</tr>
<tr>
<td>-7220</td>
<td>InstallShield encountered an error while including a DIM reference.</td>
<td>This error occurs if your project includes a DIM reference, as shown in the DIM References view, but InstallShield cannot find the DIM project file (.dim). This might occur if the .dim file was moved to a different location or it was renamed, but the path or file name in the installation project that contains the DIM references has not been updated.</td>
</tr>
</tbody>
</table>
Conflicts were detected building DIMs. In Table %1 Row %2, data files differ in the following columns: %3.

This warning occurs if InstallShield encounters a data conflict between the installation project that is open and one of its DIM references. In this warning message, %1 indicates the name of the table that contains the conflict, and %2 indicates the applicable row; %3 is in the following format:

ColumnName ("InstallationUnitValue" <> "InstallationProjectValue")

The table data for the DIM reference is available in the Direct Editor view of the DIM project. The table data for the installation is available in the Direct Editor view of the installation project.

If a data conflict occurs, InstallShield uses either the installation project data or the DIM data; it depends on which value is selected in the Conflict Resolution setting on the Build Options tab in the DIM References view:

- **Use Base Project Value**—If this value is selected, InstallShield uses the value that is in the installation project instead of the value that is in the DIM project.

- **Use DIM Project Value**—If this value is selected, InstallShield uses the value that is in the DIM project instead of the value that is in the installation project.

If the appropriate value is being used, you can ignore this warning message. If you want to use the value that is being overridden, you can either revise the value in that project, or change the value of the Conflict Resolution setting. Note, however, that if other conflicts occur for this DIM reference, changing the value of the Conflict Resolution setting may also change the resulting built values for those other conflicts.

For more information, see Resolving Build-Time Conflicts Between a Basic MSI Project and a DIM Reference.
This project includes InstallScript objects that are deprecated. These objects should be removed from the project. A prerequisite should be used instead where possible.

InstallScript objects have been deprecated in favor of InstallShield prerequisites. The recommended alternative for InstallScript objects is InstallShield prerequisites. You can use the InstallShield Prerequisite Editor to create your own InstallShield prerequisites. You can share these InstallShield prerequisites among InstallScript, InstallScript MSI, and Basic MSI projects. To learn more, see:

- Defining InstallShield Prerequisites
- Adding InstallShield Prerequisites, Merge Modules, and Objects to InstallScript Projects

Skipping build events. Build events are supported only in the Premier edition of InstallShield.

InstallShield lets you specify commands that you want to be run at various stages of the build process. This build event functionality is available in the Premier edition of InstallShield. For more information, see Specifying Commands that Run Before, During, and After Builds.

If you try to use the InstallShield to build a release that includes build events, InstallShield ignores the build event settings and generates this warning.

To resolve this warning, use the Premier edition of InstallShield to build the release.

Error loading table %1.

This error occurs if the table that is mentioned in the error message is missing from your project, or it is missing columns.

To resolve this error, open the Direct Editor view, and look for the table that is mentioned in the error message. If it exists, compare the columns in the table with those in a new project, and add any missing tables. If the table does not exist, you can export it from a new project as an .idt file, and then import the .idt file into your existing project. For more information, see:

- Exporting Tables from the Direct Editor
- Importing Tables with the Direct Editor
Building a compressed Network Image Setup.exe. All other build types are not allowed in the evaluation mode of InstallShield.

If you are using InstallShield in evaluation mode (that is, you have not activated it), you can build compressed Setup.exe files, but no other release types. If you are creating a Windows Installer–based release, the .msi database is always embedded in the Setup.exe file.

If you try to build an uncompressed release in evaluation mode, the uncompressed option is ignored, and InstallShield displays this build warning.

Once you have activated InstallShield, the evaluation-mode limitations are removed.

The current Windows Installer package name includes Unicode characters that may cause a run-time error if a compressed Network Image Setup.exe is built.

This build warning occurs if the following conditions are true:

- For the name of the .msi package, you include Unicode characters that are not supported by your build machine's ANSI code page.
- You include a setup launcher (Setup.exe file) with your release.

This warning occurs to inform you that when the Windows Installer package is extracted from Setup.exe to a temporary location on the target system, run-time error 1152 may occur.

To resolve this warning, change the name of the .msi package so that it does not contain Unicode characters that are not supported by your machine's ANSI code page. To do so, you can use the MSI Package File Name setting on the General tab for a product configuration in the Releases view.
Errors and Warnings

The current location for this package includes Unicode characters that may cause a run-time error when Windows Installer tries to extract its .cab files.

This warning occurs if the following conditions are true:

- The path for the release that InstallShield is building contains Unicode characters that are not supported by your build machine’s ANSI code page.
- You configure the release so that your product’s program files are compressed into .cab files.

You can ignore this warning if end users will launch your release from a location whose path does not contain Unicode characters that are not supported by your build machine’s ANSI code page.

If end users try to launch your installation from a path that contains Unicode characters that are not supported by the target system’s ANSI code page, run-time error 1311 occurs when Windows Installer tries to extract the .cab files.

A package cannot contain both the MsiLockPermissionsEx and LockPermissions tables.

An installation should not contain both the MsiLockPermissionsEx table and the LockPermissions table.

If you use the Permissions setting for a service, and the settings under it, you are configuring the MsiLockPermissionsEx table of the package. If Traditional Windows Installer handling is selected for the Locked-Down Permissions setting in the General Information view and you have set permissions for one or more files, folders, or registry keys in your project, you are configuring the LockPermissions table of the package.

For more information, see Securing Files, Folders, Registry Keys, and Windows Services in a Locked-Down Environment.

The language '%1' is missing from this project but included in this release.

This build warning occurs if a language is selected in the UI Languages setting on the Build tab in the Releases view, but it is not also selected in the Setup Languages setting in the General Information view.

This build warning is alerting you that the release will not include the specified run-time language. If you do not want to include the specified run-time language in your release, you can ignore this warning.

If you do want to include the specified run-time language in your release, add the language to the Setup Languages setting.

<td>J# requires the .NET Framework Redistributable Package, but it is not included in the installation. If you are sure that your end users already have the .NET Framework on their systems, you can ignore this warning message. However, if there is a chance that they will not have the .NET Framework, add it to your installation. If the .NET Framework is not on their systems, they might have trouble installing J# as part of your installation. For more information, see Adding .NET Framework Redistributables to Projects.</td>
</tr>
<tr>
<td>-7023</td>
<td>Internal build error.</td>
<td>This error occurs if a merge module such as MFC 7.1 is not configured correctly or it is corrupted. If you have more than one merge module in your project but you do not know which one is causing the error, you need to first identify the problematic merge module. You can do this by removing a merge module from your project and then building your release. If the error recurs, you have identified the problematic merge module. If not, remove a different merge module and then build. Once you have identified the merge module causing the error, try reinstalling it. If that does not resolve the error, contact the author to obtain the latest version.</td>
</tr>
<tr>
<td>-7015</td>
<td>Error copying setup.inx to media folder. Unexpected error.</td>
<td>This error occurs if Setup.inx, the compiled script file, cannot be copied to the Media folder located in the \Media\Disk Images\Disk 1 folder. This can occur if you are out of disk space or the file is locked.</td>
</tr>
<tr>
<td>-7014</td>
<td>Error copying setup.inx to media folder. Script is read-only.</td>
<td>This error occurs if Setup.inx, the compiled script file, is marked as read-only. To resolve this error, find the Setup.inx file, which is usually in the \Media\Disk Images\Disk 1 folder. Right-click this file and select Properties. Then clear the Read-only check box.</td>

<tr>
<td>-7011</td>
<td>%1 must have a strong name to be installed to the GlobalAssemblyCache.</td>
<td>You can install an assembly to the Global Assembly Cache only if it has a strong name. A strong name contains the assembly’s simple text name, version number, culture information (if available), a public key, and a digital signature. Using strong-named assemblies in the Global Assembly Cache enables you to have multiple versions of an assembly with the same name but with different versions of .dll files. The assemblies stored in the Global Assembly Cache can be shared by different applications on a computer. To resolve this error message, you have two options.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Change the target destination for the assembly to a location other than the Global Assembly Cache if sharing that assembly with other applications is not explicitly required. Note that it is not necessary to install assemblies into the Global Assembly Cache to make them accessible to COM interop.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Select an assembly that has a strong name for installation to the Global Assembly Cache. Note that once an assembly is created, you cannot sign it with a strong name. You can sign an assembly with a strong name only when you create it.</td>

<td>The custom action %1 in the InstallExecuteSequence table is run from an installed file. It must be sequenced after the %2 action. Ensure that the custom action is sequenced properly and that the base action exists in the sequence.</td>
<td>This error occurs when you have authored a custom action that runs from a file that is installed during your setup. The custom action must come after the InstallFiles action in the sequence. Otherwise the file will not exist on the target system when Windows Installer runs the custom action. The only exception to this is when you run this custom action on uninstallation. In that case, the file has already been installed so the custom action does not have to occur after InstallFiles.</td>

Media Build Errors and Warnings

Media build errors that occur before the build is generated are displayed in an error message dialog box; those that occur while the build is generated are displayed in the Output window and are recorded in the log file.

### Error 118

**Message**

Could not find CAB file with file number. The system cannot find the path specified.

**Troubleshooting Information**

This error occurs when you build an already built media and one of the cabinet files that was previously created no longer exists.

If you encounter this error, rebuild the media.

### Error 129

**Message**

Media too small. Could not fit filename on disk number.

**Troubleshooting Information**

This error can occur for any of the following reasons:

- Total size of files required to be on one disk is greater than selected disk size.
- An installation requires that certain files reside on the first disk, including the files placed in the Support Files view (such as Setup.bmp and License.txt) and Data1.cab. Also, an installation requires that certain files be compressed in Data1.cab, including the following:
  - files needed by the objects you have included in your setup
  - resource files for each language your installation supports
  - the file for the dialog box skin you selected

If your installation includes a large skin, setup files, or objects—or a large number of support files, objects, or languages—the total size of files required to be on the first disk can be greater than the disk size you selected in the Release Wizard’s Media Type panel.

To avoid this error and complete the build successfully, you must either remove the skin or some support files or objects from your project, reduce the size of some support files or choose a skin with a smaller file, or select a larger disk size.
If the error message specifies a disk other than disk 1, some of the files in your components may be too large to fit on the disk even when they have been compressed. In this case, you must either remove the large files, reduce their size, or select a larger disk size.

• There is not enough space on your drives.

To create the installation’s cabinet files, the release builder requires space in the system’s temporary folder and in the build location. To avoid this error, make sure you have enough free space on the drive on which the system's temporary folder resides and the drive on which you have specified the build location.

You can find the system’s temporary folder by typing in the word "set" at a DOS prompt. The temporary folder is identified by the value of the environment variable TEMP. You can find the build location by looking at the Release Wizard's General Options panel's Advanced dialog box or the Release view's Release Location property.

• There is not enough virtual memory.

On Windows NT, this error can be caused by a lack of free virtual memory rather than a lack of free hard disk space. For information, visit Knowledge Base article Q102757.

**Warning -5000**

**Message**

Component 'component name' contains a link to a non-existent file - 'filename'.

**Troubleshooting Information**

The indicated component contains a link to the indicated file, which cannot be found. Remove the file from the component, or if you have renamed or moved the file, restore it to the indicated name and location.

**Warning -5006**

**Message**

'EnterPassword' dialog resource not found in resource library filename.

**Troubleshooting Information**

You have selected the Show Password dialog during setup initialization option in the Release Wizard’s Password panel or the Show Password Dialog property in the Releases view, but one or more copies of _Isres.dll do not contain a resource template for this dialog box. (A separate instance of this warning is displayed for each copy of _Isres.dll that does not contain the resource template.) To fix this problem, you must use the Premier edition of InstallShield.

**Warning -5020**

**Message**

The built media files could not be uploaded to the site URL. The URL could not be parsed.
Troubleshooting Information
Verify that the URL you specified in the Release view’s FTP Host Address property exists.

Warning -5021

Message
The built media files could not be copied to the folder ‘path’.

Troubleshooting Information
You have selected the Copy the built media files to the folder option in the Release Wizard’s Postbuild Options panel or the Copy to Folder property in the Release view; the built media files could not be copied to the folder that you specified with that option. Make sure that the path you specified exists and is writable.

Warning -5032

Message
Failed to sign the self-extracting executable file.

Troubleshooting Information
The build failed to sign the self-extracting executable file as specified in the Release Wizard’s Digital Signature panel or the Release view’s Sign Media property. Among the possible causes of this error are an invalid or missing private key file.

Warning -5050

Message
The font data could not be read from the project file. The ‘Font’ table may be missing from the project.

Troubleshooting Information
Check the Direct Editor to see if a Font table is included in your project. If it is not, and you cannot use source control software to roll back to a version of your project that did include that table, try deleting the font files from your project and then re-including them.

Warning -5051

Message
Unable to create font data file: ‘data file path and name’
Troubleshooting Information
Make sure that the specified path exists and is writable, and that a read-only file of the same name does not already exist at the same location.

Error -7040

Message
No features included in the media.

Description
Your specified media does not contain any features. All media builds must include at least one feature.

Troubleshooting Information
Make sure that you have created at least one feature in the Features view.

Error -7041

Message
Could not create instance of CABEngine. CABEngine component might not be installed or registered properly. You may need to reinstall InstallShield.

Troubleshooting Information
To resolve the problem, manually register the file MediaBuild40.dll (in the InstallShield\MediaBuild folder of your build machine’s common files folder) using Regsvr32.exe (in the Windows system folder), using a DOS command line like the following:

Regsvr32.exe "C:\Program Files\Common Files\InstallShield\MediaBuild\MediaBuild40.dll"

Error -7043

Message
Could not open the following media for the differential build - "path to media header file"

Troubleshooting Information
The message refers to a media header file that you specified in the Differential Media list box in the Release Wizard’s Update panel. This error can be caused by any of the following conditions:

- The file does not exist.
- The file is corrupted.
- The file is an incompatible media, for example, a media built by InstallShield Professional 5.x.
Errors and Warnings

**Error -7044**

**Message**

Product Version is not specified in the Product Properties view.

**Troubleshooting Information**

You must specify a non-null value in the Product Version setting in the General Information view.

**Error -7045**

**Message**

File could not be found - "path\Corecomp.ini"

**Troubleshooting Information**

Corecomp.ini could not be found in the indicated location. If you have renamed or moved Corecomp.ini, place a copy in the indicated location with the file name Corecomp.ini. If you cannot restore Corecomp.ini in this way, run a repair of InstallShield.

**Error -7126**

**Message**

Unable to build the setup.

**Description**

There is not enough free disk space to build the setup.

**Troubleshooting Information**

The Media Wizard requires space in the system's temporary folder. Make sure you have enough free space on this drive, as well as in the build location.

**Error -7127**

**Message**

The Disk Images directory is use by another program.

**Troubleshooting Information**

This error can occur for any of the following reasons:

- The Disk Images or Disk1 folder that you are trying to build to may be open in Windows Explorer or DOS. Open a different folder in the Windows Explorer or DOS window, or close the window, and then rerun the media builder.
The Disk Images or Disk1 folder is read-only. Right-click the folder in Windows Explorer and click Properties. If the folder is marked as read-only, uncheck the read-only check box and then rerun the media builder.

A folder named bldback exists under the folder where the media is being built to. If such a folder exists, delete it, and then rerun the media builder.

**Error -7275**

**Message**
Certificate invalid.

**Troubleshooting Information**
The digital certificate that is specified for your project is invalid. Specify a valid certificate and build again.

**Error -7276**

**Message**
Certificate expired.

**Troubleshooting Information**
Your digital certificate has expired. Specify a current certificate and build again.

**Error -7380**

**Message**
Build canceled by the user.

**Description**
The build has been canceled by the user.

**Troubleshooting Information**
The user canceled the build process by clicking the Cancel button.

**Error -9008**

**Message**
Failed saving object property.

**Troubleshooting Information**
This error can occur if an object in the project is corrupted (for example, is missing Isrt.dll).
MSI/MSM Conversion Errors

The table below provides troubleshooting tips for each error that could be encountered while converting an installation package (.msi file) or merge module (.msm file) in the Open MSI/MSM Wizard.

The wizard also returns errors from accessing Windows Installer databases. For more information on those errors, see Build Errors and Warnings. You might receive undocumented, internal errors if the source .msi or .msm package is invalid.

Tip • Before launching the Open MSI/MSM Wizard, validate the package with Orca or Msival2.exe, both part of the Microsoft Windows Installer Platform SDK.

Table 4 • MSI and MSM Conversion Errors

<table>
<thead>

</tr>
<tr>
<td>100001</td>
<td>Unexpected error</td>
<td>The error message lists the function and table name associated with the error.</td>
</tr>
<tr>
<td>100002</td>
<td>Unable to extract file from the cabinet</td>
<td>Verify that the source is a valid .msi or .msm database.</td>
</tr>
</tbody>
</table>
Internal Errors

The following are internal errors. They should not be encountered when importing a valid .msi or .msm database.

Before launching the Open MSI/MSM Wizard, validate the package with Orca or Msival2.exe, both part of the Microsoft Windows Installer Platform SDK.

The error message will display the database table, field, and value for which the conversion failed.

Windows Installer Run-time Errors

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
- MSI Database
- MSM Database
- QuickPatch
- Transform
The following table contains a listing of Windows Installer errors that may occur during run time of an installation. The errors are related to the built-in InstallShield custom actions that are added automatically to InstallShield projects to support different functionality. For a list of the custom actions, see InstallShield Custom Action Reference.

Tip • You can find detailed information—including resolution information—on some of the run-time errors in the Knowledge Base.

Table 6 • Windows Installer Run-time Errors

<table>
<thead>

</tr>
</tbody>
</table>
| **27519**    | Error updating XML file [2]. [3] | This error may occur if your project contains XML references that you configured in the XML File Changes view. This error occurs if MSXML fails to save the target XML file. The [3] parameter refers to the error code that MSXML returned. Possible error codes are:  
- **XML_BAD_ENCODING**—The XML file contains a character that is not part of the specified encoding, which is defined on the Advanced tab for an XML file in the XML File Changes view.  
- **E_INVALIDARG**—The XML file does not have a valid file name.  
- **E_ACCESSDENIED**—A file system error occurred.  
- **E_OUTOFMEMORY**—The XML file could not be saved.  
Other values that can occur indicate that a file system error occurred. |
| **27520**    | Error opening XML file [2]. [3] | This error may occur if your project contains XML references that you configured in the XML File Changes view. This error occurs if MSXML fails to load the target XML file. The [3] parameter refers to the error code that MSXML returned. A possible error codes is:  
- **S_FALSE**—The XML file load failed. |
| **27521**    | This setup requires MSXML 3.0 or higher for configuring XML files. Please make sure that you have version 3.0 or higher. | This error may occur if your project contains XML references that you configured in the XML File Changes view. To prevent this error from occurring, consider using the Redistributables view to add an InstallShield prerequisite or merge module for MSXML to your project. |
| **27524**    | Error loading NetApi32.DLL. The ISNetApi.dll needs to have NetApi32.DLL properly loaded and requires an NT based operating system. | This error may occur if you added to your project the ability to create or set a Windows user account. The error occurs if NetApi32.dll cannot be loaded on the target system. |

</table>
Setup.exe Return Values and Run-Time Errors (InstallScript Projects)

Setup.exe may produce error messages if it cannot start properly. In most cases, you will encounter these messages when a severe error occurs. Rarely will your end users see these messages.

You can capture these return values when you call the CreateProcess API to launch Setup.exe, or use a batch file to launch Setup.exe.

When you get an error message, it appears in a message box. Every error message has a number. These are InstallScript system error messages, and there is no way to suppress them in your script. The following table describes each of these error messages:

<table>
<thead>
<tr>
<th>Error/Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3010</td>
<td>The installation required a restart but the installation is not initiating the restart. In this case, the installation completed with BATCH_INSTALL set to a non-zero value, but the System function was not called. Note that Setup.exe returns this value only if the installation was successful and was not cancelled (that is, the installation did not end via the abort keyword). Otherwise, the appropriate error value or ISERR_SETUP_CANCELED is returned. The constant for this return value is ERROR_SUCCESS_REBOOT_REQUIRED.</td>
</tr>
<tr>
<td>1641</td>
<td>This return value occurs if the installation itself is restarting the machine because the System function was called—typically as a result of the SdFinishReboot function calling System internally. Note that Setup.exe returns this value only if the installation was successful and was not cancelled (that is, the installation did not end via the abort keyword). Otherwise, the appropriate error value or ISERR_SETUP_CANCELED is returned. The constant for this return value is ERROR_SUCCESS_REBOOT_INITIATED.</td>
</tr>
</tbody>
</table>
### Errors and Warnings

The installation exited with the exit keyword.

**0x80042000**

The installation exited with the abort keyword because the end user canceled the installation.

The constant for this return value is ISERR_SETUP_CANCELED.

**0x80040708**

Unable to create required engine components. Check whether you have appropriate privileges to create COM components.

*Note* • This error message may include an additional error number and error string indicating more specific error information returned by the operating system.

<table>
<thead>
<tr>
<th>Error/Return Value</th>

Setup.exe Return Values and Run-Time Errors (Basic MSI and InstallScript MSI Projects)

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Note that project-specific differences are explained where applicable.

The table below lists the errors that might occur when Setup.exe is run from a Basic MSI or InstallScript MSI project. For Setup.exe errors that might occur for an InstallScript project, see Setup.exe Return Values and Run-Time Errors (InstallScript Projects).

You can capture these return values when you call the `CreateProcess` API to launch Setup.exe, or use a batch file to launch Setup.exe.

Note • If an error occurs on a non-English system, the error strings may not be displayed in English.

Table 9 • Setup.exe Run-time Errors and Return Values

<table>
<thead>
<tr>
<th>Error or Status Number</th>
<th>Message</th>
<th>Troubleshooting Tips</th>

<tr>
<td></td>
<td></td>
<td>If the Windows Installer engine returns ERROR_SUCCESS (0), the Setup.exe file may return ERROR_SUCCESS_REBOOT_REQUIRED (3010). This indicates that installation required a restart but the installation is not initiating the restart. In this case, the installation completed with BATCH_INSTALL set to a non-zero value, but the System function was not called.</td>
</tr>
</tbody>
</table>
**Errors and Warnings**

*Edition* • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The table below lists the errors that might occur when an end user runs an Advanced UI or Suite/Advanced UI Setup.exe installation. The Type of Code column in this table indicates the following information:

- **Exit code only**—The installation status is returned by the Advanced UI or Suite/Advanced UI Setup.exe file.
- **Error code/exit code**—The installation status is processed for evaluated error conditions, and the status is returned by the Advanced UI or Suite/Advanced UI Setup.exe file.
- **Logged only**—The installation status is logged when debug logging is enabled. (Debug logging is enabled when the /debugLog command-line parameter is passed to the Advanced UI or Suite/Advanced UI Setup.exe file to launch the Advanced UI or Suite/Advanced UI installation. For more information on command-line parameters, see Advanced UI and Suite/Advanced UI Setup.exe Command-Line Parameters.)

*Note* • Some of the error messages may be displayed before any string entries are available to the running Advanced UI or Suite/Advanced UI Setup.exe file. Therefore, in such cases (for example, Setup.xml is missing, another instance of the Advanced UI or Suite/Advanced UI installation is already running, or condition validation failed), those particular resulting error messages are displayed in English. Other errors that occur before language selection are typically displayed in the default setup language.

**Table 10 • Setup.exe Run-time Errors and Return Values**

<table>
<thead>

Visual Studio Project Import Errors and Warnings

This table lists the errors and warnings that might occur when you do any of the following:

- Convert a Visual Studio setup project (.vdproj) to an InstallShield Basic MSI project (.ism).

Table 10 • Setup.exe Run-time Errors and Return Values (cont.)

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Type of Code</th>
<th>Message</th>
<th>Troubleshooting Tips</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x8007007f</td>
<td></td>
<td></td>
<td>- If the Advanced UI or Suite/Advanced UI installation contains packages that run with transaction processing, the target system must have Windows Installer 4.5 or later. To avoid this error on these systems, you may want to create an eligibility condition for each package in the transaction to prevent the Advanced UI or Suite/Advanced UI installation from launching those packages on systems that have earlier versions of Windows Installer. For more information, see Building Conditional Statements in Advanced UI and Suite/Advanced UI Projects. This error may also occur if the Advanced UI or Suite/Advanced UI installation has trouble installing an InstallScript package because the package was built in InstallShield 2012 or earlier. For more information, see Adding an InstallScript Package to an Advanced UI or Suite/Advanced UI Project. In addition, this error may occur if there is a problem with an Advanced UI or Suite/Advanced UI extension condition. If your project includes an extension condition, check to ensure that the DLL for the extension condition has the proper exported entry points.</td>
</tr>

<tbody>
<tr>
<td>-9077</td>
<td>File key '%1' already exists in the InstallShield project. The project output '%2' was not converted.</td>
<td>This warning occurs if you have a Visual Studio project that contains a project output that has a file that is associated with a particular file key, and you import that project into an InstallShield project that already contains a file with that same file key. This scenario may occur if you import the same Visual Studio project into your InstallShield project more than once. If you encounter this warning, check the Files and Folders view to ensure that the file that is identified in the warning message is not missing from your InstallShield project. Note that the Direct Editor view shows the file key that is associated with each file in your project. The file keys are the primary keys of the <code>File</code> table in the .msi database; the <code>File</code> table cannot contain duplicate file keys.</td>
</tr>
<tr>
<td>-9078</td>
<td>The InstallShield project is not in a Visual Studio solution. The project output '%1' was not converted.</td>
<td>This error occurs if your InstallShield project is open in InstallShield, but not from within Visual Studio, and you try to import a Visual Studio project that contains project outputs into the InstallShield project. To resolve this error, open your InstallShield project from within Visual Studio, and then import the Visual Studio project into it.</td>
</tr>
<tr>
<td>-9079</td>
<td>The Visual Studio project '%1' could not be found in the current Visual Studio solution. The project output '%2' was not converted.</td>
<td>If you want to import into an InstallShield project a Visual Studio setup or merge module project that contains a project output, the Visual Studio project must be in the same solution as all of its project dependencies. Otherwise, this error occurs when you try to import the Visual Studio project. To resolve this error, ensure that your InstallShield project is in the same Visual Studio solution that contains the Visual Studio setup or merge module project that you are importing. In addition, ensure that the solution also includes all of the other Visual Studio projects that are dependencies of the Visual Studio setup or merge module project. Then you can import the Visual Studio setup or merge module project into your InstallShield project.</td>
</tr>
<tr>
<td>-9080</td>
<td>The project output group '%1' could not be found in the Visual Studio project '%2'. The project output '%3' was not converted.</td>
<td>This error occurs if you convert a Visual Studio setup or merge module project that contains a project output group but InstallShield encounters a problem when incorporating a project output of that group into the InstallShield project. To resolve this error, request technical support.</td>
</tr>
</tbody>
</table>

</thead>
<tbody>
<tr>
<td>-9081</td>
<td>File '%1' is specified to be excluded from a setup or merge module. The file was not converted.</td>
<td>This warning occurs if you import into an InstallShield project a Visual Studio setup or merge module project that contains a file whose Exclude property is set to True. If you want the specified file to be excluded from your InstallShield project, you can ignore this warning. If you want the specified file to be included in your InstallShield project, you can use the Files and Folders view in InstallShield to add it. For more information, see Adding to Your Project Files to Be Installed on Target Systems.</td>
</tr>
<tr>
<td>-9082</td>
<td>Project output '%1' is specified to be excluded from a setup or merge module. The project output was not converted.</td>
<td>This warning occurs if you import into an InstallShield project a Visual Studio setup or merge module project that contains a file in a project output, and True is selected for the Exclude property of that file. If you want the specified file to be excluded from your InstallShield project, you can ignore this warning. If you want the specified file to be included in your InstallShield project, you can use the Files and Folders view in InstallShield to add it. For more information, see Adding References to Visual Studio Solutions.</td>
</tr>
<tr>
<td>-9083</td>
<td>Visual Studio default launch conditions are not supported in InstallShield. The launch condition named '%1' was not converted.</td>
<td>This warning occurs if you import into InstallShield project a Visual Studio setup or merge module project that contains a default launch condition. If you want the specified launch condition to be excluded from your InstallShield project, you can ignore this warning. If you want to add a launch condition to your InstallShield project to check the target system for the default launch condition that Visual Studio added to the original project, you can use the System Search view in InstallShield to add it. For more information, see Adding a System Search.</td>
</tr>

</thead>
</table>
| -9086                   | MinDate '%1' for the file search named '%2' is not valid. The MinDate property was not converted. | This warning occurs if you attempt to import or convert a Visual Studio setup that has a file search with an invalid value for the MinDate property.  
To resolve this warning:  
1. Open the System Search view in InstallShield.  
2. Right-click the file search and then click Modify. The System Search Wizard opens.  
3. On the second panel of this wizard, click the Details button. The File Details dialog box opens.  
4. Enter the appropriate details. |
| -9087                   | MaxDate '%1' for the file search named '%2' is not valid. The MaxDate property was not converted. | This warning occurs if you attempt to import or convert a Visual Studio setup that has a file search with an invalid value for the MaxDate property.  
To resolve this warning:  
1. Open the System Search view in InstallShield.  
2. Right-click the file search and then click Modify. The System Search Wizard opens.  
3. On the second panel of this wizard, click the Details button. The File Details dialog box opens.  
4. Enter the appropriate details. |
| -9088                   | InstallShield does not have support for converting Visual Studio Web Setup projects into InstallShield projects. | This error occurs if you attempt to import or convert a Visual Studio Web setup project in InstallShield, since InstallShield does not have support for this conversion. If you encounter this type of error, consider creating a new project in InstallShield and using the Internet Information Services view to manage an IIS Web site on a target system. |
| -9089                   | InstallShield does not have support for converting Visual Studio CAB projects into InstallShield projects. | This error occurs if you attempt to import or convert a Visual Studio CAB setup project in InstallShield, since InstallShield does not have support for this conversion. |
| -9090                   | The Visual Studio project type could not be identified. Therefore, the project was not converted. | This error occurs if you attempt to attempt to import or convert a Visual Studio project type that InstallShield could not identify. |
Upgrade Errors (Upgrading from InstallShield Professional)

This table provides tips for troubleshooting errors that may occur when you upgrade a project (.ism file) created with InstallShield Professional to InstallShield.

Upgrade Warning 289: File Link Does Not Exist for Dynamically Linked File

In InstallShield Professional, dynamically linking to your source files allows you to add the contents of complete folders and subfolders to your setup without hard-coding paths or file names. If you add files to the source folder or remove files, the list of included files was dynamically updates when you build your release.

Upgrading to InstallShield 2021

When you upgrade an InstallShield Professional project to InstallShield 2021, and include a file via dynamic file linking that does not exist, Upgrade Warning 289 appears. The warning informs you that a file link has been created, but the file does not exist.

Upgrade Warning -305: Include In Build Property for the InstallShield Professional Component Could Not Be Directly Migrated

If a component in your InstallShield Professional project had its Include In Build property set to No, the corresponding feature will have its Release Flags property set to EXCLUDEFROMBUILD. To exclude the feature from your setup, you need to manually set a release flag in the Releases view or the Filtering Settings panel of the Release Wizard.
Note • Because the release flag in the Releases view indicates which features to include in the setup, the flag you specify in the Releases view must be something other than EXCLUDEFROMBUILD.

Upgrade Warning -480: Incrementing the Shared .dll Reference Count for Files in a File Group

In InstallShield Professional versions 6.x and earlier, setting the shared property for a file group resulted in incrementing the shared .dll reference count for all files in that file group on installation. This upgrade migrates this setting to the shared attribute of the component created, in InstallShield 2021, for this file group.

Shared .dll Reference Count Behavior

In InstallShield 2021, setting the shared attribute of a component results in incrementing of the shared .dll reference count of only the key file for that component. By definition, there can be only one key file per component. In order to increment the shared reference count for multiple files, each file requires its own component and the file must be the key file in that component.

Note • For .exe, .dll, and .ocx files, you can use the Component Wizard to quickly create components for large numbers of files.

In InstallShield 2021, even if a file is not marked as shared, if a shared .dll reference count already exists for a file, it is automatically incremented by the installation of that file and decremented by the uninstallation of that file.

Additionally, reference counts are maintained for components based on the component GUID (or Component Code property). Therefore, the shared property of a component is useful only where there might be file sharing with legacy installations, or if other components with differing component GUIDs install this file.

Upgrade Warning -481: Incrementing the Shared DLL Reference Count for Dynamically Linked Files in a File Group

In InstallShield Professional version 6.x and previous, setting the shared property for a file group which contained a dynamic file link resulted in incrementing the shared DLL reference count for all files in that file group on installation—regardless of the file link type. This upgrade migrates this setting to the shared attribute of the component created, in InstallShield 2021, for this file group.

Shared DLL Reference Count Behavior

In InstallShield 2021, setting the shared attribute of a component results in incrementing of the shared DLL reference count of only the key file for that component. Because dynamically linked files cannot be used as key files, the shared reference count is not incremented for any of the component’s files.

A component can have only one key file. Therefore, in order to increment the shared reference count for multiple files, each file must be in its own component and the file must be the component’s key file. Files must be statically linked if you want the reference count to increment the shared DLL reference count for each file.
Note • For EXE, DLL and OCX files, you can use the Component Wizard to quickly create components for large numbers of files.

In InstallShield 2021—even if a file is not marked as shared—if a shared DLL reference count already exists for a file, it is automatically incremented by the installation of that file and decremented by the uninstallation of that file.

Additionally, reference counts are maintained for components based on the component GUID (or Component Code property). Therefore, the shared property of a component is useful only where there might be file sharing with legacy installations, or if other components with differing component GUIDs install this file.

Upgrade Warning -486: Specifying Shortcut Icons

Shortcut Creation in InstallShield Professional

In InstallShield Professional version 6.x and earlier, shortcut icons were authored from the target machine’s perspective. For example, if the shortcut’s icon was installed to <TARGETDIR>\MyIcon.ico, that was the qualified path specified for the shortcut icon. At run time, the shortcut creation process would bind to the icon on the target machine.

Shortcut Creation

In InstallShield 2021, shortcut icons must be linked to at design time. Instead of specifying a path on the target machine as the icon file, the project file must specify a path on the build machine as the icon file. The build engine then creates a separate stream for your icon in the installation. The installation then uses that stream at run time during its icon creation process. This means that the setup no longer has to install the icon it is using for its shortcuts.

When upgrading your InstallShield Professional projects, InstallShield 2021 attempts to match the target icon path with a file that exists in your setup project. If unable to do so, this warning is displayed.

Correcting the Path to the Shortcut Icon

Tip • To correct the shortcut icon path:

1. Go to the Shortcuts view in the IDE and click the shortcut specified in the warning message.

2. In the Icon File property field, browse to the icon file.

Note • Shortcut icons are required in InstallShield 2021. If an icon is not specified, the build engine uses the first icon index of the shortcut’s target file as the shortcut icon.
Upgrade Warning -487: Overwriting Files Upon Installation

Installing Files Based on the File Group's Overwrite Property

In InstallShield Professional version 6.x and earlier, you had the ability to set overwrite properties for individual file groups. One file group could install files based on date, while another installed files only if the file version is older than the file version on the target machine.

Installing Files Based on File Versioning Rules

InstallShield 2021 uses a methodology called file versioning rules to determine which files need to be installed on the target machine. The only option at the component level to override file versioning rules is to set the Never Overwrite property to Yes.

File Versioning Alternatives

Although the default file versioning rules are satisfactory for most applications, there might be cases where an application’s requirements necessitate that you control the rules used to decide if a file should be overwritten. To this end, there are a couple of alternatives to file versioning that can be used either individually or in conjunction with each other to modify file versioning rules.

REINSTALLMODE

The REINSTALLMODE technique for overriding file versioning rules is a global mechanism for establishing custom versioning rules. Using this technique affects versioning rules for all files in the installation.

<table>
<thead>
<tr>
<th>Task</th>
<th>To use the REINSTALLMODE property:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Open the Property Manager.</td>
</tr>
<tr>
<td>2.</td>
<td>Create a property called REINSTALLMODE.</td>
</tr>
<tr>
<td>3.</td>
<td>Set the value of this property based on the option codes specified for the REINSTALLMODE property.</td>
</tr>
</tbody>
</table>

The installer reads this property at install time and uses its settings to override file versioning. This setting is also used by the installer during a reinstallation or repair of the application.

Companion Files

The companion files technique for overriding file versioning rules enables you to configure a file so that it installs based on the installation of a companion file. This technique is useful when it makes sense to bind the installation states of several files together.

For example, you can bind a non-versioned user data file to a versioned .exe file. If the .exe is not installed, the user data is not installed.

Upgrade Warning -488: Obsolete Event Encountered in Script File

An obsolete event was encountered in your script file. While most InstallShield Professional script events are supported in InstallShield 2021, there are some that are not available.
Events With Comparable Functionality

- OnInstallingFile
- OnUninstallingFile

These two events have been replaced with the OnInstallFilesActionBefore and OnInstallFilesActionAfter. These events are called in Install, Uninstall, and Maintenance modes.

The OnInstallFilesActionBefore event is called when the installation is preparing to add or remove files from the target machine based on the Action state of the component containing those files. On uninstall, all related actions that require the source file have already been performed—such as removing any shortcuts to the file and unregistering the file’s COM data.

The OnInstallFilesActionAfter event is called when the installation has finished adding or removing files from the target machine. On Install, the related install actions for a file have yet to be performed, such as the registration of NT Services and creation of ODBC entries.

**Note** • When using the OnInstallFilesActionBefore and OnInstallFilesActionAfter events, you can use the Windows Installer API function MsiGetComponentState to determine the action state of a component.

Event with Partial Support

The OnSelfRegistrationError event is called if you are using the XCopyFile function to copy your application files to the source media.

Unsupported Events

The following events are not supported in InstallShield 2021:

- OnFileReadOnly
- OnFileLocked
- OnNextDisk
- OnRemovingSharedFile
- OnFileError
- OnInternetError
- OnMD5Error

Upgrade Warning 495: ODBC Core Not Installed by Default

The ODBC core is not installed by default. If this is required by your setup project, select the MDAC merge module from the Redistributables view.

MDAC Prerequisite for ODBC Installation

Although InstallShield Professional provided an object that installed the ODBC core as well as ODBC drivers, InstallShield 2021 does not directly support this functionality. Because Microsoft requires you to install ODBC as a subset of MDAC, the Windows Installer does not support direct installation of the ODBC core.
Upgrade Errors and Warnings (Upgrading from InstallShield—Windows Installer Edition)

This table provides tips for troubleshooting errors and warnings that may occur when you upgrade a project (.ism file) created using a version of InstallShield—Windows Installer Edition to InstallShield.

Table 14 • Upgrade Errors and Warnings

<table>
<thead>
<tr>
<th>Error or Warning Number</th>
<th>Message</th>
<th>Troubleshooting Tips</th>
</tr>
</thead>
<tbody>
<tr>
<td>-100</td>
<td>This error occurs if you are upgrading a project that has a registry value set as a keypath for a component.</td>
<td>You cannot set a registry value as a keypath for a component. To avoid this error, remove that keypath from the component and attempt the upgrade again.</td>
</tr>
<tr>
<td>-201</td>
<td>This error occurs if your project contains a component with duplicate file names in it. The upgrader keeps only one of these files and deletes the rest.</td>
<td>To avoid this problem, make sure that you do not have duplicate file names within the same component.</td>
</tr>
<tr>
<td>-2007 -2011 -2121 -2122</td>
<td>These errors occur if the upgrader cannot read information from the old table structure, or it cannot write information to the new table structure.</td>
<td>Once the file has been upgraded, you need to navigate to the areas that failed and reinsert your settings.</td>
</tr>
<tr>
<td>-6020</td>
<td>The scripting billboard is no longer supported in the Basic MSI project. This property is not being upgraded.</td>
<td>To add support for this property after your project is upgraded, you can convert your project to an InstallScript MSI project and add your billboards in the Support Files/Billboards view.</td>
</tr>
<tr>
<td>-6021</td>
<td>The path variable cannot contain apostrophes, which are invalid characters. The name is being changed.</td>
<td>To build your project successfully, update all references to this path variable after the project is upgraded.</td>
</tr>
<tr>
<td>-6022</td>
<td>Could not open the MSI file specified in a custom action. The source property is not being converted.</td>
<td>To build your project successfully, enter the product code of the MSI file in the custom action’s Source property after the project is upgraded.</td>
</tr>
<tr>
<td>-6023</td>
<td>The necessary code page is not installed on your system. The associated string table values are not being upgraded correctly.</td>
<td>Install the appropriate code page prior to project upgrade.</td>
</tr>
</tbody>
</table>
ISRegSrv.dll is the InstallShield DLL that is called from custom actions to register and unregister self-registering files on the target system. The DLL displays the Windows Installer run-time error 1904 or 1905 when it fails for particular reasons.

[3] could be one of InstallShield's custom HRESULTs.

Table 15 • HRESULT Values for Windows Installer Run-time Errors

<table>
<thead>
<tr>
<th>HRESULT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-2147220475</td>
<td>Invalid file extension as a self-register file.</td>
</tr>
<tr>
<td>-2147220474</td>
<td>Executable file extension, but not actually an executable.</td>
</tr>
<tr>
<td>-2147220473</td>
<td>Generic registration failure.</td>
</tr>
<tr>
<td>-2147220472</td>
<td>Generic unregistration failure.</td>
</tr>
</tbody>
</table>
## DIFxAPI Errors (InstallScript Projects)

This table lists DIFxAPI errors that can be returned calling DIFx driver functions. If the return value from a DIFx driver function is a Win32 error (a positive return value), ISERR_WIN_BASE is added to the error so that it is less than ISERR_SUCCESS. For the most updated documentation on Win32 errors, see the MSDN Library.

Table 16 • DIFxAPI Errors (InstallScript)

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ISERR_ISERVICE_NOT_ENABLED</strong></td>
<td>Indicates that DIFx support has not been enabled or was disabled using Disable (SERVICE_DIFX_*). For information on enabling DIFx support, see Installing Device Drivers.</td>
</tr>
<tr>
<td><strong>ISERR_WIN_BASE + ERROR_INVALID_FUNCTION</strong></td>
<td>Indicates that the difxapi.dll was not found (in SUPPORTDIR) or that an exported function could not be found. Verify that you have enabled DIFx support in your project.</td>
</tr>
<tr>
<td><strong>ERROR_DEPENDENT_APPLICATIONS_EXIST</strong></td>
<td>The function removed an association between the driver package and the specified application but the function did not uninstall the driver package because other applications are associated with the driver package.</td>
</tr>
<tr>
<td><strong>ISERR_WIN_BASE + ERROR_ALREADY_EXISTS</strong></td>
<td>The driver package is already preinstalled and was not preinstalled again.</td>
</tr>
<tr>
<td><strong>ISERR_WIN_BASE + ERROR_INSUFFICIENT_BUFFER</strong></td>
<td>The pDestInfPath buffer is not large enough to retrieve the requested .inf file path.</td>
</tr>
<tr>
<td><strong>ISERR_WIN_BASE + ERROR_FILE_NOT_FOUND</strong></td>
<td>The specified .inf file was not found.</td>
</tr>
<tr>
<td><strong>ERROR_DRIVER_PACKAGE_NOT_IN_STORE</strong></td>
<td>An .inf file does not exist in the driver store that corresponds to the .inf file specified by DriverPackageInfPath.</td>
</tr>
<tr>
<td><strong>ISERR_WIN_BASE + ERROR_NO_MORE_ITEMS</strong></td>
<td>This error code applies only if the DRIVER_PACKAGE_ONLY_IF_DEVICE_PRESENT constant is specified but the DRIVER_PACKAGE_FORCE constant is not specified. In this case, the function did not preinstall the specified driver package because, although the specified driver package matched devices in the device tree, the driver already installed for each such device is a better match for the device than the specified driver package. This applies to present and nonpresent devices.</td>
</tr>
<tr>
<td><strong>ERROR_NO_SUCH_DEVINST</strong></td>
<td>This error code applies only if the DRIVER_PACKAGE_ONLY_IF_DEVICE_PRESENT constant is specified. The function did not preinstall the specified driver package because the driver package does not match a device in the device tree. This applies to present and nonpresent devices.</td>
</tr>
</tbody>
</table>
## Table 16 • DIFxAPI Errors (InstallScript) (cont.)

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERROR_NO_DEVICE_ID</td>
<td>The driver package does not specify a hardware ID or compatible ID that is supported by the current platform.</td>
</tr>
<tr>
<td>ERROR_MISSING_FILE</td>
<td>The function did not preinstall the driver package because files referenced by the .inf file could not be found.</td>
</tr>
<tr>
<td>ISERR_WIN_BASE + ERROR_CANNOT_MAKE</td>
<td>The function did not preinstall the driver package.</td>
</tr>
<tr>
<td>TRUST_E_NOSIGNATURE</td>
<td>The driver package is not signed.</td>
</tr>
<tr>
<td>CERT_E_EXPIRED</td>
<td>The certificate used to sign the driver package is expired.</td>
</tr>
</tbody>
</table>
| CERT_E_WRONG_USAGE | The certificate for the driver package is not valid for the requested usage. If the driver package does not have a valid WHQL signature, the function returns this error code in the following two situations
- In response to a driver signing dialog box, the user chose not to install the driver package.
- The DRIVER_PACKAGE_SILENT constant is specified. |
| CRYPT_E_FILE_ERROR | The catalog file for the driver package was not found, or possibly, some other error occurred when the function attempted to verify the driver package signature. |
| ERROR_INVALID_CATALOG_DATA | The catalog file for the driver package is not valid or was not found. |
| ERROR_SIGNATURE_OSATTRIBUTE_MISMATCH | The certificate is not valid for the current Windows version or it is expired. |
| ISERR_WIN_BASE + ERROR_SHARING_VIOLATION | A component of drive package in the driver store is locked by a thread or process. This can occur, if a process or thread, other than the thread or process being called, is currently accessing the same driver package. |
| ISERR_WIN_BASE + ERROR_ACCESS_DENIED | Only members of the Administrators group can access this functionality. |
| ISERR_WIN_BASE + ERROR_BAD_ENVIRONMENT | The Windows version on which this call was made does not support this operation. |
| ISERR_WIN_BASE + ERROR_INVALID_PARAMETER | A supplied parameter is not valid. |
| ISERR_WIN_BASE + ERROR_INVALID_NAME | The specified .inf file path is not valid. |
"String PRODUCT_NAME was not found in string table" Error

While converting an InstallScript MSI project to an InstallScript project, you may encounter this error when your setup project does not run during the conversion. You should verify if SHELL_OBJECT_FOLDER = \@PRODUCT_NAME; is in your script.

Note • Setting SHELL_OBJECT_FOLDER in OnFirstUIBefore is not necessary. If you have the following line in your script, you should delete it:

SHELL_OBJECT_FOLDER = \@PRODUCT_NAME;"

InstallScript Error Information

The InstallScript compiler displays error messages in the Output window. This window, which is normally positioned near the bottom of the main window, has a Compile tab. If the Output window is not present, on the View menu in InstallShield, click Output.

The following types of error messages are displayed to identify errors in your setup script:

Table 17 • Error Message Types

<table>
<thead>
<tr>
<th>Error Message Type</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Warnings</td>
<td>C7501 through C7503</td>
</tr>
</tbody>
</table>
InstallScript Syntax or Compiler Errors

Syntax errors prevent the file Setup.inx from being created and cause the compiler to display one of the error messages in the list below. A single syntax error can cause the compiler to generate more than one error message. The first error message is triggered by the syntax error. The others are triggered because the compiler is not able to resolve the statement or statements that follow the error.

Tip • If your script generates more than one syntax error, correct the first one in the list and then recompile. By correcting the first error, you might eliminate one or more of the others.

Table 18 • InstallScript Syntax or Compiler Errors

<table>
<thead>

### Error C8001

**Message**

'program' : multiple main programs defined

**Description**

The keyword program was encountered after the main program block.

**Troubleshooting Tips**

A script can contain only one main program block—beginning with the keyword program and ending with the keyword endprogram. Restructure your script to use only one main program block.

If your script consists of multiple source files, this error message occurs if more than one of those source files contains a main program block.

---

*Errors and Warnings*
Error C8002

**Message**

'text' : function name expected

**Description**

The compiler expected to encounter a function name at the location indicated by text.

**Troubleshooting Information**

Check for a missing or mistyped function name before a parameter list.

Check for missing semicolons in preceding lines.

Error C8003

**Message**

'name' : function has no prototype declaration

**Description**

The function specified by name has not been declared in a prototype statement.

**Troubleshooting Information**

If the function has not been declared, insert a prototype statement before the current block (main program or function definition).

If the function has been declared ahead of the current block, compare the function declaration in the prototype statement with the function header in the function definition. Be sure the spelling of the function name is identical in both places and that the number and types of parameters matches.

If the function has been declared later in the script, move the declaration before the current block.

Error C8004

**Message**

'name' : identifier already declared

**Description**

The identifier specified by name has already been declared in the current block. Identifiers can be declared only once in the same block.
Troubleshooting Information

Examine the main program block or function block where the error occurred to find the first declaration of the identifier. If the second declaration is simply a duplicate of the first, delete it. If you intended the second declaration to be a different variable than the first, rename the identifier in the second declaration and update all statements in the script that reference it.

If you cannot find a previous declaration of the variable, you may be declaring an identifier whose name is reserved in InstallScript. Reserved words are syntax colored in the script editor.

Error C8005

**Message**

'name' : function was declared as DLL function

**Description**

The function definition for the function specified by name is invalid because that function has been declared in a prototype statement as a DLL function.

**Troubleshooting Information**

If the function is not a DLL function, remove the DLL file name from the function prototype.

If the name of the user-defined function conflicts with the DLL function name, rename the user-defined function and update all statements in the script that reference it. Be sure the user-defined function has been declared in a prototype statement.

Error C8006

**Message**

'text' : missing '(' after function name

**Description**

The compiler expected to find the opening parenthesis that follows a function name in a function definition; the character or characters indicated by text were encountered instead.

**Troubleshooting Information**

Check that the function’s parameter list is enclosed within parentheses. If the function takes no parameters, the parentheses will be empty.

Verify that only space characters come between the function name and its parameter list.
Errors and Warnings

Error C8007

**Message**

'text' : comma expected

**Description**

The character or characters specified by text were encountered at a location where a comma was expected.

**Troubleshooting Information**

If the error occurred in a function declaration, then a comma required to separate parameter declarations is probably missing.

If the error occurred in a function call, then a comma required to separate parameters is probably missing.

Error C8008

**Message**

'text' : identifier expected

**Description**

The character or characters specified by text were encountered at a location where an identifier was expected.

**Troubleshooting Information**

If this error occurs in a variable declaration, check that the data type is followed by an identifier, with no intervening punctuation; check that the identifier contains only allowable characters.

If this error occurs in a function call, check that each pair of argument is delimited by one and only one comma.

Error C8009

**Message**

'text' : too many parameters

**Description**

The character or characters specified by text were encountered in a function call parameter list that contains more parameters than have been declared for the function.

**Troubleshooting Information**

To identify the argument or arguments that do not belong in the function call, compare the number and types of arguments in the function call to the number and types of parameters declared for that function.
Error C8010

Message
‘text’ : too many parameters

Description
The character or characters specified by text were encountered at a location where a right parenthesis was expected.

Troubleshooting Information
This error is usually triggered when the right parentheses is missing from the parameter list of a function header in a function definition.

Error C8011

Message
‘end’ : missing ‘begin’ at start of function

Description
The keyword begin is missing in a function declaration.

Troubleshooting Information
Insert the keyword begin before the first statement in the function. Local variable declarations should appear between the function header and the keyword begin. The function header itself should not be terminated with a semicolon.

Error C8012

Message
‘text’ : semicolon expected

Description
The character or characters specified by text were encountered at a location where a semicolon was expected.

Troubleshooting Information
Insert a semicolon to terminate the statement that appears just before the error location.
Error C8013

Message
unexpected end of source file

Description
The compiler reached the end of the source file without encountering the keyword required to close the current program or function block.

Troubleshooting Tips
- If your script contains function definitions, check that each function definition is terminated with the keyword end and a semicolon.
- Check that typedef blocks are closed with an end statement.
- Check that all flow control blocks are correctly closed.
- Check that all #if, #ifdef, and #ifndef statements have a matching #endif statement.

Error C8014

Message
'name' : identifier already defined

Description
The identifier specified by name has already been declared in the structure.

Troubleshooting Information
Examine the script and any scripts included before the error location to find the first declaration of the identifier. If the second declaration is simply a duplicate of the first, delete it. If you intended the second declaration to create a different identifier than the first, rename the identifier in the second declaration and update all statements in the script that reference it.

Error C8015

Message
'name' : member name already defined

Description
The member identified by name has already been declared in the structure.
Troubleshooting Information

Examine the structure in which the error occurred to find the first declaration of the member. If the second declaration is simply a duplicate of the first, delete it. If you intended the second declaration to be a different member than the first, rename the member in the second declaration and update all statements in the script that reference it.

Error C8016

Message
'name' : undefined label:

Description
The identifier specified by name is used in a goto statement to reference a label that has not been defined.

Troubleshooting Information

The error is located in the block directly above the error location. Find the goto statement that references name. If the goto statement is in a program block, it must reference a label that has been defined in the program block. If the goto statement is in a function definition, it must reference a label that has been defined in that function definition. Determine where you want control to flow and define the label at that location.

Error C8017

Message
'text' : expected typedef (struct) name

Description
The character or characters specified by text were encountered at a location where a typedef declaration was expected.

Troubleshooting Information

Check that a data type has been specified for the variable being declared. Verify that the reserved word for that data type is spelled correctly and is in all upper case.

If more than one variable is declared for that data type, check that the individual identifier names are separated by commas and not some other punctuation mark.

Verify that the data declaration is terminated with a semicolon.

If the error occurs in a function prototype that declares a pointer to a structure as a parameter, check that the structure has been declared ahead of the function prototype.
Error C8018

Message
'text' : typedef object illegal in this context

Description
The structure type specified by text was encountered at a location where it is not allowed.

Troubleshooting Information
This error occurs in a function prototype that declares a structure type as one of its parameters. This is not allowed. Instead, declare the parameter as a pointer to a structure by following the name of the structure type with the keyword POINTER, as shown below:

```c
typedef RECT
begin
  SHORT sX;
  SHORT sY;
end;

RECT Rectangle;
RECT POINTER pRect;

prototype SizeRectangle(RECT POINTER);
```

Error C8019

Message
'text' : expected type declaration

Description
The character or characters specified by text were encountered at a location where a data declaration was expected.

Troubleshooting Information
This error generally occurs when a semicolon is missing at the end of a data declaration in a line ahead of the error location. It also occurs in a function definition when the function header is terminated with a semicolon.

Error C8020

Message
'text' : parameter list expected
Description
The character or characters specified by text were encountered immediately after a prototype declaration for which there was no parameter list.

Troubleshooting Information
Specify the parameter list for the function above the error location. If the function takes no parameters, specify an empty list by placing opening and closing parenthesis after the function name.

Error C8021

Message
'text' : missing 'begin' after 'typedef'

Description
The character or characters specified by text were encountered in a typedef statement where the keyword begin was expected. In a typedef statement, the keyword begin must follow the structure name.

Troubleshooting Information
Insert the keyword begin after the structure name, with no intervening punctuation.

Error C8022

Message
'text' : comma or semicolon expected

Description
The character or characters specified by text were encountered at a location where a comma or semicolon was expected.

Troubleshooting Information
If this error occurs near a data declaration, check that the identifier is valid and that the data declaration is terminated with a semicolon. If two or more identifiers are being declared in the same statement, verify that they are delimited by commas.

Error C8023

Message
'text' : right bracket expected
Errors and Warnings

**Description**
The character or characters specified by text were encountered at a location where a right bracket was expected.

**Troubleshooting Information**
This error occurs when the closing right bracket is missing from a reference to an array.

**Error C8024**

**Message**
'`text`': invalid array/string size

**Description**
The character or characters specified by text may not be used to declare the size of a string or array.

**Troubleshooting Information**
If the size indicator is a constant, verify that it is spelled correctly.
Verify that the size of the array is greater than 0.

**Error C8025**

**Message**
'`text`': undefined identifier

**Description**
The identifier specified by text has not been declared.

**Troubleshooting Information**
All identifiers in a script must be declared before they can be referenced in the main program block or in a function block. Check that the identifier has been declared. If it has, check that spelling used in the declaration matches the spelling of the identifier at the error location.

**Note**
*Your script might be calling an unsupported function. See [Unsupported Functions](#) for more information.*

**“INSTALLDIR”: undefined identifier** when Compiling After Conversion
Error C8025 specifies that the identifier (INSTALLDIR in this case) has not been declared. All identifiers in a script must be declared before they can be referenced in the main program block or in a function block.

**Note**
The exact error message for error C8025 is not a specific error. It is issued to anything undefined.
As part of the changes that take place during the conversion process (from InstallScript MSI to an InstallScript project), INSTALLDIR should have been changed to TARGETDIR throughout various IDE elements. Error C8025 occurs when the value of TARGETDIR is not set in your script.

Therefore, the value of TARGETDIR must be set in your script, as it is by default in the `OnFirstUILBefore` event handler function.

You can use the following code to set TARGETDIR:

```plaintext
if ( ALLUSERS ) then
    TARGETDIR = PROGRAMFILES ^ IFX_COMPANY_NAME ^ IFX_PRODUCT_NAME;
else
    TARGETDIR = FOLDER_APPDATA ^ IFX_COMPANY_NAME ^ IFX_PRODUCT_NAME;
```

### Error C8026

**Message**

'text' : invalid use of identifier

**Description**

The identifier specified by `text` is being used incorrectly in a statement.

**Troubleshooting Information**

This error message can be triggered by a number of errors, such as the use of a structure type name, rather than the structure name, in an operation. Examine the statement at the error location and check that all identifiers in the statement are being used correctly.

### Error C8027

**Message**

missing operand

**Description**

The compiler was unable to find the operand that was expected after an operator.

**Troubleshooting Information**

This error message may be displayed when the compiler encounters an incomplete statement ending with an operator at the end of the source file.

### Error C8028

**Message**

'text' : unresolved operator
Errors and Warnings

Description
The character or characters specified by text were encountered after an expression that could not be resolved.

Troubleshooting Information
This error occurs when an operand is missing from an expression. Examine each operator in the expression and make sure that each one has the operands it requires.

Error C8031

Message
'text' : uncalled function

Description
The character or characters specified by text were encountered after a function name, where the opening parenthesis of the argument list was expected.

This error occurs in statements in which the result of a function call is assigned to a variable. The message is triggered by an error in the argument list that follows the function name.

Troubleshooting Information
Check that the argument list is delimited from the function name by an opening parenthesis.
If the argument list was not specified, insert it after the function name; when calling a function that takes no parameters, place empty set of opening and closing parentheses after the function name.

Error C8032

Message
'text' : missing member reference

Description
The character or characters specified by text were encountered at a location were a member name was expected.

Troubleshooting Information
The line of code at the error location references a structure rather than a member of a structure. Determine which member of the structure you intended to reference and insert that member name. Remember to use the member operator to delimit the structure name and the member name.

Error C8033

Message
'text' : unsubscripted array
Description
The identifier that precedes the character or characters specified by text is an unsubscripted array variable. InstallScript does not allow references to a complete array structure. You must reference elements in the array individually.

Troubleshooting Information
Determine which element of the array you want to reference and indicate its position in the array with a subscript. The subscript must be placed within square brackets and positioned immediately after the array name.

Error C8034

Message
'text' : missing expression

Description
The character or characters specified by text were encountered at a location where an expression was expected.

Troubleshooting Information
This error generally occurs in an assignment statement when the value to be assigned is missing. Insert an expression to the right of the assignment operator. If the error occurs in a statement that references a constant, verify that the definition of that constant includes both the constant name and a value.

Error C8035

Message
'text' : statement label required

Description
The character or characters specified by text were encountered after the keyword goto, where a label is required.

Troubleshooting Information
Add a label after the keyword goto or delete the goto statement.

Error C8036

Message
'name' : too many arguments
Description
The function specified by name is being called with too many arguments.

Troubleshooting Information
Compare the arguments in the function call with the parameter list in the declaration for that function. Delete the argument or arguments in the function call that are not defined in the declaration.

Error C8037

Message
'text' : variable required

Description
The constant, literal value or structure member specified by text is being passed as an argument in a parameter position that requires a variable.

Troubleshooting Information
Declare a variable of the type required for the parameter; assign the constant or literal value to that variable; then pass the variable instead of the constant or literal value.

InstallShield does not allow a structure member to be passed by reference. Declare a variable of the same type as the structure member; assign the value of the structure member to the new variable; then pass the variable instead. When the function returns, assign the value of variable to the structure member.

Error C8038

Message
'text' : numeric value required

Description
The non-numeric argument specified by text was passed in a parameter position requiring a numeric argument.

Troubleshooting Information
Make sure all arguments passed are of the correct data types for the parameter positions they occupy. Also make sure no arguments are missing.

Error C8039

Message
'value' : string value required
Errors and Warnings

Description
The number specified by value was encountered in an expression, statement, or function argument that requires string data.

