>AdminExecuteSequence</b>	ISComments	Author's comments on this Sequence.
<b>AdminUISequence</b>	ISComments	Author's comments on this Sequence.
<b>AdvtExecuteSequence</b>	ISComments	Author's comments on this Sequence.
<b>AdvtUISequence</b>	ISComments	Author's comments on this Sequence.
<b>Binary</b>	ISBuildSourcePath	Full path to the ICO or EXE file.
<b>Component</b>	ISAttributes	This is used to store InstallShield custom properties of a component. Currently the only one is ExtractAtBuild.
<b>Component</b>	ISComments	User Comments.
<b>Control</b>	ISWindowStyle	A 32-bit word that specifies non-MSI window styles to be applied to this control.
<b>Control</b>	ISControlId	A number used to represent the control ID of the Control. Used in Dialog export.
<b>CustomAction</b>	ISComments	Author's comments for this custom action.
<b>Dialog</b>	ISComments	Author's comments for this dialog.
<b>Dialog</b>	ISWindowStyle	A 32-bit word that specifies non-MSI window styles to be applied to this control. This is only used in Script Based Setups.
<b>Dialog</b>	ISResourceId	A Number that specifies the Dialog ID to be used in Dialog Export.
<b>Directory</b>	ISDescription	Description of the folder.
<b>Feature</b>	ISReleaseFlags	Release Flags that specify whether this feature will be built in a particular release.
<b>Feature</b>	ISComments	Comments.
<b>File</b>	ISBuildSourcePath	Full path, the category is of Text instead of Path because of potential use of path variables.

**Table 244** ▪ Additions to Standard MSI Tables (cont.)

Table Name	Column Name	Description
<b>File</b>	ISAttributes	This field contains the following attributes: <ul style="list-style-type: none"> <li>● OverrideSystemAttributes (0x04)</li> <li>● OverrideSystemSize (0x08)</li> <li>● OverrideSystemVersion (0x10)</li> <li>● OverrideSystemLanguage (0x20)</li> </ul> The UseSystemSettings(0x1) attribute is no longer used.
<b>Icon</b>	ISBuildSourcePath	Full path to the ICO or EXE file.
<b>Icon</b>	ISIconIndex	Optional icon index to be extracted.
<b>InstallExecuteSequence</b>	ISComments	Author's comments on this Sequence.
<b>InstallUISequence</b>	ISComments	Author's comments on this Sequence.
<b>Patch</b>	ISBuildSourcePath	Full path to patch header.
<b>ProgId</b>	ISAttributes	This is used to store InstallShield custom properties of a component, like ExtractIcon, etc.
<b>Property</b>	ISComments	User Comments.
<b>Registry</b>	ISAttributes	This is used to store InstallShield custom properties of a registry item. Currently the only one is Automatic.
<b>Shortcut</b>	ISComments	Author's comments on this shortcut.

## QuickPatch Projects

A QuickPatch project is a specific type of Windows Installer-based project recommended for installation authors who want to ship small, single upgrades to their end users. Each QuickPatch project has its own set of views.

### Patch Settings View

The Patch Settings view contains links to several views:

- **General Information View**—Enter information about your upgrade and the original installation. Specify which releases should be patched by the current project, and select which custom actions should be included.
- **Files View**—Add files to your patch, and specify file-patching options.
- **Registry View**—Specify which registry values should be changed or removed.

- **Path Variables View**—Make your patch easily portable between development systems with variable-based file linking.

## Additional Tools View

The Additional Tools view contains a link to the Direct Editor. Use the Direct Editor to edit the database tables directly.

## Patch Settings View

**Project** ▪ This information applies to QuickPatch projects.

The Patch Settings view is available when you open or create a QuickPatch project. Use this view to configure your QuickPatch.

### General Information

Enter information about your upgrade and the original installation. Specify which releases should be patched by the current project, and select which custom actions should be included.

### Files

Add files to your patch, and specify file-patching options.

### Registry

Specify which registry values should be changed or removed.

### Path Variables

Make your patch easily portable between development systems with variable-based file linking.

## General Information View

**Project** ▪ This information applies to QuickPatch projects.

The General Information view contains basic information about your QuickPatch project. You can view and configure product properties, build settings, patch history, and custom actions in this view.

### Product Properties

**Project** ▪ This information applies to QuickPatch projects.

When you click Product Properties in the General Information view, InstallShield displays the following:

**Table 245** ■ Settings for Product Properties

Setting	Description
<b>Original Setup Path</b>	This area shows the product name and the path to the original installation image. The path box is read-only.
<b>Product Version</b>	The Original setup version box shows the product version of the original installation. This box is read-only. In the QuickPatch Version box, you can change the product version for your QuickPatch project. Entry in this box is optional.
<b>FlexNet Connect Integration</b>	If FlexNet Connect was enabled in your original installation and if you designate custom version numbers that FlexNet Connect should use to identify your product (as opposed to using the standard version scheme that Windows Installer uses), type the new custom version number for your QuickPatch in this box.

## Build Settings

**Project** ■ This information applies to QuickPatch projects.

When you click Build Settings in the General Information view, InstallShield displays the following tabs:

- Common
- Identification
- Digital Signature
- Advanced

## Common Tab

**Project** ■ This information applies to QuickPatch projects.

When you click Build Settings in the General Information view, InstallShield displays several tabs. The Common tab exposes frequently used build settings for a QuickPatch:

### Build Location

Specify where you want your patch file built or browse for an existing folder.

## Launcher Settings

In this area, you can configure the following launcher settings:

**Table 246** ▪ Configurable Launcher Settings

Setting	Description
<b>Create Update.exe</b>	<p>If you want to create an Update.exe update launcher for the current QuickPatch package, select this check box.</p> <p>To learn when an Update.exe update launcher is required, see <a href="#">Patching Considerations</a>.</p>
<b>Include Windows Installer 3.1 engine</b>	Select this check box to include the Windows Installer 3.1 engine with your patch package.
<b>Include .NET Framework</b>	Select this check box to include the .NET Framework with your patch package.

## Patch Uninstallation

Select the **Allow Patch to be Uninstalled (Requires Windows Installer 3.0)** check box if you would like the QuickPatch to be uninstallable without having to uninstall and reinstall the entire application and other QuickPatch packages. Note that uninstallation of QuickPatch packages works only under certain conditions. For example, versions of Windows Installer earlier than version 3.0 cannot remove just the QuickPatch from an application. For more information, see [Removing Patches](#) in the Windows Installer help.

## Identification Tab

**Project** ▪ This information applies to QuickPatch projects.

When you click Build Settings in the General Information view of a QuickPatch project, InstallShield displays several tabs. The Identification tab exposes settings for display strings. The display strings are used to populate information about the patch in Add or Remove Programs. It is also used by the Windows Installer 3.0 (and later) APIs that interrogate and catalog patches applied to a target machine.

**Note** ▪ Patch metadata is stored directly in the patch (.msp) file and not in any of the .msi packages. The .msp file contents are not localizable. Therefore, string entries are not available for any of the metadata settings below.

**Table 247** ▪ Identification Tab Settings

Setting	Description
<b>Display name</b>	Specify the name of your patch.
<b>Support URL</b>	Specify the uniform resource locator (URL) that you would like your customers to visit for technical support.

**Table 247** ■ Identification Tab Settings (cont.)

Setting	Description
<b>Description</b>	Specify a brief description of your patch.
<b>Manufacturer name</b>	Specify the name of the application's manufacturer.
<b>Target product name</b>	Specify the name of the application or the target application suite.
<b>Classification</b>	Specify the category of upgrade. Examples include Critical Update, Hotfix, and Service Pack.

## Digital Signature Tab

**Project** ■ This information applies to QuickPatch projects.

When you click Build Settings in the General Information view of a QuickPatch project, InstallShield displays several tabs. The Digital Signature tab is where you specify settings if you want to digitally sign your patch.

**Note** ■ With QuickPatch projects, you can digitally sign the patch package and the Update.exe file. If you want to digitally sign individual files—such as your application's executable files—in your QuickPatch package, you must manually sign them and then add them to your project. You can use SignTool.exe, which is included with the Windows SDK, to manually sign your files.

**Table 248** ■ Settings in the Digital Signature Tab

Setting	Description
<b>Sign the Patch Package</b>	To digitally sign your QuickPatch package, select this check box.
<b>Sign Update.exe</b>	To digitally sign the Update.exe file, select this check box.
<b>Certificate URL</b>	Type a fully qualified URL—for example, <b>http://www.mydomain.com</b> . This URL is used in your digital signature to link to a site that you would like end users to visit to learn more about your product, organization, or company.
<b>Digital Certificate Information</b>	<p>To specify the digital certificate that you want to use to sign your release, click the Browse button next to this setting. The Certificate Selection dialog box opens, enabling you to specify either the location of the .pfx file or information about the certificate store that contains the certificate.</p> <p>To learn more, see <a href="#">Certificate Selection Dialog Box</a>.</p>

**Table 248** ■ Settings in the Digital Signature Tab (cont.)

Setting	Description
<b>Password</b>	<p>If the .pfx file that you are using has a password, enter it. InstallShield encrypts the password and stores it in your project file (.ism).</p> <p>At build time, InstallShield uses the password to sign files with a .pfx file. If your certificate is protected by a password but you do not enter it in this setting, signing with a .pfx file fails.</p> <p>Note that if you configure your project to use a certificate that was imported with password protection into a store, Windows prompts for the password at build time when InstallShield is attempting to sign your project's files. The strong key protection that Windows uses does not permit InstallShield to provide the password to the cryptographic provider.</p>
<b>Signature Description</b>	<p>Specify the signature description that you want to use for the patch package and Update.exe file, if applicable. The description that you specify is displayed on the User Account Control (UAC) box to the right of the "Program Name:" label. The UAC dialog box opens when an end user launches the signed file and elevated privileges are required.</p> <p>If you leave this setting blank, InstallShield uses the name of the file without its extension as the description to the right of the "Program Name:" label on the UAC dialog box.</p>

## Advanced Tab

**Project** ■ This information applies to QuickPatch projects.

When you click Build Settings in the General Information view, InstallShield displays several tabs. The Advanced tab exposes a comprehensive set of build settings that you can configure for a QuickPatch.

## Build Location

In the Build Location area, you can configure the following settings.

**Table 249** ■ Build Location Settings

Property	Description
<b>Build Location</b>	Specify where you want your patch file built or browse for an existing folder.