Troubleshooting Information
In a string operation, check that all operands and operators are compatible with string data.
In an assignment statement, verify that the value you are assigning to a string variable is itself a string.
In a function call, be sure that you are not passing non-string data in a parameter position that requires a string.

Error C8040

Message
'name' : incomplete argument list

Description
One or more arguments are missing in the call to the function specified by name.

Troubleshooting Information
To identify the missing argument, compare the number and types of arguments in the function call to the number and types of parameters for that function.
If all of the arguments are present, check that they are delimited by commas.

Error C8042

Message
'[' : string or array type required

Description
The identifier to the left of the bracket must be a string or array type.

Troubleshooting Information
This error occurs when you specify an index value for a variable that is not a string or array. Examine the identifier to the left of the bracket. If it is not a string or array, delete the index value or declare the variable as a string or array.

Error C8043

Message
'text' : typedef pointer type required
Errors and Warnings

Description
The character or characters specified by text can be used only with a pointer to a structure.

Troubleshooting Information
A common reason for this error is the use of a structure pointer operator between a structure name and a member name. The structure pointer operator can be used only to specify the member of a record that is referenced with a pointer to a structure. Replace the structure pointer operator with a member operator.

Error C8044

Message
'text' : typedef type required

Description
The character or characters specified by text can be used only with a structure that has been declared in a typedef statement.

Troubleshooting Information
A common reason for this error is the use of a member operator between a pointer to a structure and a member name. The member operator can be used only to specify the member of a structure that is referenced with a structure name. Replace the member operator with a structure pointer operator.

Error C8045

Message
'name' : member name not found

Description
The member specified by name does not exist in the structure you are referencing.

Troubleshooting Information
Check the structure definition for the specified member.
Check the spelling of the member name.

Error C8046

Message
numeric variable required
Description
A non-numeric argument was passed in a parameter position requiring a numeric variable.

Troubleshooting Information
Replace the argument with a numeric variable.

Error C8047

Message
'&': can only take address of variable

Description
The compiler encountered an address operation on a constant or literal.

Troubleshooting Information
The address operator (&) can be used only with a variable.

Error C8048

Message
macro name missing

Description
The #define statement at the error location has no macro name.

Troubleshooting Information
Insert a macro name after the #define preprocessor directive and before the macro value.

Error C8049

Message
missing expression for #if/#elif

Description
The #if or #elif preprocessor directive is not followed by a valid expression to determine the flow of compilation.

Troubleshooting Information
This error message is triggered if an expression has not been specified after an #if or #elif keyword. It can also be triggered if an invalid expression follows one of those directives.
Error C8050

**Message**
'text' : invalid expression for #if/#elif

**Description**
The character or characters specified by text are invalid in the expression following the #if or #elif preprocessor command.

**Troubleshooting Information**
This error message is triggered if an invalid expression after an #if or #elif keyword.

Error C8051

**Message**
missing end of string literal

**Description**
The string literal in a #define statement has no closing quotation mark.

**Troubleshooting Information**
Look for a #define statement above the line on which the error was detected. For a string constant, enclose the literal in opening and closing quotation marks. Numeric constants should not be enclosed within quotation marks.

Error C8052

**Message**
macro expansion text too large

**Description**
The text specified for the identifier in a #define statement exceeds 256 characters.

**Troubleshooting Information**
Either shorten the string specified for that identifier or divide the text into two or more shorter strings and specify each in a #define statement. Then concatenate the strings in your program.
Error C8053

**Message**

'name' : identifier not a #define macro

**Description**

The identifier specified by *name*, which is used in an #undef statement, has not been defined.

**Troubleshooting Information**

Check the spelling of the identifier specified by *name*.

Error C8054

**Message**

include file name missing

**Description**

The preprocessor directive #include does not specify the name of the file to include.

**Troubleshooting Information**

Specify the name of a source file you want to include or delete the preprocessor directive.

Error C8055

**Message**

#elif not preceded by #if

**Description**

The compiler encountered an #elif directive that was not preceded by an #if directive.

**Troubleshooting Information**

Examine the statements that precede the error location and restructure the conditional compile directives to start with an #if directive.

Error C8057

**Message**

#else not preceded by #if
Description
The compiler encountered an #else directive that was not preceded by an #if directive.

Troubleshooting Information
Examine the statements that precede the error location and restructure the conditional compile directives to start with an #if directive.

Error C8058

Message
#endif not preceded by #if

Description
The compiler encountered an #endif directive that was not preceded by an #if directive.

Troubleshooting Information
Examine the statements that precede the error location and restructure the conditional compile directives to start with an #if directive.

Error C8059

Message
'text' : unrecognized preprocessor command

Description
The character or characters specified by text and preceded by the symbol # is not recognized as a preprocessor command.

Troubleshooting Information
Verify that the preprocessor command is valid in an InstallShield script and that it is spelled correctly.

Error C8062

Message
'text' : constant operand required

Description
The character or characters specified by text were encountered in a statement where a constant was expected.
Troubleshooting Information
This error message is triggered in a switch...endswitch block when the keyword case is not followed by a constant or literal.

Error C8063

Message
input line too long

Description
A source code line exceeds 1,024 characters.

Troubleshooting Information
Divide the line into two or more lines.

Error C8064

Message
unterminated comment

Description
The comment that begins at the error location is not terminated.

Troubleshooting Information
Find the end of the comment. Insert comment termination characters or correct the comment termination characters if they were entered incorrectly.

Error C8065

Message
string literal exceeds 255 characters

Description
The string literal at the error location has more than 255 characters.

Troubleshooting Information
Divide the string literal into two or more string literals and concatenate them.
Errors and Warnings

Error C8066

**Message**

missing #endif statement at end of file

**Description**

An #if directive that appears in the script does not have a corresponding #endif directive.

**Troubleshooting Information**

Examine the preprocessor directives in your script. Make sure that all #if directives have a corresponding #endif directive.

Error C8067

**Message**

`number` : integer constant too large

**Description**

The value specified by `number` is too large for the number variable.

**Troubleshooting Information**

The valid range of NUMBER data is -2,147,483,648 and +2,147,483,647. If you specify a value in the range +2,147,483,647 to +4,294,967,295, that value will overflow and the result will be a negative number. If the value is greater than 4,294,967,299, this error message will be displayed.

Error C8068

**Message**

`char` : unrecognized character encountered

**Description**

The character specified by `char` was not recognized by the compiler.

**Troubleshooting Information**

Certain characters, such as “$” and “{,” are not recognized by the compiler.

Error C8069

**Message**

`#` : preprocessor command must be first on line
**Description**

The preprocessor directive identified by the symbol # was encountered at a location where it is not allowed. A preprocessor directive must be the first keyword in any line where it appears.

**Troubleshooting Information**

The symbol # is reserved to identify preprocessor directives. It has no other valid use in InstallScript. Examine the line that produced the error. If the symbol # appears in an identifier, rename that identifier there and everywhere else in the script where it is referenced.

---

**Error C8070**

**Message**

'text' : string constant expected

**Description**

The character or characters specified by text were encountered in a statement where a string constant was expected.

**Troubleshooting Information**

This error message is triggered in a switch...endswitch block when the keyword case is not followed by a string constant. In a switch...endswitch block, the constants specified in the case statements must be the same data type as the variable or expression result specified in the switch statement.

---

**Error C8071**

**Message**

colon expected

**Description**

The compiler expected a colon in the statement.

**Troubleshooting Information**

This error occurs in a switch statement when the constant after the keyword case is not followed by a colon. Insert a colon between the constants and the statements for that case.

---

**Error C8072**

**Message**

'elseif' : 'elseif' cannot follow 'else'
Errors and Warnings

Description
The keyword elseif was encountered after an else statement in an if...endif block.

Troubleshooting Information
The keyword elseif cannot be used in an if...endif block after an else statement. Restructure the if...endif block to avoid this error.

Error C8073

Message
'text' : missing 'then' keyword

Description
The character or characters specified by text were encountered in an if block where the keyword then was expected.

Troubleshooting Information
Locate the if statement that immediately precedes the error location. Insert the keyword then after the conditional expression that follows the keyword if.

Error C8074

Message
'else' : 'else' clause already encountered

Description
Two else statements were encountered in an if...endif block.

Troubleshooting Information
An if...endif block can include only one else branch. If you require multiple conditional branching, use an if...endif block that includes elseif statements or a switch...endswitch block instead.

Error C8075

Message
'text' : 'default' label already encountered

Description
A second default case was encountered in a switch...endswitch statement.
Troubleshooting Information

A switch...endswitch statement can include only one instance of the keyword default to specify a default case. Restructure the switch...endswitch statement to eliminate one of the default cases.

In some versions of InstallShield, this error message is displayed when multiple case labels are encountered in a switch block.

Error C8076

Message
'case' : multiple case labels for statement

Description
The compiler encountered the keyword case where it expected to find the statement or statements to be executed for the last defined case.

Troubleshooting Information
The case statement that immediately precedes the character or characters specified by text is incomplete. It may be missing a terminating semicolon.

In some versions of InstallShield, this error message is displayed when more than one default statement is encountered in a switch block.

Error C8077

Message
'name' : label already defined

Description
The label indicated by name has already been used in the main program block or function.

Troubleshooting Information
Each label in the program block or in a function block must be unique.

Error C8078

Message
label illegal in this 'for' loop

Description
You cannot define a label within a for statement.
Troubleshooting Tips
Examine the statement at the error location. Modify your code so that a label is no longer defined within the for statement.

Error C8079

Message
'text' : invalid statement

Description
The statement at the location indicated by text specifies a process that is not allowed or is invalid in the current context.

Troubleshooting Tips
Examine the statement at the error location. Verify that the process is valid. Examples of invalid statements are assignment statements with a constant or an arithmetic operation on the left side of the assignment operator and an end statement directly below a label.

If the statement at the error location is valid, examine statement blocks (such as record declarations, control statements and function definitions) in the lines above the error location. Verify that each statement block is terminated with the correct keyword.

Error C8080

Message
'text' : missing arguments for function

Description
The character or characters specified by text were encountered after a function call where an argument list was expected.

Troubleshooting Information
Determine which arguments are required by the function and revise the call to include a complete argument list within parentheses.

Error C8081

Message
'text' : invalid result for assignment
Description
The character or characters specified by text cannot be assigned the value specified by the assignment statement.

Troubleshooting Information
This error occurs when you attempt to assign a value to a structure. InstallScript does not allow direct assignment to a structure. You must assign a value to each member of the structure individually.

Error C8082

Message
'text' : missing '(' after switch

Description
The character or characters specified by text were encountered in a switch...endswitch block at a location where a left parenthesis was expected.

Troubleshooting Information
Examine the switch statement in which this error occurred. The expression that follows the keyword switch must be enclosed within parentheses.

Error C8083

Message
'text' : missing ')' after switch

Description
The character or characters specified by text were encountered in a switch...endswitch block at a location where a right parenthesis was expected.

Troubleshooting Information
Examine the switch statement in which this error occurred. The expression that follows the keyword switch must be enclosed within parentheses.

Error C8084

Message
'text' : missing 'case' after switch
Description
The character or characters specified by text were encountered in a switch...endswitch block at a location where a case statement was expected.

Troubleshooting Information
This error will occur if the switch statement is terminated with a semicolon or is not followed immediately by a case statement.

Error C8085

Message
'text' : missing '='

Description
The character or characters specified by text were encountered in a for...endfor block at a location where an equal sign was expected.

Troubleshooting Information
This error occurs when the equal sign is missing in the expression that follows the keyword for. Examine the for statement at which the error occurred and verify that the expression that follows the keyword for is structured correctly.

Error C8086

Message
'text' : missing 'to' or 'downto'

Description
The character or characters specified by text were encountered in a for...endfor block at a location where an equal sign was expected.

Troubleshooting Information
This error occurs when the keyword to or downto is missing in a for statement.

Error C8087

Message
cannot return value from program
Description
The main program block contains a return statement. You cannot return a value from a program.

Troubleshooting Information
Remove the return statement from the program block.

Error C8088

Message
'endif' : not inside if statement

Description
The keyword endif could not be matched to a previous if statement.

Troubleshooting Information
Examine the if...endif block at the error location. Verify that the keyword endif has a corresponding if statement. This error is often triggered after an earlier error in an if...endif block.

Error C8089

Message
'endfor' : not inside for statement

Description
The keyword endfor could not be matched to a previous for statement.

Troubleshooting Information
Examine the for...endfor block at the error location. Verify that the keyword endfor has a corresponding for statement. This error is often triggered after an earlier error in a for...endfor block.

Error C8090

Message
'until' : not inside repeat statement

Description
The keyword until could not be matched to a previous repeat statement.
Troubleshooting Information
Examine the repeat...until block at the error location. Verify that the keyword until has a corresponding repeat statement. This error is often triggered after an earlier error in a repeat...until block.

Error C8091

Message
'endwhile' : not inside while statement

Description
The keyword endwhile could not be matched to a previous while statement.

Troubleshooting Information
Examine the while...endwhile block at the error location. Verify that the keyword endwhile has a corresponding while statement. This error is often triggered after an earlier error in a while...endwhile block.

Error C8092

Message
'name' : function called but not defined

Description
The function specified by name has been prototyped and called in the body of the script, but it has not been defined.

Troubleshooting Information
This error can occur if the function name is not spelled identically in the prototype, the function call and the function definition. It can also occur if the function definition appears in a file that should have been included (with an #include statement) but was not.

Error C8093

Message
'name' : size required for string in typedef

Description
The identifier specified by name is a string that has been defined as a member in a typedef block, but it does not include a size specification.
Troubleshooting Information

Specify the size of all STRING declarations in a structure—InstallScript's autosizing feature does not work in typedef statements.

Error C8097

Message
'text' : syntax error

Description
The character or characters specified by text triggered an unclassified syntax error.

Troubleshooting Information
This error message is triggered for syntax errors for which there is not a specific error message.

Error C8098

Message
'text' : missing '.name' after DLL name

Description
The character or characters specified by text were encountered after a DLL file name, where a function in the DLL file was expected.

Troubleshooting Information
When calling a function from a DLL, specify the function name, not the DLL file name.

Error C8099

Message
'text' : DLL function name expected

Description
The character or characters specified by text were encountered after a DLL file name, where a function in the DLL file was expected.

Troubleshooting Information
This error occurs when the function name specified with a DLL file name has not been declared in a prototype statement. Verify that this function has been prototyped; if it has, check the spelling of the function name.
Error C8100

**Message**

'\textit{name}' : function not defined for this DLL

**Description**

The function specified by \textit{name} has not been prototyped for the DLL whose name precedes it.

**Troubleshooting Information**

This error occurs when you have prototyped functions from two or more DLLs and then called one of those functions with the wrong DLL name.

Error C8101

**Message**

'\textit{name}' : must specify DLL for this function

**Description**

The function specified by \textit{name} was prototyped twice from two different DLLs.

**Troubleshooting Information**

When calling functions with identical names from two or more DLLs, you must qualify the function name by prefixing it with the DLL name followed by a period, as in the example below:

```c
prototype MYDLL.UsefulFunction(INT, POINTER);
prototype YOURDLL.UsefulFunction(INT, POINTER);
export prototype MyFunc(HWND);

function MyFunc(HWND)
    NUMBER nValue;
    POINTER psvString;
begin
    MYDLL.UsefulFunction(nValue, psvString);
end;
```

Error C8112

**Message**

'\textit{name}' : typedef includes instance of self

**Description**

The data type of the member specified by \textit{name} is invalid. A typedef cannot contain a member that is an instance of itself.
Troubleshooting Information
Restructure your typedefs to avoid this error.

Error C8113

Message
'external' : local variables cannot be external

Description
The keyword external was encountered in data declaration within a function block.

Troubleshooting Information
Data that is local to a function cannot be declared external.

Error C8114

Message
'text' : preprocessor user define error

Description
This message is triggered by an #error directive.

Error C8115

Project • This information applies to InstallScript projects.

Message
'function name' : return type mismatch with prototype

Description
This message occurs when the return type of a script-defined function (the data type of the value returned by the function) is not the same in the function definition as it is in the function declaration. Note that if you do not explicitly specify a return type, the return type is assumed to be NUMBER.

Error C8126

Project • This information applies to InstallScript projects.
Errors and Warnings

Message
'text': string variable required

Description
The character or characters specified by text were encountered at a location where a string declaration was expected.

Troubleshooting Information
To declare an array other than a character array (that is, a string), use parentheses rather than brackets; for example:
NUMBER nArray(3);

Error C8127

Message
label illegal within try/catch/endcatch

Description
You cannot define a label within a try...catch...endcatch statement.

Troubleshooting Tips
Examine the statement at the error location. Modify your code so that a label is no longer defined within the try...catch...endcatch statement.

Error C8128

Message
goto illegal within try/catch/endcatch

Description
You cannot use a goto statement within a try...catch...endcatch statement.

Troubleshooting Tips
Examine the statement at the error location. Modify your code so that a goto statement is no longer used within the try...catch...endcatch statement.

Error C8522

Project • This information applies to InstallScript projects.
**Message**
Access is denied.

**Description**
InstallShield could not open the specified file.

**Troubleshooting Information**
This error message may occur because the specified file is read-only. In the Windows Explorer, locate the file and check its properties.

**InstallScript Fatal Errors**
Fatal errors are those that prevent the compilation from continuing. They are caused by missing include files, incorrectly specified file names, disk I/O errors, and insufficient system resources; the compiler also has certain built-in limitations, such as the limit on include files, that will trigger a fatal error if exceeded.

**Table 19 • InstallScript Fatal Errors**

</table>

Error F8501

Message
I/O error on action file

Description
An error occurred when InstallShield attempted to access an intermediate file created during compilation.

Troubleshooting Information
Each time you compile your setup, InstallShield creates intermediate files with the following file extensions: .dbg, .ino, .inx and .obs. After compilation, these files remain in the scripts folder. This message is displayed when an error occurs on an attempt to access the action file; that file has the extension .obs. Among the possible causes:

- The disk is full. Create more available disk space by deleting unwanted files; then compile again.
- There are insufficient system resources (file handles and/or memory). Close any other applications that are open; then compile again. If the error occurs on a system with sufficient disk space and system resources, investigate other obvious reasons why file access might fail:
  - The action file may be damaged. Rename it or delete it from the Scripts folder; then compile again.
  - If the action file is in a shared folder on a file server, verify that you have network rights to write to that folder.
  - If an action file exists from a previous compile, check that its file attributes have not been changed to read-only, system, or hidden. Check too that the file is not already open by another application or user.

Error F8502

Message
I/O error on debug file

Description
An error occurred when InstallShield attempted to access an intermediate file created during compilation.
Troubleshooting Information

Each time you compile your setup, InstallShield creates intermediate files with the following file extensions: .dbg, .ino, .inx and .obs. After compilation, these files remain in the scripts folder. This message is displayed when an error occurs on an attempt to access the debug file; that file has the extension .dbg. Among the possible causes:

- The disk is full. Create more available disk space by deleting unwanted files; then compile again.

- There are insufficient system resources (file handles and/or memory). Close any other applications that are open; then compile again. If the error occurs on a system with sufficient disk space and system resources, investigate other obvious reasons why file access might fail:
  - The debug file may be damaged. Rename it or delete it from the Scripts folder; then compile again.
  - If the debug file is in a shared folder on a file server, verify that you have network rights to write to that folder.
  - If a .dbg file exists from a previous compile, check that its file attributes have not been changed to read-only, system, or hidden. Check too that the file is not already open by another application or user.

Error F8503

Message
Can’t open script input file

Description
The compiler was unable to open the script file specified.

Troubleshooting Information
Verify the location and name of the file. You may have misspelled the file name or specified an incorrect path.

Error F8504

Message
Can’t open .inx output file

Description
The compiler was unable to create the file for the compiled script.

Troubleshooting Information
This error is generated if InstallShield cannot create or recreate the .inx file. Under normal circumstances, the following problems can cause this error:
- The disk is full. Create more available disk space by deleting unwanted files; then compile again.
• There are insufficient system resources (file handles and/or memory). Close any other applications that are open; then compile again. If the error occurs on a system with sufficient disk space and system resources, investigate other obvious reasons why file access might fail:
  • If the target file is in a shared folder on a file server, verify that you have network rights to write to that folder.
  • If an .inx file exists from a previous compile, check that its file attributes have not been changed to read-only, system, or hidden. Check too that the file is not already open by another application or user.

**Error F8505**

**Message**
Can’t open .dbg debug file

**Description**
The compiler was unable to create the debug file. This file contains the information required to run the script with the debugger.

**Troubleshooting Information**
The following problems will cause this error:
  • The disk is full. Create more available disk space by deleting unwanted files; then compile again.
  • There are insufficient system resources (file handles and/or memory). Close any other applications that are open; then compile again.

If the error occurs on a system with sufficient disk space and system resources, investigate other obvious reasons why file access might fail:
  • If the debug file is in a shared folder on a file server, verify that you have network rights to write to that folder.
  • If a .dbg file exists from a previous compilation, check that its file attributes have not been changed to read-only, system, or hidden. Check too that the file is not already open by another application or user.

**Error F8506**

**Message**
Out of memory

**Description**
The compiler was unable to allocate sufficient memory to complete the compilation.

**Troubleshooting Information**
Close any other applications that are open; then compile again. If the problem persists, restart Windows; then load InstallShield and compile again.
Error F8508

Message
too many macro expansions in line

Description
The specified line contains too many macros; the maximum number of macros per line is 100.

Troubleshooting Information
Reduce the number of macros on the line by breaking the line into two or more lines.

Error F8509

Message
invalid delimiter for include file name

Description
The file name specified after the preprocessor directive #include is missing the initial quotation mark or angled bracket (<).

Troubleshooting Information
File names specified with the preprocessor directive #include must be enclosed by quotation marks (“file name”) or angled brackets (<file name>). Insert a quotation mark or opening angled bracket before the file name. Note that if you insert an initial quotation mark, the file name must be followed by a closing quotation mark; if you insert an opening angled bracket, the file name must be followed by a closing angled bracket (>).

Error F8510

Message
missing delimiter for include file name

Description
The file name specified after the preprocessor directive #include is missing the closing quotation mark or angled bracket (<).

Troubleshooting Information
File names specified with the preprocessor directive #include must be enclosed by quotation marks (“file name”) or angled brackets (<file name>). Insert a quotation mark or closing angled bracket after the file name. Note that if the file name has an opening quotation mark, you must insert a quotation mark after the file name; if the file name has an opening angled bracket, you must insert a closing angled bracket (>).
Error F8511

Message
cannot open include file

Description
The compiler was unable to find or open a file that has been included in the script.

Troubleshooting Tips
The following problems can cause this error:

- The file name in an #include statement is misspelled.
- A file name in an #include statement is specified without a full path, but the file cannot be found in the source directory.
- You do not have rights to open files on the network drive where the file resides.
- The file is damaged.

Error F8512

Message
include file plus path is too large

Description
The path specified in an #include statement exceeds the maximum length of 256 characters

Troubleshooting Information
Move the included files to a folder that can be referenced with a path whose length is less than 256 characters.

Error F8513

Message
too many nested #include files

Description
InstallScript allows nesting of include files up to a maximum of 8 levels. This limit has been exceeded.

Troubleshooting Information
Reduce the number of nested levels.
Error F8514

**Message**
#if statements too deeply nested

**Description**
InstallScript allows nesting of #if statements up to a maximum of 10 levels. This limit has been exceeded.

**Troubleshooting Information**
Reduce the number of nested levels.

Error F8515

**Message**
macro expansion buffer overflow

**Description**
The expansion of macros in the error line exceeds the maximum of 1024 characters.

**Troubleshooting Information**
Restructure your code to eliminate this error.

Error F8516

**Message**
maximum error count reached

**Description**
The maximum number of errors specified on the Compile/Link tab of the Settings dialog box has been reached.

**Troubleshooting Information**
For more information about the Compile/Link tab of the Settings dialog box, see Compile/Link Tab.

Error F8517

**Message**
too many include files
Errors and Warnings

Description
The maximum number of include was exceeded.

Troubleshooting Information
A setup script can include no more than 100 source files. Combine two or more source files to bring the total number down to 100.

Error F8518

Message
I/O error on link file

Description
An error occurred when InstallShield attempted to write to the link file.

Troubleshooting Information
Each time you compile your setup, InstallShield creates intermediate files with the following file extensions: .dbg, .ino, .inx and .obs. After compilation, these files remain in the scripts folder. This message is displayed when an error occurs on an attempt to access the link file (.ino).

This error might be caused by the following:
- The disk is full. Create more available disk space by deleting unwanted files and then recompile.
- The link file is damaged. Rename it or delete it from Scripts folder and then recompile.

Error F8519

Message
user define fatal error

Description
This message is triggered by an #error directive.

InstallScript Internal Errors
An internal error may occur if syntax errors exist.

C9001 internal error
Error C9001

**Message**

'text': internal error

**Description**

The character or characters specified by text triggered an unclassified syntax error.

**Troubleshooting Information**

This error message is triggered by syntax errors for which there is not a specific error message.

InstallScript Warnings

The compiler issues warning messages to alert you to irregularities in the script that may result in inefficiencies or run-time errors.

⚠️

**Caution** • Warnings do not interrupt script compilation unless “Warnings as errors” is selected in the Compiler Settings dialog, or if the number of warnings exceeds the maximum specified. The default maximum value is 50.

<table>
<thead>
<tr>
<th>Warning Number</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>C7501</td>
<td>macro redefinition</td>
</tr>
<tr>
<td>C7502</td>
<td>string/array size exceeds recommended limit</td>
</tr>
<tr>
<td>C7503</td>
<td>function defined but never called</td>
</tr>
<tr>
<td>C7505</td>
<td>typedef definition differs from previous</td>
</tr>
</tbody>
</table>

Warning C7501

**Message**

'name': macro redefinition

**Description**

The identifier specified by name has already been used in a #define statement.

**Troubleshooting Information**

If the second definition is simply a duplicate of the first, delete it. If you intended the second definition to be different from the first, rename the identifier in the second definition and update all statements in the script that reference it.
Warning C7502

Message
'size' : string/array size exceeds recommended limit

Description
The numeric value specified by size indicates the size of a string or array that is larger than InstallScript's recommended maximum.

Troubleshooting Information
To avoid unexpected effects, reduce the size of the array.

Warning C7503

Message
'name' : function defined but never called

Description
The function specified by name is not called in your setup.

Troubleshooting Information
To reduce the size of your setup, remove the unused function from your script.

Warning C7505

Message
'name' : typedef definition differs from previous

Description
The data structure specified by name is defined in multiple library files (.obl files).

Troubleshooting Information
If the definitions are simply duplicates, delete all but one. If you intended the definitions to be different, rename the data structures to have unique names and update all statements in the script that reference them.
Virtualization Conversion Errors and Warnings

When you are converting a Windows Installer package to a virtual application, errors and warnings may occur. Some of the errors and warnings are applicable to any type of package virtualization, and others are specific to the virtualization solution for which you are preparing packages.

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>Unable to determine the full path for driver 'DriverName'</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this error when a driver referenced in the ODBCDataSource table is not being installed by the package.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>This error can be resolved in one of two ways:</td>
</tr>
</tbody>
</table>

    Editing the Windows Installer Package

1. Edit the package in InstallShield using Direct Edit mode.
2. Navigate to the ISVirtualPackage table.
3. Create an entry as follows to identify the full path of the missing driver:

    Name: <DriverName> Description
    Value: Path to Driver

    Manually Installing the Driver

Install the missing driver on your machine and then rebuild the Citrix profile.

<tr>
<td>Cause:</td>
<td>This Windows Installer package has an entry in the TypeLib or SelfReg table that contains COM data that InstallShield cannot convert to application data. Depending upon which file cannot be COM extracted, it is possible that this application will still work properly in Citrix XenApp isolation environment if you repackage this Windows Installer package with COM table mapping turned off. COM data is stored in the Windows Registry. So, if you repackage this Windows Installer package, the capture process will be able to obtain all of this data because it captures all modifications to the Registry and does not have to rely on COM extraction.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>To resolve this issue, you need to repackage your Windows Installer package with COM table mapping turned off.</td>
</tr>
</tbody>
</table>

## Error -9022: Complus Table

The following table documents this message:

### Table 23 • Error -9022: Complus Table

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Error</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'Complus'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this error when the Windows Installer package that you are converting includes a Complus table. During the conversion process, the Complus table is not read.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>The Complus table contains information needed to install COM+ applications. While Citrix XenApp supports communicating with COM+ applications, it does not support installing COM+ services. Therefore, this application cannot be deployed on Citrix XenApp.</td>
</tr>
</tbody>
</table>
Error -9024: FileSFPCatalog

The following table documents this message:

Table 24 • Error -9024: FileSFPCatalog

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Error</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'FileSFPCatalog'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this error when the Windows Installer package that you are converting includes a FileSFPCatalog table. During the conversion process, the FileSFPCatalog table is not read.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>The FileSFPCatalog table associates specified files with the catalog files used by system file protection. If this file is necessary for the function of the application, you need to use Repackager to repackage the application.</td>
</tr>
</tbody>
</table>

Warning -9026: LaunchCondition Table

The following table documents this message:

Table 25 • Warning -9026: LaunchCondition Table

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'LaunchCondition'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this warning when the Windows Installer package that you are converting includes a LaunchCondition table. During the conversion process, the LaunchCondition table is not read.</td>
</tr>
</tbody>
</table>
Warning -9027: LockPermissions Table

The following table documents this message:

Table 26 • Warning -9027: LockPermissions Table

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'LockPermissions'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this warning when the Windows Installer package that you are converting includes a LockPermissions table. During the conversion process, the LockPermissions table is not read.</td>
</tr>
</tbody>
</table>
| Resolution:   | The LockPermissions table is used to secure individual portions of your application (files, registry keys, and created folders) in a locked-down environment.  
Citrix does not support permissions on files, registry keys, or created folders. You cannot modify permissions on any of the application’s ACLs (access control lists). Because users will have full permissions when running this application in the isolation environment, this warning will not result in any problems. |
Error -9028: MoveFile Table

The following table documents this message.

Table 27 • Error -9028: MoveFile Table

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Error</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'MoveFile'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this error when the Windows Installer package that you are converting includes a MoveFile table. During the conversion process, the MoveFile table is not read.</td>
</tr>
</tbody>
</table>
| Resolution: | This MoveFile table contains a list of files to be moved or copied from a specified source directory to a specified destination directory. Because this table is not read, you need to do one of the following to resolve this issue:  
  - Option 1: Edit the Windows Installer Package—Open the Windows Installer package in InstallShield and modify it to eliminate the use of the MoveFile table by installing additional files in the specified directories.  
  - Option 2: Repackage the Application—Use the Repackaging Wizard to repackage this application, and then build the Repackager project to generate a revised Windows Installer package.  
  - Option 3: Write a Pre-Launch Script—Write a pre-launch script that performs the file moving operations identified in the MoveFile table upon application launch. |

Error -9029: MsiDriverPackages Table

The following table documents this message.

Table 28 • Error -9029: MsiDriverPackages Table

Warning -9130: Duplicate Shortcut Targets

The following table documents this message:

Table 67 • Warning -9130: Duplicate Shortcut Targets

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>'ShortcutName' shortcut already exists in the profile, but with different target. A new unique shortcut 'NewShortcutName(1)' will be created in the profile.</td>
</tr>
<tr>
<td>Cause:</td>
<td>There are two shortcuts defined in this profile that have the same name, even though they have different targets.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>On the Citrix Assistant Profile Shortcuts page, rename one of these shortcuts and then rebuild the profile.</td>
</tr>
</tbody>
</table>
Warning -9131: Unable to Resolve Installer Variable

The following table documents this message:

Table 68 • Warning -9131: Unable to Resolve Installer Variable

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>Unable to resolve an installer variable in the string 'StringName'</td>
</tr>
<tr>
<td>Cause:</td>
<td>Not all Windows Installer variables can be resolved at build time. This can result in errors if your application requires a specific value.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>Repackage this application and rebuild the profile, or use a constant value in the Windows Installer package.</td>
</tr>
</tbody>
</table>

Warning -9132: 16 Color Shortcut Icon Not Found

The following table documents this message:

Table 69 • Warning -9132: 16 Color Shortcut Icon Not Found

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>No 16 color icon found for 'ShortcutName' shortcut. Shortcut icon may look distorted when published.</td>
</tr>
<tr>
<td>Cause:</td>
<td>The icon used for this shortcut does not contain a 16-color image. Since Citrix currently does not support images with a higher number of colors, this icon may look distorted when shown and published in Citrix XenApp.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>You can modify the shortcut to use a different icon or add a 16-color image to the one currently used.</td>
</tr>
</tbody>
</table>

Warning -9133: Shortcut Icon Not Found

</table>
Warning -9134: Failure to Extract Icon from Executable

The following table documents this message:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type:</strong></td>
<td>Warning</td>
</tr>
<tr>
<td><strong>Message:</strong></td>
<td>Failed to extract icon from executable 'filename'. Make sure the executable is not corrupt.</td>
</tr>
<tr>
<td><strong>Cause:</strong></td>
<td>A corrupt icon file may cause this warning.</td>
</tr>
<tr>
<td><strong>Resolution:</strong></td>
<td>Modify the shortcut to use a different icon.</td>
</tr>
</tbody>
</table>

Error -9135: Shortcut Target is 16-Bit

The following table documents this message:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type:</strong></td>
<td>Error</td>
</tr>
<tr>
<td><strong>Message:</strong></td>
<td>The target for shortcut 'ShortcutName' is 16-bit. This application may not function properly in the Citrix Isolation Environment.</td>
</tr>
<tr>
<td><strong>Cause:</strong></td>
<td>The file this shortcut points to is a 16-bit application.</td>
</tr>
<tr>
<td><strong>Resolution:</strong></td>
<td>Replace file with a newer 32-bit version. Can also test and see if the application works properly in the Citrix environment.</td>
</tr>
</tbody>
</table>
Warning -9136: Some Files May Not Be Decompressed

The following table documents this message:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>Some files may not be decompressed from this package because it contains features with a default install level of 0.</td>
</tr>
<tr>
<td>Cause:</td>
<td>When installing a compressed Windows Installer package, the build engine runs an administrative installation of it to decompress it. One limitation of an administrative installation is that it does not decompress a file if the feature it is contained in has a default install level of 0. If there are any files in any components contained within those features, InstallShield will generate an error when it attempts to copy those files into the Citrix profile, because they will not exist in the source location.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>To resolve this issue, edit the Windows Installer package and set the default install level of that feature to something other than 0.</td>
</tr>
</tbody>
</table>

Warning -9137: Destination Directory Cannot Be Found

The following table documents this message:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>The destination directory for the 'FileName' file cannot be found. You should consider Repackaging this application before proceeding with the conversion process.</td>
</tr>
<tr>
<td>Cause:</td>
<td>This is an internal error.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>Contact InstallShield Technical Support.</td>
</tr>
</tbody>
</table>
### Warning -9138: Ignoring a DuplicateFile Table Entry

The following table documents this message:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>Ignoring a DuplicateFile table entry because unable to resolve the property used for the DestFolder: 'INVALIDPATH'</td>
</tr>
<tr>
<td>Cause:</td>
<td>You might encounter this error when the Windows Installer package that you are converting includes one or more entries in the DuplicateFile table, and a property that is used in the DestFolder column for one of those entries in the DuplicateFile table cannot be resolved. For example, if the destination for a duplicate file is set by a custom action, that destination cannot be resolved during the conversion.</td>
</tr>
</tbody>
</table>
| Resolution:   | The DuplicateFile table contains a list of files that need to be duplicated during installation, either to a different directory than the original file or to the same directory but with a different name. Because a destination in this table cannot be resolved, you need to do one of the following to resolve this issue:  
  - **Option 1: Edit the Windows Installer Package**—Open the Windows Installer package in InstallShield and modify it to eliminate the use of the problematic entry in the DuplicateFile table by including any additional copies of that file.  
  - **Option 2: Repackage the Application**—Use the Repackaging Wizard to repackage this application, and then build the Repackager project to generate a revised Windows Installer package.  
  - **Option 3: Write a Pre-Launch Script**—Write a pre-launch script that—upon application launch—performs the file copy operations for the problematic entry in the DuplicateFile table. |

### Warning -9150: Warning Building Windows Installer Package

The following table documents this message:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>

</tr>
</tbody>
</table>
Steps to Take Before Calling Technical Support

Before contacting InstallShield Technical Support, perform the following steps to attempt to clearly identify the problem you are having:

- **Check package**—To determine if this error is caused by a problem with the specific package you are converting, try to build a Citrix profile of a simple package that contains only one file.

- **Check machine and OS**—To determine if this error is caused by a configuration on a particular machine or operating system, attempt to build this Citrix profile on another machine or operating system.

- **Check individual files**—To determine if this is error limited to a specific item, find out if removing or excluding a particular item will build error free.

Application Features Requiring Pre- or Post-Conversion Actions

Some application features are ignored when creating a Citrix profile. Therefore, some additional pre- or post-conversion actions must be taken in order for the virtual application to work.
The following table lists the application features which require additional, manual conversion steps:

### Table 128 • Application Features Ignored During Profile Conversion

<table>
<thead>
<tr>
<th>Windows Installer Feature</th>
<th>Manual Conversion Steps</th>
</tr>
</thead>
</table>
| User-Defined Custom Actions | When converting a Windows Installer package to a Citrix profile, all custom actions are ignored. For user-defined custom actions, a warning message is generated. Any modifications to a target machine that a custom action in this Windows Installer package may create will not be propagated into the Citrix profile. The resolution that you should perform depends upon the purpose of the custom action:  
  - If the custom action merely automatically enters a value or makes some other kind of minor modification, you can ignore this warning.  
  - If the custom action does something which could change the behavior of the installation (such as setting a Property), you may need to resolve this issue. To resolve this issue, first attempt to launch the converted package on Citrix XenApp. If you receive any application errors, you need to repackage this application, by performing the following steps. **To successfully convert a package with user-defined custom actions:**  
  1. Use the Repackaging Wizard to repackage this application. The Repackaging Wizard monitors system changes as an application is installed, and then that data is converted into a Repackager project.  
  2. Build the Repackager project to generate a revised Windows Installer package. This new Windows Installer package does not contain any custom actions, but (as a result of being repackaged) it will include the functionality performed by the original custom action. |
| Services                  | Citrix XenApp does not support any type of services. Therefore, to resolve this issue, you need to install any required services outside of the isolation environment on the user desktop machines. **To successfully convert a package with services:**  
  1. If you have an application and a service bundled in the same Windows Installer package, you need to create a separate Windows Installer package containing just the service.  
  2. Install the service on each of the user desktop machines. The Citrix profile of this application should now be able to run in an isolation environment on machines that already have the service installed. |
While Citrix XenApp supports communicating with COM+ applications, it does not support installing COM+ services. Therefore, an application that contains COM+ services cannot be deployed on Citrix XenApp.

Automation Interface

The InstallShield Help Library explains how to use the InstallShield interface to author all elements of your installation and then build a release. For advanced developers, InstallShield exposes a COM interface that allows you to perform many of the same tasks from a program, such as a Visual Basic executable, or a script, such as a VBScript file in Windows Scripting Host. By calling methods, setting properties, accessing collections, and so on, through the automation interface, you can open a project and modify its features and component data in many of the same ways that you would in the InstallShield interface.

The highest-level object in the automation interface is the ISWiProject object. The first thing you must do to access the interface is create this object. Then, you can use its objects, methods, and properties to modify your project.

Note • The automation interface affects a project only at design time and not run time.

For information on automation interface support in Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, and Merge Module projects, see the following sections:

- Automation Objects
- Automation Collections

For information on automation interface support in Advanced UI and Suite/Advanced UI projects, see the following sections:

- Automation Objects for Advanced UI and Suite/Advanced UI Projects
- Automation Collections for Advanced UI and Suite/Advanced UI Projects

Automation Objects

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Each InstallShield automation object represents an installation element such as a feature, a component, or a file. This section describes each of the InstallShield automation objects.

The highest-level object in the automation interface is the ISWiProject object. The first thing you must do to access the interface is create this object. Then, you can use its objects, methods, and properties to modify your project.

Note • The examples provided in the Automation Objects subsections use Visual Basic sample code, not VBScript.
ISWiProject Object

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Project-specific differences are noted where appropriate.

Note • The examples provided in the Automation Objects subsections use Visual Basic sample code, not VBScript.

ISWiProject contains the interface for opening, closing, and saving an InstallShield project file (.ism or .dim). When InstallShield is installed on your system, you can instantiate a copy of ISWiProject with the following VB and VBScript syntax:

```
Set m_ISWiProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
```

To open an installation project, call the OpenProject method, as follows:

```
' Build path to the .ism file
strFile = "C:\InstallShield 2021 Projects\Test.ism"
m_ISWiProject.OpenProject strFile
```

Important • If you are using the automation interface on a 64-bit machine, you may need to load the automation interface through a 32-bit executable file. Otherwise, you may encounter an error when you instantiate a copy of ISWiProject, or any other object. For more information, see Using the Automation Interface on a 64-Bit System.

Build Status Events

The ISWiProject object raises the following status events:

- Public Event ProgressIncrement(ByVal lIncrement As Long, pbCancel As Boolean)
- Public Event ProgressMax(ByVal lMax As Long, pbCancel As Boolean)
- Public Event StatusMessage(ByVal sMessage As String, pbCancel As Boolean)

These events are raised during the build process and provide status updates. You can set pbCancel to stop the build. For sample code that demonstrates how to use these events, see Using Build Status Events.

Many feature properties and attributes are available in the automation interface through this object’s methods, properties, and collections. The following table lists the ISWiProject Object members. Remember that some methods, properties, and collections are only available for a particular project type.
### Members

**Table 1 • ISWiProject Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>

### Table 1 • ISWiProject Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISWiUpgradeTableEntries</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Collection</td>
<td>Returns a collection of ISWiUpgradeTableEntry items. This collection presents a list of static major upgrade items, as defined in the IDE.</td>
</tr>
<tr>
<td>MergeModuleSearchPath</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Read-Write Property</td>
<td>Specifies one or more comma-delimited folders that contain the merge module (.msm) files referenced by your project.</td>
</tr>
<tr>
<td>MinimumTargetDotNetVersion</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Read-Write Property</td>
<td>Specifies the minimum version of the .NET Framework that the installation requires on the target system. This parameter is optional. The default is the latest version of the .NET Framework the InstallShield interface supports.</td>
</tr>
<tr>
<td>MinimumTargetMSIVersion</td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Read-Write Property</td>
<td>Specifies the minimum version of Windows Installer that the installation requires on the target system. This parameter is optional. The default is the latest version of Windows Installer that the InstallShield interface supports.</td>
</tr>
</tbody>
</table>
| ModuleID and ModuleIDGUID   | Merge Module       | Read-Write String Properties | These properties are used only with merge module projects. Every merge module has a record in the ModuleSignature table. The ModuleID field of the ModuleSignature table is composed of two sections: ModuleID.ModuleIDGUID. For example, for a ModuleID value of IDID.019880FB_04F2_4D4B_99C9_9A0A12185229, the ModuleID and ModuleIDGUID properties of the ISWiProject object enable the following:  
  - The ModuleID property gets or sets IDID.  
  - The ModuleIDGUID property gets or sets 019880FB_04F2_4D4B_99C9_9A0A12185229. |

**Note** • If you plan to use the ISWiRelease.Build method, you should set this property.
## Table 1 • ISWiProject Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| **OnUpgrade** | Basic MSI, InstallScript MSI | Read-Write Property | Gets or sets the value for the Small/Minor/Upgrade Settings options on the Common tab in the Upgrades view. This property lets you specify whether you want end users to be prompted before proceeding with the upgrade. A Setup.exe setup launcher is required for this functionality. Available options are:  
  - **eouPrompt (1)**—Prompt.  
  - **eouUpgrade (2)**—Do not prompt the end user; just install the upgrade.  
  - **eouNoOp (0)**—Disable any prompts. Your installation should detect the upgrade scenario and run the installation in upgrade mode. |
<p>| <strong>OpenProject</strong> | Basic MSI, DIM, InstallScript InstallScript MSI, InstallScript Object, Merge Module | Method            | Opens an InstallShield installation project file (.ism or .dim). This method fails if the project is open in the InstallShield user interface.        |
| <strong>PackageCode</strong> | Basic MSI, InstallScript MSI | Read-Write Property | Gets or sets the <strong>package code</strong> as a string GUID. The GUID must be surrounded by braces—{12345678-1234-1234-1234-1234567890AB}, for example. |
| <strong>ProductCode</strong> | Basic MSI, InstallScript InstallScript MSI, InstallScript Object | Read-Write Property | Gets or sets the <strong>product code</strong> as a string GUID. The GUID must be surrounded by braces—{12345678-1234-1234-1234-1234567890AB}, for example. This property is not available for merge module projects. |
| <strong>ProductName</strong> | Basic MSI, DIM, InstallScript InstallScript MSI, InstallScript Object, Merge Module | Read-Write Property | Gets or sets the <strong>product name</strong>.                                                                                                                                                                          |</p>
<table>

</tr>
<tr>
<td>RemoveFeature</td>
<td>Basic MSI, InstallScript, InstallScript MSI, InstallScript Object</td>
<td>Method</td>
<td>Deletes a feature from the project.</td>
</tr>
<tr>
<td>SaveProject</td>
<td>Basic MSI, DIM, InstallScript, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>Method</td>
<td>Saves an InstallShield installation project.</td>
</tr>
</tbody>
</table>
| SelfRegistrationMethod| Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | Specifies the self-registration method that should be used for files that are designated as self-registering. Valid options are:  
  - esrISSelfReg (0)—Use the InstallShield self-registration table (ISSelfReg) for all self-registering files.  
  - esrSelfReg (1)—Use the Windows Installer self-registration table (SelfReg) for all self-registering files. |
| SkipUpgradeValidators | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | Enables you to skip the upgrade validators that normally run at the end of the build. |
### SwidtagProperty

This property gets or sets value for the software identification tag settings in the General Information view. This property takes one of the following options for the first parameter:

- **eswtpUniqueId (0)**—This parameter specifies the value for the Unique ID setting in the General Information view.
- **eswtpTagCreatorName (2)**—This parameter specifies the value for the Tag Creator setting in the General Information view.
- **eswtpTagCreatorRegid (3)**—This parameter specifies the value for the Tag Creator ID setting in the General Information view.
- **eswtpSfwCreatorName (4)**—This parameter specifies the value for the Software Creator setting in the General Information view.
- **eswtpSfwCreatorRegid (5)**—This parameter specifies the value for the Software Creator ID setting in the General Information view.
- **eswtpSfwLicensorName (6)**—This parameter specifies the value for the Software Licensor setting in the General Information view.
- **eswtpSfwLicensorRegid (7)**—This parameter specifies the value for the Software Licensor ID setting in the General Information view.
- **eswtpEntitlementRequired (8)**—This parameter specifies whether your product requires users to have a corresponding software entitlement in order for software reconciliation to be considered successful.

Following is sample code that uses this property:

```csharp
pProject.SwidtagProperty(eswtpTagCreatorRegid) = "regid.1986-12.com.mycompany"
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
<td></td>
<td>- <strong>eswtpEntitlementRequired (8)</strong>—This parameter specifies whether your product requires users to have a corresponding software entitlement in order for software reconciliation to be considered successful.</td>
</tr>
</tbody>
</table>

### UpgradeCode

Gets or sets the Upgrade Code property as a string GUID. The GUID must be surrounded by braces—{(12345678-1234-1234-1234-1234567890AB)}, for example.

This property is not available for merge module projects.
AddAdvancedFile Method

Project • The AddAdvancedFile method applies to the following project types.

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

The AddAdvancedFile method creates an advanced file object with the specified name and (optionally) in the specified disk image in the current project.
**Syntax**

AddAdvancedFile (FileName As String, Optional DiskType As ISWiDiskType = edtDisk1) As ISWiAdvancedFile

**Parameters**

Table 2 • AddAdvancedFile Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Pass the fully qualified filename for the advanced file that you want to add.</td>
</tr>
<tr>
<td>DiskType</td>
<td>This optional parameter specifies the Advanced Files folder in which you want to add the advanced file. Specify one of the following values.</td>
</tr>
<tr>
<td></td>
<td>• <strong>edtDisk1</strong> (1)—Add the advanced file to the Disk 1 folder. This is the default value for this optional parameter.</td>
</tr>
<tr>
<td></td>
<td>• <strong>edtLastDisk</strong> (-1)—Add the advanced file to the Last Disk folder.</td>
</tr>
<tr>
<td></td>
<td>• <strong>edtOther</strong> (0)—Add the advanced file to the Other folder.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate this method:

```vba
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pAdvancedFile As ISWiAdvancedFile

pProj.SaveProject
pProj.CloseProject
```

**Applies To**

- ISWiProject

AddAutomaticUpgradeEntry Method

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddAutomaticUpgradeEntry method to create a new IswiAutomaticUpgradeEntry item and return a handle to that object.
**Syntax**

`AddAutomaticUpgradeEntry()`

**Example**

The following Visual Basic lines demonstrate this method:

```vbnet
'########################################################################
'# THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PROJECT PATH
'########################################################################
set pProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject("C:\Documents and Settings\Testlab\My Documents\MySetups\your project name-21.ism")

'########################################################################
'To create a new entry

dim pAutoEntry
set pAutoEntry = pProject.AddAutomaticUpgradeEntry()
pAutoEntry.Name ="AutoEntry"
pAutoEntry.ReleaseFlags = "AutoFlag"
pAutoEntry.UpgradedSetupPath = "AutoPath"

'########################################################################
'To find and delete an existing entry

set pAutoEntry = nothing
set pAutoEntry = pProject.IswiAutoUpgradeEntries("AutoEntry")
pAutoEntry.Delete

pProject.SaveProject
pProject.CloseProject
```

**Applies To**

- ISWiProject

---

**AddComponent Method**

*Project* • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
The AddComponent method creates a component object with the specified name in the current project. When the component is added, a GUID is automatically generated for it (see the GUID property for ISWiComponent). After you have added the component, you can set its other properties and associate it with a feature.

**Syntax**

AddComponent (ComponentKey As String) As ISWiComponent

**Parameters**

**Table 3 • AddComponent Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ComponentKey</td>
<td>The component key is the same as the name of the component that is displayed in the Setup Design views. This string must contain only alphanumeric characters, dots (.), or underscores (_), and it must begin with a letter or an underscore. ComponentKey must be unique among your project’s component names. Component names are case-sensitive.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate this method:

```vbnet
Dim pComponent As ISWiComponent
Set pComponent = m_pProject.AddComponent("New_Component")
```

**Applies To**

- ISWiProject

---

**AddCustomAction Method**

*Project • This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Call the AddCustomAction method to add a custom action to the current project. To insert a custom action into a sequence, use the InsertCustomAction method.
Syntax

AddCustomAction (CustomActionKey As String) as ISWiCustomAction

Parameters

Table 4 • AddCustomAction Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CustomActionKey</td>
<td>The string name of the custom action you want to create.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

AddFeature Method

Project • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

The AddFeature method creates a feature with the specified name. AddFeature is a member of ISWiProject. The new feature is added to the current project as a top-level feature, but when this method is a member of an ISWiFeature object, the new feature is added as a subfeature of the current feature.

The feature is created with the same default properties that new features have when you add them in InstallShield.

After you have added the feature, you can set its other properties and associate components with it.
Syntax

AddFeature (FeatureKey As String) As ISWiFeature

Parameters

Table 5 • AddFeature Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FeatureKey</td>
<td>The feature key is the same as the name of the feature that is displayed in the Setup Design and Features views. The name becomes the index for the new ISWiFeature object. This string must contain only alphanumeric characters, dots (.), or underscores (_), and it must begin with a letter or an underscore. FeatureKey must be unique among your project’s feature names. Feature names are case-sensitive.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic lines demonstrate calling AddFeature to add a feature, a subfeature, and then associate an existing component with the subfeature:

```
Dim pProject As ISWiProject
Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\SampleApp.ism"

Dim pFeat1, pFeat2 As ISWiFeature
Dim sFeat1Name, sFeat2Name As String

sFeat1Name = "ParentFeature"
sFeat2Name = "SubFeature"

' Add the feature ParentFeature, then SubFeature under ParentFeature
Set pFeat1 = pProject.AddFeature(sFeat1Name)
Set pFeat2 = pFeat1.AddFeature(sFeat2Name)

Dim pComp
Dim sCompName As String

' Add the existing component NewComponent1 to SubFeature
sCompName = "NewComponent1"
Set pComp = pProject.ISWiComponents.Item(sCompName)
pFeat2.AttachComponent pComp

pProject.SaveProject
pProject.CloseProject
```

Applies To

- ISWiProject
- ISWiFeature
AddLanguage Method

Edition • Support for multilanguage installations is available with InstallShield Premier Edition.

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the AddLanguage method to add a language to the current project. Using this method is similar to adding a language in the General Information view in InstallShield. You can set the properties of the new language with the ISWiLanguage object.

Syntax

AddLanguage (LangId As String)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LangId</td>
<td>Pass the language ID (as a string) that you want to add to the current project. For example: oProject.AddLanguage “1035”</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

AddPatchConfig Method

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddPatchConfig method to add a patch configuration to your project. Using this method is similar to adding a patch configuration with the Patch Design view of the IDE. You can set the properties of the new patch configuration with the object.
### Syntax

```
AddPatchConfig (PatchConfigKey As String) As ISWiPatchConfig
```

### Parameters

**Table 7 • AddPatchConfig Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PatchConfigKey</td>
<td>Holds the name of your new patch configuration.</td>
</tr>
</tbody>
</table>

### Applies To

- ISWiProject

### AddPathVariable Method

**Project • This information applies to the following project types:**

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the AddPathVariable method to add a path variable to your project. Using this method is similar to adding a path variable in the Path Variables view in InstallShield. You can set the properties of the new path variable with the ISWiPathVariable object.

**Important • Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.**
Syntax
AddPathVariable (sName As String) As ISWiPathVariable

Parameters

Table 8 • AddPathVariable Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sName</td>
<td>Specifies the name of the path variable.</td>
</tr>
</tbody>
</table>

Appplies To
• ISWiProject

AddProductConfig Method

Project • This information applies to the following project types:
• Basic MSI
• InstallScript MSI
• Merge Module

Call the AddProductConfig method to add a product configuration to your project. Using this method is similar to adding a product configuration with the Release Wizard or the Releases view of the IDE. You can set the properties of the new product configuration with the ISWiProductConfig object.

Syntax
AddProductConfig (ProductConfigKey As String) As ISWiProductConfig

Parameters

Table 9 • AddProductConfig Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProductConfigKey</td>
<td>Holds the name of your new product configuration.</td>
</tr>
</tbody>
</table>

Appplies To
• ISWiProject

AddProperty Method

Project • The AddProperty method applies to the following project types.
• Basic MSI
• DIM
• InstallScript MSI
• Merge Module

The AddProperty method creates a Windows Installer property with the specified name in the current project.

**Syntax**

AddProperty (Name As String) As ISWiProperty

**Parameters**

**Table 10 • AddProperty Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Pass the name for the Windows Installer property that you want to add.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate the AddProperty method:

```vba
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

Dim pProperty As ISWiProperty
Set pProperty = pProj.AddProperty ("MYPROP")
pProperty.Value = "MyPropValue"

pProj.SaveProject
pProj.CloseProject
```

**Applies To**

• ISWiProject

---

**AddSetupFile Method**

**Project** The AddSetupFile method applies to the following project types.

• Basic MSI
• InstallScript
• InstallScript MSI
• InstallScript Object

The AddSetupFile method creates a support file with the specified name in the current project.
Syntax

AddSetupFile (FileName As String) As ISWiSetupFile

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Pass the fully qualified file name for the support file that you want to add.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic lines demonstrate the AddSetupFile method:

```vbc
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupFile As ISWiSetupFile

Set pSetupFile = pProj.AddSetupFile ("C:\My Files\MySupportFile.ext")

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject

AddSetupType Method

Project • This information applies to the following project types:

- InstallScript
- InstallScript Object

The AddSetupType method creates a setup type with the specified name in the current project.
**Syntax**

AddSetupType (Name As String) As ISWiSetupType

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Pass the name for the setup type that you want to add. The name should be the text that you want to use as the display name. The automation interface automatically generates a valid primary key for the new setup type based on the name that you specify for this parameter.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate the AddSetupType method:

```vbnet
dim pProj as ISWiProject
set pProj = createobject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.openProject "C:\MySetups\Project1.ism"
dim pSetupType as ISWiSetupType

set pSetupType = pProj.addSetupType ("Client Setup - Save Space")

pProj.saveproject
pProj.CloseProject
```

**Applies To**

- ISWiProject

**AddSQLServerConnection Method**

*Project • This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the AddSQLServerConnection method to add a new server connection to your project.
Syntax

Function AddSQLServerConnection(strConnectionName As String) As ISWiSQLConnection

Parameters

Table 13 • AddSQLServerConnection Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectionName</td>
<td>Specify the name of the new connection you want to establish.</td>
</tr>
</tbody>
</table>

Return Values

This method returns ISWiSQLConnection object.

Applies To

• ISWiProject

AddUpgradeTableEntry Method

Project • This information applies to the following project types:

• Basic MSI
• InstallScript MSI

Call the AddUpgradeTableEntry method to create a new ISWiUpgradeTableEntry item and return a handle to that object.

Syntax

AddUpgradeTableEntry()

Example

The following Visual Basic lines demonstrate this method:

'........................................................................
'#$ THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PROJECT PATH
'........................................................................
set pProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject("C:\Documents and Settings\Testlab\My Documents\MySetups\your project name-21.ism")

'........................................................................
'To create a new entry

dim pTableEntry
set pTableEntry = pProject.AddUpgradeTableEntry()
pTableEntry.UpgradeCode = "{12345678-1234-1234-1234-123456789012}"
pTableEntry.VersionMin = "1.0"
pTableEntry.VersionMax = "2.0"
pTableEntry.Language = "0"
pTableEntry.Remove = ""
pTableEntry.ActionProperty = "ACTIONPROP_AUTOMATION"
pTableEntry.Attributes = 5

'##########################################################################
' To find and delete an existing entry

set pTableEntry = pProject.IswiUpgradeTableEntries("{12345678-1234-1234-1234-123456789012}")
pTableEntry.Delete

pProject.SaveProject
pProject.CloseProject

Applies To
- ISWiProject

BuildPatchConfiguration Method

Project • This information applies to the following project types:
- Basic MSI
- InstallScript MSI

Call BuildPatchConfiguration to build the patch configuration identified by the strPatchConfiguration parameter. This action has the same effect as right-clicking on a patch configuration in the Patch Design view and then selecting Build a Patch.
**Syntax**

BuildPatchConfiguration (strPatchConfigName as string)

**Parameters**

**Table 14 • BuildPatchConfiguration Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strPatchConfigName</td>
<td>Enter the fully qualified path to your project.</td>
</tr>
</tbody>
</table>

**Properties**

**Table 15 • Properties Associated with BuildPatchConfiguration Method**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PatchConfigErrorCount</td>
<td>Include the error count associated with a particular build.</td>
</tr>
<tr>
<td>PatchConfigWarningCount</td>
<td>Include the warning count associated with a particular build.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate this method:

```vbc
'Create the project object
dim pProject
set pProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")

'Call the OpenProject method
'******************************************************************************
' # THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PROJECT PATH
'******************************************************************************
pProject.OpenProject("\Your project.ism")

pProject.OpenProject("C:\Documents and Settings\Testlab\My Documents\MySetups\your project name-21.ism")

'Call the OpenProject method
'******************************************************************************
' # THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PATCH CONFIGURATION NAME
'******************************************************************************
pProject.BuildPatchConfiguration "Config1"

MsgBox "Patch Configfuration Config1 build with " & _
    pProject.PatchConfigErrorCount & " Errors and " & _
    pProject.PatchConfigWarningCount & " Warnings"
```

**Applies To**

- ISWiProject
BuildPCPFile Method

This information applies to the following project types:

- Basic MSI
- InstallScript MSI

The BuildPCPFile method builds a patch package (.msp) file based on the settings in a patch creation properties (.pcp) file.

You do not need to have a project open in order to create a patch.

Syntax

BuildPCPFile (strPCPFile As String, strPatchFile As String, strLogFile As String, bCreateUpdateExe As Boolean) As Long

Parameters

Table 16 • BuildPCPFile Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strPCPFile</td>
<td>Specify the fully qualified path to a .pcp file. You can create or modify a .pcp file through the Patch Design view.</td>
</tr>
<tr>
<td>strPatchFile</td>
<td>Specify the fully qualified path for the .msp file you want to create. Any existing file with this name is overwritten. The file cannot be created if the directory you provided does not exist.</td>
</tr>
<tr>
<td>strLogFile</td>
<td>Specify the fully qualified path to the .log file that records this method's status and success in creating the patch package. If the file exists, the current status is appended to it.</td>
</tr>
<tr>
<td>bCreateUpdateExe</td>
<td>Set this option to True to have the package wrapped in an executable that applies the patch.</td>
</tr>
</tbody>
</table>

Return Values

BuildPCPFile() returns the result returned by the Windows Installer function UiCreatePatchPackage.

The BuildPCPFile method builds a patch package (.msp) file based on the settings in a patch creation properties (.pcp) file.

You do not need to have a project open in order to create a patch.