**Table 249** ▪ Build Location Settings (cont.)

Property	Description
<b>Project File Format</b>	<p>Select the file format that you want to use for your project file (.ism). Available options are:</p> <ul style="list-style-type: none"> <li>● <b>Binary</b>—To save the .ism file as a database file, select this option. This format is best for the speed of opening and saving the project file. This is the default format for the current project type. If you select this project file format for the current project, you can modify the .ism file in a Windows Installer database editor. You can also modify the .ism file by using the Windows Installer API or its automation interface.</li> <li>● <b>XML</b>—To save the .ism file as a hierarchical text-based format, select this option. This project file format is best for use with source code control systems. It enables you to modify the project file using XML tools.</li> </ul>  <p><b>Note</b> ▪ Both project file formats let you build releases from the command line.</p>
<b>Create Update.exe</b>	<p>Specify whether you want to create an Update.exe update launcher for the current QuickPatch package.</p> <p>To learn when an Update.exe update launcher is required, see <a href="#">Patching Considerations</a>.</p>
<b>List of Patch GUIDs to replace</b>	<p>To replace one or more earlier installed patches with the current QuickPatch, set this property to the patch GUIDs of those patches, and separate each with a comma. For example:</p> <pre>{C86838C9-DEDC-4451-B96F-94AFB9460F15},{C8633E5B-AC44-45d8-B487-C68B3B1F60D6}</pre> <p>Setting this property is typically <i>not</i> required, even if you have several QuickPatch projects in the History. However, if your QuickPatch project does not overwrite files added in an earlier QuickPatch project, it may be necessary to set this property.</p> <p>If you do not know the GUID of a patch that you want to replace, click this property and then click the ellipsis button (...). Select the patch (.msp or .exe file), and InstallShield will add the corresponding GUID to this property.</p>
<b>Create new “UpdatedImage” folder</b>	<p>This setting enables you to build your QuickPatch package with an existing UpdatedImage folder. To use this option, you must have built this package at least once (so that an UpdatedImage folder exists). Setting this option to No builds the package from the existing UpdatedImage folder. This lets you tweak the .msi package in the UpdatedImage folder and use that .msi data in a QuickPatch project. Setting this option to Yes (the default setting) regenerates the .msi file in the UpdatedImage folder every time that the package is built.</p>

**Table 249** ■ Build Location Settings (cont.)

Property	Description
<b>Generate MsiPatchOldAssembly tables</b>	Specify whether to automatically generate entries for the MsiPatchOldAssemblyFile and MsiPatchOldAssemblyName tables, which allow a patch package that is running under Windows Installer 3.0 and later to patch an assembly in the global assembly cache (GAC) without making a run-time request for the original installation source. For more information, see <a href="#">Patching Assemblies in the Global Assembly Cache</a> .
<b>Create patch sequencing entry</b>	Specify whether you want to use patch sequencing for your QuickPatch. A patch sequence accounts for obsolete patches, superseded patches, and patches that have already been applied to the product. The sequence specifies the order that Windows Installer version 3.0 and later should apply patches to an installed product, regardless of the order in which they are provided to the target machine. For versions of Windows Installer earlier than version 3.0, the patch sequence is ignored, and any patches are applied to the product in the order that they are provided to the target machine.
<b>Streamline QuickPatch</b>	<p>Specify whether you want InstallShield to streamline the creation of your QuickPatch package to build as simple a package as possible. The default value is Yes.</p> <p>The goal of QuickPatch streamlining is to generate a QuickPatch package that has fewer new subfeatures and custom actions than a non-streamlined QuickPatch package.</p> <p>For example, if your QuickPatch project includes a new file or registry entry and InstallShield does not use QuickPatch streamlining, InstallShield creates a new subfeature for that file or registry entry. InstallShield also adds one or more prebuilt InstallShield custom actions to work around certain Windows Installer patch requirements. However, if InstallShield does use QuickPatch streamlining, the file or registry entry is added to an existing feature, and no special prebuilt InstallShield custom actions are required.</p> <div>  </div> <p><b>Note</b> ■ InstallShield cannot streamline the creation of a QuickPatch package in the following scenarios:</p> <ul style="list-style-type: none"> <li>• The QuickPatch package removes an installed file.</li> <li>• The QuickPatch package removes or renames a registry key.</li> <li>• The QuickPatch package targets a non-streamlined QuickPatch image. That is, you cannot use QuickPatch streamlining if you select the check box in the History area of the General Information view for a QuickPatch that did not use QuickPatch streamlining. If you try to build a streamlined QuickPatch that targets one or more non-streamlined QuickPatch images, InstallShield displays a build warning, and it does not use streamlining.</li> </ul>

**Table 249** ▪ Build Location Settings (cont.)

Property	Description
<b>Password Protect Launcher</b>	<p>To password-protect your QuickPatch package, select Yes, and then type a password for the Launcher Password setting. When you password-protect your QuickPatch package, any end user who wants to apply your QuickPatch must enter a case-sensitive password to launch your update.</p> <p>This setting is applicable only to QuickPatch packages that use an Update.exe file.</p>
<b>Launcher Password</b>	<p>Type a password to protect your application. You must select Yes for the Password Protect Launcher setting to activate password protection.</p> <p>When you password-protect your patch, any end user who wants to apply your patch must enter a case-sensitive password to launch your update.</p> <p>This setting is applicable only to patches that use an Update.exe file.</p>

## Windows Installer Engine

In this area, you can configure the following settings for the Windows Installer engine:

**Table 250** ▪ Windows Installer Engine Settings

Property	Description
<b>Include Windows Installer 3.1 engine</b>	Specify whether the Windows Installer engine should be included with your patch package.
<b>Engine Location</b>	<p>Select one of the following options:</p> <ul style="list-style-type: none"> <li>● <b>Download Engine From The Web</b>—If the Windows Installer engine needs to be installed, it is downloaded at run time.</li> <li>● <b>Extract Engine From Update.exe</b>—The build streams the Windows Installer engine into the Update.exe file, giving you a single file to distribute to your customers. At run time, the engine is extracted from the Update.exe file and installed if required.</li> <li>● <b>Copy From Source Media</b>—The build copies the Windows Installer engine into the same directory as the Update.exe file.</li> </ul>
<b>Windows Installer 3.1 engine URL</b>	Specify the URL for the location of the engine. This is the location that the Update.exe file uses at run time to download the engine. The default URL location is a live site maintained by Revenera for your convenience.

## Microsoft .NET Framework

In this area, you can configure the following settings for the Microsoft .NET Framework:

**Table 251** ▪ Microsoft .NET Framework Settings

Property	Description
<b>Include In Build</b>	Specify whether to include the Microsoft .NET Framework in your patch.
<b>Engine Location</b>	<p>Select one of the following options:</p> <ul style="list-style-type: none"> <li>● <b>Download Engine From The Web</b>—If the .NET Framework needs to be installed, it is downloaded at run time.</li> <li>● <b>Extract Engine From Update.exe</b>—The build streams the .NET Framework into the Update.exe file, giving you a single file to distribute to your customers. At run time, the engine is extracted from the Update.exe file and installed if required.</li> <li>● <b>Copy From Source Media</b>—The build copies the .NET Framework into the same directory as the Update.exe file.</li> </ul>
<b>Engine URL</b>	Specify the URL for the location of the .NET Framework. This is the location that the Update.exe file uses at run time to download the .NET Framework. The default URL location is a live site maintained by Revenera for your convenience.

## Update Launcher Settings

In this area, you can configure the following settings for the Update.exe launcher:

**Table 252** ▪ Update Launcher Settings for a Patch

Property	Description
<b>Company Name</b>	<p>If you want to override the default company name for Update.exe with your company name, enter your company name.</p> <p>The company name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</p>
<b>Product Name</b>	<p>If you want to override the default product name for Update.exe with your product name, enter your product name.</p> <p>The product name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</p>

**Table 252** ▪ Update Launcher Settings for a Patch (cont.)

Property	Description
<b>Product Version</b>	<p>If you want to override the default product version for Update.exe with your product version, enter your product version.</p> <p>The product version is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</p>
<b>Description</b>	<p>If you want to override the default description for Update.exe with your own description, enter the appropriate description.</p> <p>The description is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</p>
<b>Copyright</b>	<p>If you want to override the default copyright notice for Update.exe with your product's copyright notice, enter your product's copyright notice.</p> <p>The copyright notice is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.</p> <p>To learn more, see <a href="#">Customizing File Properties for the Update Launcher</a>.</p>

**Table 252** ■ Update Launcher Settings for a Patch (cont.)

Property	Description
<b>Required Execution Level</b>	<p>Use the Required Execution Level setting to specify the minimum level that is required by your project's Update.exe file for running on Windows Vista and later platforms. The available options are:</p> <ul style="list-style-type: none"> <li>● <b>Administrator</b>—Update.exe requires administrative privileges to run. Administrators must authorize it; non-administrators must authenticate as an administrator.</li> <li>● <b>Highest Available</b>—Update.exe prefers administrative privileges. Administrators must authorize it; non-administrators run it without administrative privileges.</li> <li>● <b>Invoker</b>—Update.exe does not require administrative privileges, and all users can run it without administrative privileges. Update.exe does not display any UAC messages prompting for credentials or for consent.</li> <li>● <b>Use Previous Setup Manifest</b>—The Update.exe manifest uses the same required execution level that was specified for the previous setup. This is the default option.</li> </ul> <p>For InstallScript MSI projects, and for Basic MSI projects if the Create Update.exe check box is selected, InstallShield embeds an application manifest in the Update.exe launcher. This manifest specifies the selected execution level. Operating systems earlier than Windows Vista ignore the required execution level.</p> <p>If the Create Update.exe check box is cleared for a Basic MSI project, InstallShield does not embed the Windows application manifest in an Update.exe launcher.</p> <p>For more information, see <a href="#">Minimizing the Number of User Account Control Prompts During Installation</a>.</p>
<b>Icon</b>	<p>To use your own icon for the Update.exe file, specify the fully qualified name of the file that contains the icon. To specify a file, type an absolute path or a path that is relative to a path variable, or click the ellipsis button (...) to browse to the file from within the Change Icon dialog box.</p> <p>By default, the icon with index 0 is used; to specify a different icon, either select an icon in the Change Icon dialog box or append the icon's index or resource ID (preceded by a minus sign) to the file name. For example, <b>C:\Temp\MyLibrary.dll,2</b> indicates the icon with an index of 2, and <b>C:\Temp\MyLibrary.dll,-100</b> indicates the icon with a resource ID of 100.</p> <p>If you leave this setting blank, InstallShield uses a default icon for your Update.exe file.</p>

## History

---

**Project** ▪ This information applies to QuickPatch projects.

The History item in the General Information explorer within the General Information view presents a synopsis of your QuickPatch project. It lists all of the associated releases, enabling you to specify which ones should be patched by the current QuickPatch project.

## Custom Action

---

**Project** ▪ This information applies to QuickPatch projects.

The Custom Action item in the General Information explorer within the General Information view lists the custom actions that are defined in the original installation project for which you are creating a patch. It enables you to specify which actions should be executed by the current QuickPatch project.

## Files View

---

**Project** ▪ This information applies to QuickPatch projects.

The Files view enables you to manage the files in your QuickPatch and also see version numbers, languages, and other information about the files in your original installation. All of the files in the Files To Patch and Original Setup Files explorers are listed by key file.

When you click a file in the Original Setup Files explorer, the file name, the destination, the version number, and other pertinent information are displayed in the right pane. You can drag and drop files from this explorer to the Files To Patch explorer, which shows all of the files that will be added, changed, or removed when your QuickPatch is applied to the original installation.

## New File Settings

---

**Project** ▪ This information applies to QuickPatch projects.

When you click a new file in the Files To Patch explorer within the Files view, you can configure the following settings:

## File Settings

**Table 253** ■ Settings in the File Settings Area

Setting	Description
<b>Specify the file that you want to add to the patch setup</b>	If you are modifying a file in the original installation, specify the latest version of the file that you want to be installed on the target system when the patch is applied.
<b>Self-Registering</b>	<p>If the file that you are adding is a self-registering DLL or .ocx file, select this check box.</p>  <p><b>Note</b> ■ This option does not self-register .exe or .tlb files.</p>
<b>Extract COM Information</b>	If the file is a COM server and you want InstallShield to extract COM information from the file when the patch is built, select this check box.

## Integration Settings

Select the file destination and the features that you want to associate with this file.

**Note** ■ This install state binding requires feature association. When you add new data to your QuickPatch project, you must associate it with a feature. New data is installed only if the corresponding feature is installed.

## Modified/Deleted File Settings

**Project** ■ This information applies to QuickPatch projects.

When you click a file that you have added from your original installation to the Files To Patch explorer within the Files view, you can configure the following settings:

Updated File

Table 254 ▪ Settings in the Updated File Area

Setting	Description
Specify the latest version of your file	If you are modifying a file in the original installation, specify the latest version of the file that you want to be installed on the target system when the patch is applied.
Include Whole File	<p>If you want to include the selected file in your patch as a whole file, rather than only the byte-level file differences of the file, you may want to consider selecting this check box. If you do so, InstallShield configures your patch so that Windows Installer ignores any actual version number of the selected file, and instead considers it be version 1.0.0.0 when it is determining whether to update the target system’s file with the version in your QuickPatch package, or to leave the file as is.</p> <p>Selecting this check box for an unversioned file may be helpful to ensure that the file on the target system is always overwritten with the newer equivalent unversioned file in your QuickPatch package. According to Windows Installer file overwrite rules, a file of any version is maintained over an unversioned file. Therefore, if you select this check box, Windows Installer updates the unversioned file with the one in the QuickPatch package because it considers the file in the QuickPatch to be a versioned file.</p> <div></div> <p><b>Important ▪</b> According to Windows Installer file overwrite rules, the file with the highest version is maintained, even if the file already on the target system has a higher version than the one being installed. Therefore, if the file on the target system is a versioned file, you may want to avoid selecting this check box, since in some scenarios it could lead to the file on the target system not being updated. For example, if the file on the target system is version 1.1.0.0, the file in your QuickPatch project is version 2.0.0.0, and you select this check box, the file on the target system is not updated at run time. This occurs because even though the actual version number of the file in the QuickPatch package is newer than the one on the target system, Windows Installer considers the file in the QuickPatch to be 1.0.0.0, which would make it older than the file on the target system.</p>

**Table 254** ▪ Settings in the Updated File Area (cont.)

Setting	Description
<b>Extract COM Information</b>	<p>If the file is a COM server and you want InstallShield to extract COM information from the file when the patch is built, select this check box. This check box is selected by default for patch files that contain COM information in the Class or TypeLib tables in the base .msi package.</p>  <p><b>Note</b> ▪ When you specify an existing file that you want to patch, InstallShield automatically detects if the file is self-registering. If the original file was self-registering, the file in the patch is also set to self-register.</p>

## Original File Information

The Original File Information area provides information about the original file in the original installation.

## Component Information

The Component Information area provides file component information such as the component name and key file.

## Check this box to have the patch delete this file from the setup

Select this check box to remove the file from the target machine when the patch is applied.

## Registry View

**Project** ▪ This information applies to QuickPatch projects.

The Registry view in a QuickPatch project provides a visual representation of what currently exists on a source machine and what you will patch on a destination/target system once your patch project is built and applied to the target system. The Destination computer's Registry view pane and the Destination computer's registry data pane are prepopulated with registry entries in the original installation.

Each item in the Destination computer's registry data pane appears next to an icon specific to the value type and the data's current condition. Icons for data values that have been modified have a turquoise pencil. Icons for new data values have a red star in the upper-right corner. Icons for registry values that will be deleted from the target system have a red X. See the following sample icons and descriptions below.

**Table 255** ■ Icons in the Registry View of a QuickPatch Project

Icon	Description
	This icon represents a new DWORD value that will be added to the target system when the QuickPatch is applied.
	This icon represents a modified DWORD value that will be updated on the target system when the QuickPatch is applied.
	This icon represents an existing DWORD value on the target system from an earlier installation.
	This icon represents a DWORD value that exists on the target system but will be deleted when the QuickPatch project is applied.

# InstallShield Prerequisite Editor Reference

**Project** ■ The following project types include support for InstallShield prerequisites:

- Basic MSI
- InstallScript
- InstallScript MSI

All of these project types include support for the setup prerequisite type of InstallShield prerequisite. Basic MSI projects include support for the feature prerequisite type.

InstallShield also includes support for including InstallShield prerequisites as packages in Advanced UI and Suite/Advanced UI projects. For more information, see [Including InstallShield Prerequisites \(.prq\) in an Advanced UI or Suite/Advanced UI Project](#).

An InstallShield prerequisite is an installation for a product or technology framework that is required by your product. Some examples of InstallShield prerequisites that are included with InstallShield are Java Runtime Environment (JRE) and SQL Server Express Edition. You can add any of the existing InstallShield prerequisites to your installation projects and configure many of their settings. You can also create your own InstallShield prerequisites, and add them to your projects.

**Task** ■ **To open the InstallShield Prerequisite Editor:**

On the **Tools** menu, click **Prerequisite Editor**.

**Task** ■ **To open an existing prerequisite in the InstallShield Prerequisite Editor, do one of the following:**

1. On the **File** menu, click **Open**. The **Open** dialog box opens.
2. Select the file by browsing and click **Open**.

The following tabs are associated with the InstallShield Prerequisite Editor:

- [Properties](#)
- [Windows Package Manager](#)
- [Conditions](#)
- [Files to Include](#)
- [Application to Run](#)
- [Behavior](#)
- [Dependencies](#)

## Properties Tab

The Properties tab of the InstallShield Prerequisite Editor is where you specify general information about an InstallShield prerequisite.

**Table 1** • Settings on the Properties Tab

Setting	Description
<b>Unique identifier for InstallShield prerequisite</b>	<p>Type a unique file identifier for the InstallShield prerequisite or leave the default value as is. This could be the name of the prerequisite application or component, or a GUID.</p>  <p><b>Note</b> ▪ Every time you open the InstallShield Prerequisite Editor to create a new InstallShield prerequisite, a new GUID is generated and listed in this box.</p>
<b>Alternate location to download .prq from if prerequisite files are being downloaded</b>	<p>If appropriate, type the alternate URL for your .prq file. For example:</p> <p><code>http://www.mywebsite.com/MyPrq.prq</code></p> <p>For more information, see <a href="#">Specifying an Alternate URL for a .prq File</a>.</p>  <p><b>Note</b> ▪ InstallShield prerequisites do not have support for FTP URLs.</p>
<b>Description</b>	<p>Type an overview of the prerequisite. This description is displayed under the Overview heading when you select a prerequisite in the Redistributables view.</p>

## Windows Package Manager Tab

The Windows Package Manager tab of the InstallShield Prerequisite Editor lets you specify the Windows Package Manager (WPM) package you want to install as a prerequisite to your product.

Windows Package Manager is a system or set of tools used to automate installing, upgrading, configuring, and using software from a Microsoft public repository. Windows Package Manager client winget tool search the package in the repository and install the package based on the package manifest information.

**Note** ▪ Windows Package Manager prerequisites are not supported to import in Advanced UI and Suite/Advanced UI projects.

WPM prerequisites runtime are supported on Windows 10 and later workstations. In other operating systems, the WPM prerequisites are skipped during runtime.

**Table 2** ▪ Settings on the Windows Package Manager Tab

Setting	Description
<b>Install from Windows Package Manager</b>	<p>Select this if the prerequisite you want to install from the Windows Package Manager. On selecting this check box, all other tabs other than Windows Package Manager and Behavior tabs are disabled and those all are not applicable to Windows Package Manager prerequisite. And the reboot settings under the Behavior tab also disabled.</p>  <p><b>Note ▪ Note:</b> Windows Package Manager prerequisites that require administrative privileges may require to configure the Administrative privilege setting under the Behavior tab.</p>
<b>Package Id</b>	You can get the Package Id either by searching the package manifest in the Microsoft repository or by executing the Windows Package Manager client winget with the <b>search</b> or <b>show</b> options.
<b>Version</b>	<p>Specify the version of the package you want to install from the Windows Package Manager. Either the latest version or the specific version.</p> <p>By default, Windows Package Manager client winget install the latest package available in the repository. If multiple versions are available in the WPM repository, you want to install the specific version then you can specify the exact version which is available in the Windows Package Manager repository.</p>

During the WPM package installation, InstallShield checks whether the WPM client winget tool is available in the target machine. If the winget client tool is not available, InstallShield installs the Windows Package Manager prerequisite in the target machine. So, during the build, InstallShield bundle the Windows Package Manager.prq based on the setting in the Settings.xml. You may have to download the Windows Package Manager.prq files from the **Redistributable** view, by selecting the context menu option **Download Selected Item...** for the Windows Package Manager.prq, else the build may fail if you have chosen the Prerequisite Location to **Copy From Source Media** or **Extract From Setup.exe**.

Find the Settings.xml file that is installed with InstallShield. Settings.xml is installed in one of the following locations, depending on which language version of InstallShield you are using:

- **English**—InstallShield Program Files Folder\Support\0409
- **Japanese**—InstallShield Program Files Folder\Support\0411

Search for the <WPMRedistributable> element and its child element. By default, it look like this:

```
<WPMRedistributable Name="Windows Package Manager.prq" />
```

If the <WPMRedistributable Name=""> is empty, then InstallShield will not bundle the Windows Package Manager.prq during the build and wont install during the runtime. But ensure to have the WPM client winget tool available in the target machine, else the installation of WPM package will be skipped during runtime.

InstallShield frequently updates the **Windows Package Manager** prerequisite with the latest WPM winget client tool in the InstallShield server. Prefer to use the **Build Location** to **Download From The Web** so that the latest WPM winget client tool will be updated in the target machine during the runtime.