Applies To

- ISWiProject
CloseProject Method

This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

To close the project file (.ism or .dim) that you opened with OpenProject, call CloseProject.

Syntax

CloseProject()

Return Values

CloseProject always returns 0.

Applies To

- ISWiProject

CreatePatch Method

This method is deprecated for new development and has been replaced with the BuildPCPFile and BuildPatchConfiguration methods. To facilitate backward compatibility with existing build scripts, the CreatePatch method calls the BuildPCPFile method.

This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Syntax

CreatePatch()

Applies To

- ISWiProject
CreateProject Method

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Project-specific differences are noted where appropriate.

The CreateProject method creates a new InstallShield project file (.ism) for a Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, or Merge Module project; it creates a new InstallShield DIM project file (.dim) for DIM projects.

**Syntax**

CreateProject (strISWiProjectFile As String, ByVal projectType As ISWiProjectType)

**Parameters**

Table 17 • CreateProject Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strISWiProjectFile</td>
<td>Enter the fully qualified path to the .ism or .dim file that you want to create. Include the full file name.</td>
</tr>
<tr>
<td>projectType</td>
<td>Specify what type of project you want to create. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>• eptMsi (1)—Creates a Basic MSI project.</td>
</tr>
<tr>
<td></td>
<td>• eptScript (-1)—Creates an InstallScript MSI project.</td>
</tr>
<tr>
<td></td>
<td>• eptPro (9)—Creates an InstallScript project.</td>
</tr>
<tr>
<td></td>
<td>• eptProObj (10)—Creates an InstallScript Object project.</td>
</tr>
<tr>
<td></td>
<td>• eptMsm (2)—Creates a Merge Module project.</td>
</tr>
<tr>
<td></td>
<td>• eptDim (15)—Creates a DIM project.</td>
</tr>
</tbody>
</table>

**Example**

The following sample code creates a Basic MSI project called TestProject.ism.

Dim pProject As ISWiAutoAutomation Interface Version.ISWiProject
Set pProject = CreateObject("ISWiAutoAutomation Interface Version.ISWiProject")

Dim sProjectName As String
sProjectName = "C:\InstallShield 2021 Projects\TestProject.ism"
pProject.CreateProject sProjectName, eptMsi
pProject.OpenProject sProjectName, False
pProject.CloseProject

**Applies To**
- ISWiProject

---

### DeleteAdvancedFile Method

*Project* • This information applies to the following project types:
- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

The DeleteAdvancedFile method deletes the specified advanced file from the current project.

#### Syntax

DeleteAdvancedFile (pAdvancedFile As ISWiAdvancedFile) As Long

#### Parameters

**Table 18 • DeleteAdvancedFile Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pAdvancedFile</td>
<td>Specify the advanced file object to be deleted.</td>
</tr>
</tbody>
</table>

#### Example

The following Visual Basic lines demonstrate the DeleteAdvancedFile method:

```vbnet
dim pProj as ISWiProject
set pProj = createobject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
dim pAdvancedFile as ISWiAdvancedFile

set pAdvancedFile = pProj.ISWiAdvancedFiles.Item(1)
pProj.DeleteAdvancedFile pAdvancedFile

pProj.SaveProject
pProj.CloseProject
```

**Applies To**
- ISWiProject
DeleteComponent Method

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call DeleteComponent to delete a component in the project. Similar to deleting a component in the Setup Design views, DeleteComponent both removes a component from its feature and permanently deletes it from the project.

**Syntax**

```
DeleteComponent (Component As ISWiComponent)
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component</td>
<td>Specify the ISWiComponent object that the method will delete.</td>
</tr>
</tbody>
</table>

**Example**

You can use the following lines to delete all components that are associated with the feature FeatureName1:

```
Dim pProj As ISWiProject
Set pProj = CreateObject(“IswiAutoAutomation Interface Version.ISWiProject”)
pProj.OpenProject “C:\MySetups\Project1.ism”

Dim pFeat As ISWiFeature
Dim pComp As ISWiComponent

Set pFeat = pProj.ISWiFeatures.Item(“FeatureName1”)

For Each pComp In pFeat.ISWiComponents
    pProj.DeleteComponent pComp
Next

pProj.SaveProject
pProj.CloseProject
```

** Applies To **

- ISWiProject
DeleteCustomAction Method

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Call the DeleteCustomAction method to completely delete a custom action from the current project.

Syntax

DeleteCustomAction (CustomAction As ISWiCustomAction)

Parameters

Table 20 • DeleteCustomAction Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CustomAction</td>
<td>Pass the ISWiCustomAction object you want to delete from the current project.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

DeleteMergeModule Method

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the DeleteMergeModule method to completely delete a merge module from the current project.
**Syntax**

DeleteMergeModule (FileName As String)

**Parameters**

**Table 21 • DeleteMergeModule Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Pass the fully qualified file name for the merge module (.msm) file that you want to delete from the project.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject Object

---

**DeletePatchConfig Method**

*Project • This information applies to the following project types:*

- Basic MSI
- InstallScript MSI

Call the DeletePatchConfig method to delete a patch configuration from your project. Using this method is similar to deleting a patch configuration in the Patch Design view of the IDE.

**Syntax**

DeletePatchConfig (PatchConfig As ISWiPatchConfig)

**Parameters**

**Table 22 • DeletePatchConfig Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PatchConfigKey</td>
<td>Pass the name of the patch configuration that you want to delete.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

---

**DeletePathVariable Method**

*Project • This information applies to the following project types:*
• Basic MSI
• DIM
• InstallScript
• InstallScript MSI
• InstallScript Object
• Merge Module

Call the DeletePathVariable method to delete a path variable from your project. Using this method is similar to deleting a path variable from the Path Variables view in InstallShield.

**Important** • Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.

**Syntax**

DeletePathVariable (pPathVar ISWiPathVariable) As Long

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pPathVar</td>
<td>Pass the ISWiPathVariable object for the path variable that you want to delete.</td>
</tr>
</tbody>
</table>

**Appplies To**

• ISWiProject

**DeleteProductConfig Method**

**Project** • This information applies to the following project types:

• Basic MSI
• InstallScript MSI
• Merge Module

Call the DeleteProductConfig method to delete a product configuration from your project. Using this method is similar to deleting a product configuration in the Releases view of the IDE.
**Syntax**

DeleteProductConfig (ProductConfig As ISWiProductConfig)

**Parameters**

**Table 24 • DeleteProductConfig Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProductConfigKey</td>
<td>Pass the name of the product configuration that you want to delete.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

---

**DeleteProperty Method**

![Image]

*Project • This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Call the DeleteProperty method to delete a property from the Property table. The function returns 0 if successful.

**Syntax**

Public Function DeleteProperty(ByVal pProperty As ISWiProperty) As Long

**Parameters**

**Table 25 • DeleteProperty Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
<td>Pass the name of the property you want to delete.</td>
</tr>
</tbody>
</table>

**Example**

Dim proj As IswiAutoAutomation Interface Version.ISWiProject
Set proj = New IswiAutoAutomation Interface Version.ISWiProject
proj.OpenProject "c:\mysetups\your project name-3.ism"
Dim pProp As IswiAutoAutomation Interface Version.ISWiProperty
Set pProp = proj.ISWiProperties.Item("MyProperty")
proj.DeleteProperty pProp
Applies To

- ISWiProject

DeleteSetupFile Method

The DeleteSetupFile method applies to the following project types.

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

The DeleteSetupFile method deletes the specified support file from the current project.

Syntax

DeleteSetupFile (pSetupFile As ISWiSetupFile) As Long

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pSetupFile</td>
<td>The support file object to be deleted.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic lines demonstrate the DeleteSetupFile method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupFile As ISWiSetupFile

Set pSetupFile = pProj.ISWiSetupFiles.Item("MySupportFile.abc")
pProj.DeleteSetupFile pSetupFile

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject
DeleteSetupType Method

**Project** • This information applies to the following project types:

- InstallScript
- InstallScript Object

The DeleteSetupType method deletes the specified setup type from the current project.

**Syntax**

DeleteSetupType (pSetupType As ISWiSetupType) As Long

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pSetupType</td>
<td>The setup type object to be deleted.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate the DeleteSetupType method:

```vbnet
dim pProj as ISWiProject
set pProj = createobject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
dim pSetupType as ISWiSetupType

set pSetupType = pProj.ISWiSetupTypes.Item(1)
pProj.DeleteSetupType pSetupType

pProj.SaveProject
pProj.CloseProject```

**Applies To**

- ISWiProject

DeleteSQLConnection Method

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the DeleteSQLConnection method to remove a SQL Server Connection from the project.
**Syntax**

Function DeleteSQLConnection(Connection As ISWiSQLConnection) As Long

**Parameters**

Table 28 • DeleteSQLConnection Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Specify the connection you want to remove from the project.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

---

**DeselectLanguage Method**

![Icon] This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the DeselectLanguage method to deselect a language from the current project.

**Syntax**

DeselectLanguage (LangId As String)

**Parameters**

Table 29 • DeselectLanguage Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LangId</td>
<td>Pass the language ID you want to deselect in a string, as in</td>
</tr>
<tr>
<td></td>
<td>oProject.DeleteLanguage &quot;1036&quot;.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject
ExportProject Method

This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call ExportProject to convert an .ism file to XML format before checking it into a source code control program.

**Note** • When a project file format is converted to either XML or binary format, the project file extension remains *.ism.

The .isv file format has been deprecated to version 2.x of InstallShield for Windows Installer and versions of InstallShield Developer prior to 8.x.

**Syntax**

ExportProject (strISWiTextProjectFile As String, Optional strISWiProjectFile As String) As Long

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strISWiTextProjectFile</td>
<td>Enter the fully qualified path to the .isv file.</td>
</tr>
<tr>
<td>strISWiProjectFile</td>
<td>Enter the fully qualified path to the .ism file. This parameter is optional only if the .ism file is already open.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

ExportStrings Method

This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
Call ExportStrings to copy all or a portion of the string entries for a specific language to a tab-delimited Unicode text file (.txt). You can provide the .txt file to a translator who can update the file with translated text. After it has been translated, you can import the translated string entries into your project by calling the ImportStrings method.

**Syntax**

ExportStrings (strfile As String, dTimeStamp As Date, sLang As String) As Boolean

**Parameters**

Table 31 • ExportStrings Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strfile</td>
<td>Enter the fully qualified path to the text file that will contain the exported strings. If the file exists, the automation interface overwrites it. ExportStrings creates a Unicode file.</td>
</tr>
<tr>
<td>dTimeStamp</td>
<td>All string entries have a date and time that they were last modified. This timestamp is useful if you want to give the translator only the string entries that are new or have been modified since the last round of translations. To export only the string entries that have been modified since a specific date, specify the earliest date for the string entries you want to export. The automation interface exports the string entries that have changed on or since that date. To export all of the entries for the specified language, enter the number 0.</td>
</tr>
<tr>
<td>sLang</td>
<td>Specify the identifier for the language whose string entries you want to export to the text file.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

---

**ForceUpgrade Method (Advanced UI and Suite/Advanced UI)**

*Project • This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
• **Merge Module**

The ForceUpgrade method upgrades the project from an earlier version of InstallShield to the current version.

**Syntax**

```
ForceUpgrade (ISWiProjectFile As String)
```

**Parameters**

**Table 32 • ForceUpgrade Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISWiProjectFile</td>
<td>Enter the fully qualified path to the project file (.ism) that you want to upgrade. Include the full file name.</td>
</tr>
</tbody>
</table>

**Applies To**

• ISWiProject

**GenerateGUID Method**

![cube]

*Project • This information applies to the following project types:*  

• Basic MSI  
• DIM  
• InstallScript  
• InstallScript MSI  
• InstallScript Object  
• Merge Module

The GenerateGUID method generates a new, unique GUID that is returned as a string.

**Applies To**

• ISWiProject

**ImportProject Method**

![list]

*Note • This method has been deprecated to version 2.x of InstallShield for Windows Installer and versions of InstallShield Developer prior to 8.x.*

Call ImportProject to convert an .isv file to an .ism file. If you access your project from a source code control program, InstallShield saves it as a text (.isv) file. However, OpenProject and ISCmdBld.exe both require a standard InstallShield project (.ism) file.
Later, you can call `ExportProject` to convert the .ism file back to an .isv file before checking it in to your source control program.

ImportProject fails if the project is already open in the automation interface or in InstallShield.

**Syntax**

```
ImportProject (strISWiProjectFile As String, strISWiTextProjectFile As String) As Long
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strISWiProjectFile</td>
<td>Enter the fully qualified path to the resulting .ism file.</td>
</tr>
<tr>
<td>strISWiTextProjectFile</td>
<td>Enter the fully qualified path to the .isv file.</td>
</tr>
</tbody>
</table>

**Error Codes**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1007</td>
<td>The project file is already open.</td>
</tr>
<tr>
<td>1009</td>
<td>Could not import the project.</td>
</tr>
<tr>
<td>1012</td>
<td>The .isv file is missing.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

### ImportStrings Method

*Project* • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call ImportStrings to import the contents of a tab-delimited text file (.txt) into the project for a specific language. This method is useful when you have exported the entries to a text file and had them translated.
Syntax

ImportStrings (strfile As String, sLang As Integer, Optional Enum eiType, Optional strLogFile As String) As Boolean

Parameters

Table 35 • ImportStrings Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strfile</td>
<td>Enter the fully qualified path to the text file that contains the string entries that you want to import.</td>
</tr>
<tr>
<td>sLang</td>
<td>Specify the identifier for the language whose string entries you want to import to the project.</td>
</tr>
<tr>
<td>eiType</td>
<td>Specify how you want to handle conflicts when importing string entries:</td>
</tr>
<tr>
<td></td>
<td>• eiIgnore (0)—Do not replace the string entry's value if it already exists in the project for the specified language.</td>
</tr>
<tr>
<td></td>
<td>• eiOverwrite (1)—Replace the project's existing string entry with the one in the text file. This is the default value for this optional parameter.</td>
</tr>
<tr>
<td>strLogFile</td>
<td>Specify the fully qualified path to the log file that should contain the status and success of importing the string entries. The log file records any conflicts in importing string entries and lists any improperly formatted, hence unusable, entries. If the log file exists, it is overwritten.</td>
</tr>
</tbody>
</table>

Note • This parameter is optional.

Appplies To

• ISWiProject

OpenProject Method

Project • This information applies to the following project types:

• Basic MSI
• DIM
• InstallScript
• InstallScript MSI
• InstallScript Object
• Merge Module
To open your project so that you can modify it through the automation interface, call OpenProject with the fully qualified path to your .ism or .dim file. This method is equivalent to loading a project in InstallShield.

**Note** • The ISWiProject.OpenProject method fails if the project is open in InstallShield.
Syntax

OpenProject (strISWiProjectFile As String, Optional ByVal bReadOnly As Boolean) As Long

Parameters

Table 36 • OpenProject Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strISWiProjectFile</td>
<td>Enter the fully qualified path to the project file (.ism or .dim).</td>
</tr>
<tr>
<td>bReadOnly</td>
<td>Determines whether the project is opened with write privileges. True opens</td>
</tr>
<tr>
<td></td>
<td>the project as a read-only file. The default value for this optional</td>
</tr>
<tr>
<td></td>
<td>parameter is False.</td>
</tr>
</tbody>
</table>

Return Values and Errors

Table 37 • OpenProject Method Return Values and Errors

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Project successfully opened.</td>
</tr>
<tr>
<td>1</td>
<td>Project opened, but is locked by some other process.</td>
</tr>
<tr>
<td>2</td>
<td>Attempted to open project for write access, but project opened in read-only mode.</td>
</tr>
<tr>
<td>3</td>
<td>There was a problem creating the merge module catalog. Verify that the merge module search path is correct (via the File Locations tab of the Options dialog box or using -o for the Standalone Build), verify that no merge modules on the merge module path are corrupt, or self-register IsMMUpdater2.d11.</td>
</tr>
</tbody>
</table>

Error Code 1100

Unable to open file: %1. Ensure that the file is a valid InstallShield project.

Error Code 1101

Unable to open file: %1. This project was created using a previous version of InstallShield Developer, InstallShield–Windows Installer or InstallShield Express.

Error Code 1102

Unable to open file: %1. This project was created using InstallShield Professional or InstallShield Express 2.xx.

Error Code 1103

Unable to open file: %1. The project was created using a more recent version of InstallShield Developer or the project has been updated to a more recent version of InstallShield, InstallShield DevStudio, or InstallShield Developer.

Applies To

- ISWiProject
**RemoveFeature Method**

*Project* • *This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

The RemoveFeature method permanently deletes a feature from the current project.

**Syntax**

RemoveFeature (Feature As ISWiFeature) As Long

**Parameters**

**Table 38 • RemoveFeature Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feature</td>
<td>The item in ISWiFeatures that you want to remove.</td>
</tr>
</tbody>
</table>

**Example**

The following code fragment opens a project, deletes the feature named NewFeature1, and then saves and closes the project:

```vbscript
Dim pProj As ISWiProject
Dim pFeat As ISWiFeature

Set pProj = New ISWiProject
pProj.OpenProject "C:\Test\SampleProject.ism"

Set pFeat = pProj.ISWiFeatures.Item("NewFeature1")
pProj.RemoveFeature pFeat

pProj.SaveProject
pProj.CloseProject
```

When RemoveFeature is a member of ISWiFeature, it cannot be used to delete the current feature. However, you can call it to delete a subfeature, such as the first subfeature under NewFeature1 in the following example:

```vbscript
Set pFeat = pProj.ISWiFeatures.Item("NewFeature1")
pProj.RemoveFeature pFeat.Features(1)
```

**Applies To**

- ISWiProject
- ISWiFeature
**SaveProject Method**

![Image]

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

To save any changes that you have made to your project file through the automation interface, call the `SaveProject` method.

**Syntax**

`SaveProject()`

**Return Values and Errors**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERROR_SUCCESS (0)</td>
<td>Project is saved.</td>
</tr>
<tr>
<td>Error Code 1104</td>
<td>Unable to save file: %1. The project is open in read-only mode or is being used by another process.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

**ISWiAdvancedFile Object**

![Image]

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

ISWiAdvancedFile represents an advanced file in your project. The advanced file can be an existing one from the Support Files view (or the Support Files/Billboards view) in InstallShield or one added by calling `AddAdvancedFile`.

Use the project's `ISWiAdvancedFiles` collection to access a specific advanced file. You must specify either an index number or the file key for the `Item` property of `ISWiAdvancedFiles`. 
Members

Table 40 • ISWiAdvancedFile Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Read-Only Property</td>
<td>Stores the file key of the advanced file. See the description of ISWiFile above for more information about the file key.</td>
</tr>
<tr>
<td>BuildSourcePath</td>
<td>Read-Write Property</td>
<td>Stores the advanced file's fully qualified source filename. Any path variables are resolved to the actual path.</td>
</tr>
<tr>
<td>Disk</td>
<td>Read-Write Property</td>
<td>This enumerated integer property specifies the Advanced Files folder in which you want to add the advanced file. Specify one of the following values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• edtdisk1(1)—Specifies the Disk 1 folder.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• edtlastdisk(-1)—Specifies the Last Disk folder.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• edtother(0)—Specifies the Other folder.</td>
</tr>
</tbody>
</table>

Example

The file key is visible in the IDE only as the first entry in the Direct Editor view's ISDisk1 table. Instead of using the file key, you could write code similar to the following example to check for a certain file name:

```vba
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pAdvancedFile As ISWiAdvancedFile

For Each pAdvancedFile In pProj.ISWiAdvancedFiles
    If UCase(pAdvancedFile.BuildSourcePath) = "C:\MY FILES\MYADVANCEDFILE.EXT" Then
        Exit For
    End If
Next

pProj.SaveProject
pProj.CloseProject
```

If the file `C:\My Files\MyAdvancedFile.ext` is found among the project's setup files, the For loop ends, and pAdvancedFile holds a copy of the ISWiAdvancedFile object for `C:\My Files\MyAdvancedFile.ext`.

Applies To

• ISWiProject

ISWiAutomaticUpgradeEntry Object

```
Project • This information applies to the following project types:
```

The ISWiAutomaticUpgradeEntry object represents an automatic upgrade item in the Upgrades view of the InstallShield interface.

**Members**

**Table 41 • ISWiAutomaticUpgradeEntry Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete</td>
<td>Method</td>
<td>Deletes the AutomaticUpgradeEntry from the project file.</td>
</tr>
<tr>
<td>Name</td>
<td>Read-Write Property</td>
<td>Sets the name of the upgrade item as displayed in the IDE.</td>
</tr>
<tr>
<td>UpgradedSetupPath</td>
<td>Read-Write Property</td>
<td>Sets the path to the MSI package that needs to be upgraded. The build engine will create the settings required to upgrade this setup.</td>
</tr>
<tr>
<td>ReleaseFlag</td>
<td>Read-Write Property</td>
<td>Configure this upgrade entry to only be built into the setup when a certain release flag has been set.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

**Delete Method**

*Project* • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call this method to delete the ISWiAutomaticUpgradeEntry from the project file.

**Syntax**

Delete()

**Applies To**

- ISWiAutomaticUpgradeEntry
ISWiCustomAction Object

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

ISWiCustomAction represents a custom action in the Custom Actions and Sequences view (or the Custom Actions view) of InstallShield. You can retrieve a custom action by specifying an item in the ISWiCustomActions collection.

**Members**

**Table 42 • ISWiCustomAction Object Members**

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActionType</td>
<td>Read-Write Property</td>
<td>Holds the numeric custom action type. For more information, see Custom Action Type Overview.</td>
</tr>
<tr>
<td>Comment</td>
<td>Read-Write Property</td>
<td>An optional comment for the custom action.</td>
</tr>
<tr>
<td>Name</td>
<td>Read-Write Property</td>
<td>The name of the custom action.</td>
</tr>
<tr>
<td>Source</td>
<td>Read-Write Property</td>
<td>Specifies the source of the custom action. See Creating Custom Actions in the Custom Actions and Sequences View (or the Custom Actions View) for the required Source property for different types of custom actions.</td>
</tr>
<tr>
<td>SourceEx</td>
<td>Write-Only Property</td>
<td>Sets a custom action source property, same as the Source property. SourceEx replaces the existing binary record for the new path when you change a source that is stored in the Binary table. If other custom actions use the path, their path is also updated. Source creates a new binary record when other custom actions use the path. Only the path in the custom action is updated.</td>
</tr>
<tr>
<td>Target</td>
<td>Read-Write Property</td>
<td>Specifies the target of the custom action. See Creating Custom Actions in the Custom Actions and Sequences View (or the Custom Actions View) for the required Target property for different types of custom actions.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject
ISWiComponent Object

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Project-specific differences are noted where appropriate.

ISWiComponent represents a component in the InstallShield user interface. You can retrieve a component by specifying an item in the ISWiComponents collection. The component can be one created in the IDE or as a result of calling AddComponent.

Many component attributes are available in the automation interface through this object’s methods and properties. Refer to the following table to see which methods, properties, and collections are available for your project type.
## Members

**Table 43 • ISWiComponent Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AddComponentSubFolder</td>
<td>InstallScript, InstallScript Object</td>
<td>Method</td>
<td>Adds a subfolder to the current ISWiComponent.</td>
</tr>
<tr>
<td>AddDynamicFileLinking</td>
<td>Basic MSI, InstallScript, InstallScript MSI, Merge Module</td>
<td>Method</td>
<td>Adds a dynamic file link to the current component.</td>
</tr>
<tr>
<td>AddEnvironmentVar</td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Method</td>
<td>Adds an environment variable to the current component.</td>
</tr>
<tr>
<td>AddFile</td>
<td>All</td>
<td>Method</td>
<td>Adds a file to the current component.</td>
</tr>
<tr>
<td>AddRemoveFile</td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Method</td>
<td>Adds a file or folder removal entry to the current component.</td>
</tr>
<tr>
<td>Attrib64BitComponent</td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Read-Write Property</td>
<td>Set this property to True to have the component registered as 64-bit. Setting this property to False causes the component to be registered as 32-bit. If the component is 64-bit and is replacing a 32-bit component, be sure to provide a new GUID via the GUID property. Note that 64-bit support requires version 2.0 of the Windows Installer service.</td>
</tr>
<tr>
<td>Comments</td>
<td>All</td>
<td>Read-Write Property</td>
<td>Gets or sets the comments for this component.</td>
</tr>
<tr>
<td>Compressed</td>
<td>InstallScript, InstallScript Object</td>
<td>Read-Write Property</td>
<td>This Boolean property gets or sets the component’s Compressed property, which specifies whether to compress the component’s files (True) or leave them uncompressed (False) when the files are stored in a cabinet file by the release builder.</td>
</tr>
</tbody>
</table>

<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Read-Write Property</td>
<td>This property allows you to specify argument lists for the Installer class when the Rollback method is called.</td>
</tr>
<tr>
<td>DotNetInstallerClassArgUninstall</td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Read-Write Property</td>
<td>This property allows you to specify the argument lists for the Uninstall execution context for the Installer class.</td>
</tr>
<tr>
<td>DotNetPrecompile</td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Read-Write Property</td>
<td>If this property is set to True, at installation the setup creates a native image from the .NET assembly and installs it to the native image cache on the target system. This allows the assembly to load and execute faster, because it restores code and data structures from the native image cache rather than from just-in-time (JIT) compilation.</td>
</tr>
</tbody>
</table>
| DotNetScanAtBuild                         | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | This property instructs the build engine on how to handle your assembly. Set it to one of the following values:  
  - ednbNone (0)—Build does nothing.  
  - ednbProps (1)—Build scans your assembly for properties.  
  - ednbDepAndProps (2)—Build scans your assembly for properties and dependencies. |
| ExtractAtBuild                            | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | Gets or sets the component's COM Extract at Build setting. Possible values are True and False.                                              |
| FTPLocation                               | InstallScript, InstallScript Object | Read-Write Property | Gets or sets the component's FTP Location property, which specifies an FTP location for the component.                                    |
| GUID                                      | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | Holds a string GUID, also known as the Component Code property, surrounded by braces—{(12345678-1234-1234-1234-1234567890AB)}, for example. |
| HTTPLocation                              | InstallScript, InstallScript Object | Read-Write Property | Gets or sets the component's HTTP Location property, which specifies an HTTP location for the component.                                    |

</tr>
</tbody>
</table>
| IsPlatformSelected| InstallScript, InstallScript Object | Read-Write Property | In conjunction with the PlatformSuiteCheck property, gets or sets the component’s Platform Suite(s) property, which specifies to what platform suites, if any, the component is specific. Use the following constants to set this property:  
  - epsMSBackOffice = 32 (&H20)  
  - epsMSSmallBusinessServer = 256 (&H100)  
  - epsMSSmallBusinessServerWithRestrictiveLicenses = 512 (&H200)  
  - epsTerminalServices = 16 (&H10)  
  - epsWin2kAdvSvrOrWinDotNetEnterpriseServer = 128 (&H80)  
  - epsWin2kOrWinDotNetDatacenterServer = 64 (&H40)  
  - epsWinServer = 4  
  - epsWinWorkstation = 8  
  - epsWinXPHome = 2  
  - epsWinXPro = 1  
  - epsArchIa64 = 1024 (&H400)  
  - epsArchAmd64 = 2048 (&H800)  
  - epsArchIntel32 = 4096 (&H1000)  
For example:  
pFeature.IsPlatformSelected(epsWinXPHome) = True |
Table 43 • ISWiComponent Object Members (cont.)

<td>Basic MSI, DIM, InstallScript MSI, Merge Module</td>
<td>Method</td>
<td>Returns an ISWiRemoveFiles collection that contains all of the file and folder removal entries that are associated with the current component.</td>
</tr>
</tbody>
</table>
### Note

**ISWiComponent.KeyPathType must be set before setting ISWiComponent.KeyPath. Errors result if this is done in the reverse order.**

Contains the file or registry entry that serves as this component's key path. The exact type is indicated by the KeyPathType property, below.

When the key path is a file key, it contains the file key. You can view this value in the Key column of a component's file list, but be aware that file keys are subject to change when the files are dynamically linked. The file key is the same as the Name property of an ISWiFile object.

When the key path is a registry value, there is a specially formatted string that contains the registry key. The path to the registry key is enclosed in square brackets and separated from the value name with a vertical bar (or pipe character). For example, the following lines set the key path for the component m_MyComponent to the value MyName under HKEY_LOCAL_MACHINE\Software\MyCompany\Settings:

```csharp
m_MyComponent.KeyPathType = kptRegistry
m_MyComponent.KeyPath = "[HKEY_LOCAL_MACHINE\Software\MyCompany\Settings]\MyName"
```

A file cannot serve as the key file if it is dynamically linked.

---

<td>KeyPath</td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Read-Write Property</td>
<td><img src="356x482" alt="Image" /></td>
</tr>
</tbody>
</table>
### Table 43 • ISWiComponent Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| **KeyPathType** | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | ISWiComponent.KeyPathType must be set before setting ISWiComponent.KeyPath. Errors result if this is done in the reverse order. Stores a value that points to the precise type of key path contained in the KeyPath property. Specify one of the following types:  
  • kptRegistry (1)  
  • kptFile (2)  
  • kptFolder (3)  
  • kptODBC (4)  
  Note that the automation interface can set the key path type only to kptRegistry or kptFile, but the other values are possible return values if you are reading the current key path type. |
| **Miscellaneous** | InstallScript, InstallScript Object | Read-Write Property | Gets or sets the component’s Miscellaneous property, which associates a text string with the component. |
| **Name**     | All                              | Read-Only Property | Component name of the current item in the collection.                                                                                     |
| **NeverOverwrite** | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | Instructs the installer whether to replace an existing component. Specify True to leave the existing component or False to replace it. |
| **OSFilter** | InstallScript, InstallScript MSI, InstallScript Object | Read-Write Property | Gets or sets the component’s Operating Systems setting. If the target machine’s operating system does not match one of the operating systems that are specified for this setting, the component is not installed. By default, components are operating system independent, meaning that none of the component’s data are specific to certain operating systems. |
Use the following constants to set this property:

- eosOSIndepedent = 0
- eosWin95 = &H10 (16)
- eosWin98 = &H40 (64)
- eosWinMe = &H80 (128)
- eosWinNT4 = &H10000 (65536)
- eosWin2000 = &H1000000 (1048576)
- eosWinXP = &H100000 (4194304)
- eosWinServer2003 = &H8000000 (8388608)
- eosWinVista = &H10000000 (16777216)—These constants are for Windows Vista and Windows Server 2008.
- eosWin7 = &H2000000 (33554432)—These constants are for Windows 7 and Windows Server 2008 R2.
- eosWin8 = &H40000000 (67108864)—These constants are for Windows 8 and Windows Server 2012.
- eosWin81 = &H80000000 (134217728)—These constants are for Windows 8.1 and Windows Server 2012 R2.
- eosAll = &HFD100D0 (265355472)

You can specify multiple platforms; for example, `eosWin7 Or eosWinServer2008 Or eosWinVista Or eosWinServer2003`.

Tip • Use this property with the `IsPlatformSelected` property to distinguish between Windows Vista and Windows Server 2008, or between Windows 7 and Windows Server 2008 R2, or between Windows 8 and Windows Server 2012, or between Windows 8.1 and Windows Server 2012 R2.
In conjunction with the OverwriteSubOptionsVersion and OverwriteSubOptionsDate properties, gets or sets the component's Overwrite property, which specifies whether the component's files overwrite already-existing versions on the target system always, never, or conditionally based on date/time stamp or version number. Use the following constants to set this property:

- **ecomoAlways (0)**—Files on the target system are always overwritten.
- **ecomoByDate (1)**—Files on the target system are conditionally overwritten based on date/time stamp as specified by the OverwriteSubOptionsDate property.
- **ecomoByVersion (2)**—Files on the target system are conditionally overwritten based on version number as specified by the OverwriteSubOptionsVersion property.
- **ecomoByVersionThenDate (3)**—Files on the target system are conditionally overwritten based on version number or, if the file on your distribution media and the file on the target system have the same version number or if neither file has a version number, by date/time stamp as specified by the OverwriteSubOptionsVersion and OverwriteSubOptionsDate properties.
- **ecomoNever (4)**—Files on the target system are never overwritten.
In conjunction with the OverwriteMainOptions and OverwriteSubOptionsVersion properties, gets or sets the component’s Overwrite property, which specifies whether the component’s files overwrite already-existing versions on the target system always, never, or conditionally based on date/time stamp or version number. Ignored if OverwriteMainOptions is set to ecomoAlways, ecomoByVersion, or ecomoNever. Use the following constants to set this property:

- **ecomsoNewer (0)**—A file on the target system is overwritten if the file on your distribution media has a more recent date and time stamp.
- **ecomsoNewerOrSame (1)**—A file on the target system is overwritten if the file on your distribution media has a more recent or the same date and time stamp.
- **ecomsoOlder (2)**—A file on the target system is overwritten if the file on your distribution media has a less recent date and time stamp.

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| OverwriteSubOptionsDate| InstallScript,      | Read-Write    | In conjunction with the OverwriteMainOptions and OverwriteSubOptionsVersion properties, gets or sets the component’s Overwrite property, which specifies whether the component’s files overwrite already-existing versions on the target system always, never, or conditionally based on date/time stamp or version number. Ignored if OverwriteMainOptions is set to ecomoAlways, ecomoByVersion, or ecomoNever. Use the following constants to set this property:  
  - **ecomsoNewer (0)**—A file on the target system is overwritten if the file on your distribution media has a more recent date and time stamp.  
  - **ecomsoNewerOrSame (1)**—A file on the target system is overwritten if the file on your distribution media has a more recent or the same date and time stamp.  
  - **ecomsoOlder (2)**—A file on the target system is overwritten if the file on your distribution media has a less recent date and time stamp. |
In conjunction with the OverwriteMainOptions and OverwriteSubOptionsDate properties, gets or sets the component’s Overwrite property, which specifies whether the component’s files overwrite already-existing versions on the target system always, never, or conditionally based on date/time stamp or version number. Ignored if OverwriteMainOptions is set to ecomoAlways, ecomoByDate, or ecomoNever. Use the following constants to set this property:

- **ecomsoNewer (0)**—A file on the target system is overwritten if the file on your distribution media has a higher version number.
- **ecomsoNewerOrSame (1)**—A file on the target system is overwritten if the file on your distribution media has a higher or the same version number.
- **ecomsoOlder (2)**—A file on the target system is overwritten if the file on your distribution media has a lower version number.

This property corresponds to the Permanent component property in the IDE. Set Permanent to True to make sure the component is never removed; False otherwise.
In conjunction with the `IsPlatformSelected` property, gets or sets the component's Platform Suite(s) property, which specifies to what platform suites, if any, the component is specific. Use the following constants to set this property:

- **ecpscAll (0)**—The setup installs the component's files only if all of the suites that are specified by the `IsPlatformSelected` property exist on the target system.
- **ecpscAtLeastOne (1)**—The setup installs the component's files only if at least one of the suites that are specified by the `IsPlatformSelected` property exist on the target system.
- **ecpscSuiteIndependent (2)**—Installation of the component's files does not depend on the target system's suite.

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| PlatformSuiteCheck    | InstallScript, InstallScript Object          | Read-Write Property | In conjunction with the `IsPlatformSelected` property, gets or sets the component's Platform Suite(s) property, which specifies to what platform suites, if any, the component is specific. Use the following constants to set this property:  
  - **ecpscAll (0)**—The setup installs the component's files only if all of the suites that are specified by the `IsPlatformSelected` property exist on the target system.  
  - **ecpscAtLeastOne (1)**—The setup installs the component's files only if at least one of the suites that are specified by the `IsPlatformSelected` property exist on the target system.  
  - **ecpscSuiteIndependent (2)**—Installation of the component's files does not depend on the target system's suite. |
| PotentiallyLocked      | InstallScript, InstallScript Object          | Read-Write Property | This Boolean property gets or sets the component's Potentially Locked property, which specifies whether already-installed versions of the component's files may be locked—that is, in use by another application—during setup. |
| RegFileToMergeAtBuild | Basic MSI, InstallScript MSI, Merge Module   | Read-Write Property | Provides the complete path to a .reg file to have it merged with the component's registry entries at build time. |
The following options are available for determining the source of the registration information for this component:

- **rgtNone (0)**—InstallShield will not dynamically extract the data or mark the component as self-registering, but any information in the COM Registration advanced setting will be registered.
- **rgtSelfReg (-1)**—The files in this component will have their self-registration routines invoked by the installer.
- **rgtExtractAtBuild (-2)**—Dynamically extracts COM registration information when you build a release.

Because the Registration Type property has been removed from the component views in the IDE, setting the RegistrationType property in the automation interface has the following effects:

- Using **rgtNone** sets the component's COM Extract at Build property to No.
- Using **rgtSelfReg** sets the component's COM Extract at Build property to No, and sets each file in the component to use self-registration.
- Using **rgtExtractAtBuild** sets the component's COM Extract at Build property to Yes, and sets each file in the component not to use self-registration.

Use one of the following options to install the component's files locally or leave them on the distribution medium:

- **rfsLocal (0)**—Installs the files to the folder stored in the component's Destination property.
- **rfsSource (1)**—Leaves the files on the distribution medium.
- **rfsOptional (2)**—The component follows the feature's property.

<td>SourceLocation</td>
<td>All</td>
<td>Read-Write Property</td>
<td>Provides the name of a folder in the compressed setup package or in the release location where this component’s files are stored when you build a release. This property is identical to a component’s Source Location setting in InstallShield.</td>
</tr>
</tbody>
</table>

**Important** • Setting the Destination property for the ISWiComponent object resets the object’s SourceLocation property. Therefore, any code that sets the SourceLocation property should be placed after any code that sets the Destination property.
Applies To

- ISWiFeature

AddComponentSubFolder Method

_Project_ This information applies to the following project types:

- InstallScript
- InstallScript Object

The AddComponentSubFolder method adds a component subfolder to the current component or component subfolder.

Syntax

AddComponentSubFolder (Name As String) As ISWiComponentSubFolder

Parameters

Table 44 • AddComponentSubFolder Method

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Pass the name for the subfolder that you want to add.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic lines demonstrate the AddComponentSubFolder method:

```vba
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent
Dim pComponentSubFolder As ISWiComponentSubFolder

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
Set pComponentSubFolder = pComponent.AddComponentSubFolder("MyCompSubFolder")

pProj.SaveProject
pProj.CloseProject
```
Applies To

- ISWiComponent
- ISWiComponentSubFolder

AddDynamicFileLinking Method

Project • The information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

Call AddDynamicFileLinking to add a dynamic file link to a specified component. All of the files that are in the folder that you specify are automatically incorporated into your installation.

Project • In Basic MSI, InstallScript MSI, and Merge Module projects, all new dynamic file links that you add use the best practice method of component creation by default. For more information, see Determining the Appropriate Component Creation Method for Dynamically Linked Files.

Syntax

AddDynamicFileLinking (sSourceFolder As String) As ISWiDynamicFileLinking

Parameters

Table 45 • AddDynamicFileLinking Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sSourceFolder</td>
<td>Pass the fully qualified path to the folder that contains the files that you want to be dynamically linked.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic example adds a dynamic link to MyDynamicFiles to the component MyComponent:

m_ISWiFeature.ISWiComponents("MyComponent").AddDynamicFileLinking "C:\Build 141\MyDynamicFiles"

All of the files in the MyDynamicFiles folder are added to the project. The folder is scanned before every build, and any new or changed files are automatically incorporated into your project.

Applies To

- ISWiComponent
AddEnvironmentVar Method

Project • The AddEnvironmentVar method applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Call AddEnvironmentVar to add an environment variable to a component.

Syntax

AddEnvironmentVar (sName As String) As ISWiEnvironmentVar

Parameters

Table 46 • AddEnvironmentVar Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sName</td>
<td>Specifies the name of the environment variable.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic example adds the environment variable MyEnvironment to the component MyComponent:

m_ISWiFeature.ISWiComponents("MyComponent").AddEnvironmentVar "MyEnvironment"

Applies To

- ISWiComponent

AddFile Method

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Project-specific differences are noted where appropriate.
Call AddFile to add a file to a specified component or, in InstallScript projects, a component subfolder. The files that are added with this method have static file links.

**Syntax**

AddFile (FileName As String) As ISWiFile

**Parameters**

**Table 47** • AddFile Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Pass the fully qualified file name for the individual file that you want to add to this component or component subfolder.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic example adds the file MyFile.exe to the component MyComponent:

```vbnet
m_ISWiFeature.ISWiComponents("MyComponent").AddFile "C:\Build 141\MyFile.exe"
```

**Applies To**

- ISWiComponent
- ISWiComponentSubFolder

---

**AddRemoveFile Method**

**Project** • The AddRemoveFile method applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The AddRemoveFile method adds a file or folder removal entry to the current component. This file and folder removal capability is useful for scenarios such as removing application-created files that your installation does not otherwise track.

**Syntax**

AddRemoveFile () As ISWiRemoveFile

**Applies To**

- ISWiComponent
DeviceDriverFlagsEx Property

**Project • This information applies to the following project types:**

Project-specific differences are noted where appropriate.

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The DeviceDriverFlagsEx property enables you to specify the flag settings for device drivers and runtime options directly from the automation layer. You can pass the following property values to this property. Pass more than one value by using OR.

<table>
<thead>
<tr>
<th>Value</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Not set (default).</td>
</tr>
<tr>
<td>1</td>
<td>To replace any existing driver for the device with this driver, pass this property value to the DeviceDriverFlagsEx property. If you do not pass this property and a driver already exists for the device, your driver is not installed.</td>
</tr>
<tr>
<td>2</td>
<td>To prevent the Connect Device to Computer dialog from being displayed during the installation of a device driver if a device matching the driver is not connected to a computer, pass this property value.</td>
</tr>
<tr>
<td>4</td>
<td>If you pass this property value to the DeviceDriverFlagsEx property, the installation creates an Add or Remove Programs entry for the device driver only; the installation does not create an additional entry for the installation itself. DIFxApp does not support this feature on Windows Vista and later.</td>
</tr>
<tr>
<td>8</td>
<td>By default, DIFxApp does not install unsigned driver packages or driver packages that have missing files. To override this default behavior, pass this value to the DeviceDriverFlagsEx property.</td>
</tr>
<tr>
<td>16</td>
<td>By default, when DIFxApp uninstalls a driver package, DIFxApp does not remove the binary files that were copied to the system when it installed the driver. To override this default behavior, pass this value to the DeviceDriverFlagsEx property. If you do pass this value, DIFxApp removes a binary file from the system only if the binary file is identical to the corresponding binary file in the driver store.</td>
</tr>
</tbody>
</table>

**Caution • Pass this value only if you can verify that the driver’s binary files are not required by any other driver package or application.**
Applies To

- ISWiComponent

DeviceDriverSetRedist Property

Project: The DeviceDriverSetRedist property applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The DeviceDriverSetRedist property sets the custom action runtime .dll used for all device driver installations in the project. This property takes the following values:

- eddr32Bit—Specifies that the device drivers in this project target 32 bit machines and that the installation uses runtime dialogs for English only.
- eddf32BitLocalized—Specifies that the device drivers in this project target 32 bit machines and that the installation includes all localized installation runtime dialogs.
- eddf64Bit—Specifies that the device drivers in this project target Itanium 64 bit machines and that the installation uses runtime dialogs for English only.
- eddf64BitLocalized—Specifies that the device drivers in this project target Itanium 64 bit machines and that the installation includes all localized installation runtime dialogs.
- eddf64BitAMD—Specifies that the device drivers in this project target AMD 64 bit machines and that the installation uses runtime dialogs for English only.
- eddf64BitAMDLocalized—Specifies that the device drivers in this project target AMD 64 bit machines and that the installation includes all localized installation runtime dialogs.

The English runtime .dll file is smaller than the localized .dll file, so if space is an issue and you do not need the extra language runtime dialogs, use one of the English-only values (not one of the localized values).

If you use one of the localized values, the installation uses a runtime .dll that includes dialogs and text for the following languages:

- Arabic (Saudi Arabia)
- Spanish - Modern Sort (Spain)
- Norwegian (Bokmål) (Norway)
- Chinese (People’s ROC)
Applies To
- ISWiComponent

ImportINIFile Method

Project • This information applies to the following project types:
- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Call the ImportINIFile method to import INI files from the automation layer.
Syntax

ImportINIFile(INIFile As String, [DirectoryID As String])

Parameters

Table 49 • ImportINIFile Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INIFile</td>
<td>This represents the full path to the INI file that needs to be imported.</td>
</tr>
<tr>
<td>DirectoryID</td>
<td>The directory must be a valid MSI Directory identifier such as INSTALLDIR. The directory is optional if you do not specify it. InstallShield will use the component directory.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiComponent

ImportRegFile Method

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the ImportRegFile method to import the contents of a registry (REG) file into the registry data for a specified component. This method mimics manually importing a REG file in the IDE.
Syntax

ImportRegFile (RegFile As String, Optional OverWrite As Boolean)

Parameters

Table 50 • ImportRegFile Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RegFile</td>
<td>Specify the fully qualified path to the REG file that you want to import.</td>
</tr>
<tr>
<td>OverWrite</td>
<td>Choose one of the following options for instructing ImportRegFile how you want to handle conflicts when merging registry data: True—if a value exists in the component's registry data, overwrite it with the value from the REG file. False—if a value in the REG file is already present in the component's registry data, do not import that value. The default value for this optional parameter is True.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiComponent

ISWiRemoveFiles Method

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISWiRemoveFiles method returns an ISWiRemoveFiles collection that contains all of the file and folder removal entries that are associated with the current component.
Syntax

ISWiRemoveFiles As ISWiRemoveFiles

Parameters

Table 51 • RemoveRemoveFile Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pRemoveFolder</td>
<td>Pass the ISWiRemoveFile object that you want to remove.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic code illustrates how you would set a property for a specific file removal entry in a component. For the purposes of this example, assume that the variable m_oMyComp already has a reference to a component.

m_oMYComp.ISWiRemoveFiles("RemoveFile1").FileName = ".txt"

Applies To

• ISWiComponent

RemoveComponentSubFolder Method

Project • This information applies to the following project types:

• InstallScript
• InstallScript Object

The RemoveComponentSubFolder method removes the specified component subfolder from the current component or component subfolder.

Syntax

RemoveComponentSubFolder (pComponentSubFolder As ISWiComponentSubFolder) As Long

Parameters

Table 52 • RemoveComponentSubFolder Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pComponentSubFolder</td>
<td>Pass the subfolder object that you want to remove.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic lines demonstrate the RemoveComponentSubFolder method:
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent
Dim pComponentSubFolder As ISWiComponentSubFolder

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
Set pComponentSubFolder = pComponent.ISWiComponentSubFolders.Item("MyCompSubFolder")
pComponent.RemoveComponentSubFolder pComponentSubFolder

pProj.SaveProject
pProj.CloseProject

Applies To

- ISWiComponent
- ISWiComponentSubFolder

RemoveDynamicFileLinking Method

This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

Call RemoveDynamicFileLinking to remove a dynamic file link from the current component.

Syntax

RemoveDynamicFileLinking (pSourceFolder As ISWiDynamicFileLinking) As Long

Parameters

Table 53 • RemoveDynamicFileLinking Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pSourceFolder</td>
<td>Pass the ISWiDynamicFileLinking object to specify a dynamic file link that you want to remove from the project.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiComponent
RemoveEnvironmentVar Method

**Project**  •  This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

Call RemoveEnvironmentVar to remove an environment from a specified component.

**Syntax**

RemoveEnvironmentVar (sName As ISWiRemoveEnvironmentVar) As Long

**Parameters**

**Table 54 • RemoveEnvironmentVar Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sName</td>
<td>Pass the ISWiEnvironmentVar object to specify an environment variable that you want to remove.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiComponent

RemoveFile Method

**Project**  •  This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call RemoveFile to remove a file from a specified component.
Syntax

RemoveFile (pFile As ISWiFile) As Long

Parameters

Table 55 • RemoveFile Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pFile</td>
<td>Pass the ISWiFile object you want to remove.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiComponent

RemoveRemoveFile Method

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The RemoveRemoveFile method removes a file or folder removal entry from the current component. To remove a file or folder removal entry from the project, pass the ISWiRemoveFile object.

Syntax

RemoveRemoveFile (pRemoveFolder As ISWiRemoveFile) As Long

Parameters

Table 56 • RemoveRemoveFile Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pRemoveFolder</td>
<td>Pass the ISWiRemoveFile object that you want to remove.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiComponent
ISWiComponentSubFolder Object

Project • This information applies to the following project types:

- InstallScript
- InstallScript Object

The ISWiComponentSubFolder object represents a component subfolder belonging to the current component or component subfolder. The component subfolder can be an existing one from the InstallShield user interface’s Components view or one added by calling AddComponentSubFolder.

Use the project's ISWiComponentSubFolders collection to access a specific component subfolder. You must specify either an index number or the component subfolder name for the Item property of ISWiComponentSubFolders.

Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AddComponentSubFolder</td>
<td>Method</td>
<td>Adds a subfolder to the component subfolder.</td>
</tr>
<tr>
<td>AddFile</td>
<td>Method</td>
<td>Adds a file to the component subfolder.</td>

<td>Collection</td>
<td>Contains all of the files associated with this component subfolder.</td>
</tr>
<tr>
<td>Name</td>
<td>Read-Only Property</td>
<td>Stores the name of the component subfolder.</td>
</tr>
<tr>
<td>RemoveComponentSubFolder</td>
<td>Method</td>
<td>Removes a subfolder from the component subfolder.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic code illustrates the use of the ISWiComponentSubFolder object:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent
Dim pComponentSubFolder As ISWiComponentSubFolder

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
```
Set pComponentSubFolder = pComponent.ISWiComponentSubFolders.Item("MyCompSubFolder")
pComponentSubFolder.AddFile("C:\My Files\MyFile.ext")

pProj.SaveProject
pProj.CloseProject

**Applies To**

- ISWiComponent

---

### DeleteFile Method

*Project* • This information applies to the following project types:

- InstallScript
- InstallScript Object

Call DeleteFile to delete a file from a specified component subfolder. The files added with this method have static file links, similar to adding files in the IDE.

**Syntax**

DeleteFile (pFile As ISWiFile) As Long

**Parameters**

**Table 58 • DeleteFile Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pFile</td>
<td>Pass the file object that you want to delete.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic example deletes a file from the component subfolder MyCompSubFolder:

```vba
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent
Dim pComponentSubFolder As ISWiComponentSubFolder
Dim pFile As ISWiFile

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
Set pComponentSubFolder = pComponent.ISWiComponentSubFolders.Item("MyCompSubFolder")
Set pFile = pComponentSubFolder.ISWiFiles.Item("MyFile.ext")
pComponentSubFolder.DeleteFile pFile

pProj.SaveProject
pProj.CloseProject
```
Applies To

- ISWiComponentSubFolder

**ISWiCondition Object**

*Project* • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

ISWiCondition is a subset of the ISWiFeature object. This object allows you to get and set conditional logic for any of your project's features.

**Members**

**Table 59 • ISWiCondition Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>Read-Write Property</td>
<td>Gets or sets any conditions that are associated with this feature.</td>
</tr>
<tr>
<td>Level</td>
<td>Read-Write Property</td>
<td>Gets or sets the install level assigned to the feature when the condition evaluates to TRUE.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiFeature

**ISWiDynamicFileLinking Object**

*Project* • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

Project-specific differences are noted where appropriate.

ISWiDynamicFileLinking represents a dynamic file link that belongs to a component. The dynamic file link can be an existing one from the InstallShield user interface or one added by calling AddDynamicFileLinking.

ISWiEnvironmentVar Object

This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

ISWiEnvironmentVar represents an environment variable that belongs to a component. The file can be an existing one from the InstallShield user interface or one added by calling AddEnvironmentVar.
Members

Table 61 • ISWiEnvironmentVar Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EnvType</td>
<td>Read-Write Property</td>
<td>This enumerated integer property specifies whether the environment variable name refers to a system or user environment variable:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• envtSystem—Creates, modifies, or removes the specified system environment variable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• envtUser—Creates, modifies, or removes the environment variable from the user’s environment. The specified environment variable is available only to the end user who is logged on at the time of installation.</td>
</tr>
<tr>
<td>Key</td>
<td>Read-Only Property</td>
<td>Stores the key of the Environment table.</td>

</tr>
<tr>
<td></td>
<td></td>
<td>• evoiSet—in conjunction with the Placement property, sets the value of an existing environment variable. This option creates the environment variable if it does not already exist on the target system, and then it sets it during installation. If the environment variable exists on the target system, it is set during the installation.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• evoiCreate—Creates the specified environment variable on the target system if it does not already exist, and it sets the variable’s value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• evoiRemove—Removes the specified environment variable from the target system.</td>
</tr>
<tr>
<td>OnUninstall</td>
<td>Read-Write Property</td>
<td>This enumerated integer property specifies whether this environment variable should be removed from the target system when the associated feature is uninstalled:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• evouRemove—Removes the environment variable or its appended value from the target system if the associated feature is uninstalled. If the value of the OnInstall property is Create, the Remove value for OnUninstall removes the entire environment variable. If the value of the OnInstall property is Set, the Remove value for OnUninstall removes only the value that was appended to the variable’s value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• evouLeave—Leaves the environment variable or its appended value on the target system if the associated feature is uninstalled.</td>
</tr>
</tbody>
</table>
### ISWiFeature Object

**Project** • This information applies to the following project types:
- Basic MSI
- InstallScript
- InstallScript MSI

*Project-specific differences are noted where appropriate.*

ISWiFeature represents a top-level feature or a subfeature in InstallShield. You can retrieve a feature by specifying an item in the ISWiFeatures collection.

Many feature properties and attributes are available in the automation interface through this object’s methods, properties, and collections. Refer to the following table to see which methods, properties, and collections are available for your project type.

---

**Table 61 • ISWiEnvironmentVar Object Members (cont.)**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Placement | Read-Write Property | This enumerated integer property retrieves or sets the placement of the value in the Value field relative to the specified environment variable’s existing value:  
  - evpAppend—Appends the value indicated in the Value property to the end of the specified environment variable’s existing value.  
  - evpPrefix—Adds the value indicated in the Value property to the beginning of the specified environment variable’s existing value.  
  - evpReplace—Replaces the value of the specified environment variable with the value indicated in the Value property. |
| Value  | Read-Write Property | Retrieves or sets the path or value for this environment variable. |

</tbody>
</table>
| Advertise           | Basic MSI, InstallScript MSI | Read-Write Property | Gets or sets the Advertisement property for the current feature. Use the following constants to set this property:  
  - **eaAllow (1)**—Use this option to enable advertisement on this feature. Although advertisement is allowed, it is not the default option when the setup is run.  
  - **eaFavor (2)**—Use this option to have the feature advertised by default. Your end users can always change the advertisement option for a feature in Custom Setup dialog.  
  - **eaDisallow (3)**—Use this option if you do not want to allow advertising for this feature. Your end users will not be able to choose to have a feature advertised in the Custom Setup dialog.  
  - **eaDisableIfNotSupported (4)**—Advertisement only works on systems with Internet Explorer 4.01 or higher. If the target system does not meet this criteria, advertising is turned off. If the target system can support advertisement, advertising is allowed.  
| AttachComponent     | Basic MSI, InstallScript MSI | Method        | Associates a component with the current feature.                          |

</tr>
</tbody>
</table>
| SetupTypeStatus  | InstallScript, InstallScript MSI | Read-Write Property | Gets or sets the selection status of the feature in the setup type that is specified in the property's argument. Use the following constants to set this property:  
  - estSelected (10)—The feature is selected.  
  - estDeselected (11)—The feature is not selected.  
In the following Visual Basic code snippet, the Help_Files feature is not selected for the Compact setup type.  
```vbnet  
Set pFeature = pProject.ISWiFeatures.Item("Help_Files")  
Set pSetupType = pProject.ISWiSetupTypes.Item("Compact")  
pFeature.SetupTypeStatus(pSetupType) = 11  
``` |
| StatusText       | InstallScript      | Read-Write Property | Gets or sets the feature's Status Text property, which specifies the text that end users see in the uppermost line of the progress indicator during the transfer of this feature. |
| Visible          | InstallScript      | Read-Write Property | Gets or sets the feature's Visible property, which specifies whether the feature will be visible in feature dialog boxes during the installation. This property is a Boolean. |

### Applies To

- ISWiProject

### AddCondition Method

*Project* • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddCondition method to add a condition to the current feature.
Syntax

AddCondition (sKey As String) As ISWiCondition

Parameters

Table 63 • AddCondition Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sKey</td>
<td>Pass the string version of the condition you want to attach to the current feature.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiFeature

AddMergeModule Method

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddMergeModule method to associate a merge module with the current feature. This method is similar to adding a merge module to a feature in the Redistributables view.

Syntax

AddMergeModule (FileName As String)

Parameters

Table 64 • AddMergeModule Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Pass the fully qualified file name for the merge module (.msm) file that you want to associate with this feature.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiFeature

AddObject Method

Project • This information applies to InstallScript projects.
The AddObject method adds an InstallScript object with the specified moniker to the current feature.

**Syntax**

AddObject (Moniker As String) As ISWiObject

**Parameters**

**Table 65 • AddObject Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Moniker</td>
<td>Pass the moniker for the InstallScript object that you want to add. To get an InstallScript object's moniker, create a new Professional project in the IDE and add the InstallScript object to a feature, then go to the Direct Editor view's ISFeatureExtended table and see the Moniker column.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate the AddObject method:

```vbnet
dim pProj as ISWiProject
set pProj = createobject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
dim pFeature as ISWiFeature
dim pObject as ISWiObject

set pFeature = pProj.ISWiFeatures.Item(2)
set pObject = pFeature.AddObject ("@ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9")

pProj.SaveProject
pProj.CloseProject
```

**Applies To**

- ISWiFeature

**AttachComponent Method**

*Project • This information applies to the following project types:*

- Basic MSI
- InstallScript
- InstallScript MSI

Call the AttachComponent method to associate a component with the current feature. The component must exist (created manually in the IDE or by calling AddComponent) before you can associate it with a feature.
**Syntax**

`AttachComponent (Component As ISWiComponent)`

**Parameters**

Table 66 • AttachComponent Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component</td>
<td>Provide the <code>ISWiComponent</code> object that represents the component you want to associate with this feature.</td>
</tr>
</tbody>
</table>

**Applies To**

- `ISWiFeature`

---

**DeleteCondition Method**

![Project icon] This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the `DeleteCondition` method to delete a condition from the current feature.

**Syntax**

`DeleteCondition (pCondition As ISWiCondition)`

**Parameters**

Table 67 • DeleteCondition Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pCondition</td>
<td>The <code>ISWiCondition</code> object representing the condition you want to delete.</td>
</tr>
</tbody>
</table>

**Applies To**

- `ISWiFeature`

---

**RemoveComponent Method**

![Project icon] This information applies to the following project types:

- Basic MSI
Call RemoveComponent to remove a component from a specified feature. Similar to removing a component in the Setup Design views, RemoveComponent disassociates a component from its feature, but it does not permanently delete it from the project.

**Syntax**

RemoveComponent (pComponent As ISWiComponent) As Boolean

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pComponent</td>
<td>Enter the ISWiComponent object that you want to remove.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiFeature

**RemoveMergeModule Method**

- **Project**
  - This information applies to the following project types:
    - Basic MSI
    - InstallScript MSI

Call the RemoveMergeModule method to remove a merge module from only the current feature. (To delete a merge module from the project, call the DeleteMergeModule method.)

**Syntax**

RemoveMergeModule (FileName As String)

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Pass the fully qualified file name for the merge module (.msm) file that you want to remove from this feature.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiFeature
RemoveObject Method

---

Project • This information applies to InstallScript projects.

The RemoveObject method removes the specified InstallScript object from the current feature.

Syntax

RemoveObject (Object As ISWiObject) As Long

Parameters

Table 70 • RemoveObject Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>The InstallScript object to be deleted.</td>
</tr>
</tbody>
</table>

Example

The following Visual Basic lines demonstrate the RemoveObject method:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pObject As ISWiObject

Set pFeature = pProj.ISWiFeatures.Item("Help_Files")
Set pObject = pFeature.ISWiObjects.Item(1)
pFeature.RemoveObject pObject

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiFeature

ISWiFile Object

---

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module
Project-specific differences are noted where appropriate.

ISWiFile represents a file belonging to a component or, in InstallScript projects, a component subfolder in your project. The file can be an existing one from the InstallShield user interface or one added by calling AddFile.

Many feature properties and attributes are available in the automation interface through this object’s methods, properties, and collections. Note that some methods, properties, and collections are available for specific project types.

Use the component’s ISWiFiles collection to access a specific file. You must specify either an index number or the file key for the Item property of ISWiFiles. The file key is visible in the File column of the File table in the Director Editor view of InstallShield. In Basic MSI and InstallScript MSI projects, it is also listed under the Key column in a component’s file list.

Unfortunately, you might not know the file key, or it might have been reassigned if the files are dynamically linked to the component. Instead of using the file key, you could write code similar to the following example to check for a certain file name:

```vbscript
Dim m_pFile As ISWiFile

For Each m_pFile In m_pComponent.ISWiFiles
    If UCase(m_pFile.DisplayName) = "MYFILE.EXE" Then
        Exit For
    End If
Next
```

If the file name MyFile.exe is found among the component’s files, the For loop ends, and m_pFile holds a copy of the ISWiFile object for MyFile.exe.