## Conditions Tab

The Conditions tab of the InstallShield Prerequisite Editor lets you define installation conditions that determine whether an InstallShield prerequisite already is installed on the target machine. Failure to do so causes problems because the target system behaves as if the InstallShield prerequisite was not properly installed. You can also create installation conditions that specify operating system, registry, or file requirements.

If a condition evaluates as true at run time, that condition is met. The InstallShield prerequisite is installed on the target machine if the following are true:

- The target machine meets any of the operating system conditions and all of the other conditions that are listed on the Conditions tab.
- For feature prerequisites only (that is, an InstallShield prerequisite that is associated with one or more features in the main installation)—The feature that contains the feature prerequisite must be installed. Thus, if the feature has a condition that is not met on the target system, or if the end user chooses not to install the feature, the feature is not installed. As a result, none of its associated feature prerequisites are installed, unless the feature prerequisites are also associated with other features that are installed.

---

**Note** ▪ Because installation of prerequisites such as Windows service packs is not supported, the operating system version information is not expected to change. Therefore, the operating system conditions are not considered in verifying whether a prerequisite was installed correctly.

When you click the Add button on this tab, the **Prerequisite Condition dialog box** opens. This dialog box also opens when you select an existing condition on the Conditions tab and then click the Modify button.

## Files to Include Tab

When you are creating a new InstallShield prerequisite, you must specify the installation files that should be included with the InstallShield prerequisite. You can also modify the list of files for an existing InstallShield prerequisite. The Files to Include tab of the InstallShield Prerequisite Editor is where you specify the files.

When you click the Add button or the Add Multiple Files button on this tab to specify an InstallShield prerequisite file or the Modify button to change the file, the New File dialog box opens.

When you click the **Set File(s) URL** button, the **Set File(s) URL** dialog box opens.

---

**Note** ▪ InstallShield prerequisites do not have support for FTP URLs.

# Application to Run Tab

The Application to Run tab of the InstallShield Prerequisite Editor is where you specify how an InstallShield prerequisite should be installed on the target machine.

**Table 3** • Settings on the Application to Run Tab

Setting	Description
<b>Specify the application you wish to launch</b>	<p>Select the file—typically a Setup.exe setup launcher or an .msi package or an App package (msix, msixbundle, appx, or appxbundle)—that should be launched on the target machine if the InstallShield prerequisite is installed. Only files that have been specified on the Files to Include tab are included in this list</p>  <p><b>Project</b> • If you specify an .msi file and you indicate on the <a href="#">Behavior tab</a> that the progress should be shown, the Setup.exe setup launcher captures progress messages and uses Windows Installer APIs instead of MsiExec.exe to launch the .msi package at run time.</p> <p>If you specify any other file type, or if you specify an .msi file for which progress should not be shown, the Setup.exe setup launcher runs the file with either the open verb (for .msi and .exe files) or the default verb (for all other file types) at run time.</p>  <p><b>Note</b> • On selecting App package (msix, msixbundle, appx, or appxbundle) from the drop-down box, two more conditions will be added under the Condition tab based on the App package content. One condition to detect the App package based on the App package identity and publisher details, another one condition to check the Windows operating system version and build number.</p> <p>For App package, remaining configurations under the <b>Application to Run</b> tab are not applicable.</p>
<b>Requires Windows Installer engine and/or .NET Framework to be installed first</b>	<p>If the Windows Installer engine, the .NET Framework (Dotnetfx.exe), or both must be installed before this InstallShield prerequisite is installed, select this check box.</p>  <p><b>Note</b> • Selecting this check box does not add the Windows Installer engine or the .NET Framework to your installation. It only specifies that if they are included in the installation, they should be installed before this InstallShield prerequisite is installed. To include the Windows Installer engine or the .NET Framework with your installation, you must add them to your project. To learn how, see <a href="#">Adding Windows Installer Redistributables to Projects</a> or <a href="#">Adding .NET Framework Redistributables to Projects</a>.</p>

**Table 3** • Settings on the Application to Run Tab (cont.)

Setting	Description
<b>Specify the command line for the application</b>	<p>If applicable, type the command line for the file selected in the <b>Specify the application you wish to launch</b> list. Do not include the name of the file in this box.</p> <p>For information on command-line parameters that you can specify, see <a href="#">Specifying Command-Line Parameters for an InstallShield Prerequisite</a>.</p>  <p><b>Note</b> ▪ If a setup prerequisite is configured to be hidden (that is, it is not included in the setup prerequisite run-time dialog as one of the prerequisites that need to be installed), it is launched with its silent command-line parameters—not its standard command-line parameters. Therefore, if it is possible that the <b>The prerequisite should be hidden from the installation list</b> check box on the Behavior tab will be selected, specify command-line parameters in the <b>Specify the command line for the application when the setup is running in silent mode</b> box.</p>
<b>Specify the command line for the application when the setup is running in silent mode</b>	<p>If applicable, type the appropriate command line. Do not include the name of the file in this box.</p> <p>For information on command-line parameters that you can specify, see <a href="#">Specifying Command-Line Parameters for an InstallShield Prerequisite</a>.</p>  <p><b>Note</b> ▪ Using the /s command-line parameter to launch an installation that includes an InstallShield prerequisite does not automatically run the prerequisite installation silently. You may also need to specify a valid silent command-line parameter for the InstallShield prerequisite in this <b>Specify the command line for the application when the setup is running in silent mode</b> setting on the Application to Run tab.</p>
<b>Specify the return code (in decimal) the application returns if a reboot is required</b>	<p>If the selected InstallShield prerequisite application requires that the target machine be restarted after the application is installed, type the return code in this box.</p>  <p><b>Tip</b> ▪ If multiple return codes exist, list each one separated by a comma.</p> <p>If you do not know the return codes for the file that you are launching as the InstallShield prerequisite, contact the author of the file.</p> <p>For more information on InstallShield prerequisites that require a restart, see <a href="#">Restarting a Target Machine for InstallShield Prerequisite Installations</a>.</p>

# Behavior Tab

The Behavior tab of the InstallShield Prerequisite Editor is where you specify what should occur in certain scenarios.

**Table 4** • Settings on the Behavior Tab

Setting	Description
<b>The prerequisite requires administrative privileges</b>	<p>Select this check box if administrative privileges are required to install the InstallShield prerequisite or if the InstallShield prerequisite must be installed per machine. This check box is selected by default.</p>  <p><b>Note</b> • InstallShield prerequisites that require administrative privileges may require that end users provide credentials or consent before installation can occur on Windows Vista and later systems. For more information, see <a href="#">Minimizing the Number of User Account Control Prompts During Installation</a>.</p>
<b>The prerequisite may be optionally skipped by the user</b>	<p>If the installation should display a message box that enables end users to choose whether to install the InstallShield prerequisite, select this check box.</p> <p>If end users should not be able to choose whether to install the InstallShield prerequisite, clear this check box.</p>
<b>The prerequisite should be hidden from the installation list</b>	<p>If a target system needs one or more setup prerequisites to be installed, the setup prerequisite dialog is displayed at run time before the main installation runs. When an end user clicks the Install button on this dialog, the setup prerequisites are installed.</p> <p>If you want to include the current setup prerequisite in the list of setup prerequisites that are displayed in that dialog, clear this check box.</p> <p>If you do not want to include the current setup prerequisite in the list, select this check box. The setup prerequisite is hidden from the list of setup prerequisites, but it is still installed on the target system if needed.</p>  <p><b>Note</b> • Feature prerequisites are never listed in the setup prerequisite dialog at run time, regardless of whether the <b>The prerequisite should be hidden from the installation list</b> check box is selected or cleared. That is, if you add an InstallShield prerequisite to your project and associate it with a feature, that feature prerequisite is not listed in the setup prerequisite dialog that is displayed at run time before the main installation runs.</p> <p>Note that if a setup prerequisite or a feature prerequisite is marked as hidden, it is launched with its silent command-line parameters—not its standard command-line parameters. To learn more, see <a href="#">Specifying Command-Line Parameters for an InstallShield Prerequisite</a>.</p>

**Table 4** ■ Settings on the Behavior Tab (cont.)

Setting	Description
<b>Progress should be shown in the prerequisites window (raw MSI file only)</b>	<p>If you want the progress of the installation for the current InstallShield prerequisite to be displayed at run time, select this check box. The progress can be shown only if the InstallShield prerequisite installation is an .msi file; it cannot be shown if the file that the InstallShield prerequisite installation launches is a Setup.exe file. In addition, the installation that contains the prerequisite must be a Basic MSI or InstallScript MSI installation.</p> <p>If your InstallShield prerequisite installation is a Setup.exe file, this setting is ignored. In addition if the installation that contains the InstallShield prerequisite is an InstallScript installation, this setting is ignored.</p> <div data-bbox="651 667 688 711" data-label="Image"></div> <p><b>Note</b> ■ If you select this check box so that progress can be shown, only some command-line parameters are supported. Command-line parameters are specified on the Application to Run tab of the InstallShield Prerequisite Editor. For more information, see <a href="#">Specifying Command-Line Parameters for an InstallShield Prerequisite</a>.</p> <p>Also note that if you specify that the progress should be shown for a prerequisite that is an .msi package, the user interface of the prerequisite's .msi package is not displayed by default. If you want to override this behavior, you can specify /qf as a command-line parameter on the Application to Run tab.</p>

**Table 4** • Settings on the Behavior Tab (cont.)

Setting	Description
<b>If, after installing the prerequisite, the conditions still indicate it is required</b>	<p>If the conditions still indicate that the InstallShield prerequisite needs to be installed after the InstallShield prerequisite installation has been run, either of the following may be true:</p> <ul style="list-style-type: none"> <li>• The InstallShield prerequisite was not successfully installed.</li> <li>• The conditions that were specified for the InstallShield prerequisite were not accurate.</li> </ul> <p>For example, a condition may indicate that the InstallShield prerequisite needs to be installed if a particular file does not exist on the target machine. If the file is still missing even after the InstallShield prerequisite is installed, it is possible that the condition should not have been created.</p> <p>Specify the behavior that should occur if the conditions still indicate that the InstallShield prerequisite needs to be installed. The available options are:</p> <ul style="list-style-type: none"> <li>• <b>Abort the setup</b>—If your application should not be installed, select this option.</li> <li>• <b>Ask whether to continue the setup</b>—If the installation should display a message box that prompts the end user to specify whether the main installation should continue, select this option.</li> <li>• <b>Continue the setup</b>—If the installation should essentially ignore the InstallShield prerequisite's unmet condition and proceed to the next InstallShield prerequisite installation (if one is required) or the main installation, select this option.</li> </ul>