ISWiFolder Object

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

ISWiFolder represents a program folder in a component’s Shortcuts explorer in the InstallShield user interface. You can retrieve a folder by specifying an item in the `ISWiFolders` collection.

Many folder attributes are available in the automation interface through this object’s methods and properties. Refer to the following table to learn which methods, properties, and collections are available for your project type.

---

### Table 71 • ISWiFile Object Members (cont.)

*Note* • *This property does not apply to InstallScript projects.*

Applies To

- ISWiComponent

AddShortcut Method

*Project* • *This information applies to the following project types:*

- Basic MSI
Call AddShortcut to create a shortcut under the current program folder.

**Syntax**

```
AddShortcut (Name As String) As ISWiShortcut
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name you want to give the shortcut in the Shortcuts explorer.</td>
</tr>
</tbody>
</table>

- ISWiFolder

---

**AddSubFolder Method**

*This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the AddSubFolder method to create a program folder directly under the current ISWiFolder object.
Syntax
AddSubFolder (Name As String) As ISWiFolder

Parameters

Table 74 • AddSubFolder Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name you want to give the program folder in the Shortcuts explorer.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiFolder

DeleteShortcut Method

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

Call DeleteShortcut to create a shortcut from the current folder.

Syntax
DeleteShortcut (pShortcut As ISWiShortcut) As Long

Parameters

Table 75 • DeleteShortcut Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pShortcut</td>
<td>Pass the ISWiShortcut Object to specify a shortcut that you want to delete from a folder.</td>

</table>

Examples

Set pShortcut = pFolder.ISWiShortcuts("MyShortcut")
If Not pShortcut Is Nothing Then
    pFolder.DeleteShortcut pShortcut
Next
Applies To

• ISWiFolder

DeleteSubFolder Method

Project • This information applies to the following project types:

• Basic MSI
• DIM
• InstallScript
• InstallScript MSI
• InstallScript Object
• Merge Module

Call the DeleteSubFolder method to delete the specified subfolder from the current ISWiFolder object.

Syntax

DeleteSubFolder (pSubFolder As ISWiFolder) As Long

Parameters

Table 76 • DeleteSubFolder Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Pass the ISWiFolder Object to specify a subfolder that you want to delete from a folder.</td>

</table>

Example

Set pSubFolder = pFolder.SubFolders("MySubFolder")
If Not pSubFolder Is Nothing Then
   pFolder.DeleteSubFolder pSubFolder
Next

Applies To

• ISWiFolder

ISWiLanguage Object

Edition • Support for multilanguage installations is available with InstallShield Premier Edition.
**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

ISWiLanguage represents a language whose string entries are included in the current project.

To include or exclude languages, use the IsIncluded property on each relevant ISWiLanguage object.

**Members**

**Table 77 • ISWiLanguage Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>

• DIM
• InstallScript
• InstallScript MSI
• InstallScript Object
• Merge Module

Call `DeleteStringEntry` to delete a string entry from a language.

### Syntax

```vbscript
DeleteStringEntry (pLangId As ISWiStringEntry)
```

### Parameter

**Table 79 • DeleteStringEntry Method Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pLangId</td>
<td>Specify the <code>ISWiStringEntry</code> object to specify a string entry that you want to remove from the project.</td>
</tr>
</tbody>
</table>

**Applies To**

• `ISWiLanguage`
ISWiLatestSetup Object

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Indicates the Latest Setup (or UpgradedImage) item for a patch configuration where you specify settings for the latest version of your installation.

Each patch configuration must contain at least one latest setup and one previous setup in order for you to create a patch. You can have multiple previous setups per latest setup.

Every application or setup that you intend to patch to a latest setup must be added to the previous setup node.

For example, your company supports versions 1.0 and 1.1 of an application, and you want to upgrade both of these applications to version 2.0. To create a single patch to upgrade both versions, you would add V1.0 and V1.1 as previous setups to the latest setup. Your latest setup would contain V2.0.
## Members

<tr>
<td>MsiPath</td>
<td>Read-Only Property</td>
<td>Gets or Sets the latest setup path. The latest setup should be the latest version of your installation for which you want to create a patch. The default setting, &quot;ISLatestRelease&quot;, resolves to the last full release that you build. The release path that you specify in this property should be an uncompressed release, ideally created with an administrative installation if the previous product versions were compressed.</td>
</tr>
</tbody>
</table>
AddPreviousSetup Method

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Call the AddPreviousSetup method to add previous setup item to the latest setup item. Using this method is similar to adding a previous setup item with the Patch Design View of the IDE. You can set the properties of the new previous setup with the ISWiPreviousSetup object.

**Syntax**

```
AddPreviousSetup(PreviousSetupName As String) As ISWiPreviousSetup
```

**Parameter**

**Table 81 • AddPreviousSetup Method Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PreviousSetup Name</td>
<td>Holds the name of previous setup item.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiPatchConfig

DeletePreviousSetup Method

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Applies To

- ISWiLatestSetup
Call the DeletePreviousSetup method to remove specified previous setup object from the latest setup configuration.

**Syntax**

```
DeletePreviousSetup (PreviousSetup As ISWiPreviousSetup) As Long
```

**Parameter**

**Table 82 • DeletePreviousSetup Method Parameter**

</tbody>
</table>

**Applies To**

- ISWiLatestSetup

**ISWiMsiPatchSequence Object**

*Project* • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Contains all the information that the installer requires to determine the sequence of application of a small update patch relative to all other patches.
## Members

**Table 83 • ISWIMsiPatchSequence Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>FamilyName</strong></td>
<td>Read-Write Property</td>
<td>Gets the patch family name. Patches in the same patch family that target the same product version are sorted by the values in the Sequence column. The patches within the patch family are applied to the target product in the order of increasing sequence. The PatchFamily is also used to determine which patches are to be superseded. A patch may be listed in multiple rows and belong to multiple patch families if it applies to more than one product or includes multiple fixes. The Windows Installer does not interpret the PatchFamily value in any way other than comparisons for equality against other PatchFamily values. A PatchFamily value must be unique within the ProductCode targeted by the set of patches. In the complex patching scenarios the PatchFamily identifier may need to be globally unique.</td>
</tr>
<tr>
<td><strong>Sequence</strong></td>
<td>Read-Write Property</td>
<td>Gets or Sets the sequence of this patch within the specified PatchFamily. The value in Sequence is expressed in the format of Version data. The value contains between 1 and 4 fields and each field has a range of 0 to 65535. Members of PatchFamily are sorted and applied to the target product in the order of increasing Sequence values. For example, the following six values are increasing: 1, 1.1, 1.2, 2.01, 2.01.1, 2.01.1.1.</td>
</tr>
<tr>
<td><strong>Supersede</strong></td>
<td>Read-Write Property</td>
<td>Set this Boolean property to True to indicate that the small update patch supersedes the updates provided by all patches with lesser Sequence values in the same PatchFamily.</td>
</tr>
<tr>
<td><strong>Target</strong></td>
<td>Read-Write Property</td>
<td>Gets or Sets target product code. A value in this property is optional. If a product code GUID is set in this property and the patch is being applied to the specified product, the patch is sorted and applied as a member of the specified PatchFamily. If a product code GUID is set in this field and the patch is not being applied to the product specified by ProductCode, this row is ignored. If the value in ProductCode is NULL, the patch is sorted and applied as a member of PatchFamily for all targets of the patch regardless of the product code. A patch can have multiple rows in the same PatchFamily and a different ProductCode for each product targeted by the patch. One row for the PatchFamily can specify NULL for ProductCode. If the target product matches a row with a non-NULL ProductCode, the installer uses the matching row and ignores the row with the NULL ProductCode. If none of the specified product codes match the target, the patch is sorted and applied as a member of PatchFamily for all targets of the patch regardless of the product code.</td>
</tr>
</tbody>
</table>

**Applies To**
ISWiObject Object

Project • This information applies to the following project types:

- InstallScript
- InstallScript Object

The ISWiObject object represents an InstallScript object belonging to your project. The InstallScript object can be an existing one from the InstallShield user interface's Objects view or one added by calling AddObject.

Use the project's ISWiObjects collection to access a specific InstallScript object. You must specify either an index number or the moniker for the Item property of ISWiObjects. The moniker is visible in the IDE only as the Moniker in the Direct Editor view's ISFeatureExtended table.

Members

None.

Example

The following Visual Basic code illustrates the use of the ISWiObject:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pObject As ISWiObject

Set pFeature = pProj.ISWiFeatures.Item(2)
Set pObject = pFeature.ISWiObjects.Item("@ismk2:75514280-1EB4-11D3-8B09-00105A9846E9")
pFeature.RemoveObject pObject

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiFeature

ISWiPatchConfig Object

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

ISWiPatchConfig represents a patch configuration in the Patch Design view of the InstallShield user interface. You can retrieve a configuration by specifying an item in the ISWiPatchConfigs collection.
Build Status Events

The ISWiPatchConfig object raises the following status events:

- Public Event ProgressIncrement(ByVal lIncrement As Long, pbCancel As Boolean)
- Public Event ProgressMax(ByVal lMax As Long, pbCancel As Boolean)
- Public Event StatusMessage(ByVal sMessage As String, pbCancel As Boolean)

These events are raised during the patch build process and provide status updates. You can set pbCancel to stop the build. For sample code that demonstrates how to use these events, see Using Build Status Events.

Many feature properties and attributes are available in the automation interface through this object's methods, properties, and collections. The following table lists the ISWiPatchConfig object members.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AddLatestSetup</td>
<td>Method</td>
<td>Adds a ISWiLatestSetup object to the current patch configuration.</td>
</tr>

<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| LauncherIcon          | Read-Write    | Gets or sets the icon for the Update.exe file. To use your own icon for the Update.exe file, set the fully qualified name of the file that contains the icon. To specify a file, type an absolute path or a path that is relative to a path variable.  
By default, the icon with index 0 is used; to specify a different icon, either select an icon in the Change Icon dialog box or append the icon’s index or resource ID (preceded by a minus sign) to the file name. For example, C:\Temp\MyLibrary.dll,2 indicates the icon with an index of 2, and C:\Temp\MyLibrary.dll,-100 indicates the icon with a resource ID of 100.  
If you leave this setting blank, InstallShield uses a default icon for your Update.exe file. |
| LauncherPassword      | Read-Write    | Gets or sets the password to protect your application. You must set True for the PasswordProtected property to activate password protection.  
When you password-protect your patch, any end user who wants to apply your patch must enter a case-sensitive password to launch your update.  
This setting is applicable only to patches that use an Update.exe file.                                                              |
| LauncherProductName   | Read-Write    | Gets or sets the product name. This will override the default product name for Update.exe with your product name.  
The product name is displayed on the Properties dialog box for the update launcher; this Properties dialog box opens when end users right-click the Update.exe file and then click Properties.  
**To learn more, see Customizing File Properties for the Update Launcher.**                                               |

<tr>
<td>--------------------</td>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| MinorUpdateTargetRTM | Read-Write Property | MSI 3.1 Required  
Set this property to True if you want your minor-upgrade patch to essentially remove all of the patches up to the release to manufacturing (RTM) version of the product (or the most recent major upgrade of the product, if one has been installed) before applying the current minor-upgrade patch. With this option, all patches (with or without sequencing data) are removed. You do not need to target additional baseline versions and thus increase the patch payload. All end users can successfully apply the patch without applying any intermediate patches.  
If you do not want your minor-upgrade patch to remove all of those earlier patches, set False. If you select this option, it may be necessary for your patch to contain the information needed to target each of the earlier minor upgrades that were created after the RTM (or the most recent major upgrade of the product, if one was created).  
For example, if you are creating a minor-upgrade patch for service pack 2 and you select No for this property, your patch needs to target the minor-upgrade patch for service pack 1. You could also optionally target other baselines (such as RTM); doing so would increase the patch payload. Note that if you do not target the RTM version, any end user who has the RTM version but not the service pack 1 minor-upgrade patch would need to install service pack 1 before service pack 2.  
Versions of Windows Installer earlier than 3.1 ignore this setting. |
<p>| MoreInfoURL        | Read-Write Property | Gets or sets the uniform resource locator (URL) of the support URL that you would like your customers to visit for technical support. |</p>
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OptimizedInstallMode</td>
<td>Read-Write Property</td>
<td>Set this property to True if you want Windows Installer 3.1 to optimize the patching process so that it reduces the time that is required to apply the current patch. If the patch only modifies a select list of tables, Windows Installer 3.1 ignores the actions that are associated with all other tables. For more information, including the list of tables, see “Patch Optimization” in the Windows Installer Help Library. If you set True for this property, Microsoft Corporation recommends that you test your patch extensively to ensure that it behaves as expected. If you do not want Windows Installer 3.1 to optimize the patching process for the current patch, set False. Windows Installer will run a complete repair of the application when the patch is applied to the target machine. Versions of Windows Installer earlier than 3.1 ignore this property. Windows Installer 3.0 optimizes patches if the patch only modifies the select list of tables. To avoid patch optimization by Windows Installer 3.0, you must use the DisableFlyWeightPatching policy. For more information, see DisableFlyWeightPatching in the Windows Installer Help Library. Versions of Windows Installer earlier than 3.0 run a complete repair of the installation when a patch is applied.</td>
</tr>
<tr>
<td>OptimizeForLargeFiles</td>
<td>Read-Write Property</td>
<td>Set this property to True to create small bit-level patches for all application files larger than 4 MB in your installation project.</td>
</tr>
<tr>

The UAC dialog box opens when an end user launches the signed file and elevated privileges are required. If you leave this setting blank, InstallShield uses the name of the file without its extension as the description to the right of the “Program Name:” label on the UAC dialog box.</td>
</tr>
</tbody>
</table>
### AddLatestSetup Method

### SignaturePassword
- **Type:** Read-Write Property
- **Description:**
  - Gets or sets the password for .pfx file that you are using. InstallShield encrypts the password and stores it in your project file (.ism).
  - At build time, InstallShield uses the password to sign files with a .pfx file. If your certificate is protected by a password but you do not enter it in this setting, signing with a .pfx file fails.

### SignatureSPC
- **Type:** Read-Write Property
- **Description:**
  - Gets or sets the digital certificate information that you want to use to sign your patch package. Use either the location of the .pfx file or information about the certificate store that contains the certificate.

### SignatureURL
- **Type:** Read-Write Property
- **Description:**
  - Gets or sets the fully qualified URL—for example, http://www.mydomain.com. This URL is used in your digital signature to link to a site that you would like end users to visit to learn more about your product, organization, or company.

### SignPackage
- **Type:** Read-Write Property
- **Description:**
  - Set this property to True if you want to digitally sign your patch package.

### SignUpdateExe
- **Type:** Read-Write Property
- **Description:**
  - Set this property to True if you want to digitally sign Update.exe file.

### TargetProductName
- **Type:** Read-Write Property
- **Description:**
  - Gets or sets the name of the application or the target application suite.

### UpdateLauncherName
- **Type:** Read-Write Property
- **Description:**
  - Gets or Sets file name (without the .exe file extension) for update launcher that InstallShield should use for the update launcher file that it generates at build time. If this setting is blank, InstallShield uses the default value of ‘Update’, and the update launcher file is called Update.exe.

### ValidateAtBuild
- **Type:** Read-Write Property
- **Description:**
  - Set this property to True if you want to use the upgrading and patching validation every time you build a patch.

---

**Project** • **This information applies to the following project types:**
- Basic MSI
• InstallScript MSI

Call the AddLatestSetup method to add latest setup item to the current patch configuration. Using this method is similar to adding a latest setup item with the Patch Design View of the IDE. You can set the properties of the new latest setup with the ISWiLatestSetup object.

**Syntax**

AddLatestSetup(LatestSetupName As String) As ISWiLatestSetup

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>

---

**DeleteLatestSetup Method**

Project • This information applies to the following project types:

• Basic MSI
• InstallScript MSI

Call the DeleteLatestSetup method to remove specified latest setup item from the current patch configuration.

**Syntax**

DeleteLatestSetup (Latest As ISWiLatestSetup) As Long

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Latest</td>
<td>Holds the latest setup item object to be deleted.</td>
</tr>
</tbody>
</table>

**Applies To**

• ISWiPatchConfig
ISWiPatchExternalFile Object

**Project** • This information applies to the following project types:
- Basic MSI
- InstallScript MSI

Indicates the external file object that you want to create a binary file patch against versions of an application file that have not been shipped as part of the previous setup.

For example, if one of your application files was potentially updated by another setup, you should reference that file version to ensure that the file level patch can be successfully applied at runtime.

ISWiPathVariable Object

Project  •  This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

ISWiPathVariable represents a path variable that is included in the current project. The path variable can be an existing one that was created from the Path Variables view in InstallShield, or one that was added by calling the AddPathVariable method.

Important  •  Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.

</tr>
</tbody>
</table>

**For Standard Path Variables**

For standard variables, enter the directory to which you would like your variable to point.

---

*Note* • You can also refer to other path variables in the defined value by enclosing the referenced path variable name in angled brackets. For example, if you have a path variable called *MyRoot* with a value of `C:\`, you can refer to it in a path variable definition for another variable, such as *Games*. The actual path for the *Games* variable might be `C:\Programs\GameFiles`, but you can define *Games* as `<MyRoot>\Programs\GameFiles`. However, if you attempt to self-reference a path variable, the literal string is used instead. For example, defining *Games* as `<MyRoot>\Programs\Games` actually results in *Games* defined as `C:\Programs\Games`.

ISWiProductConfig Object

Project • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

InstallScript and InstallScript Object projects contain only one element in ISWiProductConfigs; it is named Media.

Only some of the members of ISWiProductConfig apply to InstallScript and InstallScript Object projects.
ISWiProductConfig represents a product configuration in the Releases view of the InstallShield user interface. You can retrieve a configuration by specifying an item in the ISWiProductConfigs collection.
### Members

<td>Adds a release to the current product configuration.</td>
</tr>
</tbody>
</table>
| **ArchitectureValidation** | Basic MSI, Merge Module | Read-Write Property | Set this property to one of the following values to indicate what type of build-time architecture validation you want to perform:  
  - **epvtLenient (0)**—Lenient architecture validation, which is the default type of validation, does not trigger build errors or warnings if the architecture that the Template Summary property specifies does not match the architecture for one or more of the product files or the custom action files that are being included in the release.  
  - **epvtStrict (1)**—Strict validation may trigger build errors and warnings if the architecture that the Template Summary property specifies does not match the architecture for one or more of the product files or custom action files that are being included in the release.  
  The value of this property also influences whether InstallShield includes 32-bit or 64-bit versions of the built-in InstallShield custom action DLLs.  
  To learn more, see [Selecting the Appropriate Type of Architecture Validation for Builds](#).  
  |
| **ConfigFlags** | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | Gets or sets a string that contains the release flags that you want to use to filter your features. Separate multiple flags with a comma. |

AddRelease Method

**Project**

*This information applies to the following project types:*

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the AddRelease method to add a release to the current product configuration. Using this method is similar to creating a release in the Release Wizard or the Releases view of the IDE.

**Syntax**

```
AddRelease (ReleaseKey As String) As ISWiRelease
```

**Parameters**

**Table 91 • AddRelease Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ReleaseKey</td>
<td>Pass the name of the release you would like to create in the current product configuration.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProductConfig

DeleteRelease Method

**Project**

*This information applies to the following project types:*

- Basic MSI
Call the DeleteRelease method to delete a release from the current product configuration. Using this method is similar to deleting a release in the Releases view of the IDE.

**Syntax**

DeleteRelease (Release As ISWiRelease)

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ReleaseKey</td>
<td>Pass the name of the release you want to delete from the current product configuration.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProductConfig

**ISWiProperty Object**

- **Project** • This information applies to the following project types:
  - Basic MSI
  - DIM
  - InstallScript MSI
  - Merge Module

ISWiProperty represents a Windows Installer property in the Property Manager of the InstallShield user interface. You can retrieve a property by specifying an item in the ISWiProperties collection.
Members

Table 93 • ISWiProperty Object

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comments</td>
<td>Read-Write Property</td>
<td>Gets or sets the comments associated with the Windows Installer property.</td>
</tr>
<tr>

Example

The following example sets the property ApplicationUsers to “OnlyCurrentUser,” which means that the option “Only for me” is selected by default in the CustomerInformation dialog:

```vbscript
Dim pProject As ISWiProject
Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\ISWiProperties.ism"

Dim pProperty As ISWiProperty
Set pProperty = pProject.ISWiProperties.Item("ApplicationUsers")

pProperty.Value = "OnlyCurrentUser"
pProperty.Comments = "Make ""Only for me"" the default radio button " & _
                  "in the CustomerInformation dialog."

pProject.SaveProject
```

Applies To

- ISWiProject

ISWiRelease Object

Project • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Project-specific differences are noted where appropriate.

ISWiRelease represents an existing release in the Releases view of InstallShield. You can retrieve a release by specifying an item in the ISWiReleases collection. The release must have been created through the Release Wizard, the Releases view, or the command-line tool ISCmdBld.exe.
## Table 94 • ISWiRelease Object Members

<td>Method</td>
<td>Rebuilds your .msi file and updates the Files table, including any new or changed files in your release.</td>
</tr>
<tr>
<td>BuildUTF8Database</td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Read-Write Property</td>
<td>If you want the Windows Installer database, along with any instance or language transforms, to be built using the UTF-8 encoding, set this Boolean property to True. The UTF-8 encoding supports characters from all languages simultaneously, enabling you to mix and match, for example, Japanese and German, or Russian and Polish, both in text shown to end users and in file names and registry keys. These mixed languages work correctly regardless of the current language of the target system. However, some scenarios result in user interface issues. For example, if an end user specifies the /qb command-line option or uninstalls the product from Add or Remove Programs, Windows Installer uses very small fonts to display the user interface text in a UTF-8 database. If you set this property to True, InstallShield creates an ANSI database when you build your release. This option does not let you mix characters from languages in different code pages.</td>
</tr>
<tr>
<td>BuildWarningCount</td>
<td>Basic MSI, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>Read-Only Property</td>

Table 94 • ISWiRelease Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| CabCompressionType| Basic MSI, InstallScript MSI | Read-Write      | If the Compressed property is set to True, you can use this CabCompressionType property to specify the type of compression that InstallShield should use when building this release's .cab files. Available options are:  
• **ecctLZX (3)**—InstallShield uses LZX compression to compress your product's data files into .cab files. This option results in the smallest .cab files; however, it also takes the most time to extract the data from these .cab files at run time.  
• **ecctMSZIP (1)**—InstallShield uses MSZIP compression to compress your product's data files into .cab files.  
• **ecctNone (0)**—InstallShield does not use any compression when creating the .cab files.  

**Important** • Using compression generally decreases the size of your compressed files, but the build process may take more time to complete. Depending on the number and size of the files being compressed, the LZX compression and the build may take hours to complete. Therefore, if you select the LZX option, it is recommended that your build machine have the latest hardware to minimize the time that it takes for the build to complete.  

| CachePath         | Basic MSI, InstallScript MSI | Read-Write      | Specifies where cached installation files should be stored on the end user's system. Use a hard-coded value such as C:\CachedFiles.  
This property is used only if the CacheWebDownload property for the current build is set to True. |

Important • Using compression generally decreases the size of your compressed files, but the build process may take more time to complete. Depending on the number and size of the files being compressed, the LZX compression and the build may take hours to complete. Therefore, if you select the LZX option, it is recommended that your build machine have the latest hardware to minimize the time that it takes for the build to complete.

</tbody>
</table>

---

Project • For Basic MSI, InstallScript MSI, and Merge Module projects, use the **DistributeLoc** property instead of **CopyToFolder** to distribute your release to a folder.
### Table 94 • ISWiRelease Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CubFile</strong></td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Read-Write Property</td>
<td>Gets or sets the name of the validation module (.cub file) that InstallShield uses to validate the built release.</td>
</tr>
<tr>
<td><strong>DefaultLang</strong></td>
<td>Basic MSI, InstallScript MSI, InstallScript Object</td>
<td>Read-Write Property</td>
<td>Gets or sets the language identifier for the default language of a given release. This property value overrides the default project language that is configured in the General Information view or the String Editor view. For more information, see Setting the Default Project Language.</td>
</tr>
<tr>
<td><strong>DelayMSIEngineReboot</strong></td>
<td>Basic MSI, InstallScript MSI</td>
<td>Read-Write Property</td>
<td>Specifies whether you want to postpone any reboot associated with installing or updating the Windows Installer engine on the target system until after your installation has completed. Set this to True to postpone the reboot, if one is necessary. Set this to False to allow the system to reboot, if necessary, immediately after the Windows Installer engine has been installed or updated and before performing your installation. This option requires Windows Installer version 2.0.</td>
</tr>
</tbody>
</table>
DigitalCertificateInfo

Gets or sets the digital certificate that you want to use to sign your release. InstallShield lets you choose between the following options:

- To specify the .pfx certificate file that you want to use for signing, set this property equal to the fully qualified path and file name of the .pfx file on your build machine.

  Instead of hard-coding a path, you can use a path variable that is defined in the Path Variables view or part of the ISWiPathVariables collection. At build time, InstallShield replaces the path variable with the appropriate value.

- To reference a certificate store that contains the certificate that you want to use for signing, set this property equal to a certificate store string. To pass a certificate store string as the value, use the following convention:

  *Store*StoreLocation:Cert Subject

  For Store, pass one of the following values:

  - MY
  - CA
  - Trust
  - Root

  For StoreLocation, pass one of the following values:

  - User
  - Machine

  For Cert Store, pass the subject of the certificate that you want to use.

  To learn more, see Digital Signing and Security.

### DisplayDotNetOptionDialog

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| DisplayDotNetOptionDialog | Basic MSI, DIM, InstallScript, MSI, InstallScript Object, Merge Module | Read-Write Property | Set this property to True if you want the installation to display the .NET option message box at run time. This message box allows the end user to specify whether to install the .NET Framework.  
Set this property to False if the installation should not allow end users to determine whether they want to install the .NET Framework.  

**Note** • *This property does not determine whether your installation includes the .NET Framework, only whether the end user has a choice to install it.*

### DistributeAfterBuild

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| DistributeAfterBuild  | Basic MSI, InstallScript MSI, Merge Module    | Read-Write Property | Set this to True if you want the build engine to automatically distribute the current release after each build to the location that you specify for the DistributeLoc or DistributeToURLLoc properties.  

**Note** • *When both the DistributeLoc and DistributeToURLLoc properties are specified, the release is copied to only the FTP location.*
DistributeLoc

If you want to be able to automatically distribute your release to a folder, specify the location for this property. The DistributeAfterBuild property must be set to True.

Note that existing folders with the same names as copied folders are overwritten, but no folders are deleted.

If the media format of the selected release is a network image, which creates only one disk image folder, the contents of the disk image folder, rather than the folder itself, are copied. If you chose to create a self-extracting executable file, the executable file, rather than the disk image folders, is copied.

**Note** • When both the DistributeLoc and DistributeToURLLoc properties are specified, the release is copied to only the FTP location.
If you want to be able to automatically distribute your release to an FTP server, specify the FTP URL for the location for this property.

The DistributeAfterBuild property must be set to True.

---

**Note** • If you need to distribute your release to a path outside the FTP default folder, use a double slash (//). For example, to distribute your release to a root-level folder called `myproduct`, where the URL of the FTP server is `ftp://ftp.mydomain.com`, enter `ftp://ftp.mydomain.com//myproduct` for the FTP location.

When both the DistributeLoc and DistributeToURLLoc properties are specified, the release is copied to only the FTP location.

---

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| KeepUnusedDirectories | Basic MSI, InstallScript MSI, Merge Module | Read-Write Property | Specify whether you want InstallShield to remove unused directories from the Directory table of the .msi file when you build this release. Available options are:  
- **False**—If a directory that is listed in the Directory column of the Directory table is not referenced in any known location in the .msi file, InstallShield removes it from the Directory table of the .msi file that it creates at build time. For Basic MSI and InstallScript MSI projects, this occurs after any merge modules are merged, but only directories that are present in the .msi file are removed; therefore, if a merge module contains new unused directories in its Directory table, the new unused directories are added to the installation.  
- **True**—InstallShield does not remove any directories from the Directory table of the .msi file that it creates at build time.  
The default value is False. |

**Note** • Under some conditions, predefined directories cannot be resolved, causing an installation to fail. Removing unused directories from the Directory table enables you to avoid unnecessary failures. Therefore, it is recommended that you do not keep unused directories.

| ObjDiffOptions     | InstallScript, InstallScript Object | Read-Write Property | Gets or sets the release's Object Difference property, which specifies the conditions for including InstallShield objects in your differential release. Use the following constants to set this property:  
  - **eodoAll (0)** — The differential release will include all objects that would be included in the equivalent full update release.  
  - **eodoExcludeAll (1)** — The differential release will not include any objects.  
  - **eodoIncludeIfChanged (2)** — The differential release will include those objects that would be included in the equivalent full update release and that are not found in, or are different from, the corresponding object in at least one of the comparison releases.  
  This property is applicable only if the EnableDifference property is set to True. |
| OneClickCabJarBaseName | Basic MSI, InstallScript MSI | Read-Write Property | Specifies the base file name for the cabinet (.cab) file generated by the build process for a One-Click installation. The ",.cab" extension is appended to the name you specify here. The generated file (or files) will be created in the Disk1 folder for the current release.  
  This property is used only if the GenerateOneClickInstall property for the current build is set to True. |
| OneClickHTMLBaseName | Basic MSI, InstallScript MSI | Read-Write Property | Specifies the base file name of the HTML file generated by the build process. The ",.htm" extension is appended to the base name you specify, and the generated file is created in the Disk1 folder of the current release location.  
  This property is used only if the GenerateOneClickInstall property for the current build is set to True. |

<td>To learn more about path variables, see <strong>Using Path Variables</strong>.</td>
</tr>
</tbody>
</table>
**PostbuildEvent**

Gets or sets the command that you want to be run after InstallShield has built and signed the release.

When you are specifying a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see Specifying Commands that Run Before, During, and After Builds.

Following is sample Visual Basic code that sets two commands:

```vb
pISWiRelease.PostbuildEvent = "Event1" + vbCrLf + "Event2"
```

At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.

**Edition** • This property is available in the Premier edition of InstallShield.
PrebuildEvent

Basic MSI, InstallScript, MSI, Merge Module

Read-Write Property

Gets or sets the command that you want to be run before InstallShield starts building the release. This event runs after InstallShield creates the release folder and log file, but before InstallShield starts building the release.

When you are specifying a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see Specifying Commands that Run Before, During, and After Builds.

Following is sample Visual Basic code that sets two commands:

```vbnet
pISWiRelease.PrebuildEvent = "Event1" + vbCrLf + "Event2"
```

At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.

Edition • This property is available in the Premier edition of InstallShield.

</tbody>
</table>
Specify the files and file patterns that you want to be digitally signed at build time. Note the following guidelines:

- To indicate a wild-card character, use an asterisk (*). For example, if you want to sign all .exe files, specify the following: *.exe

Using wild-card characters is especially helpful if you include dynamically linked files in your project and you want to sign all files that match a certain pattern.

- Put each file and each file pattern on its own line, with each separated by a carriage return.

- Note that the files and file patterns that should not be signed override any files and file patterns that should be signed. For example, if you specify *.exe for the SignFilesInclude property and the SignFilesExclude property, InstallShield does not sign any .exe files.

### Table 94 • ISWiRelease Object Members (cont.)

- To indicate a wild-card character, use an asterisk (*). For example, if you want to sign all .exe files, specify the following: *.exe

Using wild-card characters is especially helpful if you include dynamically linked files in your project and you want to sign all files that match a certain pattern.

- Put each file and each file pattern on its own line, with each separated by a carriage return.

- Note that the files and file patterns that should not be signed override any files and file patterns that should be signed. For example, if you specify *.exe for the SignFilesInclude property and the SignFilesExclude property, InstallShield does not sign any .exe files.
Specify whether you want InstallShield to sign your original files or just the files that are built into the release:

- **False**—InstallShield signs a temporary copy of each file and then uses that signed temporary copy to build a release. Note that with this behavior, InstallShield will not modify or sign your original files.
- **True**—If you want InstallShield to sign your original files, set this property to True.

The default value of this property is set to False.

The benefit of specifying True for a Basic MSI or InstallScript MSI project is that it helps create one patch that updates both compressed and uncompressed versions of a release that contains originally unsigned files.

<table>

</table>
### UseMyVersionInfo

**Project:** Basic MSI, InstallScript MSI  
**Type:** Read-Write Property  
**Description:** Set this property to True to override the default InstallShield copyright information for Setup.exe. You can specify your copyright information in the LauncherCopyright property.  
This property is applicable only to releases that meet the following criteria:  
- Single-file Setup.exe  
- Compressed files  
- Network image media type

### UsePathVariableTestValues

**Project:** Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module  
**Type:** Read-Write Property  
**Description:** If you used test values for any of your path variables, set this property to True to set those variables to their actual values at this time.

### UseProjectSkin

**Project:** InstallScript, InstallScript Object  
**Type:** Read-Write Property  
**Description:** This Boolean property gets or sets whether the release's Specify Skin property is set to Use Project Setting, which uses the skin that is selected in the Dialogs view's Skins folder.

### VMConfig

**Project:** Basic MSI, InstallScript, InstallScript MSI  
**Type:** Read-Write String Property  
**Edition:** This property is available in the Premier edition of InstallShield.  
**Description:** Gets or sets the name of the group of VM configuration settings that you want to use when distributing the selected release to a VM.  
To learn more about VM distribution, see [Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand](#).
### ISWiRelease Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>

</tr>
</tbody>
</table>
VMSnapShot

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| VMSnapShot     | Basic MSI, InstallScript, InstallScript MSI | Read-Write String Property | **Edition** • This property is available in the Premier edition of InstallShield.  

Optionally gets or sets the name of the snapshot that you want to use for distributing the release.

If a snapshot is specified for the VM configuration that is selected through the VMConfig property, the name of that snapshot is considered to be the default value for the VMSnapShot property.

If no snapshot is specified for the VM configuration, InstallShield does not revert to a specific snapshot. InstallShield powers on the VM without reverting it to a specific snapshot, and copies your installation to the VM.

To learn more about VM distribution, see Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand.
### Table 94 • ISWiRelease Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| VMStageMachineCopyPath      | Basic MSI, InstallScript, InstallScript MSI | Read-Write String Property | **Edition** • This property is available in the Premier edition of InstallShield.  
The copy path identifies the location on the VM where the release is to be distributed. The last subfolder in the path can be a path that InstallShield creates on the VM; the other folders in the path must already exist.  
If a destination path is specified for the VM configuration that is selected through the VMConfig property, that destination path is considered to be the default value for the VMStageMachineCopyPath property. To override the destination path for the selected release, set the VMStageMachineCopyPath property.  
To learn more about VM distribution, see Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand. |
| VMStagePostBuild            | Basic MSI, InstallScript, InstallScript MSI | Read-Write Boolean Property | **Edition** • This property is available in the Premier edition of InstallShield.  
Specify whether you want InstallShield to automatically distribute the selected release each time that it is successfully built. Distributing the release to the VM involves the following tasks:  
1. Revert the VM to the designated snapshot (if one is specified).  
2. Power on the VM.  
3. Copy the built release to the VM to make it available for testing.  
To learn more about VM distribution, see Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand. |
### Table 94 - ISWiRelease Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WebCreateDefaultPage</td>
<td>InstallScript</td>
<td>Read-Write Property</td>
<td>This Boolean property gets or sets the release's Create Default Web Page setting, which specifies whether InstallShield should create a default Web page (.htm file) and place it in the Disk1 folder.</td>
</tr>
</tbody>
</table>
| WebPageUrl            | InstallScript | Read-Write Property | Gets or sets the release's Web Page URL setting, which specifies the location of the Web page that should be launched if you click the Run From Web command on the Build menu in InstallShield:  
If nothing is entered for this property, InstallShield creates a Setup.htm file at build time and places it in the Disk1 folder.  
If you do enter a URL for this property, do not include the name of the page, and do not include an ending forward slash. For example, if the full URL for the Setup.htm file is `http://www.mypages.com/setup/Setup.htm`, enter the following as the Web page URL: `http://www.mypages.com/setup`  
When you click the Run from Web command on the Build menu, InstallShield launches the appropriate URL (`http://www.mypages.com/setup/Setup.htm`, in the aforementioned example). |
Table 94 • ISWiRelease Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| WebType   | Basic MSI, InstallScript MSI | Read-Write Property | Indicates the configuration of your Web installation setup package. Set this property to one of the following:  
- **ewtDownloader (0)**—Downloader. Builds this release as a combination of Setup.exe and your MSI package, where the end user downloads and launches Setup.exe, which in turn downloads and runs the MSI database, which contains all of your files.  
- **ewtFTW (1)**—Install from the Web. Builds this release as a combination of Setup.exe, your MSI database, and external cabinet (.cab) files. The end user downloads and runs Setup.exe, which in turn downloads and runs the MSI database. Based on the end user’s setup type and feature selections, only the requested CAB files are downloaded and installed to minimize download time. Application maintenance and repair use the URL specified in the URLForYourFiles property as the installation source.  
- **ewtOneExe (2)**—One executable. Builds this release as a single self-extracting Setup.exe. This setting is ideal for a package that is to be downloaded from many Web or FTP sites, since the installation package is self-contained. Note that the entire installation package is downloaded, so the download time is greater than the ewtFTW (1) (Install from the Web) setting.  

---

**ISWiRelease Object Members (cont.)**

- Indicates the configuration of your Web installation setup package. Set this property to one of the following:
  - **ewtDownloader (0)**—Downloader. Builds this release as a combination of Setup.exe and your MSI package, where the end user downloads and launches Setup.exe, which in turn downloads and runs the MSI database, which contains all of your files.
  - **ewtFTW (1)**—Install from the Web. Builds this release as a combination of Setup.exe, your MSI database, and external cabinet (.cab) files. The end user downloads and runs Setup.exe, which in turn downloads and runs the MSI database. Based on the end user’s setup type and feature selections, only the requested CAB files are downloaded and installed to minimize download time. Application maintenance and repair use the URL specified in the URLForYourFiles property as the installation source.
  - **ewtOneExe (2)**—One executable. Builds this release as a single self-extracting Setup.exe. This setting is ideal for a package that is to be downloaded from many Web or FTP sites, since the installation package is self-contained. Note that the entire installation package is downloaded, so the download time is greater than the ewtFTW (1) (Install from the Web) setting.
Example

The following lines of Visual Basic demonstrate opening a project and showing a message box of several of a release's properties:

```vbnet
Dim pProject As ISWiProject

Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\Commercial.ism", True

Dim pProdConfig As ISWiProductConfig
Set pProdConfig = pProject.ISWiProductConfigs.Item("Version 1")
' In an InstallScript project, there is only one element
' in ISWiProductConfigs, which is named "Media".

Dim pRelease As ISWiRelease
Set pRelease = pProdConfig.ISWiReleases.Item("NewRelease1")

Dim sProps As String
sProps = pRelease.Name & " has these properties:" & vbCrLf
sProps = sProps & "Build Location: " & pRelease.BuildLocation & vbCrLf
sProps = sProps & "Compressed: " & pRelease.Compressed & vbCrLf
sProps = sProps & "Default Language: " & pRelease.DefaultLang & vbCrLf

MsgBox sProps
pProject.CloseProject
```

Build Status Events

The ISWiRelease object raises the following status events:

- Public Event ProgressIncrement(ByVal lIncrement As Long, pbCancel As Boolean)
- Public Event ProgressMax(ByVal lMax As Long, pbCancel As Boolean)
- Public Event StatusMessage(ByVal sMessage As String, pbCancel As Boolean)

These events are raised during the build process and provide status updates. You can set pbCancel to stop the build. For sample code that demonstrates how to use these events, see Using Build Status Events.
**Build Method**

*Project* • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

Call the Build method to build the current release. This is a full and complete rebuild of your release.

**Syntax**

`Build()`

**Applies To**

- ISWiRelease

**BuildTablesOnly Method**

*Project* • This information applies to the following project types:

- Basic MSI
- InstallScript MSI
- Merge Module

Call the BuildTablesOnly method to build only the Windows Installer tables of the current release.

**Note** • If you have not built this setup already, a new .msi file is created, but no files are added to your setup. If you have built your setup already, the .msi file is updated when all the tables are built, but no files are transferred.

**Syntax**

`BuildTablesOnly()`

**Applies To**

- ISWiRelease

**BuildTablesRefreshFiles Method**

*Project* • This information applies to the following project types:
Call the BuildTablesOnly method to rebuild your MSI file and update the Files table, including any new or changed files in your installation.

**Note** • Changed files are updated only if the size or time stamp differs from the copy already included in the build. References to deleted files are removed from the setup, but the file remains in the build location. This type of build can be run only after a complete build has been performed, and it works only when the media is an uncompressed network image.

**Syntax**

BuildTablesRefreshFiles ()

**Applies To**

• ISWiRelease

**CubFile Property**

**Project** • This information applies to the following project types:

• Basic MSI
• InstallScript MSI
• Merge Module

CubFile is a read-write property which you must specify prior to ISWiRelease.Build. This is a build option which is the same as building a release at the command line using ISCmdBld.exe.

The string parameter associated with this property is .cub file name.

**Applies To**

• ISWiRelease

**SignMedia Property**

**Project** • This information applies to the following project types:

• Basic MSI
• InstallScript
• InstallScript MSI
• Merge Module

Project-specific differences are noted where appropriate.
The ISWiRelease.SignMedia property enables you to indicate whether to digitally sign your media, and if so, which files should be signed.

The following table lists the four states that can be assigned or retrieved from the ISWiRelease.SignMedia property.

**Table 95 • ISWiRelease.SignMedia Property Values**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| esBoth (3)   | Read-Write Property | For Basic MSI and InstallScript MSI projects: Sign the Windows Installer package (.msi file) and Setup.exe.  
For InstallScript projects: Sign both the media header file (Data1.hdr) and Setup.exe. |
| esMsi (2)    | Read-Write Property | For Basic MSI, InstallScript MSI, and Merge Module projects: Digitally sign only the Windows Installer package (.msi file or .msm file).  
For InstallScript projects: Sign the media header file (Data1.hdr). |
| esNone (4)   | Read-Write Property | For Basic MSI, InstallScript, and InstallScript MSI projects: None of the media files (Setup.exe, Windows Installer package, or the header file) are signed at build time. |
| esSetupExe (1) | Read-Write Property | For Basic MSI, InstallScript, and InstallScript MSI projects: Digitally sign only Setup.exe. |

**Applies To**

- ISWiRelease Object

**ISWiRemoveFile Object**

*Project* • *This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

ISWiRemoveFile represents a file or folder removal entry in the InstallShield user interface. To retrieve a file or folder removal entry, specify an item in the ISWiRemoveFiles collection.
Members

Table 96 • ISWiRemoveFile Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileKey</td>
<td>Read-Write Property</td>
<td>Gets or sets the FileKey property for this file or folder removal entry.</td>
</tr>
<tr>
<td>FileName</td>
<td>Read-Write Property</td>
<td>Gets or sets the FileName property for this file or folder removal entry.</td>
</tr>
<tr>
<td>DirProperty</td>
<td>Read-Write Property</td>
<td>Gets or sets the DirProperty property for this file or folder removal entry.</td>
</tr>
</tbody>
</table>
| InstallMode | Read-Write Property | Gets or sets the InstallMode property for this file or folder removal entry. Specify one of the following types:  
  - erfimOnInstall (1)—Remove the file or folder only when the associated component is being installed.  
  - erfimOnUninstall (2)—Remove the file or folder only when the associated component is being removed.  
  - erfimOnBoth (3)—Remove the file or folder when the associated component is being installed or removed. |

ISWiSequenceRecord Object

Project • This information applies to the following project types:

- Basic MSI  
- InstallScript MSI

ISWiSequenceRecord represents an action in the Custom Actions and Sequences view of the InstallShield user interface.
Members

Table 97  •  ISWiSequenceRecord Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Read-Write Property</td>
<td>Holds the string name of the specified action.</td>
</tr>
<tr>
<td>Comment</td>
<td>Read-Write Property</td>
<td>Gets or sets comments for the specified action.</td>
</tr>
<tr>
<td>Condition</td>
<td>Read-Write Property</td>
<td>Gets or sets the condition for the specified action.</td>
</tr>
<tr>
<td>Sequence</td>
<td>Read-Write Property</td>
<td>Gets or sets the sequence number for the specified action.</td>
</tr>
</tbody>
</table>

Example

The following VBScript code displays the sequence number of the LaunchConditions action in the project's Installation User Interface sequence.

```vbscript
Set oISM = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
oISM.OpenProject "C:\MySetups\MyProject.ism", True ' open read-only
Set oSequenceRecord = oISM.InstallUISequence("LaunchConditions")
MsgBox "LaunchConditions is at sequence number " & oSequenceRecord.Sequence
oISM.CloseProject
```

Applies To

- ISWiSequence

ISWiSetupFile Object

Project  •  This information applies to the following project types:
- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

ISWiSetupFile represents a support file in your project. The support file can be an existing one from the Support Files view (or the Support Files/Billboards view) in InstallShield or one that is added by calling AddSetupFile.

Use the project's ISWiSetupFiles collection to access a specific support file. You must specify either an index number or the file key for the Item property of ISWiSetupFiles.
Members

**Example**

The file key is visible in the IDE only as the first entry in the Direct Editor view’s `ISetupFile` table. Instead of using the file key, you could write code similar to the following example to check for a certain file name:

```vba
Dim pProj As ISwiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISwiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupFile As ISwiSetupFile

For Each pSetupFile In pProj.ISwiSetupFiles
    If UCase(pSetupFile.FileName) = "MYSUPPORTFILE.EXT" Then
        Exit For
    End If
Next

pProj.SaveProject
pProj.CloseProject
```

If the file name `MySupportFile.ext` is found among the project’s setup files, the For loop ends, and `pSetupFile` holds a copy of the `ISwiSetupFile` object for `MySupportFile.ext`.

**ISWiSetupType Object**

*Project • This information applies to the following project types:*
ISWiSetupType represents a setup type belonging to your project. The setup type can be an existing one from the Setup Types view in the InstallShield user interface or one added by calling AddSetupType.

Use the project's ISWiSetupTypes collection to access a specific setup type. You must specify either an index number or the setup type name for the Item property of ISWiSetupFiles. The setup type name is visible in the IDE in the Setup Types view's tree control.

**Members**

**Table 99 • ISWiSetupType Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Read-Only Property</td>
<td>Stores the name of the setup type.</td>
</tr>
<tr>
<td>Description</td>
<td>Read-Write Property</td>
<td>This string property specifies the setup type's description. (This description is displayed to end users during the installation process only if you call SdSetupTypeEx in your script.)</td>
</tr>
<tr>
<td>DisplayName</td>
<td>Read-Write Property</td>
<td>This string property specifies the name of this setup type as you would like it displayed to your users.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic code illustrates how you would set a property for a specific setup type:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pSetupType As ISWiSetupType

Set pSetupType = pProj.ISWiSetupTypes("CSSaveSpace")
pSetupType.DisplayName = "Client Setup - Save Space"

pProj.SaveProject
pProj.CloseProject
```

**ISWiShellProperty Object**

*Project • This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module
The ISWiShellProperty object represents a shortcut property that you want the Windows Shell to set. The properties that the Shell can set are defined in propkey.h, which is part of the Windows SDK.

**Members**

### ISWiShellProperty Object Members

<table>
<thead>
<tr>

<td>Read-Write Property</td>
<td>Retrieves or sets a Shell property. The properties are defined in propkey.h, which is part of the Windows SDK. PropertyName typically consists of a GUID and a property ID; for example: <code>{9F4C2855-9F79-4B39-A8D0-E1D42DE1D5F3}, 9</code></td>
</tr>
<tr>
<td>PropertyValue</td>
<td>Read-Write Property</td>
<td>Retrieves or sets a string value for the property.</td>
</tr>
</tbody>
</table>

**ISWiShortcut Object**

*Project* • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

Project-specific differences are noted where appropriate.

The ISWiShortcut object represents a shortcut in the Shortcuts explorer. The shortcut can be an existing item in an ISWiShortcuts collection or one you just created by calling AddShortcut.

Use this object’s properties to set the shortcut’s attributes in much the same manner as you would in the IDE.
## Members

### Table 101 • ISWiShortcut Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AddShellProperty</strong></td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Method</td>
<td>Adds a Shell property for the current shortcut object.</td>
</tr>
</tbody>
</table>
| **Arguments**      | Basic MSI, InstallScript MSI, InstallScript MSI, Merge Module | Read-Write Property | Gets or sets the command-line arguments that will be passed to the target file. You can substitute "%1" for the file name. The following statement might launch the target file in silent mode:  
\[ m_pShortcut.Arguments = "-s" \] |
<p>| <strong>DeleteShellProperty</strong> | Basic MSI, InstallScript MSI, Merge Module | Method          | Deletes the specified Shell property from the current shortcut object.      |
| <strong>Description</strong>    | Basic MSI, InstallScript MSI, InstallScript MSI, Merge Module | Read-Write Property | Contains any descriptive text you have entered for this shortcut. The description is displayed as a tooltip. If this property uses a string entry, Description gives you the value for the string entry identified by the ActiveLanguage property of ISWiProject. |
| <strong>DisplayName</strong>    | Basic MSI, InstallScript MSI, InstallScript MSI, Merge Module | Read-Write Property | Contains the display name you have entered for this shortcut. This name is a localizable value that will be used for the shortcut's name when it is installed instead of the name that identifies the shortcut in the Shortcuts explorer. If this property uses a string entry, DisplayName gives you the value for the string identified by the ActiveLanguage property of ISWiProject. |</p>
<table>
<thead>
<tr>
<th>Name</th>
<th>Project</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| DoNotHighlightAsNew           | Basic MSI, InstallScript, InstallScript MSI, Merge Module | Read-Write Property | Gets or sets a Boolean property that indicates whether the shortcut is configured to be highlighted on the Start menu as new after end users install the product. This has the same effect as clearing the **Highlight newly installed programs** check box in the Customize Start Menu dialog box for an individual item on a target system.  
To prevent the Start menu shortcut from being highlighted as newly installed, set this Boolean property to True. To enable the shortcut to be highlighted, set this Boolean property to False.  
For more information about this highlight functionality, see **Preventing a Shortcut on the Start Menu from Being Highlighted as Newly Installed**. |
| EnableWin8StartPin            | Basic MSI, InstallScript, InstallScript MSI, Merge Module | Read-Write Property | Gets or sets a Boolean property that indicates whether the shortcut is configured to be pinned by default to the Start screen on Windows 8 target systems.  
To pin the shortcut by default, set this Boolean property to True. To disable pinning, set this Boolean property to False.  
For more information about this pinning functionality, see **Suppressing Initial Pinning of a Shortcut to the Windows 8 Start Screen**. |
| HotKey                        | Basic MSI, InstallScript, InstallScript MSI, Merge Module | Read-Write Property | Stores the accelerator key for this shortcut as a Long.                                                                                               |

<td>Basic MSI, DIM, InstallScript MSI, Merge Module</td>
<td>Collection</td>
<td>Contains all of the Shell properties for the current shortcut object.</td>
</tr>
<tr>
<td>Name</td>
<td>Basic MSI, InstallScript,</td>
<td>Read-Only</td>
<td>Retrieves the name of the shortcut. This is the same name that appears in the Shortcuts explorer; do not confuse it with the shortcut's Display Name property.</td>
</tr>
<tr>
<td></td>
<td>InstallScript MSI, Merge Module</td>
<td>Property</td>
<td></td>
</tr>
</tbody>
</table>
PreventPinning

- **Project**: Basic MSI, InstallScript, InstallScript MSI, Merge Module
- **Type**: Read-Write Property
- **Description**: Gets or sets a Boolean property that indicates whether you want the context menu commands for pinning a shortcut to the taskbar and to the Start menu to be displayed after end users install your product.

To hide the context menu commands for pinning the shortcut to the taskbar or Start menu, set this Boolean property to True. To display the context menu commands and allowing pinning, set this Boolean property to False.

For more information about this pinning functionality, see Specifying Whether End Users Should Be Able to Pin a Shortcut to the Taskbar or Start Menu.

ReplaceExistingIfFound

- **Project**: InstallScript
- **Type**: Read-Write Property
- **Description**: Gets or sets the Replace Existing (If Found) setting for this shortcut, which specifies whether the shortcut should replace an already existing shortcut with the same display name in the same location on the target system. This property is Boolean.

ShowCmd

- **Project**: Basic MSI, InstallScript, InstallScript MSI, Merge Module
- **Type**: Read-Write Property
- **Description**: Specify one of the following options for determining what mode the file is opened with:
  - `scNormal (1)`: The program launches in a normal-sized window.
  - `scMaximized (3)`: The program launches in full-screen view.
  - `scMinNoActive (7)`: The program launches in a minimized window, visible only on the taskbar.

Target

- **Project**: Basic MSI, InstallScript, InstallScript MSI, Merge Module
- **Type**: Read-Write Property
- **Description**: Provide the path and file name for this shortcut's target file. Instead of hard-coding a path, you can use a Windows Installer directory property in square brackets—for example, [INSTALLDIR]MyApp.exe—or, in an InstallScript project, a system variable in angle brackets—<TARGETDIR>\MyApp.exe.

(Windows Installer based projects only:) If you leave this property blank, the key file of this component will automatically be set as the shortcut's target.
Applies To

- ISWiFolder

AddShellProperty Method

**Project** This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
Merge Module

The AddShellProperty method adds a Shell property for the current shortcut object. The properties that the Shell can set are defined in propkey.h, which is part of the Windows SDK.

For more information on setting Shell properties for a shortcut, see Setting Custom Shell Properties.

Syntax

Function AddShellProperty (sName As String) As ISWiShellProperty

Parameters

Table 102 • AddShellProperty Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sName</td>
<td>Pass a string to specify the name of a Shell property that you want to add to the shortcut.</td>
</tr>
</tbody>
</table>

Return Values

The AddShellProperty method returns an ISWiShellProperty object.

Example

The following sample VBScript snippet adds a Shell property to a shortcut:

Dim pShellProperty As ISWiShellProperty
Set pShellProperty = pShortcut.AddShellProperty("MyShellProperty")

Applies To

• ISWiShortcut

DeleteShellProperty Method

Project • This information applies to the following project types:

• Basic MSI
• DIM
• InstallScript MSI
• Merge Module

The DeleteShellProperty method deletes the specified Shell property from the current shortcut object.

For more information on setting Shell properties for a shortcut, see Setting Custom Shell Properties.
Syntax

DeleteShellProperty (pShellProp As ISWiShellProperty) As Long

Parameters

Table 103  DeleteShellProperty Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pShellProp</td>
<td>Pass the ISWiShellProperty object to specify a Shell property that you want to remove from a shortcut.</td>
</tr>
</tbody>
</table>

Example

The following sample VBScript snippet deletes all of the Shell properties from a shortcut:

```vbscript
Dim pShellProperty As ISWiShellProperty
For Each pShellProperty In pShortcut.ISWiShellProperties
    pShortcut.DeleteShellProperty pShellProperty
Next
```

Applies To

- ISWiShortcut

ISWiSISProperty Object

Project  This information applies to the following project types:
- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

ISWiSISProperty represents a property in the Summary Information Stream. You can retrieve a property by specifying an item in the ISWiSISProperties collection. The following Summary Information Stream property names are supported:

- Title
- Subject
- Author
- Keywords
- PackageCode
- TemplateSummary
- Comments
• Schema

Several of these properties use string entries, as required by InstallShield. In that case, they contain the value for the string identified by the ActiveLanguage property of ISWiProject.

Members

Table 104 • ISWiSISProperty Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Read-Only Property</td>
<td>Contains the property’s name. Must be one of the existing Summary Information Stream properties listed above.</td>
</tr>
<tr>
<td>Value</td>
<td>Read-Write Property</td>
<td>Gets or sets the property’s value. If this property uses a string entry, Value gives you the value for the string identified by the ActiveLanguage property of ISWiProject.</td>
</tr>
</tbody>
</table>

Example

The following VBScript example sets the property Title to Windows Installer Setup Package:

```vbscript
Option Explicit

Dim pProject
Set pProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\SampleProject.ism"

Dim pTitle, sTitle
sTitle = "Windows Installer Setup Package"
Set pTitle = pProject.ISWiSISProperties.Item("Title")
pTitle.Value = sTitle
pProject.SaveProject
pProject.CloseProject
```

Applies To

• ISWiProject

ISWiSQLConnection Object

Project • This information applies to the following project types:

• Basic MSI
• DIM
• InstallScript
• InstallScript MSI

ISWiSQLConnection represents a SQL Server connection in the SQL Scripts view of the InstallShield interface. You can retrieve an ISWiSQLConnection object by using the ISWiSQLConnections collection.
### Members

<td>Read-Write Property</td>
<td>This string gets or sets the server name. At runtime, the installation uses this server name to connect to a SQL Server. This server will be used to install the SQL scripts contained within this connection. This value can be a property. Using a property allows you to dynamically set the name of this server at runtime. You must use the [Property] notation.</td>
</tr>
<tr>
<td>UserName</td>
<td>Read-Write Property</td>
<td>This string gets or sets the user name when you choose to connect to a server using SQL Server authentication.</td>
</tr>
</tbody>
</table>
Syntax

Function AddSQLRequirement() As ISWiSQLRequirement

Return Values

This method returns ISWiSQLRequirement object.

Applies To

- ISWiSQLConnection

AddSQLScript Method

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the AddSQLScript method to add a new script file to a SQL connection.

Note • The AddSQLScript method generates the ISSQLScriptFile table key with a name such as SQLScript1, SQLScript2, or SQLScript3. If you have multiple SQL script files in your project, it may be difficult to distinguish one from the other with this naming convention. Therefore, if you want to be able to specify the key, use the AddSQLScriptEx method.

Syntax

Function AddSQLScript() As ISWiSQLScript

Return Values

This method returns an ISWiSQLScript object.

Applies To

- ISWiSQLConnection

AddSQLScriptEx Method

Project • This information applies to the following project types:

- Basic MSI
- DIM
Call the AddSQLScriptEx method to add an ISSQLScriptFile entry to a SQL connection. This method generates a valid name from the passed string. The method ensures that the name of the entry that is being added to the ISSQLScriptFile table is unique and less than 47 characters in length.

**Syntax**

Function AddSQLScriptEx (ByVal sCandidateName As String) As ISWiSQLScript

**Parameters**

**Table 106 • AddSQLScriptEx Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sCandidateName</td>
<td>Specifies the name of the script that you want to add to the SQL connection.</td>
</tr>
</tbody>
</table>

Note that file names may contain invalid characters or may be too long for the key. However, if you pass a file name in this parameter, the AddSQLScriptEx method creates an entry with a valid key that is based on the file name; the result is the same as if you had added the SQL script to a connection in the SQL Scripts view.

If you specify an empty string (""), the AddSQLScriptEx method generates the ISSQLScriptFile table key with a name such as SQLScript1, SQLScript2, or SQLScript3—the same as if the AddSQLScript method was used to add the ISSQLScriptFile entry.

**Return Values**

This method returns an ISWiSQLScript object.

**Applies To**

- ISWiSQLConnection

**DeleteSQLScript Method**

*This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the DeleteSQLScript method to remove a SQL script file from a SQL Connection in the InstallShield interface.
Syntax
Function DeleteSQLScript(Script As ISWiSQLScript) As Long

Parameters

Table 107 • DeleteSQLScript Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Specifies the name of the script you want to remove from the SQL connection in the InstallShield interface.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiSQLConnection

GetDatabaseServer Method

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the GetDatabaseServer method to return an ISWiSQLDatabaseServer object.

Syntax
Sub SetPredefinedRequirement(RHS As ISWiSQLServerVersion)

Return Values

This method returns the ISWiSQLDatabaseServer object.

Applies To

- ISWiSQLConnection

InsertSQLScript Method

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
Call the InsertSQLScript method to insert an existing script file to a SQL Connection in the InstallShield interface.

**Syntax**

Function InsertSQLScript(strScriptPath As String) As ISWiSQLScript

**Parameters**

**Table 108 • InsertSQLScript Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strScriptPath</td>
<td>Specifies the path to the script file you want to insert under the SQL Connection in the InstallShield interface.</td>
</tr>
</tbody>
</table>

**Return Values**

This method returns ISWiSQLScript object.

**Applies To**

- ISWiSQLConnection
- ISWiSQLDatabaseServer

**RemoveSQLRequirement Method**

*Project • This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

The RemoveSQLRequirement method removes a specified SQL requirement from the target product.

**Applies To**

- ISWiSQLConnection

**ISWiSQLDatabaseServer Object**

*Project • This information applies to the following project types:*

- Basic MSI
- DIM
- **InstallScript**
- **InstallScript MSI**

**ISWiSQLDatabaseServer** represents a database server that you can choose to target by version requirements at run time. You can retrieve an ISWiSQLDatabaseServer object by using the **ISWiSQLDatabaseServers** collection.

- **ISWiSQLConnection**
ISWiSQLReplace Object

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

ISWiSQLReplace allows you to get and set properties in the Text Replacement tab associated with a script file in the InstallShield interface. You can retrieve an ISWiSQLReplace object using the ISWiSQLReplaces collection.