**Table 4** • Settings on the Behavior Tab (cont.)

Setting	Description
<b>If the prerequisite requires a reboot</b>	<p>Installing an InstallShield prerequisite may require that the target machine be restarted, as described in <a href="#">Restarting a Target Machine for InstallShield Prerequisite Installations</a>.</p> <p>Specify the behavior that should occur if the InstallShield prerequisite requires that a target machine be restarted.</p> <ul style="list-style-type: none"> <li>● <b>Exit and resume on reboot</b>—To end the InstallShield prerequisite installation, allow the InstallShield prerequisite to restart the target machine, and then continue the installation, select this option.</li> <li>● <b>Note it, fail to resume if the machine is rebooted, and reboot after the installation</b>—To note that the target machine should be restarted if it is required, to schedule the restart for the end of the main installation, but to exit if the target machine restarts after the InstallShield prerequisite installation, select this option. Thus, if it appears that a restart is required but you want to postpone it until the end of the main installation (or until a subsequent InstallShield prerequisite triggers a restart), select this option.</li> </ul> <p>At run time, the value of the Windows Installer property ISSCHEDULEREBOOT is set to 1 in the main installation when a restart is still pending.</p> <ul style="list-style-type: none"> <li>● <b>Ignore it, and fail to resume if machine is rebooted</b>—To continue the installation but end it if the target machine is restarted, select this option. Thus, if it appears that a restart is required but you want to try to skip it, select this option.</li> <li>● <b>Prompt the user only if no reboot is detected, but always reboot the machine and resume on reboot</b>—To prompt the end user to restart the target machine only if it appears that the target machine does not need to be restarted, select this option. The target machine is restarted if the end user agrees to allow it, and then the installation continues.</li> <li>● <b>Prompt the user to reboot the machine even if nothing is detected, and resume on reboot</b>—To prompt the end user to restart the target machine even if it appears that the target machine does not need to be restarted, select this option. The target machine is restarted if the end user agrees to allow it, and then the installation continues.</li> <li>● <b>Reboot the machine and resume on reboot</b>—To restart the target machine and then continue the installation, select this option.</li> </ul>

## Dependencies Tab

When you are creating a new InstallShield prerequisite or modifying an existing one, you can specify other InstallShield prerequisites (.prq files) on which this InstallShield prerequisite depends. The Dependencies tab of the InstallShield Prerequisite Editor is where you specify the dependencies.

When you click the Add button on this tab to add a dependency, the New Dependency dialog box opens.

# Errors and Warnings

The following topics in the InstallShield Help Library provide information about errors and warnings that might occur when you are working with your installation.

**Table 1** ■ List of Error and Warning Topics

Topic	Description
<b>Build Errors and Warnings</b>	Lists errors and warnings that might occur during the build process.
<b>Media Build Errors and Warnings</b>	Lists InstallScript compiler errors and warnings.
<b>MSI/MSM Conversion Errors</b>	Lists errors that might occur when you use the Open MSI/MSM Wizard to convert an installation package (.msi file) or merge module (.msm file) to an InstallShield project (.ism file).
<b>Windows Installer Run-time Errors</b>	Lists Windows Installer errors that might occur during run time. The errors are related to the built-in InstallShield custom actions that are added automatically to InstallShield projects to support some types of functionality.
<b>Setup.exe Return Values and Run-Time Errors (InstallScript Projects)</b>	Lists the errors that might occur when Setup.exe runs for InstallScript installations.
<b>Setup.exe Return Values and Run-Time Errors (Basic MSI and InstallScript MSI Projects)</b>	Lists the errors that might occur when Setup.exe runs for Basic MSI and InstallScript MSI installations.
<b>Setup.exe Return Values and Run-Time Errors (Advanced UI and Suite/Advanced UI Projects)</b>	Lists return codes, errors, and logged status codes that might occur when an Advanced UI or Suite/Advanced UI Setup.exe installation is run.
<b>Visual Studio Project Import Errors and Warnings</b>	<p>Lists the errors and warnings that might occur when you do any of the following:</p> <ul style="list-style-type: none"> <li>● Convert a Visual Studio setup project (.vdproj) to an InstallShield Basic MSI project (.ism).</li> <li>● Convert a Visual Studio merge module project (.vdproj) to an InstallShield Merge Module project (.ism).</li> <li>● Import a Visual Studio setup or merge module project (.vdproj) into an InstallShield Basic MSI or Merge Module project (.ism).</li> </ul>
<b>Upgrade Errors (Upgrading from InstallShield Professional)</b>	Lists errors that might occur when you upgrade a project created with InstallShield Professional.
<b>Upgrade Warnings (Upgrading from InstallShield Professional)</b>	Lists warnings that might occur when you upgrade a project created with InstallShield Professional.

**Table 1** ▪ List of Error and Warning Topics (cont.)

Topic	Description
<b>Upgrade Errors and Warnings (Upgrading from InstallShield—Windows Installer Edition)</b>	Lists errors and warnings that might occur when you upgrade a project (.ism file) created with a version of InstallShield—Windows Installer Edition.
<b>HRESULT Values for Windows Installer Run-time Errors</b>	Provides descriptions for InstallShield custom HRESULT codes provided with Windows Installer errors 1904 and 1905.
<b>DIFxAPI Errors (InstallScript Projects)</b>	Describes each of the DIFxAPI errors that can be returned when DIFx driver functions are called.
<b>"String PRODUCT_NAME was not found in string table" Error</b>	Provides description of when this error can occur and what steps you should take to correct it.
<b>InstallScript Error Information</b>	Provides descriptions for InstallScript errors and warnings.
<b>Virtualization Conversion Errors and Warnings</b>	Lists errors and warnings that might occur during the build process when you are creating a virtual application.

In-depth articles about errors and warnings are available in the [Knowledge Base](#).

## Build Errors and Warnings

The following table contains a listing of errors and warnings that may occur during the build process.

**Note** ▪ You can find detailed information—including resolution information—on most InstallShield build errors and warnings in the [Knowledge Base](#).

For troubleshooting information about errors and warnings that may occur when you are building a virtual application, see [Virtualization Conversion Errors and Warnings](#).

**Table 2** ▪ Build Errors and Warnings

Error or Warning Number	Message	Troubleshooting Information
<b>-1031</b>	Cannot use 64-bit signing on a 32-bit operating system.	Use 64-bit operating system for 64-bit signing.
<b>-32000</b>	Build canceled by the user.	This error occurs only when the build is terminated during the build process.
<b>9571</b>	Required to set the Wide Tile Image for the Visual Asset: '%1'.	Required to specify the Wide Tile Image if Large Tile Image is specified in the Visual Asset in order to install the package.

**Table 2** • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>9570</b>	Required to select at least one supported task type for the Background Tasks declaration.	Background Tasks declaration required to select at least one supported task, add Supported Task in the Background Tasks declaration from the Declaration view.
<b>9569</b>	Required at least one supported File type or Data format. Select 'Supports any File type' or explicitly add one or more File types or Data formats in Share Target Declaration.	Share Target Declaration required to specify at least one supported File type or Data. Select 'Supports any File type' or explicitly add one or more File types or Data formats in Share Target Declaration.
<b>9568</b>	Managed URL '%1' specified is a duplicate of the base URL specified for the Web Account Provider Declaration.	One of the Managed URL is a duplicate with the base URL specified for the Web Account Provider Declaration, required to specify unique Managed URL in the Web Account Provider Declaration.
<b>9567</b>	Start page '%1' must not be specified if 'Entry point', 'Executable' or 'Runtime type' is specified in Appointments Provider Declaration.	'Entry point', 'Executable' or 'Runtime type' cannot be specified if the 'Start page' is specified in the Appointments Provider Declaration Launch Action. Required to specify either 'Entry point' or 'Start page' entries in the Launch Action.
<b>9566</b>	The Executable '%1' defined for declaration element does not exist in the package.	Custom executable specified for the declaration is not found in the package, required to redefine with the correct executable or add the executable to the package.
<b>9565</b>	The target executable 'Application Name' requires elevation when launching. The Desktop Bridge does not support packaged executables that require administrator/elevated privileges.	<p>If your application specifies</p> <pre>UIAccess=true or level="highestAvailable requireAdministrator"</pre> <p>in the requestedExecutionLevel element of the UAC manifest, conversion to UWP isn't supported currently.</p> <p>Setting the below capability flag in the package manifest will allow your application to request for elevation.</p> <pre>&lt;rescap:Capability Name="allowElevation"/&gt;</pre> <p>In order to set this flag, go to the 'ISVirtualPackage' table in the InstallShield 'Direct Editor' view and create the below entry.</p> <p>Use space as delimiter to specify multiple capabilities.</p> <ul style="list-style-type: none"> <li>● <b>Name:</b> AppxCapabilityList</li> <li>● <b>Value:</b> rescap:allowElevation</li> </ul>

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>9564</b>	The module [COM Module Name] contains COM data. This COM server will not be activatable outside of this AppX package.	Specified COM server will not be activatable outside of this AppX package as all its registry entries and extension points are in its private hive and not exposed publicly to the system. If your application uses COM only for its own personal use, then you can ignore this warning and rely on COM entries in the application's private hive (Registry.dat) to support your app. All binaries in the same appx\msix package have access to that registry, but any other apps on the system cannot see into your app's private hive.
<b>9563</b>	Could not merge registry data from dependency [Dependency Package Name]	Error while merging registry data as extracting registry.dat file from the specified dependency package failed.
<b>9562</b>	Could not merge files from dependency [Dependency Package Name]	Error while merging the dependency package to building MSIX/Appx package.  Check whether the dependency package specified exists in the source location as well as the packages are valid.
<b>9561</b>	The NT Service [Service Name] is set to start in an unsupported way	The added service doesn't have valid start type. The valid start types would be MANUAL/AUTO start. Hence defaulting it to AUTO start type.  Check the service you added.  Any service should have the proper properties like path, startup account, Type, Error control, Start Type etc.
<b>9560</b>	The NT service [Service Name] uses an unsupported startup user action error control option (SERVICE_ERROR_CRITICAL)	The added service doesn't have proper error control which can be either NORMAL or IGNORE type.  Check the service you added.  Any service should have the proper properties like path, startup account, Type, Error control, Start Type etc.
<b>9559</b>	The NT service [Service Name] uses an unsupported startup account [Account], skipping this service since no appropriate default account is available	The added service doesn't have a startup account which may come as any one: <ul style="list-style-type: none"> <li>• LocalSystem</li> <li>• NetworkService</li> <li>• LocalService</li> </ul> Check the service you added.  Any service should have the proper properties like path, startup account, Type, Error control, Start Type etc.