Members

Table 110 • ISWiSQLReplace Object Members

- essv7
- essv7sp1
- essv7sp2
- essv7sp3
- essv7sp4

**Return Values**

This method returns the ISWiSQLRequirement object.
Applies To

- ISWiSQLRequirement

ISWiSQLScript Object

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Project-specific differences are noted where appropriate.

ISWiSQLScript represents a SQL script file in the SQL Scripts explorer of the SQL Scripts view in InstallShield. You can retrieve an ISWiSQLScript object by using the ISWiSQLScripts collection.

AddSQLScriptError Method

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the AddSQLScriptError method to add a custom error handling entry to a SQL script.

Syntax

Function AddSQLScriptError()

Return Values

This method returns an ISWiSQLScriptError object.

Applies To

- ISWiSQLScript

AddSQLScriptReplacement Method

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the AddSQLScriptReplacement method to specify a string and replace it with a different string in a SQL script file.

Syntax

Function AddSQLScriptReplacement() As ISWiSQLReplace

Return Values

This method returns the ISWiSQLReplace object.

Applies To

- ISWiSQLScript
DeleteSQLReplace Method

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the DeleteSQLReplace method to remove a text replacement entry that you have added.

**Syntax**

Function DeleteSQLReplace(Replace As ISWiSQLReplace) As Long

**Applies To**

- ISWiSQLScript

DeleteSQLScriptError Method

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

Call the DeleteSQLScriptError method to remove a custom error handling entry that you have added.

**Syntax**

Function DeleteSQLScriptError(ByVal pScriptError As ISWiSQLScriptError)

**Applies To**

- ISWiSQLScript

ISWiSQLScriptError Object

**Project** - This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
ISWiSQLScriptError represents a custom error handling entry for a SQL script file in the SQL Scripts view in InstallShield. You can retrieve an ISWiSQLScriptError object by using the ISWiSQLScriptErrors collection.

**Members**

**Table 113 • ISWiSQLScriptError Object Members**

</tr>
<tr>
<td>ActionProperty</td>
<td>Read-Write Property</td>
<td>When the FindRelatedProducts action detects a related product installed on the system, it appends the product code to the property specified in this field.</td>
</tr>
</tbody>
</table>

### Applies To

- ISWiProject

### Delete Method

*Project*  •  This information applies to the following project types:

- Basic MSI
- InstallScript MSI
Call the Delete method to remove the StaticUpgradeEntry from the project file.

**Syntax**
Delete()

**Applies To**
- ISWiUpgradeTableEntry

### Automation Collections

#### ISWiAdvancedFiles Collection

**Project • This information applies to the following project types:**
- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

ISWiAdvancedFiles is a collection that contains every advanced file (as an ISWiAdvancedFile object) in your project. For example, the following Visual Basic code illustrates how you would set a property for a specific advanced file:

```vba
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

pProj.ISWiAdvancedFiles(1).Disk = edtOther

pProj.SaveProject
pProj.CloseProject
```
Members

Table 116 • ISWiAdvancedFiles Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of advanced files in the ISWiAdvancedFiles collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the advanced file to retrieve the ISWiAdvancedFile object. For example, the following statements create references to the first advanced file in the collection and the advanced file named CSSaveSpace:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Set pSetupFile1 = pProj.ISWiAdvancedFiles.Item(1)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Set pSetupFile2 = pProj.ISWiAdvancedFiles.Item(&quot;CSSaveSpace&quot;)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Item is the default property for ISWiAdvancedFiles, which means that pProj.ISWiAdvancedFiles.Item(&quot;CSSaveSpace&quot;) is equivalent to pProj.ISWiAdvancedFiles(&quot;CSSaveSpace&quot;).</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

ISWiAutomaticUpgradeEntries Collection

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

ISWiAutomaticUpgradeEntries returns a collection of ISWiAutomaticUpgradeEntry items as they are defined in the IDE.
Members

Table 117 • ISWiAutomaticUpgradeEntries Collection Members

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiAutomaticUpgradeEntries collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or upgrade code in order to retrieve the ISWiAutomaticUpgradeEntries items. Item is the default property for ISWiAutomaticUpgradeEntries, which means that m_ISWiProject.ISWiAutomaticUpgradeEntries.Item(&quot;12345678-1234-1234-1234-123456789012&quot;) is equivalent to m_ISWiProject.ISWiAutomaticUpgradeEntries(&quot;12345678-1234-1234-1234-123456789012&quot;).</td>
</tr>
</tbody>
</table>

Example

Dim m_ISWiProj As ISWIProject  
Dim m_AutomaticUpgradeEntries As ISWiAutomaticUpgradeEntries  
  
Set m_ISWiProj = New ISWIProject  
m_ISWiProj.OpenProject "C:\mysetups\build 34.ism"  
  
For Each m_AutomaticUpgradeEntries In m_ISWiProj.ISWiAutomaticUpgradeEntries  
m_AutomaticUpgradeEntries.Name = "Upgrade Msi Item1"  
Next  
  
m_ISWiProj.SaveProject  
m_ISWiProj.CloseProject  

The following line illustrates how to access a particular automatic upgrade entry:

Set m_AutomaticUpgradeEntries = ISWIProject.ISWiAutomaticUpgradeEntries ("Upgrade Msi Item1")

Applies To

• ISWiProject

ISWiComponents Collection

Project • This information applies to the following project types:

• Basic MSI
• DIM
• InstallScript
• InstallScript MSI
• InstallScript Object
• Merge Module

Project-specific differences are noted where appropriate.

The ISWiComponents collection contains all of the components associated with a specified feature. ISWiComponents provides an interface for enumerating all of the components in a feature. When ISWiComponents is a member of ISWiProject, it contains all of the components in the project, not just those belonging to a specified feature.

Members

Table 118 • ISWiComponents Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiComponents collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the component in order to retrieve the ISWiComponent object. The name of the component is case-sensitive—for example, “Help_Files” and “Help_files” are two different components. Item is the default property for ISWiComponents, which means that m_ISWiFeature.ISWiComponents.Item(“Help_Files”) is equivalent to m_ISWiFeature.ISWiComponents(“Help_Files”).</td>
</tr>
</tbody>
</table>

Examples

The following Visual Basic code opens a project, loops through each component in the feature NewFeature1, sets the RemoteInstallation property for each component to run from source, and finally saves and closes the project.

```vbnet
Dim m_ISWiProj As ISWiProject
Dim m_Feature As ISWiFeature
Dim m_Comp As ISWiComponent

Set m_ISWiProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
m_ISWiProj.OpenProject "C:\mysetups\build 34.ism"

Set m_Feature = m_ISWiProj.ISWiFeatures("NewFeature1")

If Not m_Feature Is Nothing Then
    For Each m_Comp In m_Feature.ISWiComponents
        m_Comp.RemoteInstallation = rfsSource
    Next
EndIf
```
m_ISWiProj.SaveProject
m_ISWiProj.CloseProject

The following line illustrates how to access a particular component:

Set m_Comp = m_ISWiProj.ISWiFeatures("MyFeature").ISWiComponents("MyComponent")

**Applies To**

- ISWiFeature
- ISWiProject

### ISWiComponentSubFolders Collection

*Project* • This information applies to the following project types:

- InstallScript
- InstallScript Object

ISWiComponentSubFolders is a collection that contains every component subfolder (as an ISWiComponentSubFolder object) in the current component or component subfolder. For example, the following Visual Basic code illustrates how you would apply a method to a specific component subfolder:

```vba
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent

Set pFeature = pProj.ISWiFeatures.Item("MyFeature")
Set pComponent = pFeature.ISWiComponents.Item("MyComp")
pComponent.ISWiComponentSubFolders.Item("MyCompSubFolder").AddFile("C:\My Files\MyFile.ext")

pProj.SaveProject
pProj.CloseProject
```
Members

Table 119 • ISWiComponentSubFolders Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of component subfolders in the ISWiComponentSubFolders collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the component subfolder to retrieve the ISWiComponentSubFolder object. For example, the following statements create references to the first component subfolder in the collection and the component subfolder named MyCompSubFolder:</td>
</tr>
</tbody>
</table>

```
Set pComponentSubFolder1 = pProj.ISWiComponentSubFolders.Item(1)
Set pComponentSubFolder2 = pFeature.ISWiComponentSubFolders.Item("MyCompSubFolder")
```

Item is the default property for ISWiComponentSubFolders, which means that

```
pFeature.ISWiComponentSubFolders.Item("MyCompSubFolder")
```

is equivalent to

```
pFeature.ISWiComponentSubFolders("MyCompSubFolder").
```

Applies To

- ISWiComponent
- ISWiComponentSubFolder

ISWiConditions Collection

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

The ISWiConditions collection contains all of the conditions associated with a specified feature. ISWiConditions provides an interface for enumerating all of the conditions in a feature.
Members

Table 120 • ISWiConditions Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiConditions collection.</td>

<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number of the condition in order to retrieve the ISWiCondition object. Item is the default property for ISWiConditions, which means that m_ISWiFeature.ISWiConditions.Item(2) is equivalent to m_ISWiFeature.ISWiConditions(2).</td>
</tr>
</tbody>
</table>

Applies To

- ISWiFeature

ISWiCustomActions Collection

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

The ISWiCustomActions collection contains all of the custom actions in the current project.

The VBScript example below displays a string with each custom action in the project:

```vbnet
Set pProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\MyProject.ism", True ' open read-only

sNames = "This project contains the following custom actions:" & vbNewLine

iCount = pProject.ISWiCustomActions.Count
For i = 1 to iCount
    sNames = sNames & vbTab & pProject.ISWiCustomActions(i).Name & vbNewLine
Next

pProject.CloseProject

MsgBox sNames
```
Members

**ISWiFeatures Collection**

*Project* • This information applies to the following project types:

- Basic MSI
- InstallScript
- InstallScript MSI

ISWiFeatures is a collection that contains every feature (as an ISWiFeature object) in your project.

When ISWiFeatures is a member of ISWiProject, it contains all of the top-level features in the project. To retrieve a collection of subfeatures, access the Features property of the ISWiFeature object. The result is an ISWiFeatures collection that contains the immediate subfeatures of the current top-level feature. Repeat for further levels of subfeatures.

**Members**

</table>

**Example**

The following Visual Basic code builds a string with all of the features and components in your project:

```vbnet
Dim pFeature As ISWiFeature
Dim pComponent As ISWiComponent
```
For Each pFeature In m_ISWiProject.ISWiFeatures
    ' Add feature to string
    strProject = strProject & "Feature: " & pFeature.Name & vbCrLf
    strProject = strProject & "Components: "
    For Each pComponent In pFeature.ISWiComponents
        ' Add feature’s components to string
        strProject = strProject & pComponent.Name & " "
    Next
    strProject = strProject & vbCrLf
Next

ISWiFiles Collection

Project • This information applies to the following project types:
- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

The ISWiFiles collection contains all of the files associated with a specified component or, in InstallScript
projects, a component subfolder. ISWiFiles contains several read-write properties that allow you to set
component properties and file attributes as you would in the IDE.

The following Visual Basic code illustrates how you would set a property for a specific file in a component. For the
purposes of this example, assume that the variable m_oMyComp already has a reference to a component.
**Members**

**Table 125 • ISWiFiles Collection Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiFiles collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or file key of the file in order to retrieve the ISWiFile object. You cannot use the file name; you must specify the file key. You can view this value in the Direct Editor view (in the File column of the File table) or, in Windows Installer–based projects, the Key column of a component's file list. Be aware that file keys are subject to change when the files are dynamically linked. Item is the default property for ISWiComponents, which means that m_ISWiComponent.ISWiFiles.Item(&quot;F1036_MyFile.exe&quot;) is equivalent to m_ISWiComponent.ISWiFiles(&quot;F1036_MyFile.exe&quot;).</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiComponent

**ISWiFolders Collection**

**Project • This information applies to the following project types:**

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

ISWiFolders contains every program folder belonging to a specified component.

At minimum, each component has the default folders listed below in its ISWiFolders collection. In addition, you could have added a predefined folder to the Shortcuts explorer by right-clicking on Shortcuts and choosing “Show Folder.”

- [TaskBarFolder]
- [SendToFolder]
• [DesktopFolder]

The following code demonstrates accessing the ISWiFolder object that represents the taskbar:

```vba
Dim m_pFolder As ISWiFolder
Set m_pFolder = m_pComponent.ISWiFolders("[TaskBarFolder]")
```

The taskbar, in turn, has subfolders of its own. These subfolders are contained in its SubFolders property, which is itself an ISWiFolders collection. Continuing the example above, you can now create a copy of the object for the Start menu, which is a subfolder of the taskbar in the Shortcuts explorer:

```vba
Set m_pFolder = m_pFolder.SubFolders("[StartMenuFolder]")
```

We can go ever farther with this example and get a copy of the folder MyProgFolder under the Programs menu:

```vba
Set m_pFolder = m_pFolder.SubFolders("[ProgramMenuFolder]").SubFolders("MyProgFolder")
```

</table>

**Example**

The following Visual Basic lines demonstrate this method:
'Create the project object

```
dim pProject

set pProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
```

'Call the OpenProject method

```
'########################################################################
'## THIS SAMPLE WILL NOT EXECUTE PROPERLY WITHOUT A VALID PROJECT PATH
'########################################################################

'pProject.OpenProject("\Your project.ism")

pProject.OpenProject("C:\Documents and Settings\Testlab\My Documents\MySetups\your project name-21.ism")
```

'Call the OpenProject method

' Get existing configuration

```
Set oMyConfig = pProject.ISWiProductConfigs.Item("Product Configuration 1")

' Assume project already has release configuration...

Set oNewRelease = oMyConfig.ISWiReleases.Item("Release 1")

' Make sure release setting is uncompressed to build the patch...

oNewRelease.Compressed = False

oNewRelease.SetupEXE = True

' Create and set signing parameters...

Set oMyPatchConfig = pProject.AddPatchConfig("PatchDemo1")

oMyPatchConfig.SignPackage = True

oMyPatchConfig.SignUpdateExe = True

oMyPatchConfig.SignatureSPC = "C:\Users\TestLab\Desktop\Test.pfx"

oMyPatchConfig.SignaturePassword = "XX"

Set oMyLatestImage = oMyPatchConfig.AddUpgradedImage("LatestImg1")

Set oMyPreviousImage = oMyLatestImage.AddTargetImage("PrevImage1")

' Set base image...

oMyPreviousImage.MsiPath = "<ISProjectFolder>BaseImage\PatchDesignInterfaceDemo.msi"

' Set base MSI path to the existing patch configuration

'MyPatchConfig.ISWiUpgradedImages.Item("LatestImg1").ISWiTargetImages.Item("PrevImage1").MsiPath = "<ISProjectFolder>BaseImage\PatchDesignInterfaceDemo.msi"

pProject.SaveProject

oNewRelease.Build()

oMyPatchConfig.BuildPatch

MsgBox "Patch Configuration Config1 build with " & _

    oMyPatchConfig.PatchConfigErrorCount & " Errors and " & _
oMyPatchConfig.PatchConfigWarningCount & " Warnings"

pProject.CloseProject

**ISWiObjects Collection**

*Project* • This information applies to the following project types:

- *InstallScript*
- *InstallScript Object*

ISWiObjects is a collection that contains every InstallScript object (as an ISWiObject object) in your project. The following Visual Basic code illustrates the use of this collection:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"
Dim pFeature As ISWiFeature
Dim pObject As ISWiObject

Set pFeature = pProj.ISWiFeatures.Item(2)
Set pObject = pFeature.ISWiObjects.Item("@ismk2:75514280-1EB4-11D3-8B09-00105A9846E9")
pFeature.RemoveObject pObject

pProj.SaveProject
pProj.CloseProject
```
## Members

**Table 133 • ISWiObjects Collection Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of InstallScript objects in the ISWiObjects collection.</td>
</tr>
</tbody>
</table>
| Item   | Read-Only Property       | Provide the index number or moniker of the InstallScript object to retrieve the ISWiObject object. (To get an InstallScript object's moniker, create a new Professional project in the IDE and add the InstallScript object to a feature, then go to the Direct Editor view's ISFeatureExtended table and see the Moniker column.) For example, the following statements create references to the first InstallScript object in the collection and the InstallScript object with moniker @ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9:

Set pObject1 = pProj.ISWiObjects.Item(1)  
Set pObject2 = pFeature.ISWiObjects.Item("@ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9")

Item is the default property for ISWiObjects, which means that pFeature.ISWiObjects.Item("@ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9") is equivalent to pFeature.ISWiObjects("@ismk2:755142B0-1EB4-11D3-8B09-00105A9846E9"). |

### ISWiPatchConfigs Collection

*Project • This information applies to the following project types:*

- Basic MSI
- InstallScript MSI
Members

Table 134 • ISWiPatchConfigs Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiPatchConfigs collection.</td>
</tr>
</tbody>
</table>
| Item  | Read-Only Property | Provide the index number or name of the patch configuration in order to retrieve the ISWiPatchConfig Object.  

The name of the patch configurations is case-sensitive—"Patch One" and "Patch one" are two different configurations.

Item is the default property for ISWiPatchConfigs, which means that pProject.ISWiPatchConfigs.Item("Patch1") is equivalent to pProject.ISWiPatchConfigs("Patch1").

Example

The VBScript example below simply displays a string with each patch configuration in the project:

```vbscript
Dim pProject
Set pProject = CreateObject ("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\Vegetarian.ism", True

Dim sNames
sNames = "This project contains the following patch configurations: " & vbNewLine & vbCrLf

Dim pPatchConfigs
For Each pPatchConfigs In pProject.ISWiPatchConfigs
    sNames = sNames & pPatchConfigs.Name & vbCrLf & vbCrLf & vbCrLf
Next

pProject.CloseProject

WScript.Echo sNames

The following line illustrates how to access a particular patch configuration:

Set pPatchConfig = pISWiProj.ISWiPatchConfigs.Item("Patch 1.1")
```

ISWiPathVariables Collection

Project • This information applies to the following project types:

• Basic MSI
• DIM
• InstallScript
• InstallScript MSI
• InstallScript Object
• Merge Module

The ISWiPathVariables collection contains all of the path variables that are associated with the current project. You can add a path variable with the AddPathVariable method and delete a path variable with the DeletePathVariable method.

The following VBScript code retrieves a list of every path variable in the project and displays the path variables in a message box:

```
Option Explicit
Dim pProject
Set pProject = CreateObject("ISWiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\ISWiPathVariables.ism", True

Dim sPathVars
Dim pPathVar

For Each pPathVar In pProject.ISWiPathVariables
   sPathVars = sPathVars & pPathVar.Name & " : " & pPathVar.Value & vbCrLf
Next

WScript.Echo sPathVars
pProject.CloseProject
```

The following line illustrates how to access a particular path variable:
Set `pPathVar = pProject.ISWiPathVariables.Item("MyPathVar")`

**Important** • Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.

### ISWiPreviousSetups Collection

**Project** • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

Contains collection of all previous setups belonging to the latest setup

Each patch configuration must contain at least one latest setup and one previous setup in order for you to create a patch. You can have multiple previous setups per latest setup.

Every application or setup that you intend to patch to a latest setup must be added to the previous setup node.

For example, your company supports versions 1.0 and 1.1 of an application, and you want to upgrade both of these applications to version 2.0. To create a single patch to upgrade both versions, you would add V1.0 and V1.1 as previous setups to the latest setup. Your latest setup would contain V2.0.

</tbody>
</table>

Example

The VBScript example below simply displays a string with each product configuration in the project:

```vbs
Dim pProject
Set pProject = CreateObject("ISwiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\Vegetarian.ism", True

Dim sNames
sNames = "This project contains the following product configurations: " & vbCrLf & " & vbCrLf & Tab

Dim pProductConfigs
For Each pProductConfigs In pProject.ISWiProductConfigs
    sNames = sNames & pProductConfigs.Name & vbCrLf & " & vbCrLf & Tab
Next

pProject.CloseProject

WScript.Echo sNames
```

The following line illustrates how to access a particular product configuration:

```vbs
Set pProdConfig = pISWiProj.ISWiProductConfigs.Item("Version 1.1")
```

Applies To

- ISWiProject
ISWiProperties Collection

**Project** • This information applies to the following project types:

- Basic MSI
- DLI
- InstallScript MSI
- Merge Module

The ISWiProperties collection contains all of the Windows Installer properties in the current project. This interface is similar to the Property Manager. You can add a property with the `AddProperty` method and delete a property with the `DeleteProperty` method.

The VBScript code below retrieves a list of every property in the project and displays them in a message box:

```vbnet
Option Explicit

Dim pProject
Set pProject = CreateObject("ISWiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\ISWiProperties.ism", True

Dim sProps
Dim pProp

For Each pProp In pProject.ISWiProperties
    sProps = sProps & pProp.Name & ": " & pProp.Value & " // " & _
                pProp.Comments & vbNewLine
Next

WScript.Echo sProps

pProject.CloseProject
```

- Basic MSI
- InstallScript MSI

The ISWiSequence collection is a virtual collection that contains all of the actions of the current project, sorted by sequence number.
Members

Table 147 • ISWiSequence Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiSequence collection.</td>
</tr>
<tr>
<td>InsertCustomAction</td>
<td>Method</td>
<td>Use this method to insert a custom action into the selected sequence. This method returns an ISWiSequenceRecord object.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of an action in order to retrieve its ISWiSequenceRecord object. The name of the action is case-sensitive. That is, “ThisAction” and “thisAction” are two different actions. Item is the default property for ISWiSequence, which means that pProject.InstallUISequence.Item(&quot;ThisAction&quot;) is equivalent to pProject.InstallUISequence(&quot;ThisAction&quot;).</td>
</tr>
<tr>
<td>RemoveSequenceRecord</td>
<td>Method</td>
<td>Use this method to remove an item from a sequence in the project.</td>
</tr>
</tbody>
</table>

Example

The VBScript example below displays a string with each action name and sequence number in the project’s Installation User Interface sequence:

```vbs
Dim pProject
Set pProject = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProject.OpenProject "C:\MySetups\YourProject.ism", True ' open read-only

Dim sNames
sNames = "The Installation UI sequence contains the following actions:" & vbCrLf & vbCrLf
For i = 1 to pProject.InstallUISequence.Count
    sNames = sNames & pProject.InstallUISequence.Item(i).Name & " " & _
        pProject.InstallExecuteSequence.Item(i).Sequence & vbCrLf & vbCrLf
Next

pProject.CloseProject

MsgBox sNames
```

Applies To

- ISWiProject
InsertCustomAction Method

Project • This information applies to the following project types:
- Basic MSI
- InstallScript MSI

Call the InsertCustomAction method to insert a custom action into one of the project’s sequences.

Syntax
InsertCustomAction (CustomAction As ISWiCustomAction, Comment As String, Condition as String, SequenceNumber as Long) as ISWiSequenceRecord

Parameters

Table 148 • InsertCustomAction Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CustomAction</td>
<td>The custom action you want to create.</td>
</tr>
<tr>
<td>Comment</td>
<td>An optional string comment about your custom action.</td>
</tr>
<tr>
<td>Condition</td>
<td>An optional string condition for your custom action.</td>
</tr>
<tr>
<td>SequenceNumber</td>
<td>The numeric sequence number for your custom action.</td>
</tr>
</tbody>
</table>

Return Values
The InsertCustomAction method returns an ISWiSequenceRecord object.

Applies To
- ISWiSequence

RemoveSequenceRecord Method

Project • This information applies to the following project types:
- Basic MSI
- InstallScript MSI

Call the RemoveSequenceRecord method to remove an item from a sequence in the current project.

Syntax
(sName As String) As Long
Parameters

Table 149  •  RemoveSequenceRecord Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sName</td>
<td>Pass an ISWiSequenceRecord object to specify a sequence record that you want to remove from the project.</td>
</tr>
</tbody>
</table>

Return Values

Table 150  •  RemoveSequenceRecord Method Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The item was successfully removed from a sequence.</td>
</tr>
<tr>
<td>1</td>
<td>The item was not removed from a sequence.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiSequence

ISWiSetupFiles Collection

Project  •  This information applies to the following project types:
- Basic MSI
- InstallScript
- InstallScript MSI
- InstallScript Object

ISWiSetupFiles is a collection that contains every support file (as an ISWiSetupFile object) in your project.
Members

Table 151 • ISWiSetupFiles Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of support files in the ISWiSetupFiles collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the support file to retrieve the ISWiSetupFile object. For example, the following statements create references to the first support file in the collection and the support file named MySupportFile.bmp:</td>
</tr>
</tbody>
</table>

\[
\text{Set pSetupFile1 = pProj.ISWiSetupFiles.Item(1)} \\
\text{Set pSetupFile2 = pProj.ISWiSetupFiles.Item("MySupportFile.bmp")}
\]

Item is the default property for ISWiSetupFiles, which means that pProj.ISWiSetupFiles.Item("MySupportFile.bmp") is equivalent to pProj.ISWiSetupFiles("MySupportFile.bmp").

Example

The following Visual Basic code illustrates how you would set a property for a specific support file:

```vba
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

pProj.ISWiSetupFiles(1).Splash = True

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject

ISWiSetupTypes Collection

- **Project** • This information applies to the following project types:
  - InstallScript
  - InstallScript MSI

ISWiSetupTypes is a collection that contains every setup type (as an ISWiSetupType object) in your project.
Members

Table 152 • ISWiSetupTypes Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only</td>
<td>Use this property to return the total number of setup types in the ISWiSetupTypes collection.</td>
</tr>
</tbody>
</table>
| Item  | Read-Only     | Provide the index number or name of the setup type to retrieve the ISWiSetupType object. For example, the following statements create references to the first setup type in the collection and the setup type named CSSaveSpace: Set pSetupFile1 = pProj.ISWiSetupTypes.Item(1)  
Set pSetupFile2 = pProj.ISWiSetupTypes.Item("CSSaveSpace")  
Item is the default property for ISWiSetupTypes, which means that pProj.ISWiSetupTypes.Item("CSSaveSpace") is equivalent to pProj.ISWiSetupTypes("CSSaveSpace"). |

Example

The following Visual Basic code illustrates how you would set a property for a specific setup type:

```vbnet
Dim pProj As ISWiProject
Set pProj = CreateObject("IswiAutoAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.ism"

pProj.ISWiSetupTypes("CSSaveSpace").DisplayName = "Client Setup - Save Space"

pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject

ISWiShellProperties Collection

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

ISWiShellProperties is a collection of all of the Shell properties for a specified ISWiShortcut object.
Members

Table 153 • ISWiShellProperties Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only</td>
<td>Use this property to return the total number of elements in the ISWiShellProperties collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only</td>
<td>Provide the index number or name of the Shell property in order to retrieve the ISWiShellProperty object.</td>
</tr>
</tbody>
</table>

Example

The following sample VBScript snippet retrieves the ISWiShellProperty object for the primary key MyShellProperty from the ISWiShellProperties collection:

```vbnet
Dim pShellProperty As ISWiShellProperty
Set pShellProperty = pShortcut.ISWiShellProperties("MyShellProperty")
```

Applies To

- ISWiShortcut

ISWiShortcuts Collection

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- Merge Module

ISWiShortcuts contains every shortcut belonging to a specified ISWiFolder object.

The following example makes a copy of the shortcut named MyShortcut under the program folder contained in m_pFolder:

```vbnet
Dim m_pShortcut As ISWiShortcut
Set m_pShortcut = m_pFolder.ISWiShortcuts("MyShortcut")
```
Members

Table 154 • ISWiShortcuts Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiShortcuts collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the shortcut in order to retrieve the ISWiShortcut object. Item is the default property for ISWiShortcuts, which means that m_pFolder.ISWiShortcuts.Item(&quot;MyShortcut&quot;) is equivalent to m_pFolder.ISWiShortcuts(&quot;MyShortcut&quot;).</td>
</tr>
</tbody>
</table>

Applies To
- ISWiFolder

ISWiSISProperties Collection

Project • This information applies to the following project types:
- Basic MSI
- DIM
- InstallScript MSI
- Merge Module

This collection contains all of the values for the Summary Information Stream settings in the current project. By accessing an element in this collection, you can set all of the Summary Information Stream settings in the General Information view.

The following Visual Basic code reads every Summary Information Stream setting in your project and displays each setting and its value.

```vbnet
Dim pProject As ISWiProject
Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\SampleApp.ism", True

Dim sSISProps As String
sSISProps = "This package's Summary Information Stream has the following " & _
    pProject.ISWiSISProperties.Count & " properties."

Dim pSISProp As ISWiSIProperty
For Each pSISProp In pProject.ISWiSISProperties
    sSISProps = sSISProps & vbCrLf & vbTab & _
    pSISProp.Name & ": " & pSISProp.Value
Next
```
MsgBox sSISProps
pProject.CloseProject

**Members**

**Table 155** • ISWiSISProperties Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiSISProperties collection. Since the Summary Information Stream contains seven items at present, Count always has a value of 7.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the property in order to retrieve the ISWiSISProperty object. The name of the property is case-sensitive—“TemplateSummary” and “Templatesummary” are two different properties. Item is the default property for ISWiSISProperties, which means that pISWiProject.ISWiSISProperties.Item(&quot;Subject&quot;) is equivalent to pISWiProject.ISWiSISProperties(&quot;Subject&quot;).</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

**ISWiSQLConnections Collection**

*Project* • *This information applies to the following project types:*

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

The ISWiSQLConnections collection contains all of the SQL Server connections in the current project.
Members

Table 156 • ISWiSQLConnections Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>

<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the connection in order to retrieve the ISWiSQLConnection object. The name of the connection is case-sensitive—“SQLConnection” and “SQLconnection” are two different items. Item is the default property for ISWiSQLConnections, which means that pISWiProject.ISWiSQLConnections.Item(&quot;SQLConnection&quot;) is equivalent to pISWiProject.ISWiSQLConnections(&quot;SQLConnection&quot;).</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

ISWiSQLDatabaseServers Collection

- Project • This information applies to the following project types:
  - Basic MSI
  - DIM
  - InstallScript
  - InstallScript MSI

The ISWiSQLDatabaseServers collection contains all the database servers that you can choose to target by version requirements at run time.
Members

Table 157 • ISWiSQLDatabaseServers Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiSQLDatabaseServers collection.</td>

<td>Read-Only Property</td>
<td>Provide the index number or name of the property in order to retrieve the ISWiSQLDatabaseServer object. The name of the database server is case-sensitive—“SQLDatabaseServer” and “SQLDatabaseserver” are two different items. Item is the default property for ISWiSQLDatabaseServers, which means that pISWiSQLConnection.ISWiSQLDatabaseServers.Item(&quot;SQLDatabaseServer&quot;) is equivalent to pISWiSQLConnection.ISWiSQLDatabaseServers(&quot;SQLDatabaseServer&quot;).</td>
</tr>
</tbody>
</table>

Applies To

- ISWiSQLConnection

ISWiSQLReplaces Collection

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

The ISWiSQLReplaces collection contains all the ISWiSQLReplace objects in the current project.
Members

**Table 158 • ISWiSQLReplaces Collection Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiSQLReplaces collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the property in order to retrieve the ISWiSQLReplace object. The name of the collection is case-sensitive—“SQLReplaces” and “SQLreplaces” are different. Item is the default property for ISWiSQLReplaces, which means that <code>pISWiSQLScript.ISWiSQLReplaces.Item(&quot;SQLReplace&quot;)</code> is equivalent to <code>pISWiSQLScript.ISWiSQLReplaces(&quot;SQLReplace&quot;)</code>.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiSQLScript

**ISWiSQLRequirements Collection**

**Project** • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

ISWiSQLRequirements returns a collection of all ISWiSQLRequirement objects associated with the database server.
Members

Table 159 • ISWiSQLRequirements Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only</td>
<td>Use this property to return the total number of elements in the ISWiSQLRequirements collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only</td>
<td>Provide the index number or name of the property in order to retrieve the ISWiSQLRequirement object. The name of the property is case-sensitive—“SQLRequirements” and “SQLrequirements” are different. Item is the default property for ISWiSQLRequirements, which means that pISWiSQLConnection.ISWiSQLRequirements.Item(&quot;SQLRequirement&quot;) is equivalent to pISWiSQLConnection.ISWiSQLRequirements(&quot;SQLRequirement&quot;).</td>
</tr>
</tbody>
</table>

Applies To

- ISWiSQLConnection

ISWiSQLScriptErrors Collection

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

The ISWiSQLScriptErrors collection contains all of the custom SQL script error handling entries for the ISWiSQLScriptError object.
Members

Table 160 • ISWiSQLScriptErrors Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only</td>
<td>Use this property to return the total number of elements in the ISWiSQLScriptErrors collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only</td>
<td>Provide the index number or name of the property in order to retrieve the ISWiSQLScriptError object.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiSQLScript

ISWiSQLScripts Collection

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI

The ISWiSQLScripts collection contains all the SQL scripts in the SQL Connection.

Members

Table 161 • ISWiSQLScripts Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only</td>
<td>Use this property to return the total number of elements in the ISWiSQLScripts collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only</td>
<td>Provide the index number or name of the property in order to retrieve the ISWiSQLScript object.</td>
</tr>
</tbody>
</table>

The name of the script is case-sensitive—"SQLScript" and "SQLScript" are two different items.

Item is the default property for ISWiSQLScripts, which means that pISWiSQLConnection.ISWiSQLScripts.Item("SQLScript") is equivalent to pISWiSQLConnection.ISWiSQLScripts("SQLScript").
ISWiStringEntries Collection

Project • This information applies to the following project types:

- Basic MSI
- DIM
- InstallScript
- InstallScript MSI
- InstallScript Object
- Merge Module

The ISWiStringEntries collection contains all of the string entries in the current language.

Members

Table 162 • ISWiStringEntries Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of string entries in the ISWiStringEntries collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or name of the string entry to retrieve the ISWiStringEntry object.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiLanguage

ISWiUpgradeTableEntries Collection

Project • This information applies to the following project types:

- Basic MSI
- InstallScript MSI

The ISWiUpgradeTableEntries collection contains all the static major upgrade items, as they are defined in the Upgrades view as well as the Upgrade table in the Direct Editor.
Members

Table 163 • ISWiUpgradeTableEntries Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiUpgradeTableEntries collection.</td>
</tr>
<tr>
<td>Item</td>
<td>Read-Only Property</td>
<td>Provide the index number or upgrade code in order to retrieve the ISWiUpgradeTableEntries items. Item is the default property for ISWiUpgradeTableEntries, which means that m_ISWiProject.ISWiUpgradeTableEntries.Item(&quot;12345678-1234-1234-1234-123456789012&quot;) is equivalent to m_ISWiProject.ISWiUpgradeTableEntries(&quot;12345678-1234-1234-1234-123456789012&quot;).</td>
</tr>
</tbody>
</table>

Example

Dim oProj As ISWiProject
Dim oUpgradeItem As ISWiUpgradeTableEntry
Set oProj = New ISWiProject
oProj.OpenProject "C:\MySetup.ism"

For Each oUpgradeItem In oProj.ISWiUpgradeTableEntries
    oUpgradeItem.Language = "1033"
Next

oProj.SaveProject
oProj.CloseProject

To target a specific item, replace the For Each loop in the above code with this code:

For Each oUpgradeItem In oProj.ISWiUpgradeTableEntries
    If oUpgradeItem.UpgradeCode = "{12345678-1234-1234-1234-123456789012}" Then
        oUpgradeItem.Language = "1033"
    End If
Next

Automation Objects for Advanced UI and Suite/Advanced UI Projects

**Project** • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

Each InstallShield automation object represents an installation element such as a feature, a component, or a file. This section describes each of the InstallShield automation objects.

The highest-level object in the automation interface is the ISWiProject object. The first thing you must do to access the interface is create this object. Then, you can use its objects, methods, and properties to modify your project.

**ISWiProject Object (Advanced UI and Suite/Advanced UI)**

**Project** • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

ISWiProject contains the interface for opening, closing, and saving an Advanced UI or Suite/Advanced UI project (.issuite) file. When InstallShield is installed on your system, you can instantiate a copy of ISWiProject with the following VB and VBScript syntax:

```vbscript
Set m_ISWiProject = CreateObject("ISWiAutoSuiteAutomation Interface Version.ISWiProject")
```

To open an installation project, call the OpenProject method, as follows:

```vbscript
strFile = "C:\InstallShield 2021 Projects\Test.issuite"
m_ISWiProject.OpenProject strFile
```

**Important** • If you are using the automation interface on a 64-bit machine, you may need to load the automation interface through a 32-bit executable file. Otherwise, you may encounter an error when you instantiate a copy of ISWiProject, or any other object. For more information, see Using the Automation Interface on a 64-Bit System.
Members

The following members of the ISWiProject object are available in the automation interface. Note that some methods, properties, and collections are available only for a particular project type.

Table 1 • ISWiProject Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| ActiveLanguage     | Read-Write String Property| Gets or sets the default language of the project. Specify a single language as a language identifier; for example:  
project.ActiveLanguage = "1033";                                                                                   |
| AddExitCondition   | Method                    | Adds an exit error message that you want the Advanced UI or Suite/Advanced UI installation to display under various conditions before ending the installation. |
| AddLanguage        | Method                    | Project • This is available in Suite/Advanced UI projects.  
Edition • The Suite/Advanced UI project type is available in the Premier edition of InstallShield.  
Adds a language to the project.                                                                  |
| AddPathVariable    | Method                    |                                                                                                                                             |
| AddProperty        | Method                    | Adds an Advanced UI or Suite/Advanced UI property with a specified name to the project.                                                                 |
| AddSetupFile       | Method                    | Adds a support file with the specified name to the project.                                                                                   |
| AddSuiteAction     | Method                    | Project • This is available in Suite/Advanced UI projects.  
Edition • The Suite/Advanced UI project type is available in the Premier edition of InstallShield.  
Adds an action to the project.                                                                                  |
| AddSuiteFeature    | Method                    | Adds a feature to the project or as a subfeature of an existing feature.                                                                      |
| AddSuitePackage    | Method                    | Adds a package to the project along with the specified target file and options for adding additional files.                                    |
| AddSuiteRelease    | Method                    | Adds a release to the project.                                                                                                               |
AddSuiteTransaction Method Adds a Windows Installer transaction to the project. Once your project contains a transaction, you can add .msi and .msp packages to the transaction.

ArpComments Read-Write String Property Gets or sets comments about your product. This information is displayed for your product's entry in Programs and Features.

ArpDisableChange Read-Write Boolean Property Gets or sets the value of the Disable Change Button setting in the General Information view. This setting is where you specify whether you want to disable the Change button for your product's entry in Programs and Features. The Change button enables end users to change installation options after the product has been installed. End users can remove or add features as needed.

ArpDisableRegistration Read-Write Boolean Property Inhibits or allows registration of the product in Programs and Features. If registration is disabled, the other Arp properties are ignored. Available values are:
- **False**—Your Advanced UI or Suite/Advanced UI product's entry is displayed on the target system in Programs and Features. This is the default value.
- **True**—Your Advanced UI or Suite/Advanced UI product's entry is not displayed on the target system in Programs and Features. The end user cannot use Programs and Features to remove the product, perform maintenance, or view support information. If you select this option, the other Arp properties are irrelevant.

ArpDisableRemove Read-Write Boolean Property Gets or sets the value of the Disable Remove Button setting in the General Information view. This setting is where you specify whether you want to disable the Remove button for your product's entry in Programs and Features. The Remove button enables end users to remove the product by clicking one button, which runs your uninstaller with a reduced user interface.

If the end user clicks the Remove button to remove your product, actions in the User Interface sequence of the project are executed.

<td>ArpIcon</td>
<td>Read-Write String</td>
<td>Gets or sets the path on your development system to the .ico, .exe or .dll file that contains the icon resource that you want to be used for your product’s entry in Programs and Features. If you want to use the icon in a file that is present on target systems (for example, in a file that is installed by one of the packages in the Advanced UI or Suite/Advanced UI installation), you can use a directory property as part of the path for the icon file. If you leave this property empty, InstallShield uses the icon that is specified in the Setup.exe Icon File setting on the Setup.exe tab in the Releases view.</td>
</tr>
<tr>
<td>ArpIconIndex</td>
<td>Read-Write Integer</td>
<td>If the icon file that you specify contains more than one icon resource, you can use the ArpIconIndex property to specify the index.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• A nonnegative integer refers to the order of the icon resources in the executable file. For example, 0 refers to the first icon in the file, 1 refers to the second icon, and 2 refers to the third icon.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Use a negative number to refer to a specific resource ID. For example, the icon index -12 refers to the icon with a resource ID of 12.</td>
</tr>
</tbody>
</table>
### Table 1 • ISWiProject Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| ArpProductUrl    | Read-Write String Property | Gets or sets a general URL for your company or product—for example, http://www.mycompany.com.  
On some versions of Windows, the publisher name on the Support Info dialog box is a hyperlink to this URL. The Support Info dialog box is displayed when an end user clicks the support information hyperlink for your product’s entry in Programs and Features. |
| ArpPublisher     | Read-Write String Property | Gets or sets the name of the company that created the product. This information is displayed for your product’s entry in Programs and Features.                                                                 |
| ArpReadMe        | Read-Write String Property | Gets or sets a valid URL for a Readme file or Customer Support page for your product.  
On some versions of Windows, this information is displayed on the Support Info dialog box for your product’s entry in Programs and Features. |
| ArpUpdateUrl     | Read-Write String Property | Gets or sets a URL where end users can get information about product updates or download the latest version.  
On some versions of Windows, this information is displayed on the Support Info dialog box for your product’s entry in Programs and Features. |
| CloseProject     | Method            | Closes an Advanced UI or Suite/Advanced UI project.                                                                                                                                                           |
| CreateProject    | Method            | Creates a new InstallShield project file (.issuite) for an Advanced UI or Suite/Advanced UI project.                                                                                                           |
| DeleteExitCondition | Method          | Removes an exit error message from the project.                                                                                                                                                               |
| DeleteLanguage   | Method            | Removes a language from the project.  
**Project**: This is available in Suite/Advanced UI projects.                                                                                                                                                      |
| DeletePathVariable | Method          | Removes a path variable from the project.                                                                                                                                                                     |
| DeleteProperty   | Method            | Removes an Advanced UI or Suite/Advanced UI property from the project.  
**Edition**: The Suite/Advanced UI project type is available in the Premier edition of InstallShield.                                                                                                       |

AddExitCondition Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddExitCondition method adds an exit condition to the project. Using this method is similar to defining an exit condition in the General Information view in InstallShield. You can set the properties of the exit condition with the ISWiSuiteExitCondition object.

**Syntax**

AddExitCondition (Message As String)
Parameters

Table 2 • AddExitCondition Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message</td>
<td>Specify the error message that you want the Advanced UI or Suite/Advanced UI installation to display at run time if the condition that you are configuring is true. As an alternative, you can enter a string identifier whose value is the error message that you want the installation to use.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

AddLanguage Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to Suite/Advanced UI projects.

Edition • Support for multilanguage installations is available with InstallShield Premier Edition.

The AddLanguage method adds a language to the project. Using this method is similar to adding a language in the General Information view in InstallShield. You can set the properties of the new language with the ISWiLanguage object.

Syntax

AddLanguage (LangId As String)

Parameters

Table 3 • AddLanguage Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LangId</td>
<td>Specify the language ID (as a string) that you want to add to the current project. For example: oProject.AddLanguage &quot;1035&quot;</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject
AddPathVariable Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddPathVariable method adds a path variable to the project. Using this method is similar to adding a path variable in the Path Variables view in InstallShield. You can set the properties of the new path variable with the ISWiPathVariable object.

**Important** • Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.

**Syntax**

```
AddPathVariable (sName As String) As ISWiPathVariable
```

**Parameters**

**Table 4 • AddPathVariable Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sName</td>
<td>Specify the name of the path variable that you want to add.</td>
</tr>
</tbody>
</table>

**Applies To**
- ISWiProject

AddProperty Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI
The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddProperty method adds an Advanced UI or Suite/Advanced UI property with a specified name to the project.

**Syntax**

AddProperty (Name As String) As ISWiProperty

**Parameters**

**Table 5 • AddProperty Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specify the name of the Advanced UI or Suite/Advanced UI property that you want to add.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate this method:

```vba
Dim pProj As ISWiProject
Set pProj = CreateObject("ISWiAutoSuiteAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.issuite"

Dim pProperty As ISWiProperty
Set pProperty = pProj.AddProperty ("MYPROP")
pProperty.Value = "MyPropValue"

pProj.SaveProject
pProj.CloseProject
```

**Applies To**

- ISWiProject

---

AddSetupFile Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI
The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddSetupFile method adds a support file with the specified name to the project. Using this method is similar to adding a path variable in the Support Files view in InstallShield. You can set the properties of the new path variable with the ISWiSetupFile object.

**Syntax**

AddSetupFile (FileName As String) As ISWiSetupFile

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Specify the fully qualified path and file name of the support file that you want to add.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate this method:

```vbnet
dim pProj as ISWiProject
set pProj = createobject("ISWiAutoSuiteAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.issuite"
dim pSetupFile as ISWiSetupFile
set pSetupFile = pProj.AddSetupFile ("C:\My Files\MySupportFile.ext")
pProj.SaveProject
pProj.CloseProject
```

**Applies To**

• ISWiProject

**AddSuiteAction Method (Advanced UI and Suite/Advanced UI)**

**Project** • This information applies to Suite/Advanced UI projects.

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.
The AddSuiteAction method adds an action to the project.

**Syntax**

`AddSuiteAction (ActionName As String, ActionType As ISWiSuiteActionType) as ISWiSuiteAction`

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActionName</td>
<td>Specify the name of the action that you want to add.</td>
</tr>
<tr>
<td>ActionType</td>
<td>Specify the type of action. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• esatDll (1)—Calls a function in a DLL file.</td>
</tr>
<tr>
<td></td>
<td>• esatPowerShell (2)—Runs a PowerShell script to perform system configuration tasks.</td>
</tr>
<tr>
<td></td>
<td>• esatExe (4)—Launches an executable file. The Suite/Advanced UI engine waits for the action to complete before proceeding with the next part of the installation.</td>
</tr>
<tr>
<td></td>
<td>• esatStartExe (8)—Launches an executable file. The Suite/Advanced UI engine runs the action simultaneously as the next part of the installation proceeds.</td>
</tr>
<tr>
<td></td>
<td>• esatSetProperty (16)—Sets a Suite/Advanced UI property.</td>
</tr>
<tr>
<td></td>
<td>• esatIScript (32)—Runs InstallScript code.</td>
</tr>
<tr>
<td></td>
<td>• esatClr (64)—Calls a public method in a managed assembly.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

**AddSuiteFeature Method (Advanced UI and Suite/Advanced UI)**

*Project* • *This information applies to the following project types:*

- Advanced UI
- Suite/Advanced UI

*Edition* • *The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*
The AddSuiteFeature method creates a feature with the specified name. AddSuiteFeature is a member of ISWiProject. The new feature is added to the current project as a root-level feature, but when this method is a member of an ISWiSuiteFeature object, the new feature is added as a subfeature of the current feature.

The feature is created with the same default properties that new features have when you add them in InstallShield.

After you have added the feature, you can set its other properties and associate packages with it.

**Syntax**

AddSuiteFeature (SuiteFeatureKey As String) As ISWiSuiteFeature

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SuiteFeatureKey</td>
<td>The feature key is the same as the name of the feature that is displayed in the Features view. The name becomes the index for the new ISWiSuiteFeature object. This string must contain only alphanumeric characters, dots (.), or underscores (_), and it must begin with a letter or an underscore. FeatureKey must be unique among your project’s feature names. Feature names are case-sensitive.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate calling AddSuiteFeature to add a feature and a subfeature:

```
Dim pProject As ISWiProject
Set pProject = New ISWiProject
pProject.OpenProject "C:\MySetups\SampleApp.issuite"

Dim pFeat1, pFeat2 As ISWiSuiteFeature
Dim sFeat1Name, sFeat2Name As String

sFeat1Name = "ParentFeature"
sFeat2Name = "SubFeature"

' Add the feature ParentFeature, then SubFeature under ParentFeature
Set pFeat1 = pProject.AddSuiteFeature(sFeat1Name)
Set pFeat2 = pFeat1.AddSuiteSubFeature(sFeat2Name)

pProject.SaveProject
pProject.CloseProject
```

**Applies To**

- ISWiProject
AddSuitePackage Method (Advanced UI and Suite/Advanced UI)

- **Project** • This information applies to the following project types:
  - Advanced UI
  - Suite/Advanced UI

  Project-specific differences are noted where applicable.

- **Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddSuitePackage method adds a package (such as an .msi package, an InstallScript package, an .exe package, or other supported type) along with the specified target file and options for adding additional files. Using this method is similar to adding a package in the Packages view in InstallShield. You can set the properties of the new package with the ISWiSuitePackage object.

**Syntax**

AddSuitePackage (PackageType As ISWiSuitePackageType, TargetFileName As String, AdditionalFiles As ISWiAdditionalFiles) As ISWiSuitePackage
Parameters

Table 9 • AddSuitePackage Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PackageType</strong></td>
<td>Specify the type of package that you are adding to the project.</td>
</tr>
<tr>
<td></td>
<td>The following project types are available in Advanced UI and Suite/Advanced UI projects:</td>
</tr>
<tr>
<td></td>
<td>• esptMsi (1)—Windows Installer package (.msi)</td>
</tr>
<tr>
<td></td>
<td>• esptMsp (2)—Windows Installer patch (.msp)</td>
</tr>
<tr>
<td></td>
<td>• esptIsp (4)—InstallScript package</td>
</tr>
<tr>
<td></td>
<td>The following project types are available only in Suite/Advanced UI projects:</td>
</tr>
<tr>
<td></td>
<td>• esptTransaction (-1)—Windows Installer transaction. This package type is available in Suite/Advanced UI projects.</td>
</tr>
<tr>
<td></td>
<td>• esptExe (3)—executable package (.exe). This package type is available in Suite/Advanced UI projects.</td>
</tr>
<tr>
<td></td>
<td>• esptismMsi (5)—Basic MSI project (.ism)</td>
</tr>
<tr>
<td></td>
<td>• esptismIsp (6)—InstallScript project (.ism)</td>
</tr>
<tr>
<td></td>
<td>• esptappx (7)—Sideloading Windows App package (.appx)</td>
</tr>
<tr>
<td></td>
<td>• esptWebDeploy (8)—Web Deploy package (.zip)</td>
</tr>
<tr>
<td><strong>TargetFileName</strong></td>
<td>Specify the file in the package (such as the .msi file) that the Advanced UI or Suite/Advanced UI installation should invoke.</td>
</tr>
<tr>
<td><strong>AdditionalFiles</strong></td>
<td>Specify the type of additional files that you want to add for the package. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• eaftNothing (0)—Add nothing. This package does not need any additional files.</td>
</tr>
<tr>
<td></td>
<td>• eaftAdjacentFiles (1)—Add adjacent files; that is, add the files next to this package.</td>
</tr>
<tr>
<td></td>
<td>• eaftSubFolders (2)—Add files in subfolders; that is, add the files below this package.</td>
</tr>
<tr>
<td></td>
<td>• eaftAdjacentFilesAndSubFolders (3)—Add adjacent files and files in subfolders; that is, add the files next to and below this package.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject
AddSuiteRelease Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddSuiteRelease method adds a release with the specified name to the project. Using this method is similar to adding a release in the Releases view in InstallShield. You can set the properties of the new release with the ISWiSuiteRelease object.

Syntax

AddSuiteRelease (ReleaseName As String) as ISWiSuiteRelease

Parameters

Table 10 • AddSuiteRelease Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ReleaseName</td>
<td>Specify the name of the release that you want to add.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

AddSuiteTransaction Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to Suite/Advanced UI projects.

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddSuiteTransaction method adds a Windows Installer transaction to a Suite/Advanced UI project, and it returns a package. Once your project contains a transaction, you can add .msi and .msp packages to the transaction.
Syntax

AddSuiteTransaction () As ISWiSuitePackage

Parameters

The AddSuiteTransaction method does not take any parameters.

Applies To

- ISWiProject

CloseProject Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

To close the .issuite file that you opened with OpenProject, call CloseProject.

Syntax

CloseProject ()

Return Values

CloseProject always returns 0.

Applies To

- ISWiProject

CreateProject Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI
**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The CreateProject method creates a new InstallShield project file (.issuite) for Advanced UI and Suite/Advanced UI projects.

**Syntax**

CreateProject (strISWiProjectFile As String, ByVal ProjectType As ISWiProjectType)

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strISWiProjectFile</td>
<td>Enter the fully qualified path to the .issuite file that you want to create. Include the full file name.</td>
</tr>
<tr>
<td>ProjectType</td>
<td>Specify the type of project that you want to create. The valid value is:</td>
</tr>
<tr>
<td></td>
<td>• eptSuite (16)—Creates an Advanced UI or Suite/Advanced UI project.</td>
</tr>
</tbody>
</table>

**Example**

The following sample code creates an Advanced UI or Suite/Advanced UI project and sets its product version to 2.00.0000.

```vbnet
' Declare a variable and set its value.
dim proj
set proj = CreateObject("ISWiAutoSuite22.ISWiProject")

' Create a project.
proj.CreateProject "d:\scratch\packagetest.issuite", 16 '16: ISWiProjectType.eptSuite
proj.OpenProject "d:\scratch\packagetest.issuite", false
proj.ProductVersion = "2.00.0000"
proj.SaveProject
proj.CloseProject
```

**Applies To**

• ISWiProject

---

**DeleteExitCondition Method (Advanced UI and Suite/Advanced UI)**

**Project** • This information applies to the following project types:

• Advanced UI
• **Suite/Advanced UI**

*Edition* • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The DeleteExitCondition method removes an exit condition from the project. Using this method is similar to removing an exit condition in the General Information view in InstallShield.

**Syntax**

DeleteExitCondition (ExitCondition As ISWiSuiteExitCondition)

**Parameters**

**Table 12 • DeleteExitCondition Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ExitCondition</td>
<td>Specify the ISWiSuiteExitCondition object that you want the method to remove from your project.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

---

**DeleteLanguage Method (Advanced UI and Suite/Advanced UI)**

*Project* • This information applies to Suite/Advanced UI projects.

*Edition* • Support for multilanguage installations is available with InstallShield Premier Edition.

The DeleteLanguage method removes a language from the current project. Using this method is similar to removing a language in the General Information view in InstallShield.

**Syntax**

DeleteLanguage (Language As ISWiLanguage)
DeletePathVariable Method (Advanced UI and Suite/Advanced UI)

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Language</td>
<td>Specify the ISWiLanguage object that you want the method to remove from your project.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

**DeletePathVariable Method (Advanced UI and Suite/Advanced UI)**

*Project* - This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

*Edition* - The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeletePathVariable method removes a path variable with a specified name from the project.