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>9558</b>	This MSI includes [Count of service] NT services. However, the built UWP app package will not include them as the package does not include the Server target	<p>The MSI has NT services enabled, but the UWP app package doesn't server target support enabled.</p> <p>It can be solved by enabling the Server Extensions and further update to its version details in</p> <p>Releases-&gt;Release-Name-&gt;APPX/MSIX-&gt;Include Server Extension</p>
<b>9557</b>	Unable to create resources.pri. Without resources.pri, scaled logos will not be used.	Check whether Windows 10 SDK is installed in the system, if not, install Window 10 SDK.
<b>9556</b>	Unable to locate the Windows 10 SDK. Some functionality may be unavailable.	Check whether Windows 10 SDK is installed in the system, if not, install Window 10 SDK.
<b>9554</b>	The protocol handler [Name] does not contain any 'open' verbs.	This is a warning message.
<b>9553</b>	The file type association for extension [extension] does not contain any 'open' verbs but does contain other verbs	Add and 'open' verb in the files association.
<b>9552</b>	Unexpected error writing Msix App file entries	<p>Error while adding payload file/folder to the Msix package.</p> <p>Check whether the source files are exist in the system during the build.</p>
<b>9551</b>	Unexpected error initializing .msix writer	Error while initializing the Msix Package writer, such as while creating the folder for the Msix package in the output location or the processor architecture information is missing for the application package.

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>9513</b>	Schema validation error in [File Name]([Line number])	<p>Error while validating the MSIX/Appx manifest xml against the schema files.</p> <p>Refer <a href="https://docs.microsoft.com/en-us/uwp/schemas/">https://docs.microsoft.com/en-us/uwp/schemas/</a> to compose the manifest entries, like what all are mandatory and supported values.</p> <p>Required to correct the values in the corresponding views in the MSIX project.</p> <p>For example, recheck the values specified for declaration added and see whether the values are as per the schema or not.</p>
<b>9512</b>	Unable to add file [File Name] to package	Error while adding the specified file to the msix package. Make sure the specified file exists on the system and there is enough disk space is available.
<b>9510</b>	Warning building Windows Installer package	This error occurs if a latest image in the Patch Design view does not have at least one previous image. A latest image must have at least one previous image to create a patch.
<b>-7355</b>	The %4 value for string %2 does not meet validation criteria for table %1 column %3.	This warning occurs if a localized string value does not meet validation criteria for a column in the String Editor table. To resolve this warning, update the flagged value in the String Editor.
<b>-7354</b>	The %4 value for string %2 does not contain a legitimate value for table %1 column %3.	This error occurs if a localized string value does not contain a legitimate value in the named column of the String Editor table. To resolve this error, update the flagged value in the String Editor.
<b>-7350</b>	An error occurred building the ISWSEWrap table. The File %1 could not be found.	This error occurs if your project includes a WiseScript custom action but the executable file that is specified for it in the Custom Actions and Sequences view could not be found. To resolve this error, modify the path in the WiseScript Executable setting for this custom action.
<b>-7348</b>	Error 0x%08x saving file %s	In this error message, %s refers to the path and file name of a file that needs to be saved at build time for an Advanced UI or Suite/Advanced UI project. To resolve this error, ensure that the file is available and is not read-only or locked.

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7347</b>	InstallShield does not support signing with .spc and .pvk files. Replace the digital certificate information in your project with a .pfx certificate, or with a reference to a certificate in a certificate store.	<p>This error occurs if you added .spc and .pvk files to your project in an earlier version of InstallShield that included support for digitally signing with those files, and then you open your project in InstallShield 2021 and attempt to build a release or a patch.</p> <p>To resolve this error, remove the .spc reference from the release or patch configuration. You can replace it with a .pfx certificate, or with a reference to a certificate in a certificate store. To learn more, see:</p> <ul style="list-style-type: none"> <li>● <a href="#">Digital Signing and Security</a></li> <li>● <a href="#">Digitally Signing a Release and Its Files at Build Time</a></li> <li>● <a href="#">Signing a Patch Package</a></li> <li>● <a href="#">Signing a QuickPatch Package</a></li> </ul>
<b>-7346</b>	The files in this release are being signed with a SHA-1 certificate. Windows will not trust files that were signed with SHA-1 certificates if they were signed after January 1, 2016.	<p>This warning occurs if your project is configured to use a SHA-1 certificate to digitally sign your release at build time.</p> <p>SHA-256 is favored over SHA-1, which is being deprecated because of the potential for security vulnerabilities. Thus, it is recommended that you replace any SHA-1 certificates in your InstallShield projects with SHA-256 certificates.</p> <p>In InstallShield, to replace a SHA-1 certificate with a SHA-256 certificate for signing your releases, use the Signing tab in the Releases view to replace the reference to the current certificate with one for a SHA-256 certificate.</p> <p>To learn more, see <a href="#">Digital Signing and Security</a>.</p>
<b>-7337</b>	Feature %1 has no associated packages.	<p>If you build a release for a Suite/Advanced UI project or an Advanced UI project, and the project contains a feature that does not contain any packages, this build warning is displayed.</p> <p>To resolve this build warning, ensure that at least one package is associated with the feature. To learn more, see <a href="#">Associating a Package in an Advanced UI or Suite/Advanced UI Project with a Feature</a>.</p> <p>If you intentionally are not including a package with the feature that is identified in the build warning, you can ignore this build warning.</p>

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7336</b>	Advanced UI projects do not have support for Events.	<p>If you use the InstallShield to open a Suite/Advanced UI project that includes one or more actions in the Events view, InstallShield opens the project as an Advanced UI project, and it displays this build error at build time. Advanced UI projects do not have support for events.</p> <p>To resolve this build error, remove the actions from your project, or use the Premier edition of InstallShield to edit the project and build releases.</p> <p>To learn more, see <a href="#">Using Actions to Extend the Behavior of a Suite/Advanced UI Installation</a>.</p>
<b>-7335</b>	The project contains a reference to undefined Action '%1'.	<p>If you add an action to your Suite/Advanced UI project, associate the action with a package in your project, and then delete part of the action from your project by editing the .issuite project file in a text editor, this error occurs at build time.</p> <p>To resolve this error, remove the action that is referenced in the build error from your .issuite file.</p>
<b>-7334</b>	The package '%1' includes references to Windows features, which are not supported in this edition of InstallShield. These references will not be included in the build.	<p>If you use the InstallShield to open a Suite/Advanced UI project that includes support for enabling one or more Windows roles or features, InstallShield opens the project as an Advanced UI project, and it displays this build error at build time. Advanced UI projects do not have support for enabling Windows roles or features.</p> <p>To resolve this build error, remove the support for Windows roles and features from your project, or use the Premier edition of InstallShield to edit the project and build releases.</p> <p>To learn more, see <a href="#">Enabling Windows Roles and Features During a Suite/Advanced UI Installation</a>.</p>

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7329</b>	Including IA64 %1 %2 in an x64 package.	<p>This build warning occurs if the following conditions are true:</p> <ul style="list-style-type: none"> <li>• x64 is specified for the Template Summary setting.</li> <li>• The project includes an Itanium 64-bit file that the installation may transfer to target systems at run time.</li> </ul> <p>An x64 target system cannot run an Itanium 64-bit file.</p> <p>Depending on your requirements, you may want to replace the IA64 file with an x64 file. In other scenarios, you may want to ignore this build warning. For example, if the file's component has a condition that prevents the component from being installed on x64 systems, you may want to ignore this build warning.</p>
<b>-7328</b>	Including x64 %1 %2 in an IA64 package.	<p>This build warning occurs if the following conditions are true:</p> <ul style="list-style-type: none"> <li>• IA64 is specified for the Template Summary setting.</li> <li>• The project includes an x64 file that the installation may transfer to target systems at run time.</li> </ul> <p>An Itanium 64-bit target system cannot run an x64 file.</p> <p>Depending on your requirements, you may want to replace the x64 file with an IA64 file. In other scenarios, you may want to ignore this build warning. For example, if the file's component has a condition that prevents the component from being installed on IA64 systems, you may want to ignore this build warning.</p>

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7327</b>	Including 64-bit %1 %2 in a strict 32-bit package.	<p>This build warning occurs if the following conditions are true:</p> <ul style="list-style-type: none"> <li>• Intel is specified for the Template Summary setting.</li> <li>• Strict is selected for the Platform Validation setting.</li> <li>• The project includes an x64 file that the installation may transfer to target systems at run time.</li> </ul> <p>An x86 target system cannot run an x64 file.</p> <p>Depending on your requirements, you may want to replace the x64 file with an x86 file. In other scenarios, you may want to ignore this build warning. For example, if the file's component has a condition that prevents the component from being installed on x86 systems, you may want to ignore this build warning.</p> <p>For more information, see <a href="#">Selecting the Appropriate Type of Architecture Validation for Builds</a>.</p>
<b>-7326</b>	Including 32-bit %1 %2 in a strict 64-bit package.	<p>This build warning occurs if the following conditions are true:</p> <ul style="list-style-type: none"> <li>• An x64 architecture is specified for the Template Summary setting.</li> <li>• Strict is selected for the Platform Validation setting.</li> <li>• The project includes an x86 file that the installation may transfer to target systems at run time.</li> </ul> <p>In many cases, an x64 target system can run an x86 file. However, if the x64 system does not have 32-bit Windows-on-Windows (WOW64) support, it may not be able to run an x86 file.</p> <p>Depending on your requirements, you may want to replace the x86 file with an x64 file. In other scenarios, you may want to ignore this build warning. For example, if the file's component has a condition that prevents the component from being installed on x64 systems, you may want to ignore this build warning.</p> <p>For more information, see <a href="#">Selecting the Appropriate Type of Architecture Validation for Builds</a>.</p>

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7325</b>	An unexpected error occurred validating the architecture for file %1.	<p>This build error occurs if InstallShield cannot determine whether a file in the project is 32 bit or 64 bit when performing architecture validation.</p> <p>For more information, see <a href="#">Selecting the Appropriate Type of Architecture Validation for Builds</a>.</p>
<b>-7324</b>	%1 Custom Action %2 cannot call a function in native code %3.	<p>This build error occurs if your project contains a managed-code custom action for a standard DLL file. To resolve this error, replace the custom action with a standard DLL custom action that calls a function in the DLL file. Otherwise, replace the DLL file with a .NET assembly that was written in managed code such as Visual Basic .NET or C#.</p> <p>For more information, see <a href="#">Calling a Public Method in a Managed Assembly</a>.</p>
<b>-7323</b>	%1 Custom Action %2 cannot call a function in managed code %3.	<p>This build error occurs if your project contains a standard DLL custom action for a .NET assembly file. To resolve this error, replace the custom action with a managed-code custom action that calls a public method in the .NET assembly. Otherwise, replace the .NET assembly with a standard DLL that was written in native code such as C++.</p> <p>For more information, see <a href="#">Calling Functions in Standard DLL Files</a>.</p>
<b>-7322</b>	IA64 %1 Custom Action %2 cannot execute in an x64 package.	<p>This build warning occurs if the following conditions are true:</p> <ul style="list-style-type: none"> <li>• x64 is specified for the Template Summary setting.</li> <li>• The project contains a custom action file that targets Itanium 64-bit systems.</li> </ul> <p>An x64 target system cannot run an IA64 custom action.</p> <p>To learn more, see <a href="#">Using the Template Summary Property</a>.</p>

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7321</b>	x64 %1 Custom Action %2 cannot execute in an IA64 package.	<p>This build warning occurs if the following conditions are true:</p> <ul style="list-style-type: none"> <li>• IA64 is specified for the Template Summary setting.</li> <li>• The project contains a custom action file that targets x64 systems.</li> </ul> <p>An IA64 target system cannot run an x64 custom action.</p> <p>To learn more, see <a href="#">Using the Template Summary Property</a>.</p>
<b>-7320</b>	64-bit %1 Custom Action %2 must not be included in a strict 32-bit package.	<p>This build error occurs if the following conditions are true:</p> <ul style="list-style-type: none"> <li>• Intel is specified for the Template Summary setting.</li> <li>• Strict is selected for the Platform Validation setting.</li> <li>• The project includes a 64-bit custom action file.</li> </ul> <p>Note that 64-bit DLL files cannot be run on 32-bit target systems.</p> <p>For more information, see <a href="#">Selecting the Appropriate Type of Architecture Validation for Builds</a>.</p>
<b>-7319</b>	32-bit %1 Custom Action %2 must not be included in a strict 64-bit package.	<p>This build error occurs if the following conditions are true:</p> <ul style="list-style-type: none"> <li>• x64 is specified for the Template Summary setting.</li> <li>• Strict is selected for the Platform Validation setting.</li> <li>• The project includes a 32-bit DLL custom action file.</li> </ul> <p>Note that 32-bit DLL files cannot be run on 64-bit target systems that do not have 32-bit Windows-on-Windows (WOW64) support.</p> <p>For more information, see <a href="#">Selecting the Appropriate Type of Architecture Validation for Builds</a>.</p>

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7318</b>	InstallScript Custom Action %1 must not be included in a strict 64-bit package.	<p>This build error occurs if the following conditions are true:</p> <ul style="list-style-type: none"> <li>• x64 is specified for the Template Summary setting.</li> <li>• Strict is selected for the Platform Validation setting.</li> <li>• The project includes an InstallScript custom action.</li> </ul> <p>Note that InstallScript custom actions cannot be run on 64-bit target systems that do not have 32-bit Windows-on-Windows (WOW64) support.</p> <p>For more information, see <a href="#">Selecting the Appropriate Type of Architecture Validation for Builds</a>.</p>
<b>-7317</b>	64-bit VBScript/JScript Custom Action %1 must not be included in a strict 32-bit package.	<p>This build error occurs if the following conditions are true:</p> <ul style="list-style-type: none"> <li>• Intel is specified for the Template Summary setting.</li> <li>• Strict is selected for the Platform Validation setting.</li> <li>• The project includes a 64-bit VBScript or JScript custom action file.</li> </ul> <p>Note that 64-bit script files cannot be run on 32-bit target systems.</p> <p>For more information, see <a href="#">Selecting the Appropriate Type of Architecture Validation for Builds</a>.</p>
<b>-7316</b>	32-bit VBScript/JScript Custom Action %1 must not be included in a strict 64-bit package.	<p>This build error occurs if the following conditions are true:</p> <ul style="list-style-type: none"> <li>• x64 is specified for the Template Summary setting.</li> <li>• Strict is selected for the Platform Validation setting.</li> <li>• The project includes a 32-bit VBScript or JScript custom action file.</li> </ul> <p>Note that 32-bit script files cannot be run on 64-bit target systems that do not have 32-bit Windows-on-Windows (WOW64) support.</p> <p>For more information, see <a href="#">Selecting the Appropriate Type of Architecture Validation for Builds</a>.</p>
<b>-7315</b>	An unexpected error occurred validating the architecture for custom action %1.	<p>This build error occurs if InstallShield cannot determine whether a custom action file in the project is 32 bit or 64 bit when performing architecture validation.</p> <p>For more information, see <a href="#">Selecting the Appropriate Type of Architecture Validation for Builds</a>.</p>

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7314</b>	An unexpected error occurred validating the architecture for custom actions.	<p>This build error occurs if InstallShield cannot determine whether a file in the project is 32 bit or 64 bit when performing architecture validation.</p> <p>For more information, see <a href="#">Selecting the Appropriate Type of Architecture Validation for Builds</a>.</p>
<b>-7313</b>	Advanced UI projects do not have support for Windows App packages.	<p>If you open a Suite/Advanced UI project that includes a Windows App package in the InstallShield, it is opened as an Advanced UI project, and it displays this build error at build time. Advanced UI projects do not have support for Windows App packages.</p> <p>To resolve this build error, remove the Windows App package from your project, or use the Premier edition of InstallShield to edit the project and build releases.</p>
<b>-7312</b>	The certificate file '%1' is selected for package '%2', but it is not included with this package's files. Either delete the file from the Certificate File setting, or add the file to the Windows App package.	<p>The versions of Windows that support Windows App packages do not install a sideloading package unless they trust the source of the package. If you are using a custom certificate, such as the one that is generated in Visual Studio, the Suite/Advanced UI installation can make Windows trust the source of your package by adding the custom certificate to the certificate store of target systems. The Suite/Advanced UI installation does this if you include the .cer file in your sideloading package, and specify it in the Certificate File setting for the Windows App package in the Packages view.</p> <p>If you specify a .cer file but do not include the file in your project, you may encounter this build warning at build time. To add the .cer file, find the Windows App package in the Packages view, and expand its node in the view. Select the Packages Files node, and right-click the right-pane, and then click Add. InstallShield lets you browse to select the file that you want to add.</p>

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7311</b>	Unable to load manifest file for sideloading app package '%1'.	<p>This build error occurs if you are trying to build a Suite/Advanced UI installation that includes a sideloading Windows App package but InstallShield cannot Windows Appread the app package's manifest file. This may occur if you are trying to build on a Windows XP or Windows Server 2003 system. The ability to create and build a Suite/Advanced UI installation that includes a sideloading Windows App package requires Windows Vista or later or Windows Server 2008 or later on the machine that has InstallShield or the Standalone Build.</p> <p>To resolve this error, remove the Windows App package from the Packages view, or build your release on Windows Vista or later or on Windows Server 2008 or later.</p>
<b>-7308</b>	Suite/Advanced UI installations do not support sideloading Windows App packages that are built for only ARM processors.	<p>This error occurs if you include a Windows App package that targets the ARM processor architecture in a Suite/Advanced project. InstallShield does not have support for including that type of package in an installation.</p> <p>To resolve this error, use the Packages view remove the package that is listed in the error message from your project, and consider replacing it with a package that targets x86 or x64 systems, or that is neutral.</p>
<b>-7295</b>	Advanced UI projects do not have support for .exe primary packages.	<p>InstallShield lets you add .exe packages as a primary package to a Suite/Advanced UI project, which is available in the Premier edition of InstallShield; however, InstallShield does not let you add .exe packages as primary packages to an Advanced UI project, which is available in the InstallShield.</p> <p>If you use the InstallShield to open a project that was created in the Premier edition, and if the project contains an .exe package as a primary package, this build error occurs.</p> <p>To resolve this build error, either use the Premier edition of InstallShield to build the release, or use the Packages view to remove the .exe package from the project.</p> <p>For more information about the differences between Advanced UI and Suite/Advanced UI projects, see <a href="#">Advanced UI Projects vs. Suite/Advanced UI Projects</a>.</p>

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7294</b>	An Advanced UI project can include only one language.	<p>A Suite/Advanced UI project, which is available in the Premier edition of InstallShield, includes support for multiple languages; however, an Advanced UI project, which is available in the InstallShield, includes support for only one.</p> <p>If you use the InstallShield to open a project that was created in the Premier edition, and if the project contains more than one language, this build error occurs.</p> <p>To resolve this build error, either use the Premier edition of InstallShield to build the release, or remove all but one language from the Setup Languages setting in the General Information view of the project. You may also need to remove all but one language from the UI Languages setting on the Build tab in the Releases view.</p> <p>For more information about the differences between Advanced UI and Suite/Advanced UI projects, see <a href="#">Advanced UI Projects vs. Suite/Advanced UI Projects</a>.</p>
<b>-7293</b>	An Advanced UI project can include only one primary package.	<p>A Suite/Advanced UI project, which is available in the Premier edition of InstallShield, includes support for multiple primary packages; however, an Advanced UI project, which is available in the InstallShield, includes support for only one.</p> <p>If you use the InstallShield to open a project that was created in the Premier edition, and if the project contains more than one primary package, this build error occurs.</p> <p>To resolve this build error, either use the Premier edition of InstallShield to build the release, or remove all but one primary package from the Packages view of the project.</p> <p>For more information about the differences between Advanced UI and Suite/Advanced UI projects, see <a href="#">Advanced UI Projects vs. Suite/Advanced UI Projects</a>.</p>

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7292</b>	An update URL is set but this release is not configured to be digitally signed.	<p>This build warning occurs if a URL is specified in the Update URL setting on the Update tab in the Releases view of the Advanced UI or Suite/Advanced UI project, but the release is not configured to be digitally signed.</p> <p>To resolve this warning, specify digital signature information on the Signing tab for the release in the Releases view.</p> <p>To learn more about updates, see <a href="#">Supporting Downloadable Updates for an Advanced UI or Suite/Advanced UI Installation</a>.</p>
<b>-7291</b>	An update URL is set but the project contains packages with files located on the source media.	<p>This warning occurs if a URL is specified in the Update URL setting on the Update tab in the Releases view of the Advanced UI or Suite/Advanced UI project, but one or more packages in the Advanced UI or Suite/Advanced UI project is configured to be stored on the source media.</p> <p>If you are building a base Advanced UI or Suite/Advanced UI setup launcher, you can ignore this warning.</p> <p>If you are building the update Advanced UI or Suite/Advanced UI setup launcher that will be downloaded and launched when an earlier base setup launcher is run on a target system, change the run-time location of the packages in your project to either extracted from the setup launcher or downloaded from the Web. The update setup launcher cannot rely on packages that are stored on the source media. For more information, see <a href="#">Specifying a Run-Time Location for a Specific Package in an Advanced UI or Suite/Advanced UI Project</a>.</p> <p>To learn more, see <a href="#">Supporting Downloadable Updates for an Advanced UI or Suite/Advanced UI Installation</a>.</p>
<b>-7256</b>	To digitally sign a software identification tag file, .NET Framework 3.5 must be installed.	<p>If your project is configured to include a software identification tag and if the release that you are building is configured to use a .pfx file to digitally sign your release, InstallShield attempts to digitally sign the tag that it creates at build time. If your build machine does not have .NET Framework 3.5, this build warning is displayed.</p> <p>To resolve this build warning, install .NET Framework 3.5 on your build machine.</p>