**Important** - Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see Predefined Path Variables.

**Syntax**

```plaintext
DeletePathVariable (pPathVar ISWiPathVariable) As Long
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pPathVar</td>
<td>Pass the ISWiPathVariable object for the path variable that you want to delete.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject
DeleteProperty Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteProperty method removes an Advanced UI or Suite/Advanced UI property with a specified name from the project.

**Syntax**

DeleteProperty(ByVal pProperty As ISWiProperty) As Long

**Parameters**

Table 15 • DeleteProperty Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
<td>Pass the ISWiProperty object that you want to remove.</td>
</tr>
</tbody>
</table>

**Example**

The following Visual Basic lines demonstrate this method:

Dim proj As ISWiAutoSuiteAutomation Interface Version.ISWiProject
Set proj = New ISWiAutoSuiteAutomation Interface Version.ISWiProject
proj.OpenProject "c:\mysetups\your project name-3.issuite"
Dim pProp As ISWiAutoSuiteAutomation Interface Version.ISWiProperty
Set pProp = proj.ISWiProperties.Item("MyProperty")
proj.DeleteProperty pProp

**Applies To**

- ISWiProject

DeleteSetupFile Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI
The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteSetupFile method removes the specified support file from the project.

### Syntax

DeleteSetupFile (pSetupFile As ISWiSetupFile) As Long

### Parameters

**Table 16 • DeleteSetupFile Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pSetupFile</td>
<td>Pass the ISWiSetupFile object that you want to delete.</td>
</tr>
</tbody>
</table>

### Example

The following Visual Basic lines demonstrate this method:

```vba
Dim pProj As ISWiProject
Set pProj = CreateObject("ISWiAutoSuiteAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.issuite"
Dim pSetupFile As ISWiSetupFile

Set pSetupFile = pProj.ISWiSetupFiles.Item("MySupportFile.abc")
pProj.DeleteSetupFile pSetupFile

pProj.SaveProject
pProj.CloseProject
```

### Applies To

- ISWiProject

---

**DeleteSuiteAction Method (Advanced UI and Suite/Advanced UI)**

**Project • This information applies to Suite/Advanced UI projects.**

**Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.**

The DeleteSuiteAction method removes an action from the project.
Syntax

DeleteAction (SuiteAction As ISWiSuiteAction)

Parameters

Table 17 • AddSuiteAction Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SuiteAction</td>
<td>Specify the ISWiSuiteAction object that you want to delete.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

DeleteSuiteFeature Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteSuiteFeature method permanently removes a feature from the current project.

Syntax

DeleteSuiteFeature (Feature As ISWiSuiteFeature) As Long

Parameters

Table 18 • DeleteSuiteFeature Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feature</td>
<td>Specify the ISWiSuiteFeature object that you want to remove.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject
DeleteSuitePackage Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteSuitePackage method removes a package or a Windows Installer transaction from the current project.

**Syntax**

```
DeleteSuitePackage (Package As ISWiSuitePackage) As Long
```

**Parameters**

Table 19 • DeleteSuitePackage Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package</td>
<td>Specify the ISWiSuitePackage object that you want to remove.</td>
</tr>
</tbody>
</table>

**Applies To**
- ISWiProject

DeleteSuiteRelease Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteSuiteRelease method removes a release from the Advanced UI or Suite/Advanced UI project.

**Syntax**

```
DeleteSuiteRelease (SuiteRelease As ISWiSuiteRelease)
```
Parameters

Table 20 • DeleteSuiteRelease Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SuiteRelease</td>
<td>Pass the ISWiSuiteRelease object that you want to delete.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

ForceUpgrade Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ForceUpgrade method upgrades the project from an earlier version of InstallShield to the current version.

Syntax

ForceUpgrade (ISWiProjectFile As String)

Parameters

Table 21 • ForceUpgrade Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISWiProjectFile</td>
<td>Enter the fully qualified path to the Advanced UI or Suite/Advanced UI project file (.issuite) that you want to upgrade. Include the full file name.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

GenerateGUID Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The GenerateGUID method generates a new, unique GUID that is returned as a string.

**Syntax**

GenerateGUID ()

**Applies To**
- ISWiProject

**ISWiSuiteEvent Method (Advanced UI and Suite/Advanced UI)**

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSuiteEvent accesses a specific event in the project.

**Syntax**

ISWiSuiteEvent (EventType as ISWiSuiteEventType) as ISWiSuiteEvent
Parameters

Table 22 • ISWISuiteEvent Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>Specify the type of event. Available options are:</td>
</tr>
<tr>
<td>__________________________</td>
<td></td>
</tr>
<tr>
<td>• esetOnBegin (0)</td>
<td>— The OnBegin event is the first event in a Suite/Advanced UI installation. Actions that are scheduled for this event are executed during all modes (install, maintenance, repair, etc.) unless the conditional statement that is defined for the action evaluates as false.</td>
</tr>
<tr>
<td>• esetOnResuming (1)</td>
<td>— The OnResuming event launches its actions when a Suite/Advanced UI installation is resuming after the target machine has been restarted.</td>
</tr>
<tr>
<td>• esetOnStaging (2)</td>
<td>— The OnStaging event launches its actions immediately before the Suite/Advanced UI installation is staged; that is, before the Suite/Advanced UI installation downloads its package (if applicable), extracts its packages from the Setup.exe file (if applicable), and copies its packages to a directory that the end user specifies on the BrowseStageFolder wizard page or by setting the ISRootStagePath property through the command line.</td>
</tr>
<tr>
<td>• esetOnStaged (3)</td>
<td>— The OnStaged event launches its actions after the Suite/Advanced UI installation has downloaded its packages (if applicable), extracted them from the Setup.exe file, and copied them to the staging directory.</td>
</tr>
<tr>
<td>• esetOnPackagesConfiguring (4)</td>
<td>— The OnPackagesConfiguring event launches its actions immediately before the packages in the Suite/Advanced UI installation are being installed, modified, repaired, or removed.</td>
</tr>
<tr>
<td>• esetOnPackagesConfigured (5)</td>
<td>— The OnPackagesConfigured event launches its actions when the packages in the Suite/Advanced UI installation have been installed, modified, repaired, or removed.</td>
</tr>
<tr>
<td><strong>Type (cont.)</strong></td>
<td></td>
</tr>
<tr>
<td>• esetOnRebooting (6)</td>
<td>— The OnRebooting event launches its actions immediately before the Suite/Advanced UI installation triggers a restart of the machine.</td>
</tr>
<tr>
<td>• esetOnEnd (7)</td>
<td>— The OnEnd event launches its actions immediately before the end of a successful Suite/Advanced UI installation. If the end user cancels the Suite/Advanced UI installation or the installation encounters an error, the OnEnd event does not run.</td>
</tr>
<tr>
<td>• esetOnPackageConfiguring (8)</td>
<td>— This event launches the actions that the Suite/Advanced UI installation should launch before installing, removing, repairing, or modifying a package.</td>
</tr>
<tr>
<td>• esetOnPackageConfigured (9)</td>
<td>— This event launches the actions that the Suite/Advanced UI installation should launch after installing, removing, repairing, or modifying a package.</td>
</tr>
</tbody>
</table>

For more information, see Types of Events in a Suite/Advanced UI Installation.

- ISWiProject

OpenProject Method (Advanced UI and Suite/Advanced UI)

This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

To open your Advanced UI or Suite/Advanced UI project so that you can modify it through the automation interface, call OpenProject with the fully qualified path to your .issuite file. This method is equivalent to loading a project in InstallShield.

Note • The OpenProject method fails if the project is open in InstallShield.

Syntax

OpenProject (strISWiProjectFile As String, Optional ByVal bReadOnly As Boolean) As Long

Parameters

Table 23 • OpenProject Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strISWiProjectFile</td>
<td>Enter the fully qualified path to the project file (.issuite).</td>
</tr>
<tr>
<td>bReadOnly</td>
<td>Determines whether the project is opened with write privileges. True opens the project as a read-only file. The default value for this optional parameter is False.</td>
</tr>
</tbody>
</table>

Return Values and Errors

Table 24 • OpenProject Method Return Values and Errors

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The project was successfully opened.</td>
</tr>
<tr>
<td>1</td>
<td>The project was opened, but it is locked by some other process.</td>
</tr>
</tbody>
</table>
Example

The following Visual Basic lines demonstrate this method:

```
Dim pProj As ISWiProject
Set pProj = CreateObject("ISWiAutoSuiteAutomation Interface Version.ISWiProject")
pProj.OpenProject "C:\MySetups\Project1.issuite"
' Modify project here.
pProj.SaveProject
pProj.CloseProject
```

Applies To

- ISWiProject

SaveProject Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

To save any changes that you have made to your Advanced UI or Suite/Advanced UI project file through the automation interface, call the SaveProject method.

Syntax

```
SaveProject ()
```
Return Values and Errors

Table 25 • SaveProject Method Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERROR_SUCCESS (0)</td>
<td>Project is saved.</td>
</tr>
<tr>
<td>Error Code 1104</td>
<td>Unable to save file: %1. The project is open in read-only mode or is being used by another process.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiProject

ISWiLanguage Object (Advanced UI and Suite/Advanced UI)

Edition • Support for multilanguage installations is available with InstallShield Premier Edition.

Project • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiLanguage object represents a language whose string entries are included in the project; it provides access to the translated strings.

To include or exclude languages, use the IsIncluded property on each relevant ISWiLanguage object.
Members

Table 26 • ISWiLanguage Object Members

<table>
<thead>
<tr>

AddStringEntry Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddStringEntry method adds a new string entry to a language.

Syntax

AddStringEntry (StringId) As ISWiStringEntry
Parameters

Table 27 • AddStringEntry Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>StringId</td>
<td>Specify the identifier for the string entry.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiLanguage

DeleteStringEntry Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteStringEntry method removes a string entry from the project.

Syntax

DeleteStringEntry (StringEntry As ISWiStringEntry)

Parameters

Table 28 • DeleteStringEntry Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>StringEntry</td>
<td>Specify the ISWiStringEntry object that you want to remove from the project.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiLanguage

ISWiPathVariable Object (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:
• Advanced UI
• Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The ISWiPathVariable object represents a path variable that is included in the project. Path variables help make projects' build paths more portable across machines.

To add or remove path variables, call ISWiProject.AddPathVariable or ISWiProjectDeletePathVariable.

**Important** • Predefined path variables cannot be modified or deleted. If you attempt to do so, exception error 3142 occurs. For more information, see [Predefined Path Variables](#).
## Members

**Table 29 • ISWIThPathVariable Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Read-Write String Property</td>
<td>Gets or sets the name of the path variable.</td>
</tr>
<tr>
<td>PathVarType</td>
<td>Read-Write Integer Property</td>
<td>This enumerated integer property gets or sets the type of the path variable. Available values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>epvtPreDefined (1)</strong>—Predefined path variables are variables that are set to certain standard Windows directories. These variables cannot be renamed or modified, but they can be used in your installation project to point to predefined directories.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>epvtCustom (2)</strong>—Custom path variables are sometimes referred to as standard path variables or user-defined variables. These variable types are defined through InstallShield. These variables do not rely on any outside sources, such as the registry or system paths.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>epvtEnvironment (4)</strong>—Environment path variables are based on the values of your system's environment variables. You can set an environment path variable in your project to an existing environment variable on your machine.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>epvtRegistry (8)</strong>—Registry path variables enable you to define your own variables based on the default value of a specified registry key. The registry key must already be present when you set a path variable to the value of the key.</td>
</tr>
<tr>
<td>TestValue</td>
<td>Read-Write String Property</td>
<td>Gets or sets the test value of the path variable.</td>
</tr>
</tbody>
</table>
Table 29 • ISWiPathVariable Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value</td>
<td>Read-Write String</td>
<td>Gets or sets the value of the path variable.</td>
</tr>
<tr>
<td></td>
<td>Property</td>
<td></td>
</tr>
</tbody>
</table>

**For Standard Path Variables**

For standard variables, enter the directory to which you would like your variable to point.

**Note** • You can also refer to other path variables in the defined value by enclosing the referenced path variable name in angled brackets. For example, if you have a path variable called MyRoot with a value of C:\, you can refer to it in a path variable definition for another variable, such as Games. The actual path for the Games variable might be C:\Programs\GameFiles, but you can define Games as <MyRoot>\Programs\GameFiles. However, if you attempt to self-reference a path variable, the literal string is used instead. For example, defining Games as <MyRoot>\Programs\Games actually results in Games defined as C:\Programs\Games.

**Value (cont.)**

**For Registry Path Variables**

Enter the complete registry key, with the final “subkey” being the name of the value whose data contains the folder. For example, define MyRegVar as follows:

HKEY_LOCAL_MACHINE\SOFTWARE\TestKey\TestValue

Assume that TestKey has the following subkey and values:

[HKEY_LOCAL_MACHINE\SOFTWARE\TestKey]
@="C:\MyPath1"
"TestValue"="C:\MyPath2"
[HKEY_LOCAL_MACHINE\Software\TestKey\TestValue]
@="C:\MyPath3"

Even though HKEY_LOCAL_MACHINE\SOFTWARE\TestKey has a subkey called TestValue, MyRegVar points to the value TestValue, and the current value will be C:\MyPath2. (Note, however, that if a value named TestValue does not exist, InstallShield reads the default value (C:\MyPath3) of the subkey HKEY_LOCAL_MACHINE\SOFTWARE\TestKey\TestValue.)

**For Environment Path Variables**

For environment path variables, enter the name of the variable as it appears on the Environment dialog box.

**Applies To**

• ISWiProject
ISWiProperty Object (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiProperty object represents an Advanced UI or Suite/Advanced UI property. You can retrieve a property by specifying an item in the ISWiProperties collection.
Members

Table 30 • ISWiProperty Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comments</td>
<td>Read-Write String</td>
<td>Gets or sets an internal note about the string entry. The comments are not displayed at run time.</td>
</tr>
<tr>
<td>FormatPropertyValue</td>
<td>Read-Write Boolean Property</td>
<td>Gets or sets the check box in the Formatted column in the Property Manager view. The check box that lets you indicate whether the value is a formatted expression that contains property names, environment variable references, or other special strings that you want to be resolved at run time. The run-time resolution occurs early at run time, before the installation executes the actions in the OnBegin event. To leave the property value as is at run time, set this property equal to False. Square brackets and other characters have no special meaning. To replace the formatted expressions at run time, set this property equal to True. To learn about the syntax that is available for formatted expressions, see Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time.</td>
</tr>
<tr>
<td>Name</td>
<td>Read-Write String</td>
<td>Gets or sets the name of the Advanced UI or Suite/Advanced UI property.</td>

ISWiSetupFile Object (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI
**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSetupFile object represents a support file in your project.

To add or remove support files, call ISWiProject.AddSetupFile or ISWiProject.DeleteSetupFile.

**Members**

**Table 31 • ISWiSetupFile Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FileName</td>
<td>Read-only String Property</td>
<td>Gets the name of the support file (without the path).</td>
</tr>
<tr>
<td>Language</td>
<td>Read-Write String Property</td>
<td>Gets the string that identifies the language identifier for the support file; for example: \n\n  \n  m_pFile.Language = &quot;1033&quot;</td>
</tr>
<tr>
<td>Path</td>
<td>Read-only String Property</td>
<td>Gets the fully qualified path (including the file name) of the support file’s source location. Instead of hard-coding a path, you can use a path variable that is defined in the Path Variables view or part of the ISWiPathVariables collection. At build time, InstallShield replaces the path variable with the appropriate value.</td>
</tr>
<tr>
<td>Target</td>
<td>Read-Write String Property</td>
<td>Gets or sets the support file’s target directory within SETUP SUPPORTDIR. The following line specifies the support file to be stored in the MyFolder1\MyFolder2 folder under SETUP SUPPORTDIR: \n\n  m_pFile.Target = &quot;MyFolder1\MyFolder2&quot;</td>
</tr>
</tbody>
</table>

**Applies To**

**ISWiSuiteAction Object (Advanced UI and Suite/Advanced UI)**

**Project** • This information applies to Suite/Advanced UI projects.
Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSuiteAction object represents an action in the Suite/Advanced UI project.

Note that some ISWiSuiteAction properties are applicable to only certain action types.
## Members

### Table 32  •  ISWiSuiteAction Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AbortCode</td>
<td>Read-Write</td>
<td>String Property Note • <em>This property applies to .exe actions.</em> Gets or sets a comma-delimited list of the codes that the action could return when the installation should be aborted. Note that if the action cannot be launched or loaded, the installation is aborted. This property is available if the value of the action’s WaitForExit property is True.</td>
</tr>
<tr>
<td>ActionName</td>
<td>Read-Only</td>
<td>String Property Gets or sets the name of the action.</td>
</tr>
<tr>
<td>Arguments</td>
<td>Read-Write</td>
<td>String Property Note • <em>This property applies to .exe actions.</em> If appropriate, gets or sets the command-line parameters that should be used with the action. Separate multiple parameters with spaces.</td>
</tr>
<tr>
<td>CancelCode</td>
<td>Read-Write</td>
<td>String Property Note • <em>This property applies to .exe actions.</em> Gets or sets a comma-delimited list of the codes that the action could return when the installation should be cancelled. This property is available if the value of the action’s WaitForExit property is True.</td>
</tr>
<tr>
<td>Class</td>
<td>Read-Write</td>
<td>String Property Note • <em>This property applies to managed-code actions.</em> Gets or sets the name of the class for the managed method that you want the selected action to call. To learn more, see Working with a Managed-Code Action in a Suite/Advanced UI Installation.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| DefaultResponse | Read-Write Integer Property | Gets or sets a string that describes how you want the installation to respond if the code that the action returns is not specified for the IgnoreCode, AbortCode, RebootCode, or CancelCode properties. Available values are:  
  - **esadcIgnore (0)** — The installation proceeds with the next part of the installation. This is the default option.  
  - **esadcAbort (1)** — The installation is aborted.  
  - **esadcReboot (2)** — The target system is restarted.  
  - **esadcCancel (3)** — The installation is cancelled.  
  This property is available if the value of the action’s WaitForExit property is True. |
| FormatPropertyValue | Read-Write Boolean Property | Gets or sets the value of the Format Property Value setting in the Events view. This setting lets you indicate whether the value that you enter in the Property Value setting (or through the PropValue property in the automation interface) is a formatted expression that contains property names, environment variable references, or other special strings that you want to be resolved at run time. Available options are:  
  - **True** — Replace the formatted expressions at run time.  
  - **False** — Leave the property value as is at run time. The value that you are entering does not include formatted expressions.  
  To learn about the syntax that is available for these expressions, see Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time. |
| FunctionName | Read-Write String Property | For a DLL action: Gets or sets the name of the function in the DLL that you would like to call.  
  For an InstallScript action: Gets or sets the InstallScript function that you want to call. |

</tr>
</tbody>
</table>
| **SourcePath** | Read-Write String Property | *Note • This property applies to PowerShell actions.*  
Gets or sets the source path to the PowerShell script (.ps1) that you want to use for your action.  
If the file is not present on target systems at run time, and if none of the packages in your Suite/Advanced UI installation are going to install it, you can reference a file that is included in your project as a support file. At run time, the file is available on the target system only during your product's installation process.  
Instead of hard-coding a location, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value. |
| **TargetFile** | Read-Write String Property | *Note • This property applies to .exe, DLL, and managed-code actions.*  
Gets or sets the run-time path to the file that you want to use for your action.  
If the file is not present on target systems at run time, and if none of the packages in your Suite/Advanced UI installation are going to install it, you can reference a file that is included in your project as a support file. At run time, the file is available on the target system only during your product's installation process. |

### ISWiSuiteActionRef Object (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to Suite/Advanced UI projects.

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSuiteActionRef object represents a reference to the scheduling of an action during a Suite/Advanced UI event. You can schedule an action multiple times—even in a single event.

To schedule actions, call ISWiSuiteEvent.AddSuiteActionRef. To remove the references to the scheduling of actions, call ISWiSuiteEvent.DeleteSuiteActionRef.

MoveTo Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to Suite/Advanced UI projects.

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The MoveTo method reschedules a Suite/Advanced UI action to occur directly after the specified other action.

Syntax

MoveTo (PrecedingActionRef As ISWiSuiteActionRef)
Parameters

Table 34 • MoveTo Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PrecedingActionRef</td>
<td>Specifies the action that precedes the action that you want to reschedule. The default value of Nothing indicates the top position.</td>

ISWiSuiteCondition Object (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSuiteCondition object represents the following types of conditions:
- Exit condition (used for the Condition property of the ISWiSuiteExitCondition object)
- Feature condition (used for the Condition property of the ISWiSuiteFeature object)
- Detection condition (used for the DetectionCondition property of the ISWiSuitePackage object)
- Eligibility condition (used for the EligibleCondition property of the ISWiSuitePackage object)

The ISWiSuiteCondition object can also exist in the Conditions collection of an All, Any, or None condition group. To add or remove conditions from a condition group, call AddCondition, AddGroup, AddExtensionCondition, or DeleteCondition.
**Members**

</tbody>
</table>
Applies To

- ISWiSuiteExitCondition
- ISWiSuiteFeature
- ISWiSuitePackage

**Table 35 • ISWiSuiteCondition Object Members (cont.)**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Read-only Integer Property</td>
<td>Gets the type of condition, condition group, or condition check. Available options are:</td>
</tr>
</tbody>
</table>

- **esctAll (0)**—An All condition group operates like a logical AND operation. All of the conditions that are in the All group must evaluate to true in order for the condition group to evaluate to true.

- **esctAny (1)**—An Any condition group operates like a logical OR operation. If any of the conditions that are in the Any group evaluate to true, the entire condition group evaluates to true. If none of the conditions that are in the Any group evaluate to true, the entire condition group evaluates to false.

- **esctNone (2)**—A None condition group operates like a logical NOR operation. If none of the conditions that are in the None group evaluate to true, the entire condition group evaluates to true. If any of the conditions that are in the None condition group evaluate to true, the entire condition group evaluates to false. Note that if the None condition group consists of only one conditional statement, it operates like a logical NOT operation.

- **esctBuiltin (11)**—A built-in condition check has one or more subsettings. Examples of the built-in condition checks are Platform, File Exists, Eligible Package, and Feature Operation.

- **esctExtension (21)**—An extension condition uses a C/C++ DLL that you created to implement your own custom condition that checks target systems for factors that the other types of condition checks do not evaluate.

To identify group conditions, use the following:

\[\text{pCondition.Type} < 10\]
AddCondition Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddCondition method adds a condition to a condition group.

To add an extension condition to a condition group, use the AddExtensionCondition method.

**Syntax**

```
AddCondition (ConditionCheckName As String) As ISWiSuiteCondition
```
### Parameters

#### Table 36 • AddCondition Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConditionCheckName</td>
<td>Specify the name of the type of condition check. Available options are:</td>
</tr>
<tr>
<td>• Platform</td>
<td>Check target systems for one or more characteristics such as the operating system version, the architecture, and other platform details on target systems. For descriptions of each of the settings that are displayed for this type of condition check, see Platform Condition Settings.</td>
</tr>
<tr>
<td>• FileExists</td>
<td>Check target systems for the presence of a particular file. For descriptions of each of the settings that are displayed for this type of condition check, see File Exists Condition Settings.</td>
</tr>
<tr>
<td>• FileValue</td>
<td>Check target systems for specific information—date, version number, or content—for a particular file. For descriptions of each of the settings that are displayed for this type of condition check, see File Comparison Condition Settings.</td>
</tr>
<tr>
<td>• RegistryExists</td>
<td>Check target systems for the presence of a particular registry key, and optionally a specific value name. For descriptions of each of the settings that are displayed for this type of condition check, see Registry Exists Condition Settings.</td>
</tr>
<tr>
<td>• RegistryValue</td>
<td>Check target systems for specific information—DWORD, QWORD, string, multistring, file version, or product version—for a particular registry entry. If you do not specify a value name, the default value for the key that you specify is used for the comparison. For descriptions of each of the settings that are displayed for this type of condition check, see Registry Comparison Condition Settings.</td>
</tr>
<tr>
<td>• PropertyValue</td>
<td>Check the value of a particular built-in Advanced UI or Suite/Advanced UI property, or a property that is defined in the Property Manager view. For descriptions of each of the settings that are displayed for this type of condition check, see Property Comparison Condition Settings.</td>
</tr>
<tr>
<td>• MsiInstalled</td>
<td>Check target systems for the presence of a product that was installed by a particular .msi package. For descriptions of each of the settings that are displayed for this type of condition check, see MSI Package Condition Settings.</td>
</tr>
<tr>
<td>• MsiRelated</td>
<td>Check target systems for the presence of a version of a product that you want to update, or for the presence of future versions of a product that you do not want to downgrade. In either case, the product whose presence is being checked is installed by an .msi package. For descriptions of each of the settings that are displayed for this type of condition check, see MSI Upgrade Condition Settings.</td>
</tr>
</tbody>
</table>
ParcelRef—Check whether a different package or a feature in the Advanced UI or Suite/Advanced UI installation is eligible for installation on a target system. For example, if a patch package is eligible for installation only if the base package is eligible for installation, you can create an Eligible Package condition to tie the patch’s eligibility to the base package’s eligibility. For descriptions of each of the settings that are displayed for this type of condition check, see Eligible Package Condition Setting.

IspInstalled—Check target systems for the presence of a product that was installed by a particular InstallScript package. For descriptions of each of the settings that are displayed for this type of condition check, see InstallScript Package Condition Settings.

Locale—Match one or more locale-related settings on target systems. For descriptions of each of the settings that are displayed for this type of condition check, see Locale Condition Settings.

SuiteInstalled—Check whether a particular version of an Advanced UI or Suite/Advanced UI installation is already installed on a target system. For descriptions of each of the settings that are displayed for this type of condition check, see Suite Installed Condition Settings.

AppxInstalled—Check target systems for the presence of a particular Windows App. For descriptions of each of the settings that are displayed for this type of condition check, see Windows App Package Condition Settings.

ParcelAction—Check the target state of a particular package in the Suite/Advanced UI installation. This type of condition is available only for actions that are associated with an event in the Events view or Packages view. For descriptions of each of the settings that are displayed for this type of condition check, see Package Operation Condition Settings.

FeatureAction—Check the target state of a particular feature in the Suite/Advanced UI installation. This type of condition is available only for actions that are associated with an event in the Events view or Packages view. For descriptions of each of the settings that are displayed for this type of condition check, see Feature Operation Condition Settings.

**Project** • The ParcelAction and FeatureAction type of conditions are available in Suite/Advanced UI projects.

- ISWiSuiteCondition

Move Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:
• Advanced UI
• Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The Move method moves a condition or a condition group within a condition tree.

Syntax
Move (Direction As ISWiDirection)

Parameters

Table 43 • Move Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direction</td>
<td>Specify the direction in which you want to move a condition or a condition group within a condition tree. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• edUp (0)—Move the item up in the condition tree.</td>
</tr>
<tr>
<td></td>
<td>• edDown (1)—Move the item down in the condition tree.</td>
</tr>
<tr>
<td></td>
<td>• edLeft (2)—Move the item to the left in the condition tree.</td>
</tr>
<tr>
<td></td>
<td>• edRight (3)—Move the item to the right in the condition tree.</td>
</tr>
</tbody>
</table>

Applies To
• ISWiSuiteCondition

ISWiSuiteConditionParameter Object (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:
• Advanced UI
• Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.
The ISWiSuiteConditionParameter object represents a parameter for a condition check. It is the equivalent of the value that is configured in a condition subsetting for a conditional statement. You can retrieve a parameter value by specifying an item in the ISWiSuiteConditionParameters collection.

The ISWiSuiteConditionParameters collection contains all of the available parameters for built-in conditions. To add or remove parameters for an extension condition, call ISWiSuiteCondition.AddParameter or ISWiSuiteCondition.DeleteParameter.

**Members**

**Table 44 • ISWiSuiteConditionParameter Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content</td>
<td>Read-Write</td>
<td>Gets or sets the value of the parameter.</td>
</tr>

<td></td>
<td>String Property</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Read-Write</td>
<td>Gets or sets the name of the parameter.</td>
</tr>
<tr>
<td></td>
<td>String Property</td>
<td></td>
</tr>
</tbody>
</table>

The only time that it is appropriate to customize the Name property is when you are configuring an extension condition in your project.

**Applies To**

- ISWiSuiteCondition

**ISWiSuiteDFLFilter Object (Advanced UI and Suite/Advanced UI)**

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSuiteDFLFilter object represents a filter for a dynamic link that includes additional files that a package in an Advanced UI or Suite/Advanced UI project requires.
## Members

### Table 45 • ISWiSuiteDFLFilter Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CanMove</td>
<td>Method</td>
<td>Indicates whether a filter can move up or down in the filter criteria; the result is returned as a Boolean value.</td>
</tr>
<tr>
<td>ISWiSuiteDFLFilters</td>
<td>Collection</td>
<td>Contains all of the filters that are associated with a dynamic link for the additional files that a package requires.</td>
</tr>
<tr>
<td>MoveDown</td>
<td>Method</td>
<td>Moves a filter down below the filter that follows it.</td>
</tr>
<tr>
<td>MoveUp</td>
<td>Method</td>
<td>Moves a filter up above its preceding filter.</td>
</tr>
<tr>
<td>Pattern</td>
<td>Read-Write String Property</td>
<td>Specify the name of the dynamic folder whose files you want to include or exclude in your dynamic link, or specify the name of a dynamic file that you want to include in your dynamic link.</td>
</tr>
</tbody>
</table>

To indicate a wild-card character, use an asterisk (*). For example, to include all .htm files, you could enter *.* in an include File setting. To include all files, you could enter *.*. To refer to the root folder (the one that contains the package file) in a path, use a dot and a backslash:.

For example, to refer to a ReadMe.txt file in a subfolder called MyDirectory, where MyDirectory is a subfolder of the folder that contains the package, you could use the following filter:

```
.
\MyDirectory\ReadMe.txt
```

For more information, including background on how InstallShield determines which files and folders to include in and exclude from the release, see Defining Filters for a Dynamically Linked Folder in an Advanced UI or Suite/Advanced UI Project.

### Applies To

- ISWiSuiteDynamicFileLink

### CanMove Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI
The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The CanMove method indicates whether a filter can move up or down in the filter criteria; the result is returned as a Boolean value.

**Syntax**

CanMove (Direction As ISWiDirection)

**Parameters**

**Table 46 • CanMove Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direction</td>
<td>Specify one of the following ISWiDirection values to check whether it is possible to move the filter in this direction within the list of filter criteria:</td>
</tr>
<tr>
<td></td>
<td>• edUp (0)—Verify whether it is possible to move the filter higher in the list of filter criteria.</td>
</tr>
<tr>
<td></td>
<td>• edDown (1)—Verify whether it is possible to move the filter lower in the list of filter criteria.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiSuiteDFLFilter

**MoveDown Method (Advanced UI and Suite/Advanced UI)**

**Project • This information applies to the following project types:**

- Advanced UI
- Suite/Advanced UI

**Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.**

The MoveDown method moves a filter down below the filter that follows it.

**Syntax**

MoveDown ()
Applies To

- ISWiSuiteDFLFilter

MoveUp Method (Advanced UI and Suite/Advanced UI)

Project  
This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition  
The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The MoveUp method moves a filter up above the filter that precedes it.

Syntax

MoveUp ()

Applies To

- ISWiSuiteDFLFilter

ISWiSuiteDynamicFileLink Object (Advanced UI and Suite/Advanced UI)

Project  
This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition  
The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSuiteDynamicFileLink object represents a dynamic link for the additional files that a package in an Advanced UI or Suite/Advanced UI project requires.

To add or remove dynamic links, call AddDynamicFileLink or DeleteDynamicFileLink.
Members

**Table 47 • ISWiSuiteDynamicFileLink Object Members**

<table>

<tr>
<td>ISWiSuiteDFLFilters</td>
<td>Collection</td>
<td>Contains all of the filters that are associated with a dynamic link for the additional files that a package requires.</td>
</tr>
<tr>
<td>Source</td>
<td>Read-Write String Property</td>
<td>Gets or sets the path to the source folder that contains the package that you want to include in your Advanced UI or Suite/Advanced UI project. It also is the source of dynamically included files for the package. Instead of hard-coding a location, you can use a path variable that is defined in the Path Variables view. At build time, InstallShield replaces the path variable with the appropriate value.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiSuiteFolder

**AddFilter Method (Advanced UI and Suite/Advanced UI)**

*Project* • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

*Edition* • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see [Advanced UI Projects vs. Suite/Advanced UI Projects](#).

The AddFilter method adds a filter to a dynamic link for the additional files that a package requires.

**Syntax**

AddFilter (FilterType As ISWiSuiteDFLFilterType) As ISWiSuiteDFLFilter
Parameters

Table 48 • AddFilter Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>

</tr>
</thead>
<tbody>
<tr>
<td>FilterType</td>
<td>Specify the type of filter that you want to add to a dynamic link. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• esdfIncFolder (301)—Include folders that match the specified filter.</td>
</tr>
<tr>
<td></td>
<td>• esdfExcFolder (302)—Exclude folders that match the specified filter.</td>
</tr>
<tr>
<td></td>
<td>• esdfIncFile (303)—Include files that match the specified filter.</td>
</tr>
<tr>
<td></td>
<td>• esdfExcFile (304)—Exclude files that match the specified filter.</td>
</tr>
</tbody>
</table>

Applies To

• ISWiSuiteDynamicFileLink

DeleteFilter Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:

• Advanced UI
• Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteFilter method removes a filter from a dynamic link for the additional files that a package requires.

Syntax

DeleteFilter (Filter As ISWiSuiteDFLFilter)

Parameters

Table 49 • DeleteFilter Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter</td>
<td>Specify the ISWiSuiteDFLFilter object that you want to remove.</td>
</tr>
</tbody>
</table>

Applies To

• ISWiSuiteDynamicFileLink
ISWiSuiteEvent Object (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to Suite/Advanced UI projects.

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSuiteEvent object represents a Suite/Advanced UI run-time event. Actions that are scheduled for a given event are executed at run time under certain conditions.

**Members**

**Table 50 • ISWiSuiteEvent Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AddSuiteActionRef</td>
<td>Method</td>
<td>Schedules a Suite/Advanced UI action during a run-time event.</td>

<td>Method</td>
<td>Removes an action from a run-time event.</td>
</tr>
<tr>
<td>ISWiSuiteActionRefs</td>
<td>Collection</td>
<td>Contains all of the Suite/Advanced UI actions that are scheduled for a specific event in a package.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiProject

**AddSuiteActionRef Method (Advanced UI and Suite/Advanced UI)**

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI
**Edition** - The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddSuiteActionRef method schedules a Suite/Advanced UI action during a run-time event. You can schedule an action to run multiple times during an event if necessary.

**Syntax**

AddSuiteActionRef (Action As ISWiSuiteAction)

**Parameters**

**Table 51 • AddSuiteActionRef Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Specify the action to schedule in this event.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiSuiteEvent

---

**DeleteSuiteActionRef Method (Advanced UI and Suite/Advanced UI)**

**Edition** - The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteSuiteActionRef method removes a Suite/Advanced UI action from a run-time event.

**Syntax**

DeleteSuiteActionRef (ActionRef As ISWiSuiteActionRef)
Parameters

Table 52 • DeleteSuiteActionRef Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActionRef</td>
<td>Specify the action as an ISWiSuiteActionRef object that you want to delete from an event.</td>
</tr>
</tbody>
</table>

Applies To

- ISWiSuiteEvent

ISWiSuiteExitCondition Object (Advanced UI and Suite/Advanced UI)

Project • This information applies to Suite/Advanced UI projects.

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSuiteExitCondition object represents an exit condition in the Suite/Advanced UI project.

To add or remove exit conditions, call ISWiProject.AddExitCondition or ISWiProject.DeleteExitCondition.

Members

Table 53 • ISWiSuiteExitCondition Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message</td>
<td>Read-Write String Property</td>
<td>Gets or sets the error message that you want the Advanced UI or Suite/Advanced UI installation to display at run time if the conditions that are defined for this message are true.</td>
</tr>
</tbody>
</table>
| Condition  | Read-only Object Property | This property accesses the ISWiSuiteCondition object. Gets the root-level condition group (Any, All, or Not) that the Advanced UI or Suite/Advanced UI installation evaluates at run time for the exit condition.

Exit conditions always have a condition, so there is no need to add a condition.

Applies To

- ISWiProject
ISWiSuiteFeature Object (Advanced UI and Suite/Advanced UI)

**Project**  •  This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

**Edition**  •  The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiSuiteFeature object represents a root-level feature or a subfeature in an Advanced UI or Suite/Advanced UI project. You can retrieve a feature by specifying an item in the ISWiSuiteFeatures collection.
## Members

### Table 54 • ISSiSuiteFeature Object Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AddCondition</td>
<td>Method</td>
<td>Adds a condition to a feature without a condition.</td>
</tr>
<tr>
<td>AddSuiteSubFeature</td>
<td>Method</td>
<td>Adds a subfeature to an existing feature.</td>
</tr>
<tr>
<td>AllowSelectionChange</td>
<td>Read-Write Boolean Property</td>
<td>Gets or sets the value of the Allow UI Selection Change setting for the feature. This setting indicates whether end users should be allowed to select or deselect the feature on the InstallationFeatures wizard page.</td>
</tr>
<tr>
<td>AttachPackage</td>
<td>Method</td>
<td>Associates a package in the project with a feature.</td>
</tr>
<tr>
<td>Condition</td>
<td>Read-only Object Property</td>
<td>This property accesses the ISSiSuiteCondition object. Gets the feature’s condition, if one is associated with the feature.</td>
</tr>
<tr>
<td>Cost</td>
<td>Read-Write Property</td>
<td>Gets or sets how much space (in bytes) that the feature requires on the target system.</td>
</tr>
<tr>
<td>DeleteCondition</td>
<td>Method</td>
<td>Removes a condition from a feature.</td>
</tr>
<tr>
<td>DeleteSubSuiteFeature</td>
<td>Method</td>
<td>Removes a subfeature from a feature.</td>
</tr>
<tr>
<td>Description</td>
<td>Read-Write String Property</td>
<td>Gets or sets the description for this feature.</td>
</tr>
<tr>
<td>DisplayName</td>
<td>Read-Write String Property</td>
<td>Gets or sets the name of the feature.</td>
</tr>
</tbody>
</table>
The following VBScript lines display information about a feature. Since feature can include subfeatures, the script is implemented recursively.

```vbscript
Sub WriteFeature(indent, f)
    out.WriteLine indent & f.DisplayName & " (" & f.Name & ")"
    out.WriteLine indent & "  Release Flags:" & f.ReleaseFlags
    If f.Visible Then out.WriteLine indent & "  Visible"
    FollowParentState
    Read-Write
    Boolean Property
    This property is available for subfeatures; it is not available for root-level features.
    Gets or sets the value of the Follow Parent State setting for the subfeature. This setting indicates whether you want the subfeature's state to be determined by its parent feature. Available values are:
    - **True**—The selected subfeature will be installed whenever its parent feature is installed.
    - **False**—If the selected subfeature's parent feature is installed, the selected subfeature can be either installed or not installed. This is the default option. Note that if the selected subfeature's parent feature is not installed, the selected subfeature cannot be installed.
    This setting is especially useful if you want the subfeature to be hidden on the InstallationFeatures wizard page, but its parent feature is not hidden.
    ISWiSuiteFeatures
    ISWiSuitePackages
    Name
    Read-Write
    String Property
    Gets or sets the name of the feature in the collection.
    ReleaseFlags
    Read-Write
    String Property
    Gets or sets the release flags that are associated with this feature. Separate multiple flags with a comma.
    You can specify which release flags you want to use to filter the project’s features in the ReleaseFlags property of ISWiRelease.
    RemovePackage
    Method
    Removes a package from a feature.
    Visible
    Read-Write
    Boolean Property
    Gets or sets the feature's Visible setting, which specifies whether the feature will be visible on the InstallationFeatures wizard page during installation.
```

**Example**

The following VBScript lines display information about a feature. Since feature can include subfeatures, the script is implemented recursively.

```vbscript
Sub WriteFeature(indent, f)
    out.WriteLine indent & f.DisplayName & " (" & f.Name & ")"
    out.WriteLine indent & "  Release Flags:" & f.ReleaseFlags
    If f.Visible Then out.WriteLine indent & "  Visible"
```
AddCondition Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:

• Advanced UI
• Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddCondition method adds a condition to a feature without a condition.

Syntax

AddCondition () As ISWiSuiteCondition

Parameters

The AddCondition method does not take any parameters.

Applies To

• ISWiSuiteFeature
AddSuiteSubFeature Method (Advanced UI and Suite/Advanced UI)

**Project** - This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

**Edition** - The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddSuiteSubFeature method adds a subfeature to an existing feature in the project.

**Syntax**

AddSuiteSubFeature (InternalName As String) As ISWiSuiteFeature

**Parameters**

Table 55 • AddSuiteSubFeature Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InternalName</td>
<td>Specify the internal name (which is displayed in the Features pane of the Feature view) of the subfeature that you want to add to the existing feature.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiSuiteFeature

AttachPackage Method (Advanced UI and Suite/Advanced UI)

**Project** - This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

**Edition** - The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AttachPackage method associates a package with a feature in the project.

**Syntax**

AttachPackage (Package As ISWiSuitePackage)
DeleteCondition Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteCondition method removes a condition from a feature.

**Syntax**

DeleteCondition ()

**Parameters**

The DeleteCondition method does not take any parameters.

**Applies To**

- ISWiSuiteFeature

DeleteSuiteSubFeature Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI
The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteSuiteSubFeature method removes a subfeature from a feature in the project.

**Syntax**

DeleteSuiteSubFeature (SubFeature As ISWiSuiteFeature)

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SubFeature</td>
<td>Specify the ISWiSuiteFeature object that you want to remove from the feature.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiSuiteFeature

RemovePackage Method (Advanced UI and Suite/Advanced UI)

**Project**

This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition**

The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The RemovePackage method removes a package from a feature in the project.

**Syntax**

RemovePackage (Package As ISWiSuitePackage)
### Parameters

**Table 58 • RemovePackage Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package</td>
<td>Specify the ISWiSuitePackage object that you want to remove from the feature.</td>
</tr>
</tbody>
</table>

### Applies To

- ISWiSuiteFeature

---

**ISWiSuiteFile Object (Advanced UI and Suite/Advanced UI)**

**Project** • *This information applies to the following project types:*

- Advanced UI
- Suite/Advanced UI

**Edition** • *The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

The ISWiSuiteFile object represents a file in a package of an Advanced UI or Suite/Advanced UI project. You can change the file or its source path. The file’s other properties are read-only.
Members

Table 59 • ISWiSuiteFile Object Members

<table>
<thead>

<td>.msi, .msp, .exe, InstallScript, Basic MSI project, InstallScript project</td>
<td>If applicable, gets or sets the command line that should be used to launch the target file whenever the Advanced UI or Suite/Advanced UI installation is running with a user interface. Do not include the name of the file in this property. The value of this property can include one or more formatted expressions that contain property names, environment variable references, and other special strings; at run time, the installation expands the values of these expressions. To learn about the syntax that is available for these expressions, see Using Formatted Expressions that Advanced UI and Suite/Advanced UI Installations Resolve at Run Time. For more information, including valid types of entries for this property, see Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation.</td>
</tr>
<tr>
<td>Enable</td>
<td>Read-Write</td>
<td>Support varies</td>
<td>Gets or sets a value to indicate whether an operation for a package is enabled.</td>
</tr>
</tbody>
</table>
ExitBehavior

The ExitBehavior property indicates the behavior that should occur if one or more of the detection conditions still indicate that the package needs to be launched. Available options are:

- **epseDetectPrompt (0)** — Ask whether to continue the setup.
  The Advanced UI or Suite/Advanced UI installation displays a message box that prompts the end user to specify whether the Advanced UI or Suite/Advanced UI installation should continue.

- **epseDetectAbort (1)** — Abort the setup.
  The Advanced UI or Suite/Advanced UI installation ends without proceeding further.

- **epseDetectIgnore (2)** — Continue the setup.
  The Advanced UI or Suite/Advanced UI installation essentially ignores the executable file’s unmet condition and proceeds to the next package in the installation (if one is required).

ForceApplicationShut down

If the selected sideloading app package (or any package that depends on this package) is in use at installation run time, you can require that the processes that are associated with the package are forced to shut down so that registration can proceed. Use this property to indicate whether you want to force application shutdown in that scenario.
### RebootCode

**Name**: RebootCode  
**Type**: Read-Write  
**String Property**: RebootCode.exe  
**Description**: If the selected package requires that the target system be restarted after the product is installed, this property gets or sets one or more return codes. If multiple return codes exist, each one separated by a comma.

For more information on Advanced UI or Suite/Advanced UI packages that require a restart, see Restarting a Target System for an Advanced UI or Suite/Advanced UI Package.

### RebootRequest

**Name**: RebootRequest  
**Type**: Read-Write  
**String Property**: RebootRequest.msi, RebootRequest.msp, RebootRequest.exe, RebootRequest.InstallScript, RebootRequest.Basic MSI project, RebootRequest.InstallScript project  
**Description**: The installation of an Advanced UI or Suite/Advanced UI package may require that the target system be restarted, as described in Restarting a Target System for an Advanced UI or Suite/Advanced UI Package.

The RebootRequest property indicates the behavior that should occur if the package requires that a target system be restarted. Available options are:

- **epsrDetectExit (1)**—Allow the machine to reboot.
- **epsrDetectReboot (2)**—Prompt, then exit or reboot the machine.
- **epsrDetectIgnore (4)**—Ignore the reboot request.
- **epsrAlwaysRebootPrompt (8)**—Always prompt, then exit or reboot the machine.
- **epsrAlwaysRebootSilent (16)**—Always reboot the machine.
- **epsrDetectDelay (32)**—Delay the prompt, then exit or reboot the machine.

</tbody>
</table>
The ISWiSuitePackage object represents a package or a Windows Installer transaction that is included in an Advanced UI or Suite/Advanced UI project.

To add or remove packages and transactions, call ISWiProject.AddSuitePackage or ISWiProject.DeleteSuitePackage.

**Important** • Note that some ISWiSuitePackage items are not applicable to all types of Advanced UI or Suite/Advanced UI package files. Use the PackageType property to determine the package type. If one of the other ISWiSuitePackage properties returns an empty value, that property is not applicable to that package type.

Also note that the Advanced UI project type, which is available in the InstallShield, does not have support for most of the types of package files; the only ones that it does support are .msi, msp, and InstallScript packages.

### CerFile

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CerFile</td>
<td>Read-Write String Property</td>
<td>Gets or sets the .cer file that you are using in your sideloading package.</td>
</tr>
</tbody>
</table>

**Project** • *This is available in Suite/Advanced UI projects.*

**Edition** • *The Suite/Advanced UI project type is available in the Premier edition of InstallShield.*

The versions of Windows that support Windows App packages do not install a sideloading Windows App package unless they trust the source of the package. If you are using a custom certificate, such as the one that is generated in Visual Studio, the Suite/Advanced UI installation can make Windows trust the source of your package by adding the custom certificate to the certificate store of target systems.

### LoggingCmdLine

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Type of Package File</th>
<th>Description</th>
</tr>
</thead>
</table>
| LoggingCmdLine| Read-Write String Property | .exe, .msi, .msp, .exe, InstallScript, InstallScript project | This property is available if the value of the LoggingEnable property is True. Gets or sets the value of the Logging Command Line setting in the Packages view. This setting indicates the command line that the Advanced UI or Suite/Advanced UI installation should pass to the .exe package to enable the logging. Include any appropriate supported flags. If the .exe package that you are configuring supports it, include a path that references the Advanced UI or Suite/Advanced UI property ISLogDir, enclosed within square brackets, in place of the path to the directory where the log file should be created. For example, to generate a log file that logs everything verbosely for an .msi package that is run by a Setup.exe file that InstallShield built, enter the following command line: 

```bash
/v"/l*v "[ISLogDir]FileName.log"
```

The Advanced UI or Suite/Advanced UI installation replaces [ISLogDir] with the path to the folder that will contain the log file. The Advanced UI or Suite/Advanced UI /log command-line parameter lets end users specify the path to the directory for the package log files. For more information, see Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation. |

### LoggingEnable

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Type of Package File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LoggingEnable</td>
<td>Read-Write Boolean Property</td>
<td>.msi, .msp, .exe, InstallScript, Basic MSI project, InstallScript project</td>
<td>Gets or sets the Enable Logging Support setting in the Packages view. This setting indicates whether you want the package to generate a log file if the Advanced UI or Suite/Advanced UI installation is launched from the command line with the /log command-line parameter. Note that if a package does not have support for logging, it is recommended that you do not enable logging support for that package. If you select Yes, configure the other logging-related properties as needed. For more information, see Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation.</td>
</tr>
</tbody>
</table>

</table>
This property accesses the ISWiSuiteOperation object.

Gets the operation of the specified type. Available options are:

- **esotInstall (1)**—The package is launched as a first-time installation.
  
  This operation is available for the following types of package files: .msi, .msp, .exe, .appx, InstallScript, Basic MSI project, and InstallScript project.

- **esotRemove (2)**—The product that the package installed is removed.
  
  This operation is available for the following types of package files: .msi, .exe, .appx, InstallScript, Basic MSI project, and InstallScript project.

- **esotRepair (3)**—The product that the package installed is repaired.
  
  This operation is available for the following types of package files: .msi, .exe, InstallScript, Basic MSI project, and InstallScript project.

- **esotModify (4)**—The package is launched in maintenance mode to enable end users to install, remove, or modify the product.
  
  This operation is available for the following types of package files: .msi, .msp, .exe, InstallScript, Basic MSI project, and InstallScript project.
This property accesses the ISWiPackageLoc object. Gets or sets where the package is configured to be located. Available options are:

- **epiSourceMedia (0)**—Copy from source media. That is, store the package and its files on the source media. If the Advanced UI or Suite/Advanced UI installation will be run uncompressed from fixed media—such as CD, DVD, or local network—use this option.

- **epiSetupExe (1)**—Extract from Setup.exe. That is, compress the package and its files into Setup.exe, to be extracted at run time, if necessary. If the entire Advanced UI or Suite/Advanced UI installation must be self-contained in Setup.exe, use this option. Note that the Web option results in smaller installations and shorter download time; however, the Setup.exe option provides for a completely self-contained installation.

- **epiWeb (2)**—Download from the Web. That is, download the package and its files (if necessary) from the URL that is specified for the package. This option is recommended if your installation will be downloaded from the Internet and you want to minimize the Advanced UI or Suite/Advanced UI package size and download time. An Advanced UI or Suite/Advanced UI package is not downloaded if the correct version is already present on the target system.

Note that you can override this property for all packages when you are configuring a release.

| ParcelType    | Read-Write String Property | .msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project | Project: In Suite/Advanced UI projects, this property is available for edit. In Advanced UI projects, this property is read-only, since an Advanced UI project has support for only one primary package. Gets the type of package that identifies whether the presence of this package on the target system should influence whether the Suite/Advanced UI installation runs in first-time-installation mode or maintenance mode. Available options for this setting are:

- **espltPrimary (0)**—The selected package is a main part of the Advanced UI or Suite/Advanced UI installation. At run time, if all of the primary packages in the installation are absent from the target system, the installation runs as a first-time installation. If any of the primary packages are present on the target system, the installation runs in maintenance mode.

- **espltDependency (1)**—The selected package should not be a factor in determining which mode is used to run the Advanced UI or Suite/Advanced UI installation.

For more information, see Primary Packages vs. Dependency Packages in Advanced UI and Suite/Advanced UI Projects.
### ProgressCapture

Read-Write String Property

**Type of Package File**
- `.msi`
- `.msp`

**Description**
Gets or sets the value of the Status Messages Reporting setting in the Packages view. This setting indicates what sort of status messages are available for displaying in the user interface of the Advanced UI or Suite/Advanced UI installation. Available options are:

- **epsptCaptureFull (3)**—Action text. The Advanced UI or Suite/Advanced UI installation’s status messages include the action text from the standard actions and custom actions in the package.

- **epsptCaptureFullVerbose (4)**—Action text and action data. The Advanced UI or Suite/Advanced UI installation’s status messages include the action text as well as action data from the standard actions and custom actions in the package.

At run time, the Advanced UI or Suite/Advanced UI installation updates the `ISParcelStatus` property with the action text and, if applicable, the action data in the `ISParcelStatus` property, which is displayed on the InstallationProgress wizard page of the Advanced UI or Suite/Advanced UI installation by default.

For example, when the InstallFiles action in an `.msi` package is executing, the `ISParcelStatus` property is updated with the action text “Copying new files” to inform end users about the current progress of the installation. If you choose to include action data in the status messages, the `ISParcelStatus` property may also be updated with action data such as the name, directory, and size of each file as it is being installed on the target system.

### ReleaseFlags

Read-Write String Property

**Type of Package File**
- `.msi`
- `.msp`
- `.exe`
- `.appx`
- `InstallScript`
- `Web Deploy`
- `Basic MSI project`
- `InstallScript project`

**Description**
Gets or sets the release flags that are assigned to the package. Separate multiple flags with a comma.

You can use release flags to selectively include and exclude this package from different builds of your Advanced UI or Suite/Advanced UI installation.
### Table 68 • ISWiSuitePackage Object Members (cont.)

<tr>
<th>Name</th>
<th>Type</th>
<th>Type of Package File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RootFolder</strong></td>
<td>Read-only Object Property</td>
<td>.msi, .msp, .exe, .appx, InstallScript, Web Deploy, Basic MSI project, InstallScript project</td>
<td>This property accesses the ISWiSuiteFolder object. Gets the root folder that contains the package and its folders and files.</td>
</tr>
<tr>
<td><strong>SharedPackage</strong></td>
<td>Read-Write Boolean Property</td>
<td>.msi, .msp, .exe, .appx, InstallScript, Basic MSI project, InstallScript project</td>
<td>Gets or sets the value for the Shared setting in the Packages view. This setting indicates whether the package is shared with other products and should be removed only if no other products that are left behind are using this package.</td>
</tr>
</tbody>
</table>
Table 68 • ISWiSuitePackage Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Type of Package File</th>
<th>Description</th>
</tr>
</thead>
</table>
| UpgradeType   | Read-Write String Property | .msi, Basic MSI Project | Gets or sets the value of the Minor Upgrade Handling setting in the Packages view. This setting indicates the behavior that should occur when an earlier version of the package is present on the target system. Available options are:  
  - **epsutNone (0)**—None. The Advanced UI or Suite/Advanced UI installation launches the package without running it in minor upgrade mode. That is, the Advanced UI or Suite/Advanced UI installation does not set the REINSTALL or REINSTALLMODE properties for the package.  
  - **epsutAuto (1)**—Automatic. The Advanced UI or Suite/Advanced UI installation launches the package in upgrade mode by setting the REINSTALL property to ALL and the REINSTALLMODE property to vomus. It does not inform the end user that the product will be upgraded.  
  - **epsutPrompt (2)**—Ask the user. The Advanced UI or Suite/Advanced UI installation displays a secondary window that asks the end user whether they want to continue. If the end user chooses to continue, the Advanced UI or Suite/Advanced UI installation launches the package in upgrade mode. If the end user chooses to not continue, the package does not run. |
Example

The following VBScript lines demonstrate how to display information about a package in a project. Windows Installer transactions can contain multiple packages, so the script is implemented recursively.

```vbnet
Sub WritePackage(indent, p)
    If p.PackageType = -1 Then ' Transaction
        out.WriteLine indent & "Transaction:"
        For Each sp In p.ISWiSuitePackages
            WritePackage indent & "  ", sp
        Next
    Else
        out.WriteLine indent & IDS(p.DisplayName) & " (" & p.Name & ")"
        out.WriteLine indent & "Type: " & p.PackageType
        out.WriteLine indent & "Description: " & p.Description
        out.WriteLine indent & "Shared: " & p.SharedPackage
        out.WriteLine indent & "Release Flags: " & p.ReleaseFlags
    End If
End Sub
```

<td></td>
</tr>
<tr>
<td></td>
<td>Property</td>
<td>InstallScript, Web Deploy, Basic MSI project, InstallScript project</td>
<td></td>
</tr>
</tbody>
</table>

Edition • The Suite/Advanced UI project type is available in the Premier edition of InstallShield.

Gets or sets a semicolon-delimited list of one or more Windows roles and features that the selected package requires be enabled on target systems that have Windows Vista or later or Windows Server 2008 or later.

The names of the roles and features should be the string that tools such as Deployment Image Servicing and Management (DISM.exe) and Package Manager (Pkgmgr.exe) use to identify the role or feature on a particular version of Windows. For a list of available Windows roles and features on each version of Windows for which you are supporting, see Microsoft TechNet.

At run time, if this package is eligible to be installed and it requires one or more Windows roles and features that are disabled, the Suite/Advanced UI installation enables them before launching the package.

For more information, see Enabling Windows Roles and Features During a Suite/Advanced UI Installation.
out.WriteLine indent & "Files:
WriteFolder indent & "  ", p.RootFolder
out.WriteLine indent & "Detection Condition:
WriteCondition indent & "  ", p.DetectCondition
out.WriteLine indent & "Eligibility Condition:
WriteCondition indent & "  ", p.EligibleCondition
End If
End Sub

Applies To

• ISWiProject

AddDetectCondition Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:

• Advanced UI
• Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddDetectCondition method adds a detection condition to a package in an Advanced UI or Suite/Advanced UI project.

The detection condition is a condition that the Advanced UI or Suite/Advanced UI installation should use to evaluate whether the package is already installed on target systems. If this does not change from false to true (or from true to false) at run time, the Advanced UI or Suite/Advanced UI installation assumes that the package failed to install (or remove) its payload. In addition, subsequent maintenance and remove operations (or subsequent maintaince and install operations) may not behave as expected.

Syntax

AddDetectCondition () As ISWiSuiteCondition

Parameters

The AddDetectCondition method does not take any parameters.

Applies To

• ISWiSuitePackage
AddEligibleCondition Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to the following project types:
- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddEligibleConditionPackage method adds an eligibility condition to a package in an Advanced UI or Suite/Advanced UI project.

The eligibility condition is a condition that the Advanced UI or Suite/Advanced UI installation should use to determine whether the target system meets the requirements that are necessary for the package to be run. For example, if the package should be run only on 64-bit systems, you could set up an x64 platform requirement in a condition; the Advanced UI or Suite/Advanced UI installation would launch the package only on 64-bit systems. You may also want to set up an eligibility condition to prevent end users from being able to install the current package version over a future newer version.

**Syntax**

```plaintext```
AddEligibleCondition () As ISWiSuiteCondition
```

**Parameters**

The AddEligibleConditionPackage method does not take any parameters.

**Applies To**
- ISWiSuitePackage

AddSuitePackage Method (Advanced UI and Suite/Advanced UI)

**Project** • This information applies to Suite/Advanced UI projects.

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The AddSuitePackage method adds a package (an .msi package or an .msp patch) to a Windows Installer transaction in the project. It also adds the specified target file and options for adding additional files. Using this method is similar to adding a package to a transaction in the Packages view in InstallShield. You can set the properties of the new package with the ISWiSuitePackage object.
To add other types of packages to the project, see AddSuitePackage Method (Advanced UI and Suite/Advanced UI).

**Syntax**

AddSuitePackage (PackageType As ISWiSuitePackageType, TargetFileName As String, AdditionalFiles As ISWiAdditionalFiles) As ISWiSuitePackage

**Parameters**

**Table 69 • AddSuitePackage Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageType</td>
<td>Specify the type of package that you are adding to the transaction. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• esptMsi (1)—Windows Installer package (.msi)</td>
</tr>
<tr>
<td></td>
<td>• esptMsp (2)—Windows Installer patch (.msp)</td>
</tr>
<tr>
<td>TargetFileName</td>
<td>Specify the file in the package (such as the .msi file) that the Advanced UI or Suite/Advanced UI installation should invoke.</td>
</tr>
<tr>
<td>AdditionalFiles</td>
<td>Specify the type of additional files that you want to add for the package. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• eaftNothing (0)—Add nothing. This package does not need any additional files.</td>
</tr>
<tr>
<td></td>
<td>• eaftAdjacentFiles (1)—Add adjacent files; that is, add the files next to this package.</td>
</tr>
<tr>
<td></td>
<td>• eaftSubFolders (2)—Add files in subfolders; that is, add the files below this package.</td>
</tr>
<tr>
<td></td>
<td>• eaftAdjacentFilesAndSubFolders (3)—Add adjacent files and files in subfolders; that is, add the files next to and below this package.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiSuitePackage

**DeleteCondition Method (Advanced UI and Suite/Advanced UI)**

*Project* • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI
The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The DeleteCondition method removes a detection or eligibility condition from a package in an Advanced UI or Suite/Advanced UI project.

**Syntax**

DeleteCondition (pCondition As ISWiSuiteCondition)

**Parameters**

**Table 70 • DeleteCondition Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pCondition</td>
<td>Specify the ISWiSuiteCondition object for the condition that you want to remove. The ISWiSuiteCondition object that you specify should be the condition object that is returned from the package’s EligibleCondition property or its DetectionCondition property.</td>
</tr>
</tbody>
</table>

**Applies To**

- ISWiSuitePackage

---

**MoveDown Method (Advanced UI and Suite/Advanced UI)**

*Project • This information applies to the following project types:*

- Advanced UI
- Suite/Advanced UI

*Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.*

If your project has more than one package or transaction, the Packages view lists them in the same order in which the Advanced UI or Suite/Advanced UI installation launches them at run time. The MoveDown method moves a package or transaction down in the ordered list, below the item that follows it.

**Syntax**

MoveDown ()
Parameters
The MoveDown method does not take any parameters.

Applies To
• ISWiSuitePackage

MoveUp Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:
• Advanced UI
• Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

If your project has more than one package or transaction, the Packages view lists them in the same order in which the Advanced UI or Suite/Advanced UI installation launches them at run time. The MoveUp method moves a package or transaction up in the ordered list, above the item that precedes it.

Syntax
MoveUp ()

Parameters
The MoveUp method does not take any parameters.

Applies To
• ISWiSuitePackage

ISWiSuiteRelease Object (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:
• Advanced UI
• Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.
Note that some edition- and project-specific differences are noted where applicable.

The ISWiSuiteRelease object represents a release in the Releases view of InstallShield.

To add or remove releases, call ISWiProject.AddSuiteRelease or ISWiProject.DeleteSuiteRelease.
## Members

**Table 71 • ISWiSuiteRelease Object Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Build</strong></td>
<td>Method</td>
<td>Build a release. Note that to get any feedback about the build process, you must subscribe to events on the release. To learn more, see Using Build Status Events.</td>
</tr>
<tr>
<td><strong>BuildLocation</strong></td>
<td>Read-Write String Property</td>
<td>Gets or sets the top-level directory where the release will be built.</td>
</tr>
</tbody>
</table>
| **CachePackagesLocally** | Read-Write Boolean Property | Gets or sets the Cache Packages Locally setting on the Setup.exe tab in the Releases view. This setting lets you specify whether you want to cache the Advanced UI or Suite/Advanced UI packages that are run on a target system in the location that is defined for each package in the Packages view. The default value is True.

If you are building an uncompressed release, you may want to specify No for the value of this setting.

| **CertPassword**   | Write-only String Property | Sets the password for the .pfx file if the file has a password. InstallShield encrypts the password and stores it in your project file (.ism). At build time, InstallShield uses the password to sign files with a .pfx file. If your certificate is protected by a password but you do not enter it in this setting, signing with a .pfx file fails. |

*Note* • This property is not applicable if the certificate that you are using for signing is in a certificate store. Note that if the certificate was imported into the store with password protection, you will be prompted to enter the password at build time.

| **DefaultLanguage** | Read-Write String Property | Gets or sets the language identifier for the default language of a given release. This property value overrides the default project language that is configured in the General Information view or the String Editor view. For more information, see Setting the Default Project Language. |
DigitalCertificateInfo

- **Type**: Read-Write String Property
- **Description**: Gets or sets the digital certificate that you want to use to sign your release.
  
  To specify a .pfx certificate on your machine, specify the path and file name.
  
  To reference a certificate store that contains the certificate, use a string in the following format:
  
  
  *Store*StoreLocation:Cer Subject

  *Store* refers to the name of the certificate store that contains the certificate: Available options are:
  
  - My
  - Root
  - Trust
  - CA

  *StoreLocation* refers to the location of the certificate store that contains the certificate. Available options are:
  
  - User
  - Machine

  *Cert Subject* refers to the subject of the certificate.

DigitalURL

- **Type**: Read-Write String Property
- **Description**: Gets or sets the URL that is used in your digital certificate to link to a location that you would like end users to visit to learn more about your product, organization, or company. Use a fully qualified URL—for example, http://www.mydomain.com.

EnableLangSelectionDialog

- **Type**: Read-Write Boolean Property
- **Description**: Gets or sets the Languages Dialog setting on the Build tab in the Releases view. This setting lets you specify whether you want your installation to display the language selection wizard page when the installation is run with a full user interface.
LauncherPrivileges

Gets or sets the Required Execution Level setting on the Setup.exe tab in the Releases view. This setting is where you specify the minimum level that is required by your project’s Setup.exe file for running on Windows Vista and later platforms. The available options are:

- `ereLAsAdmin (2)`—Setup.exe requires administrative privileges to run. Administrators must authorize it; non-administrators must authenticate as an administrator.
- `ereLAsHighestAvail (1)`—Setup.exe prefers administrative privileges. Administrators must authorize it; non-administrators run it without administrative privileges.
- `ereLAsInvoker (0)`—Setup.exe does not require administrative privileges, and all users can run it without administrative privileges. Setup.exe does not display any UAC messages prompting for credentials or for consent. This is the default option for Advanced UI and Suite/Advanced UI projects.

InstallShield embeds an application manifest in the Setup.exe launcher. This manifest specifies the selected execution level. Operating systems earlier than Windows Vista ignore the required execution level.

PackageLocation

Gets or sets the run-time location for the packages that are configured in the Packages view of the project. Available options are:

- `eplSourceMedia (0)`—Copy from source media.
- `eplSetupExe (1)`—Extract from Setup.exe.
- `eplWeb (2)`—Download from the Web.
- `eplIndividual (3)`—Follow individual selections.

To learn more, see Specifying the Run-Time Location for Advanced UI or Suite/Advanced UI Packages at the Release Level.
### Password

**Type:** Read-Write String Property

- Gets or sets the password for your installation. Passwords are case-sensitive.
- This property is used only if you set the value of the PasswordProtect property to True.
- To learn more, see [Password-Protecting an Advanced UI or Suite/Advanced UI Installation](#).

### PasswordProtect

**Type:** Read-Write Boolean Property

- Gets or sets the Password Protect Launcher setting on the Setup.exe tab in the Releases view. This setting lets you indicate whether you want to password-protect your installation.
- To learn more, see [Password-Protecting an Advanced UI or Suite/Advanced UI Installation](#).

### PathVariableOverrides

**Type:** Read-Write String Property

- Gets or sets the value of a path variable in your project for the specified release. If this property is used to set the value of a path variable, it overrides any value that is set in the Path Variables view.
- Note that you can use this variable to get or override user-defined path variables, environment variables, and registry variables that are configured in the Path Variables view; however, you cannot override predefined path variables such as `<WindowsFolder>`.
- Following is sample Visual Basic code that overrides the value of a path variable called PathVar1:

```vbnet
pISWiSuiteReleasePathVariableOverrides = "PathVar1=C:\Test1" + vbCrLf + "PathVar2=C:\Test2"
```
PostBuildEvent

String Property

Edition • This property is available in the Premier edition of InstallShield.

Gets or sets the command that is run after InstallShield has built and signed the release.

To specify more than one command, enter each command on a separate line in the string. At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.

When you are entering a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see Specifying Commands that Run Before, During, and After Builds.

PreBuildEvent

String Property

Edition • This property is available in the Premier edition of InstallShield.

 Gets or sets the command that is run before InstallShield starts building the release. This event runs after InstallShield creates the release folder and log file, but before InstallShield starts building the release.

To specify more than one command, enter each command on a separate line in the string. At build time, InstallShield runs each command in the order that they are listed. The build waits until a command finishes before proceeding to the next one.

When you are entering a command, you can use any path variables and environment variables that are defined in your project, instead of using a hard-coded path. You can also use certain variables that are defined specifically for build event commands. To learn more, see Specifying Commands that Run Before, During, and After Builds.
PreProcessorDefines

This information applies to Suite/Advanced UI projects.

Gets or sets the preprocessor variable definitions. Preprocessor variable definitions that are specified here apply only to the current release; they are not used when compiling the script for other releases. Use the following format, with no spaces before or after equals signs or commas:

MYVARIABLE1=123,MYVARIABLE2

Such variables can be tested in the script by #if and #ifdef statements that control the flow of the script.

Entering the name of a preprocessor variable for this setting defines the variable. For example if you enter MYVARIABLE for this setting, the script commands in the following #ifdef loop are executed:

#ifdef MYVARIABLE
   // Commands
#endif

After you add or change a preprocessor variable definition for this setting, you must compile your installation for the addition or change to take effect.

ProductNameOverride

Gets or overrides the product name that was specified in the General Information view with a new value for the selected release. For information on how the product name is used, see Specifying a Product Name.
Table 71 • ISWiSuiteRelease Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ProductVersionOverride</strong></td>
<td>Read-Write String Property</td>
<td>Gets or overrides the product version that was specified in the General Information view with a new value for the selected release. The version must contain only numbers. The version number is typically in the format <code>aaa.bbb.cccccc</code> or <code>aaa.bbb.cccccc.ddddd</code>, where <code>aaa</code> represents the major version number, <code>bbb</code> represents the minor version number, <code>ccccc</code> represents the build number, and <code>ddddd</code> represents the revision number. The maximum value for the <code>aaa</code> and <code>bbb</code> portions is 255. The maximum value for <code>ccccc</code> and <code>ddddd</code> is 65,535. Note that although you can include the fourth field (<code>ddddd</code>), the installation does not use this part of the product version to distinguish between different product versions. To learn more, see Specifying the Product Version. The product version that you specify is displayed on the Properties dialog box for <code>Setup.exe</code>. For more information, see Customizing File Properties for the Setup Launcher.</td>
</tr>
</tbody>
</table>
| **ReleaseFlags**      | Read-Write String Property | Gets or sets a string that contains the release flags that you want to use to filter your features. Separate multiple flags with a comma. Release flags enable you to customize your installation by including or excluding certain items in each release. Once you have assigned release flags to features and packages in the Advanced UI or Suite/Advanced UI project, you can create a release that includes features and packages based on those flags. By default, all features and packages are included in a release. Once you specify a flag for the `ReleaseFlags` property (or for the Release Flags setting on the Build tab in the Releases view), only unflagged items and items that contain the specified release flag are included in your installation.  

*Note* • If a release does not have release flags, it will include all applicable items that have release flags. To include only unflagged items, specify a flag that does not exist. For example, you might use NoFlags. This way, only unflagged items are built into a release.
Table 71 • ISWisSuiteRelease Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SetupExeCompany</td>
<td>Read-Write String Property</td>
<td>Gets or sets the value to override the default company name for Setup.exe. Note that you must also select a value of True for the UseMyVersionInfo property. The company name is displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties. To learn more, see Customizing File Properties for the Setup Launcher.</td>
</tr>
<tr>
<td>SetupExeCopyright</td>
<td>Read-Write String Property</td>
<td>Gets or sets a custom copyright notice for Setup.exe. Note that you must also select a value of True for the UseMyVersionInfo property. The copyright is displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties. To learn more, see Customizing File Properties for the Setup Launcher.</td>
</tr>
<tr>
<td>SetupExeDescription</td>
<td>Read-Write String Property</td>
<td>Gets or sets a custom file description for Setup.exe. Note that you must also select a value of True for the UseMyVersionInfo property. The description is displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties. To learn more, see Customizing File Properties for the Setup Launcher.</td>
</tr>
<tr>
<td>SetupExeVersion</td>
<td>Read-Write String Property</td>
<td>Gets or sets the value to override the default product version and file version for Setup.exe with your own version number. Note that you must also select a value of True for the UseMyVersionInfo property. The product version and file version are displayed on the Properties dialog box for the setup launcher; this Properties dialog box opens when end users right-click the Setup.exe file and then click Properties. Note that the file version always contains four fields. If you specify fewer than four fields for your product version, the remaining fields are filled with zeros. For example, if you specify a product version of 1.1, the file version that is used in the version resources of Setup.exe is 1.1.0.0. To learn more, see Customizing File Properties for the Setup Launcher.</td>
</tr>
</tbody>
</table>
### ISWiSuiteRelease Object Members (cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SetupFileName</strong></td>
<td>Read-Write String Property</td>
<td>Gets or sets the file name—without the .exe file extension—that InstallShield should use for the setup launcher file that it generates at build time. If this setting is blank, InstallShield uses the default value of Setup, and the setup launcher file is called Setup.exe.</td>
</tr>
</tbody>
</table>
| **Build64bitSetupExe** | Read-Write String Property | Gets or sets the value of the 64-Bit Setup Launcher setting for the current suite release. The possible values are:  
  - TRUE - to 64-bit Setup Launcher.  
  - FALSE - to 32-bit Setup Launcher. |
| **SetupIcon**      | Read-Write String Property | Gets or sets the release's Setup.exe Icon File setting, which specifies the fully qualified name of the file from which the executable file's icon is taken at build time. If the property's value is null, a default icon is used.  
  By default, the icon with index 0 is used; to specify a different icon, add a comma (,) as well as the icon's index or resource ID (preceded by a minus sign) after the file name. For example, `C:\Temp\MyLibrary.dll,2` indicates the icon with an index of 2, and `C:\Temp\MyLibrary.dll,-100` indicates the icon with a resource ID of 100.  
  Instead of hard-coding a path, you can use a path variable that is defined in the Path Variables view or part of the ISWiPathVariables collection. At build time, InstallShield replaces the path variable with the appropriate value. |
| **SignatureDescription** | Read-Write String Property | Gets or sets the signature description for the Setup.exe file. The description that you specify is displayed on the User Account Control (UAC) box to the right of the “Program Name:” label. The UAC dialog box opens when an end user launches the signed file and elevated privileges are required.  
  If you leave this setting blank, InstallShield uses the name of the file without its extension as the description to the right of the “Program Name:” label on the UAC dialog box. |
| **SignEnabled**    | Read-Write Boolean Property | Gets or sets the Sign Setup.exe setting on the Signing tab in the Releases view. This setting lets you indicate whether you want to sign the Advanced UI or Suite/Advanced UI installation. |
| **SuiteGuidOverride** | Read-Write String Property | Gets or overrides the GUID that uniquely identifies the Advanced UI or Suite/Advanced UI installation. |

<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| VMStageMachineCopyPath| Read-Write String Property | Project • *This is available in Suite/Advanced UI projects.* Edition • The Suite/Advanced UI project type is available in the Premier edition of InstallShield.*  
The copy path identifies the location on the VM where the release is to be distributed. The last subfolder in the path can be a path that InstallShield creates on the VM; the other folders in the path must already exist.  
If a destination path is specified for the VM configuration that is selected through the VMConfig property, that destination path is considered to be the default value for the VMStageMachineCopyPath property. To override the destination path for the selected release, set the VMStageMachineCopyPath property.  
To learn more about VM distribution, see Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand. |
| VMStagePostBuild      | Read-Write Boolean Property | Project • *This is available in Suite/Advanced UI projects.* Edition • The Suite/Advanced UI project type is available in the Premier edition of InstallShield.*  
Specify whether you want InstallShield to automatically distribute the selected release each time that it is successfully built. Distributing the release to the VM involves the following tasks:  
1. Revert the VM to the designated snapshot (if one is specified).  
2. Power on the VM.  
3. Copy the built release to the VM to make it available for testing.  
To learn more about VM distribution, see Distributing Releases to a Virtual Machine that InstallShield Provisions at Build Time or on Demand. |

Build Method (Advanced UI and Suite/Advanced UI)

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

To build a release in an Advanced UI or Suite/Advanced UI project, call the Build method.

Syntax

Build ()

Build Status Events

The ISWiSuiteRelease object uses the following build status events:

- StatusMessage (string Message, ref bool Cancel)
- ProgressMax (int Max, ref bool Cancel)
- ProgressIncrement (int Increment, ref bool Cancel)
- TextCancel (ref bool Cancel)
- GetDotNetLibrary (out object ???)
- WarningMessage (string Message)
- ErrorMessage (string Message)
- IsCancelledByUserAnError (ref bool IsError)
- StatusMessageEx (string Message, object Tag, ref bool Cancel)

These events occur during the build process; they provide status updates. You can set pbCancel to stop the build.

Automation Collections for Advanced UI and Suite/Advanced UI Projects

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

Each Advanced UI or Suite/Advanced UI automation collection is a set of objects. For example, the ISWiSuiteFeatures collection is a set of ISWiSuiteFeature objects in the current project. This section describes each of the Advanced UI or Suite/Advanced UI automation collections.

ISWiLanguages Collection

Edition • Support for multilanguage installations is available with InstallShield Premier Edition.

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

The ISWiLanguages collection contains all of the languages in the current language.

ISWiSuiteFeatures Collection

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

ISWiSuiteFeatures is a collection that contains every feature (as an ISWiSuiteFeature object) in your project.
When ISWiSuiteFeatures is a member of ISWiProject, it contains all of the root-level features in the project. To retrieve a collection of subfeatures, access the Features property of the ISWiSuiteFeature object. The result is an ISWiSuiteFeatures collection that contains the immediate subfeatures of the current root-level feature. Repeat for further levels of subfeatures.

**Members**

Table 84 • ISWiSuiteFeatures Collection Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Read-Only Property</td>
<td>Use this property to return the total number of elements in the ISWiSuiteFeatures collection.</td>
</tr>
</tbody>
</table>
| Item   | Read-Only Property     | Provide the index number or name of the feature to retrieve the ISWiSuiteFeature object. For example, the following statements create a copy of the first item in the collection and of the feature named Help_Files:  

```
Set pFeat1 = m_ISWiProject.ISWiSuiteFeatures.Item(1)
Set pFeat2 = m_ISWiProject.ISWiSuiteFeatures.Item("Help_Files")
```

The name of the feature is case-sensitive—for example, “Help_Files” and “Help_files” are two different features. Item is the default property for ISWiSuiteFeatures, which means that the following two lines of code are equivalent:

```
m_ISWiProject.ISWiSuiteFeatures.Item("Help_Files")
m_ISWiProject.ISWiSuiteFeatures("Help_Files").
```

** Applies To **

- ISWiProject

** ISWiSuiteFiles Collection **

- **Project** • This information applies to the following project types:
  - Advanced UI
  - Suite/Advanced UI
**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

Object Reference for Expressions in Advanced UI and Suite/Advanced UI Projects

Project • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

Edition • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

In various settings of Advanced UI and Suite/Advanced UI projects, you can embed object expressions to query target systems for information about a file, a registry entry, or other items. Object expressions use this convention:

[@Object(Parameters, ...).Property(Parameters, ...)]

Each object expression contains a reference to an object, which is a collection of object-specific properties. Objects and properties may contain parameters.

This section of the documentation explains each of the objects that are available for use in object expressions.

Table 1 • Objects That Are Available for Object Expressions

<table>
<thead>
<tr>
<th>Object</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feature Object</td>
<td>Check target systems for information about a feature in an Advanced UI or Suite/Advanced UI installation.</td>
</tr>
<tr>
<td>File Object</td>
<td>Check target systems for information about a file during an Advanced UI or Suite/Advanced UI installation.</td>
</tr>
<tr>
<td>Parcel Object</td>
<td>Check target systems for information about a package in an Advanced UI or Suite/Advanced UI installation.</td>
</tr>
<tr>
<td>Platform Object</td>
<td>Check target systems for operating system details during an Advanced UI or Suite/Advanced UI installation.</td>
</tr>
<tr>
<td>Registry Object</td>
<td>Check the registry on target systems during an Advanced UI or Suite/Advanced UI installation.</td>
</tr>
</tbody>
</table>

Feature Object

To create an object expression that checks target systems for information about a feature in an Advanced UI or Suite/Advanced UI installation, use the Feature object. The Feature object has support for properties such as DisplayName, ActionState, and InstalledState.
**Syntax**

```plaintext
[@Feature(FeatureName).ActionState]
[@Feature(FeatureName).AllowSelectionChange]
[@Feature(FeatureName).Cost]
[@Feature(FeatureName).Description]
[@Feature(FeatureName).DisplayName]
[@Feature(FeatureName).InstalledState]
[@Feature(FeatureName).Visible]
```

**Parameters**

One parameter is available for the Feature object.

**Table 2 • Parameters for the Feature Object**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FeatureName</td>
<td>Specify the name of the feature.</td>
</tr>
</tbody>
</table>

**Properties**

The following properties are available for the Feature object.

**Table 3 • Properties for the Feature Object**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActionState</td>
<td>Retrieves the currently set action state of the feature. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>• 0—No action will be taken for the feature.</td>
</tr>
<tr>
<td></td>
<td>• 1—The feature will be installed.</td>
</tr>
<tr>
<td></td>
<td>• 2—The feature will be removed.</td>
</tr>
<tr>
<td>AllowSelectionChange</td>
<td>Retrieves a Boolean value that indicates whether end users should be allowed to select or deselect the feature on the InstallationFeatures wizard page. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>• true—End users should be able to select or deselect the feature through the wizard interface. This is the default option.</td>
</tr>
<tr>
<td></td>
<td>• false—End users should not be able to select or deselect the feature through the wizard interface. If this feature is visible on the InstallationFeatures wizard page, it appears in a read-only state (either selected or deselected, based on other factors, such as the feature’s condition).</td>
</tr>
<tr>
<td>Cost</td>
<td>Retrieves how much space (in bytes) the feature requires on the target system if this value was specified in the Features view.</td>
</tr>
</tbody>
</table>
Examples
The following examples demonstrate use of the Feature object in object expressions.

Table 4 • Sample Feature Object Expressions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[@Feature(FeatureABC).ActionState]</td>
<td>Determine whether the Advanced UI or Suite/Advanced UI is installing the FeatureABC feature.</td>
</tr>
<tr>
<td>[@Feature(FeatureABC).Cost]</td>
<td>Determine how much space (in bytes) the feature requires.</td>
</tr>
</tbody>
</table>

File Object
To create an object expression that checks target systems for information about a file during an Advanced UI or Suite/Advanced UI installation, use the File object. The File object has support for properties such as Date and Version.

Syntax
[@File(FilePath,64Bit).Content]
[@File(FilePath,64Bit).Date( Parameter)]
[@File(FilePath,64Bit).Version]
Parameters

The following parameters are available for the File object.

Table 5 • Parameters for the File Object

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FilePath</td>
<td>Specify the path to the file. You can use property directory identifiers such as [ProgramFilesFolder].</td>
</tr>
</tbody>
</table>
| 64Bit     | Use this optional Boolean parameter to indicate whether the file is in a 64-bit location, such as in the System32 folder on a 64-bit system. Valid options are:  
  - true—Check the 64-bit location.  
  - false—Check the 32-bit location.  
  If you omit this property, or if or the target system is running a 32-version of Windows, the installation checks the 32-bit location. |

Properties

The following properties are available for the File object.

Table 6 • Properties for the File Object

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content</td>
<td>If the file is a text file (for example, .txt, .htm, .xml, .config, .ini, or .sql), retrieves the contents of the file.</td>
</tr>
</tbody>
</table>
| Date     | Retrieves the date and time for the file. Optional parameters that are available for this property are:  
  - modified—Retrieves the date and time at which the file was last modified. This is the default parameter.  
  - access—Retrieves the date and time at which the file was last accessed.  
  - create—Retrieves the date and time at which the file was created.  
  If you omit a parameter for the Date property, the File object returns the last-modified date. |
| Version  | Retrieves the version of the file. For an unversioned file, this property returns empty. |
Examples

The following examples demonstrate use of the File object in object expressions.

Table 7 • Sample File Object Expressions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[@File([ProgramFilesFolder]MyCompany\MyProduct.exe,false).Date(modified)]</td>
<td>Obtain the last modified date and time for a file called MyProduct.exe. On 32-bit target systems, the path may be this: C:\Program Files\MyCompany\MyProduct.exe On 64-bit target systems, the path may be this: C:\Program Files (x86)\MyCompany\MyProduct.exe</td>
</tr>
<tr>
<td>[@File([SystemFolder]notepad.exe).Version]</td>
<td>Obtain the version number of notepad.exe in the System32 folder on 32-bit target systems or in the SysWOW64 folder on 64-bit target systems.</td>
</tr>
</tbody>
</table>

Parcel Object

To create an object expression that checks target systems for information about a package in an Advanced UI or Suite/Advanced UI installation, use the Parcel object. The Parcel object has support for properties such as Eligible, ActionState, and DetectedState.

Syntax

[@Parcel(PackageGUID).ActionState]
[@Parcel(PackageGUID).DetectedState]
[@Parcel(PackageGUID).Eligible]
[@Parcel(PackageGUID).ExitCode]
[@Parcel(PackageGUID).Type]

Parameters

One parameter is available for the Parcel object.

Table 8 • Parameters for the Parcel Object

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageGUID</td>
<td>Specify the GUID of the package.</td>
</tr>
</tbody>
</table>
# Properties

The following properties are available for the Parcel object.

## Table 9 • Properties for the Parcel Object

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **ActionState**| Retrieves the currently set action state of the package. This value may change, depending on when at run time the property is queried. Valid values are:  
  - 1—The package will run its install operation.  
  - 2—The package will run its modify operation.  
  - 3—The package will run its repair operation.  
  - 4—The package will run its remove operation.  
  - 5—No action will be performed for the package. |
| **DetectedState**| Retrieves the installed state of the package. Valid values are:  
  - 0—The package is not installed.  
  - 1—The package is currently installed. |
| **Eligible** | Retrieves a Boolean value that indicates whether the target system meets the requirements that are necessary for the package to be run. |
| **ExitCode** | Retrieves the exit code for the package once its scheduled operation has completed. The value of this property is indeterminate before package operations are run. |
| **Name** | Retrieves the display name of the package. |
| **Type** | Retrieves the type of package. Valid values are:  
  - 0—Executable package (.exe)  
  - 1—Windows Installer package (.msi)  
  - 2—Patch package (.msp)  
  - 3—InstallScript package (.hdr)  
  - 5—Sideloading Windows App package (.appx)  
  - 6—Web Deploy package (.zip) |
Examples

The following examples demonstrate use of the Parcel object in object expressions.

Table 10 • Sample Parcel Object Expressions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[@Parcel(0F283EC0-E9D1-4D18-801D-0014F6CA96DF).DetectedState]</td>
<td>Determine whether the referenced package is installed.</td>
</tr>
<tr>
<td>[@Parcel(0F283EC0-E9D1-4D18-801D-0014F6CA96DF).ExitCode]</td>
<td>Obtain the exit code for the package once its scheduled operation has completed.</td>
</tr>
</tbody>
</table>

Platform Object

To create an object expression that checks target systems for operating system details during an Advanced UI or Suite/Advanced UI installation, use the Platform object. The Platform object has support for properties such as Architecture, FullVersion, and MajorVersion.

Syntax

[@Platform.Architecture]
[@Platform.BuildNumber]
[@Platform.CSDVersion]
[@Platform.FullVersion]
[@Platform.MajorVersion]
[@Platform.MinorVersion]
[@Platform.ProductType]
[@Platform.ServicePackVersion]
[@Platform.Value]

Parameters

The Platform object does not have any parameters.

Properties

The following properties are available for the Platform object.

Table 11 • Properties for the Parcel Object

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Architecture</td>
<td>Retrieves the architecture (x86, x64, IA64, ARM, or Unknown) of the machine on which the Advanced UI or Suite/Advanced UI installation is running.</td>
</tr>
</tbody>
</table>
Examples

The following examples demonstrate use of the Platform object in object expressions.

Table 12 • Sample Platform Object Expressions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[@Platform.FullVersion]</td>
<td>Obtain the version number of the target system.</td>
</tr>
<tr>
<td>[@Platform.Architecture]</td>
<td>Obtain the architecture of the target system.</td>
</tr>
</tbody>
</table>
Registry Object

To create an object expression that checks the registry on target systems during an Advanced UI or Suite/Advanced UI installation, use the Registry object.

Syntax

[@Registry(RegistryKeyPath,64Bit).KeyValue(DataValueName)]
[@Registry(RegistryKeyPath,64Bit).Value]

Parameters

The following parameters are available for the Registry object.

Table 13 • Parameters for the Registry Object

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| RegistryKeyPath | Specify the full path of the registry key that you want to check on target systems. Use the following abbreviations for the root:  
|                 | • HKCR  
|                 | • HKCU  
|                 | • HKLM  
| 64Bit           | Use this optional Boolean parameter to indicate whether to check the 64-bit view of the registry. Valid options are:  
|                 | • true—Check the 64-bit view of the registry.  
|                 | • false—Check the 32-bit view of the registry.  
|                 | If you omit this property, or if the target system is running a 32-version of Windows, the installation checks the 32-bit view of the registry. |

Properties

The following properties are available for the Registry object.

Table 14 • Properties for the Registry Object

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KeyValue</td>
<td>Retrieve the value data of the value that is passed as a parameter for the KeyValue property.</td>
</tr>
<tr>
<td>Value</td>
<td>Retrieve the value data of the registry key’s default value.</td>
</tr>
</tbody>
</table>
Examples

The following examples demonstrate use of the Registry object in object expressions.

Table 15 • Sample Registry Object Expressions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[@Registry(HKLM\Software\Microsoft\Windows NT\CurrentVersion, false).KeyValue(RegisteredOwner)]</td>
<td>On 32-bit target systems, obtain the value data of the RegisteredOwner value for the following registry key: HKLM\Software\Microsoft\Windows NT\CurrentVersion. On 64-bit target systems, obtain the value data of the RegisteredOwner value for the following registry key: HKLM\Software\Wow6432Node\Microsoft\Windows NT\CurrentVersion.</td>
</tr>
<tr>
<td>[@Registry(HKLM\Software[COMPANY][PRODUCT], true).Value]</td>
<td>On 32-bit and 64-bit target systems, obtain the value data of the default value for the following registry key: HKLM\Software\My Company Name\My Product Name.</td>
</tr>
<tr>
<td>[@Registry(HKCR\Software\My Company Name\My Product Name, false).KeyValue(MyFile[[]1[]].exe)]</td>
<td>On 32-bit target systems, obtain the value data of the MyFile[1].exe value for the following registry key: HKCU\Software\My Company Name\My Product Name. On 64-bit target systems, obtain the value data of the MyFile[1].exe value for the following registry key: HKLM\Software\Wow6432Node\My Company Name\My Product Name. To avoid treating the square brackets in the data value name as parameter parse indicators, the square brackets are escaped as shown in the sample expression.</td>
</tr>
</tbody>
</table>
InstallShield Custom Action Reference

This section describes each of the built-in InstallShield custom actions that are added automatically to InstallShield projects to support different functionality.

Windows Logo • If you are applying for the Windows logo, the intended behavior of each custom action in your installation must be documented. This does not apply to custom action types 19 (displays an error, returns failure, and ends the installation), 35 (sets the installation directory), or 51 (sets a property). ISICE10 validates that each custom action is documented.

_serial_verifyCA_isx
Decreases the value of the property SERIALNUMVALRETRYLIMIT by 1.

_serial_verifyCA_isx_helper
Decreases the value of the property SERIALNUMVALRETRYLIMIT by 1.

CheckForProductUpdates
Uses FlexNet Connect to check for product updates.
This custom action launches an executable file called Agent.exe, and it passes the following:
/au[ProductCode] /EndOfInstall

CheckForProductUpdatesOnReboot
Uses FlexNet Connect to check for product updates on reboot.
This custom action launches an executable file called Agent.exe, and it passes the following:
/au[ProductCode] /EndOfInstall /Reboot

DLLWrapCleanup
Standard DLL wrapper that cleans extracted data.
This is a Windows Installer DLL custom action. The name of the DLL file is dllwrap.dll, and its entry point is DLLWrapCleanup.

DLLWrapStartup
Standard DLL wrapper that extracts data that describes calls.
This is a DLL custom action. The name of the DLL file is dllwrap.dll, and its entry point is DLLWrapStartup.

ISChainPackageCommit
Removes extracted files from a multi-package transaction.
ISChainPackagePrepare
Prepares and extracts files for a multi-package transaction.

ISChainPackageRollback
Removes extracted files from a multi-package transaction.

ISComponentServiceCosting
Extracts information from the ISComPlusApplication table and saves it in a temporary file for COM+ applications.
This is a Windows Installer DLL custom action. The name of the DLL file is iscomsrv.dll, and its entry point is ISComponentServiceCosting.

ISComponentServiceFinalize
Commits COM+ applications during installation and uninstallation.
This is a Windows Installer DLL custom action. The name of the DLL file is iscomsrv.dll, and its entry point is ISComponentServiceFinalize.

ISComponentServiceInstall
Installs COM+ applications during an installation.
This is a DLL custom action. The name of the DLL file is iscomsrv.dll, and its entry point is ISComponentServiceInstall.

ISComponentServiceRollback
Rolls back COM+ applications during a failed installation or uninstallation.
This is a DLL custom action. The name of the DLL file is iscomsrv.dll, and its entry point is ISComponentServiceRollback.

ISComponentServiceUninstall
Removes COM+ applications during uninstallation.
This is a DLL custom action. The name of the DLL file is iscomsrv.dll, and its entry point is ISComponentServiceUninstall.

ISIISCleanup
Removes temporary files and registry entries for an IIS installation.
This is a DLL custom action. The name of the DLL file is IISHelper.dll, and its entry point is ISIISCleanup.

ISIISCosting
Creates a list of actions in a temporary file for an IIS installation. Sets the CustomActionData property for other IIS actions.
This is a DLL custom action. The name of the DLL file is IISHelper.dll, and its entry point is ISIISCosting.
ISIISInstall
Creates Web sites, applications, virtual directories, and other items for an IIS installation.
This is a DLL custom action. The name of the DLL file is IISHelper.dll, and its entry point is ISIISInstall.

ISIISRollback
Removes Web sites, applications, virtual directories, and other items during rollback for IIS.
This is a DLL custom action. The name of the DLL file is IISHelper.dll and its entry point is ISIISRollback.

ISIISUninstall
Removes Web sites, applications, virtual directories, and other items during uninstallation for IIS.
This is a DLL custom action. The name of the DLL file is IISHelper.dll, and its entry point is ISIISUninstall.

ISInstallPrerequisites
Launches the installation of prerequisites that are associated with features.
This is a DLL custom action. The name of the DLL file is PrqLaunch.dll, and its entry point is InstallPrerequisites.

ISJITCompileActionAtInstall
Precompiles .NET assemblies at installation time.
This custom action launches a Microsoft executable file called ngen.exe.

ISJITCompileActionAtUninstall
Deletes a precompiled .NET assemblies at uninstallation time.
This custom action launches a Microsoft executable file called ngen.exe.

ISLockPermissionsCost
Sets the CustomActionData property for the ISLockPermissionsInstall action.
This is a DLL custom action. The name of the DLL file is ISLockPermissions.dll, and its entry point is ISLockPermissionsCostAction.

ISLockPermissionsInstall
Sets permissions when the product is installed.
This is a DLL custom action. The name of the DLL file is ISLockPermissions.dll, and its entry point is ISLockPermissionsInstallAction.

ISNetApiInstall
Creates users and groups from an .ini file.
This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetApiInstall.
ISNetApiRollback
Rolls back changes for users and groups.
This is a DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetApiRollback.

ISNetCreateIniForOneUser
Extracts operations to a temporary file for users and groups.
This is a DLL custom action called ISNetAPI.dll.

ISNetDeleteIniFile
Cleans up temporary files for users and groups.
This is a DLL custom action called ISNetAPI.dll.

ISNetGetGroups
Puts groups into a combo box.
This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetGetGroups.

ISNetGetServers
Puts a list of servers into a combo box.
This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetGetServers.

ISNetGetUsers
Puts a list of users into a combo box.
This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetGetUsers.

ISNetSetLogonName
Stores the user, group, and server properties that were entered in the LogonInformation dialogs.
This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetSetLogonName.

ISNetValidateLogonName
Verifies that a valid user name, server, and password combination were entered in the LogonInformation dialogs.
This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetValidateLogonName.

ISNetValidateNewUserInformation
Stores the user, group, and server properties that were entered in the LogonInformation dialogs.
This is a Windows Installer DLL custom action. The name of the DLL file is ISNetAPI.dll, and its entry point is ISNetValidateNewUserInformation.

**ISNetworkSharesCosting**
Extracts information from the ISNetworkShares table and saves it in a temporary file for network sharing.

This is a Windows Installer DLL custom action. The name of the DLL file is ISNetworkShares.dll, and its entry point is ISNetworkSharesCosting.

**ISNetworkSharesFinalize**
Cleans up temporary files for configuring network shares.

This is a Windows Installer DLL custom action. The name of the DLL file is ISNetworkShares.dll, and its entry point is ISNetworkSharesFinalize.

**ISNetworkSharesInstall**
Configures network sharing for one or more folders.

This is a Windows Installer DLL custom action. The name of the DLL file is ISNetworkShares.dll, and its entry point is ISNetworkSharesInstall.

**ISNetworkSharesRollback**
Rolls back network sharing for one or more folders.

This is a Windows Installer DLL custom action. The name of the DLL file is ISNetworkShares.dll, and its entry point is ISNetworkSharesRollback.

**ISNetworkSharesUninstall**
Removes network sharing for one or more folders.

This is a Windows Installer DLL custom action. The name of the DLL file is ISNetworkShares.dll, and its entry point is ISNetworkSharesUninstall.

**ISPrint**
Prints the contents of a ScrollableText control on a dialog.

This is a Windows Installer DLL custom action. The name of the DLL file is SetAllUsers.dll, and its entry point is PrintScrollableText.

**ISQuickPatchFinalize**
Cleans shared reference counts for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is QuickPatchHelper.dll, and its entry point is ISQuickPatchFinalize.

**ISQuickPatchFixShortcut**
Reinstalls shortcuts for a QuickPatch.
This is a Windows Installer DLL custom action. The name of the DLL file is QuickPatchHelper.dll, and its entry point is ISQuickPatchFixShortcut.

**ISQuickPatchHelper**
Applies clean feature states for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is QuickPatchHelper.dll, and its entry point is ISQuickPatchHelper.

**ISQuickPatchInit**
Cleans component and feature states for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is QuickPatchHelper.dll, and its entry point is ISQuickPatchInit.

**ISQuickPatchInit9X**
Cleans component and feature states for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is QuickPatchHelper.dll, and its entry point is ISQuickPatchInit9X.

**ISQuickPatchInit9X2**
Cleans component and feature states for a QuickPatch.

This is a Windows Installer DLL custom action. The name of the DLL file is QuickPatchHelper.dll, and its entry point is ISQuickPatchInit9X2.

**ISRunSetupTypeAddLocalEvent**
Runs the AddLocal events that are associated with the Next button on the SetupType dialog. This action needs to be called when the installation does not display the SetupType dialog.

This is a Windows Installer DLL custom action. The name of the DLL file is ISXExpHlp.dll, and its entry point is ISRunSetupTypeAddLocalEvent.

**ISSearchReplaceCosting**
Creates a temporary file that has a list of changes that need to be made in text files.

This is a DLL custom action. The name of the DLL file is isschrpl.dll, and its entry point is ISSearchReplaceCosting.

**ISSearchReplaceFinalize**
Cleans up temporary files for text file changes.

This is a DLL custom action. The name of the DLL file is isschrpl.dll, and its entry point is ISSearchReplaceFinalize.
**ISSearchReplaceInstall**
Applies text file changes when the product is installed.

This is a DLL custom action. The name of the DLL file is `isschrpl.dll`, and its entry point is `ISSearchReplaceInstall`.

**ISSearchReplaceRollback**
Rolls back text file changes and cleans up temporary files for text file changes.

This is a DLL custom action. The name of the DLL file is `isschrpl.dll`, and its entry point is `ISSearchReplaceRollback`.

**ISSearchReplaceUninstall**
Applies text file changes when the product is uninstalled.

This is a DLL custom action. The name of the DLL file is `isschrpl.dll`, and its entry point is `ISSearchReplaceUninstall`.

**ISSelfRegisterCosting**
Extracts operations to a temporary file for self-registration.

This is a Windows Installer DLL custom action. The name of the DLL file is `isregsvr.dll`, and its entry point is `ISSelfRegisterCosting`.

**ISSelfRegisterFiles**
Registers self-registering files.

This is a Windows Installer DLL custom action. The name of the DLL file is `isregsvr.dll`, and its entry point is `ISSelfRegisterFiles`.

**ISSelfRegisterFinalize**
Cleans up temporary file from self-registration.

This is a Windows Installer DLL custom action. The name of the DLL file is `isregsvr.dll`, and its entry point is `ISSelfRegisterFinalize`.

**ISSetAllUsers**
Sets `ALLUSERS` per upgrade or initial installation requirements.

This is a DLL custom action. The name of the DLL file is `SetAllUsers.dll`, and its entry point is `SetAllUsers`.

**ISSetTARGETDIR**
Sets `TARGETDIR` to `[INSTALLDIR]`.

This is a DLL custom action. The name of the DLL file is `SetAllUsers.dll`, and its entry point is `SetTARGETDIR`.
**ISSetupFilesCleanup**
Cleans up the temp directory of support files.
This is a DLL custom action. The name of the DLL file is SFHelper.dll, and its entry point is SFCleanupEx.

**ISSetupFilesExtract**
Extracts support files to a temp directory.
This is a DLL custom action. The name of the DLL file is SFHelper.dll, and its entry point is SFStartupEx.

**ISSQLQueryDatabases**
Finds database catalogs that are available on a specified database server.
This is a DLL custom action. The name of the DLL file is issqlsrv.dll, and its entry point is ISSQLQueryDatabases.

**ISSQLServerCosting**
Extracts operations to a temporary file for SQL scripts.
This is a DLL custom action. The name of the DLL file is issqlsrv.dll, and its entry point is ISSQLServerCosting.

**ISSQLServerFilteredList**
Finds available servers for SQL scripts.
This is a DLL custom action. The name of the DLL file is issqlsrv.dll, and its entry point is ISSQLServerFilteredList.

**ISSQLServerFinalize**
Cleans up temporary files and the state for SQL scripts.
This is a DLL custom action. The name of the DLL file is issqlsrv.dll, and its entry point is ISSQLServerFinalize.

**ISSQLServerInitialize**
Adds property names for SQL login password to MsiHiddenProperties.
This is a DLL custom action. The name of the DLL file is issqlsrv.dll, and its entry point is ISSQLServerInitialize.

**ISSQLServerInstall**
Runs SQL scripts during an installation.
This is a DLL custom action. The name of the DLL file is issqlsrv.dll, and its entry point is ISSQLServerInstall.

**ISSQLServerList**
Finds available servers.
This is a DLL custom action. The name of the DLL file isissqlsrv.dll, and its entry point is ISSQLServerList.
**ISSQLServerRemoveLoginInfo**
Removes SQL database login credentials from the Windows registry during an uninstallation.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerRemoveLoginInfo`.

**ISSQLServerRollback**
Runs SQL scripts during a failed installation or uninstallation.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerRollback`.

**ISSQLServerRollbackLoginInfo**
During a failed installation or uninstallation, rolls back SQL database login credentials that are stored in the Windows registry.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerRollbackLoginInfo`.

**ISSQLServerUninstall**
Runs SQL scripts during an uninstallation.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerUninstall`.

**ISSQLServerValidate**
Tests server connections.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerValidate`.

**ISSQLServerWriteLoginInfo**
Writes SQL database login credentials to the Windows registry during an installation.

This is a DLL custom action. The name of the DLL file is `issqlsrv.dll`, and its entry point is `ISSQLServerWriteLoginInfo`.

**ISUnSelfRegisterFiles**
Unregisters self-registering files.

This is a DLL custom action. The name of the DLL file is `isregsvr.dll`, and its entry point is `ISUnSelfRegisterFiles`.

**ISVerifyScriptingRuntime**
Verifies that an InstallScript MSI installation was launched using `Setup.exe`, and if not, it displays the message contained in the property `STANDARD_USE_SETUPEXE`. This custom action is included in all InstallScript MSI projects, and it is scheduled for the beginning of the User Interface sequence.
**Note** • The ISVerifyScriptingRuntime custom action is called in an InstallScript MSI installation in which the InstallScript UI style is the traditional style (which uses the InstallScript engine as an external UI handler). It is not called for the new style (which uses the InstallScript engine as an embedded UI handler).

*To learn more, see Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations.*

**ISXmlAppSearch**
Performs a system search for XML: finds file, performs XPath queries, and stores the results in properties. Driven by the ISXmlLocator table.

This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is ISXmlAppSearch.

**ISXmlCosting**
Extracts operations to a temporary file for XML file changes.

This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is ISXmlCosting.

**ISXmlFinalize**
Cleans up temporary files for XML file changes.

This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is ISXmlFinalize.

**ISXmlInstall**
Applies XML file changes.

This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is ISXmlInstall.

**ISXmlRollback**
Rolls back XML file changes.

This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is ISXmlRollback.

**ISXmlUnInstall**
Uninstalls XML file changes.

This is a DLL custom action. The name of the DLL file is `isxmlcfg.dll`, and its entry point is ISXmlUnInstall.

**LaunchProgramFileFromSetupCompleteSuccess**
Launches an executable file at the end of an installation.

This is a Windows Installer DLL custom action. The name of the DLL file is `SerialNumCAHelper.dll`, and its entry point is LaunchProgram.

**LaunchReadmeFileFromSetupCompleteSuccess**
Launches a readme file at the end of an installation.
This is a Windows Installer DLL custom action. The name of the DLL file is SerialNumCAHelper.dll, and its entry point is LaunchReadMe.

**setAllUsersProfile2K**
Initializes the ALLUSERSPROFILE directory identifier for Windows 2000 or later.

**SetAllUsersProfileNT**
Initializes the ALLUSERSPROFILE directory identifier for Windows NT 4.

**SetARPINSTALLLOCATION**
Sets the value of the ARPINSTALLLOCATION property to the fully qualified path for the application's primary folder.

**setUserProfileNT**
Initializes the USERPROFILE directory identifier.

**ShowMsiLog**
Displays the Windows Installer log file in Notepad if the end user selects the *Show the Windows Installer log* check box in the SetupCompleteSuccess, SetupCompleteError, or SetupInterrupted dialogs and then clicks Finish. This works only with Windows Installer 4.0 and later.

**WiseScriptFinalize**
Cleans up temporary files for a WiseScript custom action.

This is a DLL custom action. The name of the DLL file is WiseScriptBridge.dll, and its entry point is WiseScriptFinalize.

**WiseScriptInitialize**
Extracts required files for a WiseScript custom action.

This is a DLL custom action. The name of the DLL file is WiseScriptBridge.dll, and its entry point is WiseScriptInitialize.

**WiseScriptRollback**
Cleans up temporary files for a WiseScript custom action.

This is a DLL custom action. The name of the DLL file is WiseScriptBridge.dll, and its entry point is WiseScriptFinalize.
Command-Line Tools

In addition to its graphical user interface, InstallShield provides several command-line programs that you can use during build time, for instance, as part of a batch process, or during run time to customize the behavior of your installation.
**Authoring-Time Programs**

**Table 1 • Descriptions of Authoring-Time Programs**

<table>
<thead>
<tr>
<th>Task</th>
<th>Program</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scan an IIS Web site and record its settings so that you can import them into an InstallShield project</td>
<td>iisscan.exe</td>
</tr>
</tbody>
</table>

**Build-Time Programs**

**Table 2 • Descriptions of Build-Time Programs**

<table>
<thead>
<tr>
<th>Task</th>
<th>Program</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compile an InstallScript file (.rul)</td>
<td>Compile.exe</td>
</tr>
<tr>
<td>Build a release; if applicable, also compile the InstallScript</td>
<td>ISCmdBld.exe</td>
</tr>
<tr>
<td>Build a release (available for legacy InstallScript projects)</td>
<td>ISBuild.exe</td>
</tr>
<tr>
<td>Sign an already-built InstallScript release</td>
<td>iSign.exe</td>
</tr>
<tr>
<td>Build a release (InstallScript self-extracting executable files)</td>
<td>ReleasePackager.exe</td>
</tr>
<tr>
<td>Modify a Setup.ini file that is embedded in a Basic MSI or InstallScript MSI Setup.exe file</td>
<td>SetupIni.exe</td>
</tr>
</tbody>
</table>

**Run-Time Programs**

**Table 3 • Descriptions of Run-Time Programs**

<table>
<thead>
<tr>
<th>Task</th>
<th>Program</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run a Setup.exe installation and pass command-line parameters (Basic MSI, InstallScript, and InstallScript MSI projects)</td>
<td>Setup.exe</td>
</tr>
<tr>
<td>Run a Setup.exe installation and pass command-line parameters (Advanced UI and Suite/Advanced UI projects)</td>
<td>Setup.exe</td>
</tr>
<tr>

Compile.exe

InstallShield includes a command-line compiler that you can invoke from the Command Prompt window or from a DOS batch file. This program, called Compile.exe, is in the following folder:

*InstallShield Program Files Folder*/System

**Note** • *When you build a release from the command line using ISCmdBld.exe, the build engine automatically compiles your script; therefore, you do not need to use Compile.exe directly unless you want to use compiler options that are different from those specified for the project in InstallShield. For more information, see ISCmdBld.exe.*

**Syntax**

Compile script_file [iswi_obl_file] [isrt_obl_file] [ifx_obl_file] switches

You can pass any or all of your command-line parameters to Compile.exe in the form of a command file. To specify a command file to Compile.exe, use the following syntax:

Compile @command_file

In this example, *command_file* is the name of a text file, including any extension. You can specify an absolute or relative path with the file name.

You can specify all or part of the command line in a command file. You can use more than one command file in a Compile command. Compile.exe accepts the command file’s input as if it were specified in that location on the command line.

In the command file, each parameter must begin and end on the same line—you cannot use the backslash (\) to combine a parameter across two lines. In the command file, arguments can be separated by spaces or tabs (as on the command line) and by newline (\n) characters.
## Parameters

The following parameters are available for use with the compiler.

### Table 4 • Command-Line Parameters for Compile.exe

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| script_file | Specifies the name of the setup script. Note the following:  
  - The file name can include a drive designation and an absolute or relative path. If the file name is unqualified, the compiler will search for the script in the current directory of the current drive.  
  - If the specified setup script uses #include directives to include other files in the setup, and if the file names specified by #include statements do not include a path, you must specify the location of those files with the -i switch unless they reside in the current directory. Note that included files may themselves specify #include directives; be sure the -i switch specifies a search path that can be used to find all included source files.  
  - Long path and file names must be enclosed in double quotation marks.  
  - By default, the setup script created as part of a new InstallShield project is named setup.rul. |
| isrt_obl_file | Specifies the name of the library file Isrt.obl. It is not necessary to include the full path for the library file, as long as the path is identified with the -libpath switch.  
  Isrt.obl is in the following directory:  
  `InstallShield Program Files Folder\Script\Isrt\Lib`  
  This parameter is required unless you are using the -c or -l switch. |
| ifx_obl_file | Specifies the name of the library file Ifx.obl. It is not necessary to include the full path for the library file, as long as the path is identified with the -libpath switch.  
  Ifx.obl is in the following directory:  
  `InstallShield Program Files Folder\Script\Ifx\Lib`  
  This parameter is required unless you are using the -c or -l switch. |
### Table 4 • Command-Line Parameters for Compile.exe (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| iswi_obl_file     | *Project* • This parameter applies to the following project types:  
|                   | • Basic MSI  
|                   | • InstallScript MSI  
|                   | Specifies the name of the library file Iswi.obl. It is not necessary to include the full path for the library file, as long as the path is identified with the -libpath switch.  
|                   | Iswi.obl is in the following directory:  
|                   | InstallShield Program Files Folder\Script\Iswi\Lib  
|                   | This parameter is required unless you are using the -c or -l switch. |
| ifxobject_obl_file| *Project* • This parameter applies to InstallScript Object projects.  
|                   | Specifies the name of the library file Ifxobject.obl. It is not necessary to include the full path for the library file, as long as the path is identified with the -libpath switch.  
|                   | Ifxobject.obl is in the following directory:  
|                   | InstallShield Program Files Folder\Script\Ifx\Lib  
|                   | This parameter is required unless you are using the -c or -l switch. |
## Switches

You can pass the following switches to the compiler. If you are not specifying the full path to the script files and library files, you must specify the location of the folders that contain those files by using the -i and -libpath switches (as noted in the -i and -libpath descriptions below). All of the other switches are optional.

### Table 5 • Switches for Compile.exe

<table>
<thead>
<tr>
<th>Switch</th>
<th>Description</th>
</tr>
</thead>
</table>
| /d or -d<variable name=preprocessor define> | Provides a preprocessor definition that is applicable to your InstallScript. Following is an example:  

```
Compile.exe -dVARIABLENAME=Value
```

The variable name must be a valid InstallScript identifier; the value must be a constant. No space is permitted between the switch and the expression or within the expression.

If you reference the preprocessor in InstallScript, use either of the following formats:

- `#ifdef VARIABLENAME`
- `#if VARIABLENAME=Value`

That is, for `#ifdef` statements, you can use just the value name. For `#if` statements, use a name=value pair.

This parameter is optional.

**Note** • *It is recommended that you use this command-line parameter only if a preprocessor is not defined in either of the following areas in InstallShield:*

- On the Compile/Link tab of the Settings dialog box, which is displayed when you click Settings on the Build menu
- For Basic MSI and InstallScript MSI projects: In the Preprocessor Defines setting for the product configuration in the Releases view

*If you define a preprocessor in either of these areas in InstallShield and then you use the -d command-line parameter to define the same preprocessor, Compile.exe displays a cannot-define-symbol message to inform you that the preprocessor cannot be redefined through an InstallShield project or product configuration setting.*

| /e or -e | Specifies the maximum number of error messages. The default value is 50. When the maximum number of error messages has been generated, compilation stops. |
| /g or -g | Specifies that a debugging information file should be produced. This file is given the name of the installation and extension .dbg. |
/gi or -gi

Specifies that debugging information should be included in the compiled script file, so a debugging information file is not needed.

This option makes the compiled script larger and the installation slower, and makes it easier for others to reverse engineer your code, so it should typically not be used when creating your final installation for distribution to end users.

/i or -i<search path>

Specifies a search path—a list of paths, each separated by a semicolon—that identifies the directories to search for source files that have been included in the main installation's InstallScript code through #include statements. Long path names must be enclosed in double quotation marks.

Project • For InstallScript and InstallScript Object projects, you must specify the full paths for the following folders:

- InstallShield Program Files Folder\Script\Ifx\Include
- InstallShield Program Files Folder\Script\Isrt\Include

For Basic MSI and InstallScript MSI projects, you must specify the full paths for the following folders:

- InstallShield Program Files Folder\Script\Iswi\Include
- InstallShield Program Files Folder\Script\Isrt\Include

The aforementioned directories contain the script header files for built-in InstallScript functionality. If you do not specify these folders, compiler errors occur.

---

Table 5 • Switches for Compile.exe (cont.)

<table>
<thead>
<tr>
<th>Switch</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/gi or -gi</td>
<td>Specifies that debugging information should be included in the compiled script file, so a debugging information file is not needed. This option makes the compiled script larger and the installation slower, and makes it easier for others to reverse engineer your code, so it should typically not be used when creating your final installation for distribution to end users.</td>
</tr>
<tr>
<td>/i or -i&lt;search path&gt;</td>
<td>Specifies a search path—a list of paths, each separated by a semicolon—that identifies the directories to search for source files that have been included in the main installation's InstallScript code through #include statements. Long path names must be enclosed in double quotation marks.</td>
</tr>
</tbody>
</table>

---

Project • For InstallScript and InstallScript Object projects, you must specify the full paths for the following folders:

- InstallShield Program Files Folder\Script\Ifx\Include
- InstallShield Program Files Folder\Script\Isrt\Include

For Basic MSI and InstallScript MSI projects, you must specify the full paths for the following folders:

- InstallShield Program Files Folder\Script\Iswi\Include
- InstallShield Program Files Folder\Script\Isrt\Include

The aforementioned directories contain the script header files for built-in InstallScript functionality. If you do not specify these folders, compiler errors occur.
Table 5 • Switches for Compile.exe (cont.)

<table>
<thead>
<tr>
<th>Switch</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/libpath or -lib&lt;path&gt;</td>
<td>Specifies a single path that identifies a directory to search for libraries such as Ifx.obl, Isrt.obl, or a custom library file. To specify multiple directories, use the -libpath switch multiple times. Long path names must be enclosed in double quotation marks.</td>
</tr>
</tbody>
</table>

**Project** • For InstallScript and InstallScript Object projects, you must specify the full paths for the following folders (unless you have used the full path with the library file names):

- InstallShield Program Files Folder\Script\Ifx\Lib
- InstallShield Program Files Folder\Script\Isrt\Lib

For Basic MSI and InstallScript MSI projects, you must specify the full paths for the following folders (unless you have used the full path with the library file names):

- InstallShield Program Files Folder\Script\Iswi\Lib
- InstallShield Program Files Folder\Script\Isrt\Lib

The aforementioned directories contain the libraries that define the built-in InstallScript functions. If you do not specify these folders or the full paths with the library names, compiler errors occur.

/o or -o<compiled script file name> | Specifies the file name to assign to the compiled script. Note the following:

- The file name can include a drive designation and an absolute or relative path. If a path is not specified, the compiler will store the compiled script in the current directory.
- If this parameter is not specified, the compiled script is given the name of the script file and the extension .inx and is stored in the current directory.
- Long path and file names must be enclosed in double quotation marks.

/q or -q | Suppresses the output of the copyright message and version information.

/v or -v | Sets the warning level to one of the following values:

- 0—Displays no warning messages.
- 1—Displays any system warning message that InstallShield is unable to handle.
- 2—Displays Level 1 messages, plus a message if string length exceeds the limit.
- 3—Displays all warning messages. This is the default setting.
Additional Information

- When specifying file names, you can use either short or long file names; however, long file names must be enclosed within double quotation marks.
- If you specify a relative path to a file name (for example ..\..\My Functions), that path must be relative to the current directory of the current drive at the time that you invoke the compiler.

Examples

Sample Command Line for an InstallScript Project

The following command line for an InstallScript project compiles the Setup.rul script file that is located in the C:\InstallShield 2021 Projects\My InstallScript Project\script files folder:

```
"C:\Program Files\InstallShield\2021\System\Compile.exe"
"C:\InstallShield 2021 Projects\My InstallScript Project\script files\setup.rul"
-ifx.obl
-isrt.obl
-libpath"C:\Program Files\InstallShield\2021\Script\Ifx\Lib"
-libpath"C:\Program Files\InstallShield\2021\Script\Isrt\Lib"
-"C:\Program Files\InstallShield\2021\Script\Ifx\Include"
-"C:\Program Files\InstallShield\2021\Script\Isrt\Include"
-"C:\InstallShield 2021 Projects\My InstallScript Project\script files"
```

Sample Command Line for an InstallScript MSI or Basic MSI Project

The following command line for an InstallScript MSI or Basic MSI project compiles the Setup.rul script file that is located in the C:\InstallShield 2021 Projects\My New Project\script files folder:

```
"C:\Program Files\InstallShield\2021\System\Compile.exe"
"C:\InstallShield 2021 Projects\My New Project\script files\setup.rul"
-ISWI.obl
-isrt.obl
-libpath"C:\Program Files\InstallShield\2021\Script\Iswi\Lib"
-libpath"C:\Program Files\InstallShield\2021\Script\Isrt\Lib"
-"C:\Program Files\InstallShield\2021\Script\Ifx\Include"
-"C:\Program Files\InstallShield\2021\Script\Isrt\Include"
-"C:\InstallShield 2021 Projects\My New Project\script files"
```

ISCmdBld.exe

You can build a release from the command line using ISCmdBld.exe for Windows Installer-based projects and for InstallScript projects. If your project includes InstallScript, ISCmdBld.exe also compiles it before building the release.
**Syntax**

The following statement illustrates running `ISCmdBld.exe` to build the release **Othello Beta**:

```cmd
ISCmdBld.exe -p "C:\InstallShield 2021 Projects\My Othello Project\Othello.ism" -r "Othello Beta" -c COMP -a "Build 245"
```

The first parameter in the example above, starting with `-p`, is the path to the `.ism` file that you would like to build. Next, `-r Othello Beta` is the name of the release. The parameter `-c COMP` specifies that you would like your package to be compressed into one file. Finally, `-a "Build 245"` points to the specific product configuration.

If a command-line build completes without any errors, InstallShield sets the environment variable `ERRORLEVEL` to 0. If an error occurs during a command-line build, `ERRORLEVEL` is set to 1. If `ERRORLEVEL` is set to any other value, this typically indicates an invalid parameter was passed to `ISCmdBld.exe`, and the specific cause of the error is displayed in the Command Prompt window in which `ISCmdBld.exe` was running.

**Command-Line Parameters**

*Project • Some of the `ISCmdBld.exe` command-line parameters are applicable to only certain project types.*

**Table 6 • `ISCmdBld.exe` Command-Line Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-a &lt;product configuration&gt;</code></td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>This parameter specifies the product configuration for the release. If it does not exist, it is created. Although this parameter is not required, you should include it if you are including the parameter for the release name.</td>
</tr>
<tr>
<td><code>-b &lt;build location&gt;</code></td>
<td>Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI</td>
<td>The fully qualified path to the folder where you want the output folders and files to be placed. UNC paths are acceptable. The built installation's files will be located in the Disk Images\Disk1 subfolder of the location that you specify. This parameter is optional. If it is left unspecified, the build will place the build package and files in the directory specified in the File Locations tab of the Options dialog box. Enclose long file names in quotation marks.</td>
</tr>
<tr>
<td><code>-c &lt;release configuration&gt;</code></td>
<td>Basic MSI, InstallScript MSI</td>
<td>This parameter enables you to specify whether your release is compressed into one file or remains uncompressed in multiple files. The valid arguments for this parameter are COMP and UNCOMP. To specify that your release be compressed into one file, use the COMP argument. If you do not want your release compressed, use the UNCOMP argument. If the parameter is omitted for a release that already exists, the configuration is based on what was specified in the InstallShield interface. If the parameter is omitted for a new release, the files remain uncompressed.</td>
</tr>
</tbody>
</table>
**Table 6 • ISCmdBld.exe Command-Line Parameters (cont.)**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| `-d <variable name=preprocessor define>` | Basic MSI, InstallScript MSI, InstallScript Object | Use this parameter to provide a preprocessor definition that is applicable to your InstallScript. To specify more than one preprocessor definition, separate each with a comma, as in the following example: ISCmdBld.exe -d VARIABLENAME1=Value1,VARIABLENAME2=Value2 If you reference the preprocessor in InstallScript, use either of the following formats:  
  • #ifdef VARIABLENAME  
  • #if VARIABLENAME=Value  
  That is, for #ifdef statements, you can use just the value name. For #if statements, use a name=value pair. This parameter is optional.  
  
  **Note** • *It is recommended that you use this command-line parameter only if a preprocessor is not defined in either of the following areas in InstallShield:*  
  • On the Compile/Link tab of the Settings dialog box, which is displayed when you click Settings on the Build menu  
  • For Basic MSI and InstallScript MSI projects: In the Preprocessor Defines setting for the product configuration in the Releases view  
  
  *If you define a preprocessor in either of these areas in InstallShield and then you use the -d command-line parameter to define the same preprocessor, ISCmdBld.exe displays a cannot-define-symbol message to inform you that the preprocessor cannot be redefined through an InstallShield project or product configuration setting.* |
| `-e <Y/N>`                     | Basic MSI, InstallScript MSI, Merge Module | For installation projects, this parameter specifies whether you want to create a Setup.exe file along with your installation. Specify `-e Y` to build Setup.exe or `-e N` to just create an installation. For merge module projects, the meaning of `-e` is different from installation projects. Specifying `-e n` will cause the merge module to be built and then copied to the merge modules folder. Specifying `-e Y` will cause the merge module to only be built but not copied to the merge modules folder. |
Table 6 - ISCmdBld.exe Command-Line Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-f &lt;release flags&gt;</td>
<td>Advanced UI, Basic MSI, InstallScript MSI, Suite/Advanced UI</td>
<td>Use this parameter to specify any release flags that you would like to include in your release. Separate multiple flags with commas.</td>
</tr>
<tr>
<td>-fv &lt;version number&gt;</td>
<td>Basic MSI, InstallScript MSI</td>
<td>If you want to override the default file version for <code>Setup.exe</code> with your own version number, use this parameter to specify the file version, such as <code>-fv 2.5.0.0</code>. This is an optional parameter.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> • The file version always contains four fields. If you specify fewer than four fields for your file version, the remaining fields are filled with zeros. For example, if you specify a file version of 1.1, the file version that is used in the version resources of <code>Setup.exe</code> is 1.1.0.0.</td>
</tr>
<tr>
<td>-g &lt;minimum target MSI version&gt;</td>
<td>Basic MSI, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>Use this parameter to specify the minimum version of Windows Installer that the installation requires on the target machine—for example, 2.0.2600.0. This parameter is optional. The default is the latest version of Windows Installer that the InstallShield interface supports.</td>
</tr>
<tr>
<td>-h</td>
<td>Basic MSI, InstallScript MSI</td>
<td>To skip the upgrade validators at the end of the build, use this parameter.</td>
</tr>
<tr>
<td>-i &lt;.ini file path&gt;</td>
<td>Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>Instead of passing all of your parameters on the command line, you can include them all in an initialization (.ini) file and call that file from the command line. For more information, see Passing Command-Line Build Parameters in an .ini File. Absolute and relative paths are acceptable. Enclose long file names in quotation marks.</td>
</tr>
<tr>
<td>-j &lt;minimum target Microsoft .NET Framework version&gt;</td>
<td>Basic MSI, InstallScript MSI</td>
<td>This parameter specifies the minimum version of the .NET Framework that the installation requires on the target machine—for example, 1.0.3705.2. This parameter is optional. The default is the latest version of the .NET Framework that the InstallShield interface supports.</td>
</tr>
</tbody>
</table>
Table 6 • ISCmdBld.exe Command-Line Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| -l <path variable>="new path" | Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI | Use this parameter to override a path variable that has been specified in the Path Variables view. You can specify this parameter multiple times, once for each path variable override. For example: 

```
ISCmdBld.exe -l VariableName="C:\Path" -l VariableName2="C:\Path2"
```

To reference a file in a sibling project that is within the same Visual Studio solution folder, use the predefined path variable called VSSolutionFolder. For more information, see [Using the VSSolutionFolder Path Variable with Visual Studio Solutions](#).

| -licCheckTimeOut <seconds> | Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI | Use this parameter to set the time period to check the availability of the license from the license server.

For example, in the following command line, IsCmdBld waits for the license availability in the configured license server for the 40 secs and checks the availability in 15 secs intervals. If the license is available before 40 secs, then the build continues with the available license else the build fails with the existing reason (failed to get the license).