**Table 2** • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7255</b>	Only .pfx files can be used to digitally sign a software identification tag file.	<p>If your project is configured to include a software identification tag and if the release that you are building is configured to use a certificate in a certificate store to digitally sign your release, InstallShield generates this build warning.</p> <p>To resolve this build warning, switch from a certificate in a certificate store to a .pfx file. If you do not need to have a digitally signed tag, you can ignore this warning.</p>
<b>-7246</b>	<p>Package "%1" has an MSI Package condition in which an asterisk (*) is used as a placeholder for one of the condition's settings.</p> <p>InstallShield cannot substitute this placeholder because the appropriate .msi package could not be found.</p>	<p>In order for InstallShield to replace an asterisk in a condition with the appropriate information (such as the product code or product version) from a package in an Advanced UI or Suite/Advanced UI project, the package must be available at build time.</p> <p>To resolve this error, ensure that the package file is in the source location. If dynamic file linking is used for the package, ensure that the dynamic link filters are not excluding the package file from the build.</p>
<b>-7244</b>	The project does not contain any primary packages. You may need to add a package, or select Primary in the Package Type setting for a package in the Packages view.	<p>This error occurs if your Advanced UI or Suite/Advanced UI project does not contain any packages that are configured to be the primary package.</p> <p>To resolve this error if your project does not contain any packages, use the Packages view to add a package to your project. For more information, see <a href="#">Guidelines for Adding Packages to an Advanced UI or Suite/Advanced UI Project</a>.</p> <p>If you already have a dependency package in your project and you want to make it a primary package, use the Package Type setting in the Packages view. To learn more, see <a href="#">Primary Packages vs. Dependency Packages in Advanced UI and Suite/Advanced UI Projects</a>.</p>
<b>-7243</b>	The Detection Condition setting for package '%1' in the Packages view is empty. This type of condition evaluates whether the package is already installed on target systems.	<p>The Detection Condition setting cannot be empty for an .exe type of package in an Advanced UI or Suite/Advanced UI project.</p> <p>For more information, see <a href="#">Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects</a>.</p>

**Table 2** • Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7240</b>	Package '%1' is not associated with any features.	<p>Each package that is included in the Packages view of an Advanced UI or Suite/Advanced UI project should be associated with one or more features. Otherwise, the package are not included in any releases that you build.</p> <p>For more information, see <a href="#">Associating a Package in an Advanced UI or Suite/Advanced UI Project with a Feature</a>.</p>
<b>-7239</b>	The target file '%1' that was selected for an operation's Target setting in the Packages view for package '%2' was not found in the project.	<p>This error occurs if the target file for one of the packages in the Advanced UI or Suite/Advanced UI installation is missing at build time.</p> <p>To resolve this error, ensure that the target file is in the source location. If dynamic file linking is used for the package, ensure that the dynamic link filters are not excluding the target file from the build.</p>
<b>-7236</b>	<p>InstallShield could not create the software identification tag because the value for the %1 setting in the General Information view is invalid. Ensure that it does not contain any of the following characters:</p> <p>\ / : * ? " &lt; &gt;  </p>	<p>InstallShield uses the values that you enter for the Unique ID and Tag Creator ID settings as part of the name of the tag file (<i>TagCreatorID_UniqueID.swidtag</i>). Therefore, the ID that you enter must not contain any characters that are invalid for file names.</p> <p>To resolve this issue, enter a valid value in the setting that is mentioned in the warning message.</p> <p>For more information, see <a href="#">Including a Software Identification Tag for Your Product</a>.</p>
<b>-7235</b>	InstallShield could not create the software identification tag because the %1 setting in the General Information view is empty.	<p>Creation of a software identification tag requires that several settings in the General Information view have values. To resolve this warning, enter the appropriate value in the setting that is mentioned in the warning message, or select No for the Use Software Identification Tag setting.</p> <p>For more information, see <a href="#">Including a Software Identification Tag for Your Product</a>.</p>

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7234</b>	InstallShield could not create the software identification tag because the template file Swidtag.xml could not be opened.	<p>InstallShield uses the Swidtag.xml file, which is installed to one of the following locations, to build tag files:</p> <p><i>InstallShield Program Files folder\Support\0409</i>  <i>InstallShield Program Files folder\Support\0411</i></p> <p>To resolve this issue, ensure that the Swidtag.xml file is present and not locked.</p> <p>For more information, see <a href="#">Including a Software Identification Tag for Your Product</a>.</p>
<b>-7233</b>	An invalid URL (%2) is specified in the Packages view for package %1.	<p>This build error occurs if you selected Download From The Web for a package in the Packages view of an Advanced UI or Suite/Advanced UI project, but the URL setting under the Location setting is blank, or it contains an invalid URL. To resolve this error, enter a URL that starts with one of the following strings:</p> <ul style="list-style-type: none"> <li>• http://</li> <li>• https://</li> <li>• ftp://</li> </ul>
<b>-7225</b>	The project does not contain any packages.	<p>This build error occurs if try to build an Advanced UI or Suite/Advanced UI project that does not contain any packages.</p> <p>To resolve this error, use the Packages view to add a package to your project. For more information, see <a href="#">Guidelines for Adding Packages to an Advanced UI or Suite/Advanced UI Project</a>.</p>
<b>-7223</b>	A Mode condition or a Detection condition is required for the Setup.exe to run correctly.	<p>This build error occurs if your Advanced UI or Suite/Advanced UI project includes an .exe package but you have not configured the appropriate conditions for it yet.</p> <p>For information on adding detection conditions to a package in a project, see the following:</p> <ul style="list-style-type: none"> <li>• <a href="#">Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects</a></li> <li>• <a href="#">Guidelines for Defining Conditions in an Advanced UI or Suite/Advanced UI Project</a></li> </ul> <p>For information on how mode conditions are created, see <a href="#">Triggering Install Mode or Maintenance Mode of an Advanced UI or Suite/Advanced UI Installation</a>.</p>

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7222</b>	No supported languages included in the media. You must select at least one supported language for the media.	This error occurs only when no supported language is selected in the media. To resolve this issue, ensure that at least one language is selected for the Language(s) setting in the Releases view.
<b>-7220</b>	InstallShield encountered an error while including a DIM reference.	This error occurs if your project includes a DIM reference, as shown in the DIM References view, but InstallShield cannot find the DIM project file (.dim). This might occur if the .dim file was moved to a different location or it was renamed, but the path or file name in the installation project that contains the DIM references has not been updated.

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7218</b>	Conflicts were detected building DIMs. In Table %1 Row %2, data files differ in the following columns: %3.	<p>This warning occurs if InstallShield encounters a data conflict between the installation project that is open and one of its DIM references. In this warning message, %1 indicates the name of the table that contains the conflict, and %2 indicates the applicable row; %3 is in the following format:</p> <p><b>ColumnName ("InstallationUnitValue" &lt;&gt; "InstallationProjectValue")</b></p> <p>The table data for the DIM reference is available in the Direct Editor view of the DIM project. The table data for the installation is available in the Direct Editor view of the installation project.</p> <p>If a data conflict occurs, InstallShield uses either the installation project data or the DIM data; it depends on which value is selected in the Conflict Resolution setting on the Build Options tab in the DIM References view:</p> <ul style="list-style-type: none"> <li>● <b>Use Base Project Value</b>— If this value is selected, InstallShield uses the value that is in the installation project instead of the value that is in the DIM project.</li> <li>● <b>Use DIM Project Value</b>—If this value is selected, InstallShield uses the value that is in the DIM project instead of the value that is in the installation project.</li> </ul> <p>If the appropriate value is being used, you can ignore this warning message. If you want to use the value that is being overridden, you can either revise the value in that project, or change the value of the Conflict Resolution setting. Note, however, that if other conflicts occur for this DIM reference, changing the value of the Conflict Resolution setting may also change the resulting built values for those other conflicts.</p> <p>For more information, see <a href="#">Resolving Build-Time Conflicts Between a Basic MSI Project and a DIM Reference</a>.</p>

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7216</b>	This project includes InstallScript objects that are deprecated. These objects should be removed from the project. A prerequisite should be used instead where possible.	<p>InstallScript objects have been deprecated in favor of InstallShield prerequisites. The recommended alternative for InstallScript objects is InstallShield prerequisites. You can use the InstallShield Prerequisite Editor to create your own InstallShield prerequisites. You can share these InstallShield prerequisites among InstallScript, InstallScript MSI, and Basic MSI projects. To learn more, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Defining InstallShield Prerequisites</a></li> <li>• <a href="#">Adding InstallShield Prerequisites, Merge Modules, and Objects to InstallScript Projects</a></li> </ul>
<b>-7215</b>	Skipping build events. Build events are supported only in the Premier edition of InstallShield.	<p>InstallShield lets you specify commands that you want to be run at various stages of the build process. This build event functionality is available in the Premier edition of InstallShield. For more information, see <a href="#">Specifying Commands that Run Before, During, and After Builds</a>.</p> <p>If you try to use the InstallShield to build a release that includes build events, InstallShield ignores the build event settings and generates this warning.</p> <p>To resolve this warning, use the Premier edition of InstallShield to build the release.</p>
<b>-7214</b>	Error loading table %1.	<p>This error occurs if the table that is mentioned in the error message is missing from your project, or it is missing columns.</p> <p>To resolve this error, open the Direct Editor view, and look for the table that is mentioned in the error message. If it exists, compare the columns in the table with those in a new project, and add any missing tables. If the table does not exist, you can export it from a new project as an .idt file, and then import the .idt file into your existing project. For more information, see:</p> <ul style="list-style-type: none"> <li>• <a href="#">Exporting Tables from the Direct Editor</a></li> <li>• <a href="#">Importing Tables with the Direct Editor</a></li> </ul>

**Table 2** ▪ Build Errors and Warnings (cont.)

Error or Warning Number	Message	Troubleshooting Information
<b>-7211</b>	Building a compressed Network Image Setup.exe. All other build types are not allowed in the evaluation mode of InstallShield.	<p>If you are using InstallShield in evaluation mode (that is, you have not activated it), you can build compressed Setup.exe files, but no other release types. If you are creating a Windows Installer-based release, the .msi database is always embedded in the Setup.exe file.</p> <p>If you try to build an uncompressed release in evaluation mode, the uncompressed option is ignored, and InstallShield displays this build warning.</p> <p>Once you have activated InstallShield, the evaluation-mode limitations are removed.</p>