```
ISCmdBld.exe -p "C:\InstallShield 2021 projects\TestProj.ism" -licCheckTimeOut 40
```

| -m <.cub file name> | Basic MSI, InstallScript MSI, Merge Module | Use this parameter if you want to validate the installation or merge module package after it is built. Pass the path of the .cub file name with this parameter.

Absolute and relative paths are acceptable. To use multiple .cub files, separate each path with a semicolon (;). Enclose long file names in quotation marks.

For example, in the following command line, the -m parameter indicates that validation should be performed with the InstallShield Validation Suite for Windows 7 (ISWin7.cub) and the Full MSI Validation Suite (darice.cub): 

```
ISCmdBld.exe -m ".\Support\Validation\ISWin7.cub;..\Support\Validation\darice.cub"
```
-n
Specify this parameter if you do not want Setup.rul to be compiled as part of the build process.

Note that if you are building from the command line and specifying an .ini file with the build settings, you can specify the following in the [Project] section of the .ini file, instead of adding the -n command line build flag:

[Project]
CompileScript=No

Like the command-line build flag, this CompileScript keyword helps you specify whether Setup.rul should be compiled as part of the build process.

Note • The -n parameter cannot be used with the -q3 parameter.

-o <merge module search path>
This parameter specifies one or more comma-delimited folders that contain the merge module files (.msm) that are referenced by your project.

InstallShield provides additional ways for specifying the folders that contain merge modules. For more information, see Specifying the Directories that Contain Merge Modules.

-p <project location>
Pass the path to the project (.ism) file. This path can be fully qualified, relative, or just the file name. If only the project file name is passed, the file is retrieved relative to the current working directory. For example:

ISCmdBld.exe -p "C:\InstallShield 2021 Projects\MyProject1\MyProject1.ism"

UNC paths are also acceptable. Enclose long file names in quotation marks.

This is the only required parameter.

-patch_config <patch configuration>
Use this parameter to build a standard patch. Pass the name of the patch configuration in the Patch Design view that you want to build. For example, the following command line builds the patch configuration called Version 1.2 in the MyProject1.ism project:

ISCmdBld.exe -p "C:\InstallShield 2021 Projects\MyProject1\MyProject1.ism" -patch_config "Version 1.2"
### Table 6 • ISCmdBld.exe Command-Line Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-prqpath</code> <code>&lt;InstallShield prerequisite search path&gt;</code></td>
<td>Basic MSI, InstallScript, InstallScript MSI</td>
<td>This parameter specifies one or more comma-delimited folders that contain the InstallShield prerequisite files (.prq) that are referenced by your project. InstallShield provides additional ways for specifying the folders that contain InstallShield prerequisite files. For more information, see Specifying the Directories that Contain InstallShield Prerequisites.</td>
</tr>
<tr>
<td><code>-q1</code></td>
<td>Basic MSI, InstallScript MSI, Merge Module</td>
<td>Builds only the Windows Installer tables for your release. If you have not built this installation already, a new .msi file is created, but no files are added to your installation. If you have built your installation already, the .msi file is updated when all the tables are built, but, again no files are transferred. Ideally, this option is to be used to test the user interface of your installation. <strong>Note</strong> • <em>The <code>-q1</code> parameter cannot be used with the <code>-q2</code> or <code>-q3</code> parameters.</em></td>
</tr>
<tr>
<td><code>-q2</code></td>
<td>Basic MSI, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>For Basic MSI, InstallScript MSI, and Merge Module projects: Builds the Windows Installer tables and refreshes files. This option rebuilds your .msi file and updates the Files table, including any new or changed files in your installation. Changed files are updated only if the size or time stamp differs from the copy already included in the build. References to deleted files are removed from the installation, but the file remains in the build location. This type of build can be run only after a complete build has been performed, and it works only when the media is an uncompressed network image. For InstallScript and InstallScript Object projects: Rebuilds only those portions of the release that have changed since the last build. If this parameter is not used, the entire file media library is rebuilt. <strong>Note</strong> • <em>The <code>-q2</code> parameter cannot be used with the <code>-q1</code> or <code>-q3</code> parameters.</em></td>
</tr>
</tbody>
</table>
### Table 6 - ISCmdbld.exe Command-Line Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>-q3</strong></td>
<td>Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>Compiles only Setup.rul. For Basic MSI projects, this parameter also streams ISSetup.dll into the Binary table of the .msi package, if one was previously built.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> The -q3 parameter cannot be used with the -q2 or -q3, or -n parameters.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> This parameter does not upgrade the project. If your project was created with InstallShield Developer 8 or earlier, you should upgrade it to the latest version of InstallShield before using -q3. For example, use -u to upgrade.</td>
</tr>
<tr>
<td><strong>-r &lt;release name&gt;</strong></td>
<td>Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI</td>
<td>The release name as specified in the Releases view. You can use an existing release name or create a new one. Although this parameter is not required, you should include it if you are including -a, the parameter for product configurations.</td>
</tr>
<tr>
<td><strong>-s</strong></td>
<td>Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>This parameter enables you to build your release in silent mode. Silent builds are useful if you want to run the build without displaying any errors or warning messages. This parameter is optional.</td>
</tr>
<tr>
<td><strong>-se or -SE</strong></td>
<td>Basic MSI, InstallScript, InstallScript MSI, Suite/Advanced UI, QuickPatch, Merge Module</td>
<td>This parameter allows you to run the build without displaying any information except error messages. Use this parameter to build and get only build errors (errors, fatal errors, and validation errors). This parameter is optional.</td>
</tr>
</tbody>
</table>
### Table 6 - ISCmdBld.exe Command-Line Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-t &lt;Microsoft .NET Framework path&gt;</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Regasm.exe and InstallUtilLib.dll are utilities that are included with each version of the .NET Framework. This parameter specifies the path for the directory that contains the installed 32-bit version of these files that you want to use at build time for releases that include .NET installer classes and COM interop. This is not the path to .NET Framework redistributable files.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note • If you are using InstallShield on a 64-bit system, ISCmdBld.exe determines the location of the corresponding 64-bit version of the .NET Framework based on the path that you specify for this parameter, and ISCmdBld.exe uses the 64-bit location of Regasm.exe and InstallUtilLib.dll when appropriate.</td>
</tr>
<tr>
<td>-u</td>
<td>Basic MSI</td>
<td>This parameter enables you to upgrade—but not build—your release. You can use this parameter to upgrade an installation project that you created using InstallShield—Windows Installer Edition version 2.03 or earlier.</td>
</tr>
<tr>
<td>-v</td>
<td>Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI</td>
<td>This parameter enables you to create a verbose build log file that may be useful if Revenera Support is helping you troubleshoot an issue with your installation.</td>
</tr>
<tr>
<td>-w</td>
<td>Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>This parameter treats warnings that occur during the build process as errors. Each warning increments the error count by one.</td>
</tr>
<tr>
<td>-x</td>
<td>Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module</td>
<td>If you want the build to stop when it encounters an error, use the -x parameter. If you want the build to stop when it encounters a warning, use this parameter in conjunction with the -w parameter.</td>
</tr>
</tbody>
</table>
### Table 6 • ISCmdBld.exe Command-Line Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| `-y <product version>` | Advanced UI, Basic MSI, InstallScript MSI, Merge Module, Suite/Advanced UI | This parameter enables you to specify a product version from the command line. This is especially helpful if you want to increment the build version (the third field) of the product version. For example, to set the product version to 1.0.5:  
    ISCmdBld.exe -y "1.0.5"  
    For information on valid product version numbers, see Specifying the Product Version.  
    This parameter is optional. |
| `-z <property name=property value>` | Advanced UI, Basic MSI, InstallScript MSI, Merge Module, Suite/Advanced UI | In Basic MSI, InstallScript MSI, and Merge Module projects, this parameter enables you to override the value of a Windows Installer property. In Advanced UI and Suite/Advanced UI projects, this parameter enables you to override the value of an Advanced UI or Suite/Advanced UI property.  
    For example, to set the value of the property called `PropertyName` to `PropertyValue`, use the following command line:  
    ISCmdBld.exe -z `PropertyName=PropertyValue`  
    If you want to set the value to a string that includes one or more spaces, use quotation marks; for example, to set the value of the property called `PropertyName` to `My Property Value`, use the following command line:  
    ISCmdBld.exe -z "PropertyName=My Property Value"  
    If you specify a property that does not exist in the Property table, InstallShield creates the property in the installation that it builds.  
    If you specify both the `-y` parameter to override the product version, and the `-z` parameter to override the `ProductVersion` property, InstallShield uses the value specified for the `-y` parameter.  
    This parameter is optional. |
| `cert_password` | Advanced UI, Basic MSI, InstallScript, InstallScript MSI, InstallScript Object, Merge Module, Suite/Advanced UI | This parameter specifies the digital certificate password, this is an optional parameter. If it is not specified, the password configured in the project is used to sign the files. |
ISBuild.exe

*Project* • *This information applies to InstallScript projects.*

ISBuild.exe is a command-line tool that is available for legacy InstallScript projects. The following parameters are associated with ISBuild.exe:

**Table 7 • Command-Line Parameters for ISBuild.exe**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-p &lt;project file&gt;</td>
<td>This specifies the fully qualified path and file name of the project file. By default, the project file is in the following location:</td>
</tr>
<tr>
<td></td>
<td>C:\InstallShield 2021 Projects\Project Name\Project File</td>
</tr>
<tr>
<td></td>
<td>This parameter should be enclosed in quotation marks.</td>
</tr>
<tr>
<td>-m &lt;media name&gt;</td>
<td>This specifies the media name for the media that will be built. This parameter should be enclosed in quotation marks.</td>
</tr>
<tr>
<td>-b &lt;build location&gt;</td>
<td>This specifies the fully qualified path to the folder where you want the output folders and files to be placed. This parameter is optional.</td>
</tr>
<tr>
<td>-s</td>
<td>This runs ISBuild.exe in silent mode. This parameter is optional.</td>
</tr>
<tr>
<td>-r</td>
<td>This indicates that the media should refresh the build. The default is a complete rebuild. This parameter is optional.</td>
</tr>
</tbody>
</table>

IISscan.exe

*Edition* • *The ability to import IIS data into an InstallShield project is available only in the Premier edition of InstallShield.*

The IIS scanner (IISscan.exe) is a tool that scans an IIS Web site and records the values of the settings that you can configure in the Internet Information Services view in InstallShield. IISscan.exe creates an XML file that contains all of the values. You can use this XML file to import the values into the Internet Information Services view. Then you can modify the settings as needed.

When you use IISscan.exe to scan a Web site, you must place the IISscan.exe file on the machine that contains the IIS Web site.

*Note* • IISscan.exe requires administrative privileges. Therefore, you may need to launch it from an elevated Command Prompt window.

IISscan.exe is installed in the following location:
InstallShield Program Files Folder\System

Syntax

iisscan.exe -website "Site Name" -outfile "C:\PathToFile\FileName.xml"

Parameters

Table 8 • Command-Line Parameters for IIScan.exe

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-website</td>
<td>Specify the name of the Web site on the IIS server that you want to scan.</td>
</tr>
<tr>
<td>-outfile</td>
<td>Specify the full path and name of the XML file that you want the scanner to create. This parameter is optional. If you do not pass this parameter, the IIS scanner records the IIS settings in a file called iisscan.xml in the same directory that contains the IIS scanner.</td>
</tr>
</tbody>
</table>

Tip • InstallShield lets you configure filters if you want to prevent certain IIS data—such as Web sites, applications, virtual directories, application pool, or any of their settings—from ever being imported into the Internet Information Services view. To learn more, see Filtering IIS Data When Importing a Web Site and Its Settings into an InstallShield Project.

iSign.exe

Project • This information applies to the following project types:
- InstallScript
- InstallScript Object

Use the command-line tool iSign.exe to digitally sign a release of an InstallScript project from the command line after you have built the release.

iSign.exe is in the following directory:
InstallShield Program Files Folder\System

iSign.exe lets you choose between the following options:
- You can specify the .pfx certificate file on your machine that you want to use for signing.
- You can reference a certificate store that contains the certificate that you want to use for signing.

Syntax

iSign.exe [options] PathToData1.hdrFile

For example, for signing with a .pfx file:
iSign.exe -pfx "C:\Temp\MyFile.pfx" -p "Password" "C:\InstallShield 2021\MyProject\Media\Release 1\Disk Images\Disk1\data1.hdr"

For signing with a certificate in a certificate store:

iSign.exe -store "Root" -sl "Machine" ss "My Certificate" "C:\InstallShield 2021\MyProject\Media\Release 1\Disk Images\Disk1\data1.hdr"

**Command-Line Parameters**

Following is a list of the parameters that you can use with iSign.exe. Note that some are available only if you are using a .pfx file, and some are available only if you are using a certificate in a certificate store.

**Table 9 • Command-Line Parameters for iSign.exe**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Signing Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-pfx &lt;path to .pfx file&gt;</td>
<td>.pfx file</td>
<td>Specify the fully qualified path to the .pfx file that contains the certificate that you want to use to sign your release.</td>
</tr>
</tbody>
</table>
| -p <password>     | .pfx file          | If the .pfx file that you are using has a password, specify it with this parameter.  
|                   |                    | If your certificate is protected by a password but you do not enter it for this parameter, signing with a .pfx file fails. |
| -store <store name> | certificate in certificate store | Specify the name of the certificate store that contains the certificate that you want to use. Available options are:  
|                   |                    | • My  
|                   |                    | • Root  
|                   |                    | • Trust  
|                   |                    | • CA  |
| -sl <store location> | certificate in certificate store | Specify the location of the certificate store that contains the certificate that you want to use. Available options are:  
|                   |                    | • User  
|                   |                    | • Machine  |
| -ss <subject>     | certificate in certificate store | Specify the subject of the certificate that you want to use. This parameter is applicable if the certificate is in a certificate store. |

**Note** • *This parameter is not applicable if the certificate that you are using for signing is in a certificate store. Note that if the certificate was imported into the store with password protection, you will be prompted to enter the password while signing with iSign.exe.*
ReleasePackager.exe

**Project** • *This information applies to InstallScript projects.*

Use ReleasePackager.exe to build a self-extracting executable file from the command line. This can be useful if you are building from a batch file.

ReleasePackager.exe is installed in the following location:

*InstallShield Program Files Folder\System*

**Syntax**

ReleasePackager.exe "disk_images_folder" "package_file" ["icon_file" [icon_index]]
### Parameters

**Table 10 • Command-Line Parameters for ReleasePackager.exe**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>disk_images_folder</strong></td>
<td>This optional parameter specifies the folder that contains the disk images to be incorporated in the self-extracting executable file. A typical value is: C:\InstallShield 2021 Projects\ProjectName\Media\ReleaseName\Disk Images</td>
</tr>
<tr>
<td><strong>package_file</strong></td>
<td>This parameter specifies the fully qualified name of the self-extracting executable file. A typical value is: C:\InstallShield 2021 Projects\ProjectName\Media\ReleaseName\Package\PackageName.exe</td>
</tr>
<tr>
<td><strong>icon_file</strong></td>
<td>This optional parameter specifies the fully qualified name of the file that contains the icon you want to use for your self-extracting executable file.</td>
</tr>
<tr>
<td><strong>icon_index</strong></td>
<td>This optional parameter specifies the numeric index of the icon from <em>icon_file</em> that you want to use for your self-extracting executable file. If you do not specify an index, the icon at index 0 is used.</td>
</tr>
<tr>
<td><strong>-s</strong></td>
<td>This optional parameter is available for running ReleasePackager.exe in silent mode. To pass this parameter to ReleasePackager.exe, the syntax is as follows: ReleasePackager.exe &quot;disk_images_folder&quot; &quot;package_file&quot; [&quot;icon_file&quot; [icon_index]] -s</td>
</tr>
</tbody>
</table>

Note that the `-s` parameter must be specified after the other parameters. If you do not want to specify an icon file or icon index, you must specify the default values of a null string (""") for the icon file and 0 for the icon index.

### Example

ReleasePackager.exe "C:\InstallShield 2021 Projects\My Project\Media\My Release\Disk Images" "C:\InstallShield 2021 Projects\My Project\Media\My Release\Package\MyPackage.exe" "C:\My Icon Files\MyIcons.dll" 2 -s

### SetupIni.exe

**Project • This information applies to the following project types:**

- Basic MSI
- InstallScript MSI

SetupIni.exe is a command-line tool that enables you to modify a Setup.ini file that is embedded in a Setup.exe or Update.exe file. Setup.ini is an initialization file that is created during the build process of installation projects to control certain elements of the installation.

SetupIni.exe is installed in the following location:
InstallShield Program Files Folder\System

Syntax

SetupIni.exe PathToSetup.exe Section Key Value

Parameters

Table 11 • Command-Line Parameters for SetupIni.exe

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PathToSetup.exe</td>
<td>Specify the path and file name to the Setup.exe file that contains the Setup.ini file that you want to modify.</td>
</tr>
<tr>
<td></td>
<td>If the path contains spaces, enclose it within quotation marks.</td>
</tr>
<tr>
<td>Section</td>
<td>Specify the name of the section that you want to modify.</td>
</tr>
<tr>
<td>Key</td>
<td>Specify the name of the key whose value you want to set.</td>
</tr>
<tr>
<td>Value</td>
<td>Specify the value that you want to use for the specified key.</td>
</tr>
<tr>
<td></td>
<td>If the value contains spaces, enclose it within quotation marks.</td>
</tr>
</tbody>
</table>

Example

SetupIni.exe "C:\InstallShield 2021 Projects\My Project\Media\My Release\Package\MySetup.exe" Startup CmdLine MYPROPERTY="MyValue"

MsiExec.exe Command-Line Parameters

MsiExec.exe is the executable program of the Windows Installer used to interpret installation packages and install products on target systems. After you build your release, you can install your Windows Installer package (.msi) from the command line.

Your Windows Installer package can be accessed from the folder that contains your built release. The default location is as follows:

C:\InstallShield 2021 Projects\ProjectName\ReleaseName\DiskImages\Disk1\ProductName.msi

After building a release of your product, you can install it from the command line:

msiexec /i "C:\InstallShield 2021 Projects\ProjectName\ReleaseName\DiskImages\Disk1\ProductName.msi"
The table below provides a detailed description of `MsiExec.exe` command-line parameters.

**Table 12 • MsiExec.exe Command-Line Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>/i &lt;package&gt; or &lt;product code&gt;</code></td>
<td>Use this format to install the product Othello:</td>
</tr>
<tr>
<td></td>
<td><code>mssieexec /i &quot;C:\InstallShield 2021 Projects\Othello\Trial Version\Release\DiskImages\Disk1\Othello Beta.msi&quot;</code></td>
</tr>
<tr>
<td></td>
<td>Product Code refers to the GUID that is automatically generated in the Product Code property of your product’s project view.</td>
</tr>
</tbody>
</table>

| `/f [p|o|d|c|a|u|m|s|v] <package> or <product code>` | Installing with the `/f` option will repair or reinstall missing or corrupted files. |
|-----------------------------------------------|-----------------------------------------------------------------------------------|
| For example, to force a reinstall of all files, use the following syntax: | `mssieexec /fa "C:\InstallShield 2021 Projects\Othello\Trial Version\Release\DiskImages\Disk1\Othello Beta.msi"` |
| Use the aforementioned syntax in conjunction with the following flags: |                                                                                   |
| • `p` reinstalls a file if it is missing        |                                                                                   |
| • `o` reinstalls a file if it is missing or if an older version of the file is present on the user’s system |                                                                                   |
| • `e` reinstalls a file if it is missing or if an equivalent or older version of the file is present on the user’s system |                                                                                   |
| • `c` reinstalls a file if it is missing or if the stored checksum of the installed file does not match the new file’s value |                                                                                   |
| • `a` forces a reinstall of all files          |                                                                                   |
| • `u` or `m` rewrite all required user registry entries |                                                                                   |
| • `s` overwrites any existing shortcuts        |                                                                                   |
| • `v` runs your application from the source and re-caches the local installation package |                                                                                   |

| `/a <package>` | The `/a` option allows users with administrator privileges to install a product onto the network. |
For InstallScript MSI projects in which the InstallScript UI style is the new style (which uses the InstallScript engine as an embedded UI handler): If you try to uninstall the product through the command line using the statement Msiexec.exe /x {ProductCode}, the uninstallation may be successful. However, the Windows Installer displays an error dialog near the end of the uninstallation. The error dialog indicates that the Windows Installer service could not be accessed.

To perform an uninstallation from the command line in this scenario, the current recommended method is to use one of the following:

msiexec.exe /i {ProductCode} REMOVE=ALL
msiexec.exe /x {ProductCode} /qn

This is not necessary if your InstallScript MSI project is using the traditional style for the InstallScript UI (which uses the InstallScript engine as an external UI handler).

To learn more, see Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/x &lt;package&gt; or &lt;product code&gt;</td>
<td>The /x option uninstalls a product.</td>
</tr>
<tr>
<td>/j [u</td>
<td>m] &lt;package&gt;</td>
</tr>
<tr>
<td>/j [u</td>
<td>m] &lt;package&gt; /t &lt;transform list&gt;</td>
</tr>
<tr>
<td>/j [u</td>
<td>m] &lt;package&gt; /g</td>
</tr>
<tr>
<td>/j &lt;language ID&gt;</td>
<td>• g specifies language ID</td>
</tr>
<tr>
<td></td>
<td>• t applies a transform to your advertised product</td>
</tr>
</tbody>
</table>

Transforms allow the synchronization of applications across different languages. For example, if you upgrade the English version of your product, you could apply a transform to automatically upgrade the French version of your product.
Use the `/L` option to specify the path to the log file. Optionally include one or more of the following flags to indicate which information to record in the log file:

- `i` logs status messages.
- `w` logs non-fatal warning messages.
- `e` logs any error messages.
- `a` logs the commencement of action sequences.
- `r` logs action-specific records.
- `u` logs user requests.
- `c` logs initial user interface parameters.
- `m` logs out-of-memory messages.
- `o` logs out-of-disk-space messages.
- `p` logs all of the properties and their values at the end of the installation.
- `v` logs verbose output.
- `x` logs extra debugging information.
- `+` appends the information to an existing log file.
- `!` flushes each line to the log.
- `*` is a wild-card character that enables you to log all information (excluding the verbose output that `v` provides and the extra debugging information that `x` provides).

For example, to generate a log file that logs everything verbosely, use the following:

```bash
/L*v "C:\MyLogFiles\package.log"
```

### Table 12 • MsiExec.exe Command-Line Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>/L[iwaeurcmopvx+!*]</code> &lt;log file&gt;</td>
<td>Use the <code>/L</code> option to specify the path to the log file. Optionally include one or more of the following flags to indicate which information to record in the log file:</td>
</tr>
<tr>
<td></td>
<td>- <code>i</code> logs status messages.</td>
</tr>
<tr>
<td></td>
<td>- <code>w</code> logs non-fatal warning messages.</td>
</tr>
<tr>
<td></td>
<td>- <code>e</code> logs any error messages.</td>
</tr>
<tr>
<td></td>
<td>- <code>a</code> logs the commencement of action sequences.</td>
</tr>
<tr>
<td></td>
<td>- <code>r</code> logs action-specific records.</td>
</tr>
<tr>
<td></td>
<td>- <code>u</code> logs user requests.</td>
</tr>
<tr>
<td></td>
<td>- <code>c</code> logs initial user interface parameters.</td>
</tr>
<tr>
<td></td>
<td>- <code>m</code> logs out-of-memory messages.</td>
</tr>
<tr>
<td></td>
<td>- <code>o</code> logs out-of-disk-space messages.</td>
</tr>
<tr>
<td></td>
<td>- <code>p</code> logs all of the properties and their values at the end of the installation.</td>
</tr>
<tr>
<td></td>
<td>- <code>v</code> logs verbose output.</td>
</tr>
<tr>
<td></td>
<td>- <code>x</code> logs extra debugging information.</td>
</tr>
<tr>
<td></td>
<td>- <code>+</code> appends the information to an existing log file.</td>
</tr>
<tr>
<td></td>
<td>- <code>!</code> flushes each line to the log.</td>
</tr>
<tr>
<td></td>
<td>- <code>*</code> is a wild-card character that enables you to log all information (excluding the verbose output that <code>v</code> provides and the extra debugging information that <code>x</code> provides).</td>
</tr>
</tbody>
</table>

For example, to generate a log file that logs everything verbosely, use the following:

```
/L*v "C:\MyLogFiles\package.log"
```

<table>
<thead>
<tr>
<th><code>/p &lt;patch package&gt;</code></th>
<th>Use the <code>/p</code> option to apply a patch to an installed product. To patch an installed administrative image, combine this option with <code>/a</code> as shown:</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>/p PatchPackage /a Package</code></td>
<td>Use the <code>/p</code> option to apply a patch to an installed product. To patch an installed administrative image, combine this option with <code>/a</code> as shown:</td>
</tr>
</tbody>
</table>

```
/p PatchPackage /a Package
```
### Table 12 • MsiExec.exe Command-Line Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| /q [n|b|r|f] | The `/q` option is used to set the user interface level in conjunction with the following flags:  
  * `/q` or `/qn` creates no user interface  
  * `/qb` creates a basic user interface  
The following user interface settings display a modal dialog box at the end of installation:  
  * `/qr` displays a reduced user interface  
  * `/qf` displays a full user interface  
  * `/qn+` displays no user interface  
  * `/qb+` displays a basic user interface |
| /? or /h | Either command displays Windows Installer copyright information |
| /y <file name> | This command calls the DllRegisterServer entry-point function of the DLL or OCX file specified in `<file name>`. |
| /z <file name> | This command calls the DllUnregisterServer entry-point function of the DLL or OCX file specified in `<file name>`. |
| /n {product code} | The `/n` `{product code}` option is available for patches that are created in the Patch Design view for Basic MSI projects that support the installation of multiple instances of a product.  
  Use the `/n` option with the `/p` option to specify the product code of the instance to which you want to apply a patch. For example:  
  ```msiexec /p mypatch.msp /n {00000001-0002-0000-0000-624474736554}``` |
| TRANSFORMS | Use the TRANSFORMS command-line parameter to specify any transforms that you would like applied to your base package. Your transform command-line call might look something like this:  
  ```msiexec /i "C:\InstallShield 2021 Projects\Othello\Trial Version\Release\DiskImages\Disk1\Othello.msi" TRANSFORMS="New Transform 1.mst"```  
  You can separate multiple transforms with a semicolon. Because of this, it is recommended that you do not use semicolons in the name of your transform because the Windows Installer service will interpret those incorrectly. |
**Setup.exe and Update.exe Command-Line Parameters**

Setup.exe can accept a number of command-line parameters. Update.exe (available only for Basic MSI and InstallScript MSI projects) accepts nearly all of the same command-line parameters. Using these parameters, end users can specify such data as the language that the installation should run in and whether to launch Setup.exe silently. For Basic MSI and InstallScript MSI, end users can also pass parameters through Setup.exe to the included .msi file.

**Note** • Command-line options that require a parameter must be specified with no space between the option and its parameter. For example, Setup.exe /v"ALLUSERS=2" is valid, while Setup.exe /v "ALLUSERS=2" is not. Quotation marks around an option’s parameter are required only if the parameter contains spaces. If a path within a parameter contains spaces, you may need to use quotation marks within quotation marks, as in the following example:

```
Setup.exe /v"INSTALLDIR="c:\My Files\"
```

**Project** • Some of the command-line options apply to only certain project types. Project-specific information is listed for each option.

**Built-In Command-Line Parameters**

This section describes valid command-line parameters for Setup.exe. The parameters are organized into the following categories:

- Silent Installations
- Special Installation Modes
- Passing Data to the Installation
- Download and Cache Locations (Basic MSI and InstallScript MSI Projects)
- Debugging
- SMS Data
- Minimum UI
- Miscellaneous
### Silent Installations

#### Table 13 • Parameters for Silent Installations

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/p&quot;password&quot;</td>
<td>Basic MSI, InstallScript MSI</td>
<td>If you configured the password-related settings for your release on the Setup.exe tab in the Releases view, the end user must specify the password with the /p option when running the installation silently. A typical command is as follows: Setup.exe /s /p&quot;password&quot;</td>
</tr>
<tr>
<td>/r</td>
<td>InstallScript, InstallScript MSI</td>
<td>Use this command line to run the installation in record mode. In order to run an InstallScript MSI or InstallScript installation in silent mode, you must first run Setup.exe with the /r option to generate a response file, which stores information about the data entered and options selected by the user at run time. Launching an InstallScript MSI or InstallScript installation with the /r parameter displays all the run-time dialogs and stores the data in a file called Setup.iss, created inside the system's Windows folder. To specify an alternative response file name and location, use the /f1 option, described below. Basic MSI projects do not create or use a response file for silent installations.</td>
</tr>
</tbody>
</table>
For an InstallScript MSI or InstallScript project, the command `Setup.exe /s` runs the installation in silent mode, by default based on the responses contained in a response file called `Setup.iss` in the same directory. (Response files are created by running `Setup.exe` with the `/r` option.) To specify an alternative file name or location of the response file, use the `/f1` option.

The command `Setup.exe /s` also suppresses the `Setup.exe` initialization dialog for a Basic MSI installation, but it does not read a response file. To run a Basic MSI installation silently, use the following command line:

```
Setup.exe /s /v/qn
```

To specify the values of public properties for a silent Basic MSI installation, you can use a command such as the following one:

```
Setup.exe /s /v"/qn INSTALLDIR=D:\Destination"
```

**Note** • Using this command-line parameter to launch an installation that includes an InstallShield prerequisite does not automatically run the prerequisite installation silently. You may also need to specify a valid silent command-line parameter for the InstallShield prerequisite in the **Specify the command line for the application when the setup is running in silent mode** setting on the **Application to Run** tab in the InstallShield Prerequisite Editor.

**For more information, see** Specifying Command-Line Parameters for an InstallShield Prerequisite.

Using the `/f1` option enables you to specify where the response file is (or where it should be created) and what its name is, as in the following example:

```
Setup.exe /s /f1"C:\Temp\Setup.iss"
```

Specify an absolute path; using a relative path gives unpredictable results. The `/f1` option is available both when creating a response file (with the `/r` option) and when using a response file (with the `/s` option).
Table 13 • Parameters for Silent Installations (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/f2</td>
<td>InstallScript,</td>
<td>When running an InstallScript MSI or InstallScript installation in silent mode (using the /s option), the log file Setup.log is by default created in the same directory and with the same name (except for the extension) as the response file. The /f2 option enables you to specify an alternative log file location and file name, as in the following example: Specify an absolute path; using a relative path gives unpredictable results.</td>
</tr>
</tbody>
</table>
## Special Installation Modes

### Table 14 • Parameters for Special Installation Modes

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>/a</code></td>
<td>Basic MSI, InstallScript MSI</td>
<td>The <code>/a</code> parameter does not work with <code>Update.exe</code>. <code>Update.exe</code> launches a patch that accesses and modifies an existing cached <code>.msi</code> file on the system, and an administrative installation does not cache the <code>.msi</code> file. The <code>/a</code> option causes <code>Setup.exe</code> to perform an administrative installation. An administrative installation copies (and uncompresses) your data files to a directory that is specified by the user, but it does not create shortcuts, register COM servers, or create an uninstallation log. <strong>Tip</strong> • If an installation contains InstallShield prerequisites and you want to extract them from <code>Setup.exe</code>, add a path after the <code>/a</code> parameter to extract the prerequisites to that location. A sample command is <code>Setup.exe /a&quot;C:\temp&quot;</code>.</td>
</tr>
<tr>
<td><code>/j</code></td>
<td>Basic MSI, InstallScript MSI</td>
<td>The <code>/j</code> option causes <code>Setup.exe</code> to perform an advertised installation. An advertised installation creates shortcuts, registers COM servers, and registers file types, but does not install your product’s files until the user invokes one of these “entry points.”</td>
</tr>
<tr>
<td><code>/x</code></td>
<td>Basic MSI, InstallScript MSI</td>
<td>The <code>/x</code> option causes <code>Setup.exe</code> to uninstall a previously installed product.</td>
</tr>
</tbody>
</table>
### Table 14 • Parameters for Special Installation Modes (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| /uninst   | InstallScript, InstallScript MSI | Important • This parameter does not apply to InstallScript MSI projects in which the InstallScript UI style is the new style (which uses the InstallScript engine as an embedded UI handler). To learn more, see Using the InstallScript Engine as an External vs. Embedded UI Handler for InstallScript MSI Installations.

The /uninst option is provided for compatibility with earlier versions of InstallShield. This option causes the InstallScript engine to execute the event handler function OnUninstall, whose default code uninstalls the previously installed product.

Project • Note that in InstallScript MSI installations, the /uninst parameter does not invoke the InstallScript engine uninstall behavior that processes install log and removes any resources that were created and logged through script. However, the /removeonly option does invoke this behavior.

| /removeonly | InstallScript, InstallScript MSI | The /removeonly option sets the REMOVEONLY system variable equal to a non-zero value. The default code for the OnMaintUIBefore event handler function conditionally displays the SdWelcomeMaint dialog, depending on the value of REMOVEONLY. |
The `/instance=<InstanceId>` option—which is available for Basic MSI projects that support the installation of multiple instances of a product—lets you specify which instance you want to install, update, or uninstall. `<InstanceId>` represents the value of the `InstanceId` property that identifies the instance. Whenever you use this option and include a valid `InstanceId` value, the installation suppresses the instance selection dialog.

For example, the following sample command line installs the instance that has 2 as the value of the `InstanceId` property:

```
Setup.exe /instance=2
```

Use `default` to identify the instance that is installed by the base installation package, as in the following example:

```
Setup.exe /instance=default
```

To specify the instance that you want to uninstall, include the `/x` option with the `/instance=<InstanceId>` option.

For more information, see Naming an Instance and Run-Time Behavior for Installing Multiple Instances of a Product.

### Passing Data to the Installation

#### Table 15 • Parameters for Passing Data to the Installation

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/v</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Use the /v option to pass command-line options and values of public properties through to Msiexec.exe. If you want to pass more than one argument to Msiexec.exe, you can use the /v option multiple times at the command line, once for each argument. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Setup.exe /v&quot;/l*v c:\test.log&quot; /v&quot;MYPROPERTY1=value1&quot; /v&quot;/qb&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>As an alternative, you can pass multiple arguments through the /v option as in the following example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Setup.exe /v&quot;/l*v c:\test.log MYPROPERTY1=value1 /qb&quot;</td>
</tr>
<tr>
<td>Note</td>
<td>If you pass the /v parameter at the command prompt when launching Setup.exe, any parameters that are specified for the CmdLine keyname in Setup.ini are ignored. To learn more, see Setup.ini.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>/v&quot;ISSCRIPTCMDLINE=&quot;&lt;Option1&gt;&lt;Option2&gt;&quot;&quot;</th>
<th>Basic MSI projects that have InstallScript custom actions</th>
<th>This option specifies command-line parameters to be passed to the script. Any property supported by InstallScript MSI (where appropriate) can be specified. (The most common ones are /d and /z.) For example, the following indicates that you want to debug the script, and that the CMDLINE variable should contain TEST.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Setup.exe /v&quot;ISSCRIPTCMDLINE=&quot;-d -zTEST&quot;&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note that as shown above, when you want to specify that a double quote character is not a delimiter for the command line but a delimiter for the property, use &quot;. Note also that as with any public Windows Installer property, this property should be specified with all uppercase letters.</td>
</tr>
</tbody>
</table>
The `/z` option is used to pass data to the InstallScript system variable CMDLINE, as in the following example:

```
Setup.exe /"My Custom Data"
```

When this command line is used, the variable `CMDLINE` contains the string `My Custom Data`.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| /z        | InstallScript MSI | The `/z` option is used to pass data to the InstallScript system variable CMDLINE, as in the following example: 
```
Setup.exe /"My Custom Data"
```

When this command line is used, the variable `CMDLINE` contains the string `My Custom Data`. |
Download and Cache Locations (Basic MSI and InstallScript MSI Projects)

Table 16 • Parameters for Download and Cache Locations

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/ua</td>
<td>Basic MSI, InstallScript MSI</td>
<td>In the Release Wizard, you can specify download locations for the Windows Installer installers InstMsiA.exe and InstMsiW.exe. A user can specify an alternative URL at run time using the /ua option (for the InstMsiA.exe location) and /uw option (for the InstMsiW.exe location), as in the following example: Setup.exe /uw&quot;<a href="http://www.otherlocation.com/engines">http://www.otherlocation.com/engines</a>&quot; The file name is not necessary.</td>
</tr>
<tr>
<td>/uw</td>
<td>Basic MSI, InstallScript MSI</td>
<td>Note • You must specify the full URL with the parameters.</td>
</tr>
<tr>
<td>/um</td>
<td>Basic MSI, InstallScript MSI</td>
<td>In the Release Wizard, for a Web Downloader build, you can specify a download location for your .msi database. A user can specify an alternative URL using the /um option, as in the following example: Setup.exe /um&quot;<a href="http://www.otherlocation.com/packages/product.msi">http://www.otherlocation.com/packages/product.msi</a>&quot; Note • You must specify the full URL with the parameter.</td>
</tr>
<tr>
<td>/b</td>
<td>Basic MSI, InstallScript MSI</td>
<td>In the Release Wizard, for a Downloader build, you can specify whether to cache the contents of a compressed package on the local system. With the /b option, the user can specify the directory in which to cache the installation files, as in the following example: Setup.exe /b&quot;C:\CacheDirectory&quot; Note • You must specify the full URL with the parameter.</td>
</tr>
</tbody>
</table>
Debugging

Table 17 • Parameters for Debugging

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/d</td>
<td>Basic MSI projects with InstallScript custom actions, InstallScript, InstallScript MSI</td>
<td>For an InstallScript project, running the command <code>Setup.exe /d</code> runs the installation program with the InstallScript Debugger.</td>
</tr>
</tbody>
</table>

**Note** • Debugging InstallScript code requires the debug-information file `Setup.dbg` to be available. In addition, in order to debug an installation on a system other than your development machine, you need to copy certain files from your development machine to the debugging machine. To learn more, see Debugging an Installation on Any Computer.

For a Basic MSI project, the following command runs your InstallScript custom actions in the InstallScript Debugger:

```
Setup.exe /v"ISSCRIPTDEBUG=1 ISSCRIPTDEBUGPATH="path-to-Setup.dbg"
```
The `/debuglog` parameter lets you generate a log file for `Setup.exe`. To generate a log named `InstallShield.log` in the same directory as the `Setup.exe` file, pass just the command-line parameter. Note that this does not work if the `Setup.exe` file is in a read-only location. For example:

`setup.exe /debuglog`

To specify the name and location of the log file, pass the path and name, as in the following example:

`Setup.exe /debuglog"C:\PathToLog\setupexe.log"`

To generate a log file for the feature prerequisites in the installation, use the `/v` parameter to set the `ISDEBUGLOG` property to the full path and file name for the log file, as follows:

`Setup.exe /debuglog"C:\PathToSetupLogFile\setup.log" /v"ISDEBUGLOG=prereq.log"`

You can use directory properties and environment variables in the path for the feature prerequisite log file.

Additionally, use the option `/newlog` with the `/debuglog` parameter or set the **Always Create Debug Log** option to **Yes** in the IDE setting to overwrite the existing debug log and create the log(s) newly.

To overwrite the existing log named `InstallShield.log` in the same directory as the `Setup.exe` file, pass just the command-line parameter. For example, `setup.exe /debuglog /newlog`.

To specify the name and location of the existing log file to overwrite, pass the path and name, as in the following example:

`setup.exe /debuglog"C:\PathToLog\setupexe.log" /newlog`

**Note** • The message “The setup command line is invalid. The Setup cannot proceed” will be shown when `/newlog` option was not used with `/debuglog` parameter or the **Always Create Debug Log** option is not set to **Yes**.
**SMS Data**

**Table 18 • Parameters for SMS Data**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| /m        | InstallScript, InstallScript, MSI | The `/m` option causes `Setup.exe` to generate an SMS Management Information Format (.mif) file. Following is a typical command:  
  
  ```
  Setup.exe /m"SampleApp"
  ```

  Including the `.mif` file extension is not necessary. |
| /m1       | InstallScript, InstallScript, MSI | Using the `/m1` parameter (along with `/m`) enables you to specify a serial number to be written to the .mif file. A typical command is as follows:  
  
  ```
  Setup.exe /m"SampleApp" /m1"1234-5678"
  ``` |
| /m2       | InstallScript, InstallScript, MSI | Using the `/m2` parameter (along with `/m`) enables you to specify a locale string to be written to the .mif file. A typical command is as follows:  
  
  ```
  Setup.exe /m"SampleApp" /m2"ENU"
  ``` |

**Minimum UI**

**Table 19 • Parameters for Minimum UI**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| /passive  | Advanced UI, Suite/Advanced UI | Use the `/passive` parameter to runs a suite installer setup in a minimum UI mode (just displaying a progress panel):  
  
  ```
  Setup.exe /passive
  ```

  To uninstall using a minimum UI mode, use the following command:  
  
  ```
  Setup.exe /passive /remove
  ``` |
## Miscellaneous

### Table 20 • Parameters for Miscellaneous

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/delayedstart:&lt;number of seconds&gt;</td>
<td>InstallScript</td>
<td>Specifies the amount of time (in seconds) by which initialization of the installation is delayed after Setup.exe is launched.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> Using the <code>delayedstart</code> option is recommended when manually launching an additional installation after reboot (for example, by using the RunOnce key). The delay allows the operation system to initialize completely; this prevents the problems—such as Remote Procedure Call (RPC) errors—that can occur if an installation initializes before the operating system has initialized completely. The recommended delay length is 30 seconds.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note that this option is not needed when the installation starts automatically after reboot (for example, due to a call to SdFinishReboot before reboot).</td>
</tr>
<tr>
<td>/runfromtemp</td>
<td>Basic MSI, InstallScript, InstallScript MSI</td>
<td>This parameter allows the setup author to always clone the setup and run it from the temporary directory, even if the setup does not meet the conditions for running from the temporary directory. This parameter is ignored if the setup is a self-extracting executable file (.exe).</td>
</tr>
<tr>
<td>/Clone_wait</td>
<td>InstallScript, Basic MSI, InstallScript MSI, Suite/Advanced UI</td>
<td>This parameter indicates that the original setup should wait for the cloned setup process to complete before exiting.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>By default, the original setup is enabled to wait for the completion of the installation process.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For more information on Clone_wait, see Changing the Default Clone_wait Parameter for the Setup.</td>
</tr>
<tr>
<td>/extract_all:&lt;path&gt;</td>
<td>InstallScript</td>
<td>Specifies that a self-extracting package's files should not be run but simply extracted to the location that is specified by &lt;path&gt;.</td>
</tr>
</tbody>
</table>
The build engine automatically creates an installation that supports Setup.exe cloning in cases where cloning is required (for example, multi-disk installations). If you need to do this manually, pass /h to Setup.exe and it will clone itself to a temporary location and run from that location.
/hide_progress

Basic MSI, InstallScript, InstallScript MSI

Suppresses the display of any small and standard progress dialogs that might be shown during initialization.

The small progress dialog is usually used for installations that display a splash screen during initialization, since a standard-size progress dialog does not leave any space for the splash screen. Specifying the /hide_progress option hides the small progress dialog for those installations, so end users would see just the splash screen without any progress indication.

Note • For InstallScript installations: If you specify /hide_progress and include a splash screen in your InstallScript installation, the length of time that the splash screen is displayed depends on whether SmallProgress=Y or SmallProgress=N is specified in Setup.ini.

• If SmallProgress=Y is specified, the splash screen is shown for as long as the progress dialog would have been displayed if /hide_progress was not specified.

• If SmallProgress=N is specified, the splash screen is shown for the length of time specified in the SplashTime key; thus, using /hide_progress and SmallProgress=Y at the same time is not recommended.

For InstallScript MSI installations: If you include a splash screen, the installation automatically switches to the small progress dialog, and the splash screen is shown only during the time that the progress dialog is displayed. Note that this is true even if /hide_progress is specified. Therefore, it is recommended that you avoid using /hide_progress with a splash screen in InstallScript MSI installations.

/hide_splash

InstallScript, InstallScript MSI

Suppresses the display of the splash screen if one is included.
### Table 20 • Parameters for Miscellaneous (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/hide_usd</td>
<td>InstallScript</td>
<td>Suppresses display of the dialog that is displayed by an update-enabled installation to let the end user select which instance of your product will be updated. This dialog is displayed by default when an update-enabled installation detects multiple previous instances. When this command-line option is used and an update-enabled installation detects multiple previous instances, the installation creates a new instance.</td>
</tr>
<tr>
<td>/ig(InstanceGUID)</td>
<td>InstallScript</td>
<td>Specifies the value of the system variable INSTANCE_GUID; for example, -ig{722C7440-B317-4B3B-AECA-0199EA4E7CDB}. If this option is not used, the installation automatically assigns a value to INSTANCE_GUID (for multi-instance installations, this value is a newly generated GUID; for standard installations, this value is the same as the value of PRODUCT_GUID). This option is useful if you have created an installation launcher—that is, a custom application that runs before your installation does to perform pre-setup tasks, such as determining the instance GUID that you want to use for the installation. Do not specify anything other than a valid GUID with this option.</td>
</tr>
<tr>
<td>/installfromweb&quot;PathToDisk1Files&quot;</td>
<td>InstallScript</td>
<td>This option is similar to the media_path option except that this option forces the installation to behave like a launched One-Click Install installation, even if the path to the media files is not a URL. Use this option if you are launching the installation from a Web page manually. In addition, this option is added automatically if the built-in Setup.ocx file is used to launch the installation.</td>
</tr>
</tbody>
</table>
Table 20 • Parameters for Miscellaneous (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/media_path&quot;PathToDisk1Files&quot;</td>
<td>InstallScript</td>
<td>This option indicates that the installation should look for the Disk1 files in the location that is specified. Note that only the Setup.exe file needs to be in the original launch location; the installation obtains all other required files from the specified location (including Setup.exe, which must be present in the media location). You can specify a URL as the path to the media files; in this case, the installation behaves like a launched One-Click Install installation, which always shows the security dialog. To learn more about the behavior of One-Click Install installations, see One-Click Install Installations in InstallScript Projects.</td>
</tr>
<tr>
<td>/L&lt;LanguageID&gt;</td>
<td>Basic MSI, InstallScript, InstallScript MSI</td>
<td>This option indicates that the installation should run in the specified language as specified. You can specify the language ID as either a hexadecimal or decimal number. If you specify the hexadecimal number, be sure to proceed the value with 0x. For example, the following commands indicate that the installation should be run in German: Setup.exe -L0x0407 Setup.exe -L1031 Note that if you specify a language ID that is not supported by the installation or you specify an invalid language ID, the parameter is ignored. Also note that if this parameter is specified and it is valid, the language dialog (if enabled) is automatically suppressed.</td>
</tr>
<tr>
<td>/w</td>
<td>Basic MSI, InstallScript MSI</td>
<td>For a Basic MSI project, the /w option forces Setup.exe to wait until the installation is complete before exiting.</td>
</tr>
</tbody>
</table>

Note • If you are using the /w option in a batch file, you may want to precede the entire Setup.exe command-line option with start /WAIT. A properly formatted example of this usage is as follows: start /WAIT setup.exe /w
User-Defined Command-Line Parameters

**Project** • This information about user-defined command-line parameters applies to InstallScript projects.

For user-defined command-line parameters in InstallScript MSI projects, use the -z command-line parameter that is described above.

Along with the command-line parameters that are listed above, -bd, -f, and -zi are command-line parameters that are reserved for use in InstallScript projects. User redefinition of these command-line parameters, either uppercase or lowercase, can cause errors.

You can define your own command-line arguments, which are copied to the system variable CMDLINE as at run time. Like predefined command-line parameters, you can pass custom arguments directly to Setup.exe, place them in Setup.ini, or (for testing purposes while you are using the InstallShield IDE) place them in the Settings dialog box, which is displayed when you click Settings on the Build menu in InstallShield.

**Note** • Setup.exe initializes correctly even on systems with more than 256 MB of memory and always stays in memory until the setup is complete. Due to the nature of DOS, when you launch Setup.exe from the command line, a DOS prompt is quickly returned although Setup.exe is still in memory.

Advanced UI and Suite/Advanced UI Setup.exe Command-Line Parameters

**Project** • This information applies to the following project types:

- Advanced UI
- Suite/Advanced UI

**Edition** • The Advanced UI project type is available in the InstallShield. The Suite/Advanced UI project type is available in the Premier edition of InstallShield. For information about the differences between these two project types, see Advanced UI Projects vs. Suite/Advanced UI Projects.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/SMS</td>
<td>InstallScript MSI</td>
<td>For an InstallScript MSI project, Setup.exe automatically waits for the installation to finish before exiting, so this option (used by earlier versions of InstallShield Professional) is no longer necessary.</td>
</tr>
</tbody>
</table>
The Setup.exe setup launcher for Advanced UI and Suite/Advanced UI installations can accept a number of command-line parameters. Note that passing undefined parameters or invalid property definitions results in an invalid command-line error.

Table 21 • Parameters for Advanced UI and Suite/Advanced UI Setup Launchers

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/d</td>
<td>The /d parameter lets you debug the InstallScript actions in your Suite/Advanced UI installation with the InstallScript Debugger.</td>
</tr>
<tr>
<td>/d&quot;PathTo.dbgFile&quot;</td>
<td></td>
</tr>
</tbody>
</table>

**Note** • **Debugging InstallScript code requires the debug-information file Setup.dbg to be available. In addition, in order to debug an installation on a system other than your development machine, you need to copy certain files from your development machine to the debugging machine. To learn more, see Debugging an Installation on Any Computer.**

The following command runs your InstallScript custom actions in the InstallScript Debugger:

```plaintext```
Setup.exe /d
```
If the installation is located in a path at which they were originally compiled, you also need to specify the path to your debug symbols file (.dbg):

```plaintext```
Setup.exe /d"Path-to-Setup.dbg"
```
For more information about InstallScript actions in Suite/Advanced UI projects, see **Working with an Action that Runs InstallScript Code in a Suite/Advanced UI Installation**.

For more information on debugging issues, see **Troubleshooting Issues with an Advanced UI or Suite/Advanced UI Installation**.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/debuglog</td>
<td>The /debuglog parameter lets you generate a log file for Setup.exe.</td>
</tr>
<tr>
<td>/debuglog&quot;PathToLog&quot;</td>
<td>To generate a log named InstallShield.log in the same directory as the Setup.exe file, pass just the command-line parameter. Note that this does not work if the Setup.exe file is in a read-only location. For example:</td>
</tr>
<tr>
<td></td>
<td>Setup.exe /debuglog</td>
</tr>
<tr>
<td></td>
<td>To specify the name and location of the log file, pass the path and name, as in the following example:</td>
</tr>
<tr>
<td></td>
<td>Setup.exe /debuglog&quot;C:\PathToLog\setupexe.log&quot;</td>
</tr>
<tr>
<td></td>
<td>For more information, see <strong>Troubleshooting Issues with an Advanced UI or Suite/Advanced UI Installation</strong>.</td>
</tr>
</tbody>
</table>
### /language:LCID

The `/language:LCID` parameter indicates that the installation should run in the specified language as specified. Specify the language ID as a decimal number. For example, to indicate that the installation should be run in German, pass the language ID as follows:

```
Setup.exe /language:1031
```

Note that if you specify a language ID that is not supported by the installation or you specify an invalid language ID, the parameter is ignored. Also note that if this parameter is specified and it is valid, the language wizard page (if enabled) is automatically suppressed.

### /log

The `/log` parameter lets you generate a log file for each package in the Advanced UI or Suite/Advanced UI installation for which logging is enabled.

To generate package log files in a particular folder, pass the folder path with the `/log` parameter to the Advanced UI or Suite/Advanced UI Setup.exe file. You can optionally separate the `/log` parameter and the path with a colon. For example, both of the following command lines generate a log file in the `PathToLogFiles` folder:

```
Setup.exe /log:C:\PathToLogFiles
Setup.exe /log:"C:\PathToLogFiles"
```

Note that the path to the log file location must already exist.

To generate package log files in the `%TEMP%` directory, leave out the path. For example:

```
Setup.exe /log
```

Note that logging must be enabled for a package, and the package’s logging-related settings (which vary, depending on whether the package is an `.msi` package, an `.msp` package, some other type of package) must be configured in the Packages view. For more information, see [Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation](#).

### /password:MyPassword

If you configured the password-related settings for your release on the `Setup.exe` tab in the Releases view, the end user must specify the password with the `/password` parameter at run time during a silent installation. A typical command is as follows:

```
Setup.exe /silent /password:MyPassword
```

---

|                     | To generate package log files in a particular folder, pass the folder path with the `/log` parameter to the Advanced UI or Suite/Advanced UI Setup.exe file. You can optionally separate the `/log` parameter and the path with a colon. For example, both of the following command lines generate a log file in the `PathToLogFiles` folder:          |
|                     | `Setup.exe /log:C:\PathToLogFiles`                                                                                                                                                                        |
|                     | `Setup.exe /log:"C:\PathToLogFiles"`                                                                                                                                                                      |
|                     | Note that the path to the log file location must already exist.                                                                                                                                          |
|                     | To generate package log files in the `%TEMP%` directory, leave out the path. For example:                                                                                                                |
|                     | `Setup.exe /log`                                                                                                                                                                                           |
|                     | Note that logging must be enabled for a package, and the package’s logging-related settings (which vary, depending on whether the package is an `.msi` package, an `.msp` package, some other type of package) must be configured in the Packages view. For more information, see [Supporting the Creation of Package Log Files for Command-Line Launching of an Advanced UI or Suite/Advanced UI Installation](#). |

| /password:MyPassword | If you configured the password-related settings for your release on the `Setup.exe` tab in the Releases view, the end user must specify the password with the `/password` parameter at run time during a silent installation. A typical command is as follows:                      |
|                     | `Setup.exe /silent /password:MyPassword`                                                                                                                                                                  |
You can pass properties to the Advanced UI or Suite/Advanced UI installation in more than one way. Following are examples:

- `Setup.exe MyPropertyName=MyPropertyValue`
- `Setup.exe /MyPropertyName:MyPropertyValue`

To clear the value of a property, even if it is set by the Advanced UI or Suite/Advanced UI Setup.xml file, use the following syntax:

- `Setup.exe MyPropertyName=`

The following properties have special meaning to the Advanced UI or Suite/Advanced UI installation when they are passed on the command line:

- **ISFeatureInstall** — This property provides a comma-delimited list of feature names that are to be installed with the current installation operation. It is intended for a silent first-time installation.

- **ISFeatureRemove** — This property provides a comma-delimited list of feature names that are to be removed with the current installation operation. It is intended for maintenance installations.

For more information, see Advanced UI and Suite/Advanced UI Property Reference.

### Table 21 • Parameters for Advanced UI and Suite/Advanced UI Setup Launchers (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PropertyName=Value</td>
<td>You can pass properties to the Advanced UI or Suite/Advanced UI installation in more than one way. Following are examples:</td>
</tr>
<tr>
<td>/PropertyName:Value</td>
<td><code>Setup.exe MyPropertyName=MyPropertyValue</code></td>
</tr>
<tr>
<td>PropertyName=</td>
<td><code>Setup.exe /MyPropertyName:MyPropertyValue</code></td>
</tr>
<tr>
<td>/remove</td>
<td>The <code>/remove</code> parameter uninstalls the packages that are currently installed on the target system and that were installed by the Advanced UI or Suite/Advanced UI installation. This option also removes the Advanced UI or Suite/Advanced UI installation's entry in Add or Remove Programs if the maintenance condition in the Advanced UI or Suite/Advanced UI Setup.xml file is false.</td>
</tr>
<tr>
<td>/repair</td>
<td>The <code>/repair</code> parameter repairs the packages that are currently on the target system and that were installed by the Advanced UI or Suite/Advanced UI installation.</td>
</tr>
<tr>
<td>/silent</td>
<td>The <code>/silent</code> parameter runs the installation without a user interface.</td>
</tr>
</tbody>
</table>
Command-Line Tools

For information on how to specify command lines that you want an Advanced UI or Suite/Advanced UI installation to use when launching one of its packages, see Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation.

### Setup.exe (InstallScript Projects)

**Setup.exe** is the main installation executable file; it performs installation initialization and launches the installation engine to execute the installation on the target system.

When you create and build a release, Setup.exe and other setup engine redistributable files are placed in the Disk1 folder. You must ship these files on Disk1 of your distribution media.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/stage_only</td>
<td>The /stage_only parameter runs the staging part of the Advanced UI or Suite/Advanced UI installation, in which the Advanced UI or Suite/Advanced UI installation copies its packages to a directory that is specified by the user on the BrowseStageFolder wizard page. If any of the packages are compressed into the Advanced UI or Suite/Advanced UI Setup.exe file, the /stage_only option also extracts the packages from the Setup.exe file before copying them to the staging directory. In addition, if any of the packages are located on the Web, the /stage_only option downloads the packages and adds them to the staging directory. Note that this option does not run the packages in the Advanced UI or Suite/Advanced UI installation. Furthermore, it does not uncompress any of the packages. Thus, if you are creating a patch for an Advanced UI or Suite/Advanced UI installation and you need to generate an uncompressed .msi package for a package in your Advanced UI or Suite/Advanced UI installation, for example, use the stage-only option. Then perform an administrative installation for the .msi package. <strong>Tip</strong> • The ISRootStagePath property stores the path to the folder that contains the copied files. To specify a default value for this property, set this property from the command line while passing the /stage_only parameter, as shown in the following example: Setup.exe /stage_only ISRootStagePath=&quot;C:\MyStagingArea&quot;</td>
</tr>
<tr>
<td>/SuiteGUID</td>
<td>The /SuiteGUID parameter retrieves the Suite GUID from Setup.exe and the GUID saves into SuiteGUID.log file under Setup.exe location.</td>
</tr>
</tbody>
</table>

For information on how to specify command lines that you want an Advanced UI or Suite/Advanced UI installation to use when launching one of its packages, see Passing Command-Line Parameters to a Package in an Advanced UI or Suite/Advanced UI Installation.
You can pass command-line options directly to Setup.exe, or you can place them in Setup.ini. For testing purposes, while you are using InstallShield, you can pass command-line options to Setup.exe through the Run/Debug tab of the Settings dialog box, which is displayed when you click Settings on the Build menu.

**Note** • A self-extracting executable file accepts any command-line parameter that Setup.exe accepts.

For a list of supported parameters, see Setup.exe and Update.exe Command-Line Parameters.
Command-Line Tools
Frequently Asked Questions

This section lists common questions (sorted by topic) and provides links to answers. Where the techniques or steps to perform a specific task are different in different project types, answers for each project type are displayed.

**Project Types**
- Which project type should I use?
- How do I convert my project to a different project type?
  - Why do I get “error C8025 ‘INSTALLDIR’: undefined identifier” when compiling my script after conversion?
  - Why do I get the following error: “String PRODUCT_NAME was not found in string table”?

**Files and Folders**
- What is the difference between INSTALLDIR and TARGETDIR?
- How does Windows Installer determine whether to overwrite an existing file?
- How do I register a COM server?
- How do I install, start, stop, delete, uninstall, or configure a Windows service?
- How do I create an empty folder?
- How do I set a key file for a dynamic file link?
- What happens if I put more than one executable file in the same component?

**Features and Components**
- How do I conditionally select a feature?
- How do I conditionally hide a feature?
- Why should I use uppercase directory identifiers when setting component destinations?
Frequently Asked Questions

- How do I change the value in the Link To column for a component?

**Redistributables**
- How do I add the Windows Installer to my project?
- How do I add the .NET Framework to my project?

**Shortcuts**
- How do I create an Internet shortcut?
- How do I create a shortcut to a folder?

**Registry**
- How do I read data from the registry?
- How do I write a property's value to the registry?

**InstallScript**
- How do I find out what sort of built-in functions are available in the InstallScript language?
- What is the maximum number of statements that I can use in a compiled script file? What other limits exist for InstallScript?

**INI Files**
- How do I read data from an .ini file?
- How do I get all key names from an .ini file?

**Properties**
- How do I get or set a Windows Installer property in InstallScript?
- Why does my deferred custom action show a blank value for a Windows Installer property?

**Conditions**
- How do I detect administrator privileges?
- How do I detect a first-time installation?
- How do I call a function only during the installation sequence?
- How do I detect if the user has selected a specific feature?
- How do I detect if the user is running a particular operating system?

**End-User Interface**
- How do I populate a list box at run time?
- How do I display a file browse dialog?
- How do I display a network browse dialog?
Custom Actions

- How do I search for a file on the end user’s system?
- How do I launch my application after the installation is complete?
- How do I place a file in the .msi database and extract it during run time?
- How do I exit the installation from within a custom action?
- How can I use the INSTALLDIR variable after I have created a custom action that runs VBScript code?
- How can I change ODBC properties (like DBQ and SystemDB) through script?

SQL Scripts

- How do I override the default SQL run-time behavior?
- How can I control the execution of a SQL script based on certain conditions in an InstallScript project?
- How do I enforce a server-side installation in an InstallScript project?
- How do I enforce a SQL server-side installation in a Windows Installer-based project?
- How do I handle SQL run-time errors?
- How do I ensure that my SQL scripts run only against a full of SQL Server?

Building Releases

- How do I build my release from the command line?
- How do I change project settings from the command line?

Deployment

- How do users run my installation in silent mode?

Uninstallation

- How do I remove files that were created by my product?
- How do I remove registry data created by my product?

Answers to many other questions are available in the Knowledge Base.
## Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>.bin file</td>
<td>A binary file that is executable on UNIX platforms. Application files usually have a <code>.bin</code> extension.</td>
</tr>
<tr>
<td>.bmp file</td>
<td>A bitmap file of an image represented as an array of bits. In bitmap graphics, an image is displayed on the screen as a collection of tiny squares called pixels, which together form a pattern. Each pixel in the image corresponds with one or more bits.</td>
</tr>
<tr>
<td>.cab file</td>
<td>See cabinet file.</td>
</tr>
<tr>
<td>.command file</td>
<td>A command file that is executable on Mac OS X platforms. Application files usually have a <code>.command</code> extension.</td>
</tr>
<tr>
<td>.cub file</td>
<td>A validation module that stores and provides access to custom actions for internal consistency evaluators (ICEs). See also custom action and internal consistency evaluator.</td>
</tr>
<tr>
<td>.exe file</td>
<td>An executable binary file on Windows platforms. Application files usually have an <code>.exe</code> file extension.</td>
</tr>
<tr>
<td>.gif file</td>
<td>A graphics interchange format file supported on the Web. This type of file is in a bit-mapped graphics file format used for displaying bitmap images. These files use lossless compression, a method of compression in which no data is lost. This type of file supports up to 256 colors; it also supports transparency, where the background color can be set to transparent to let the color on the underlying page show through. This type of file format is more suitable than the <code>.jpg</code> file format for images with only a few distinct colors, such as line drawings.</td>
</tr>
</tbody>
</table>
### InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>.idt file</td>
<td>An exported Windows Installer database table.</td>
</tr>
<tr>
<td>.ism file</td>
<td>The working file that InstallShield uses to store project information. When you build a release, InstallShield uses the .ism file to create an .msi file for distribution.</td>
</tr>
<tr>
<td>.jar file</td>
<td>A Java archive file that contains the classes, images, and sound files for an installation, zipped up into a single file.</td>
</tr>
<tr>
<td>.jpg file</td>
<td>Also known as JPEG, which is the abbreviation for Joint Photographic Experts Group, the original name of the committee that wrote the standard. This type of file is one of the image file formats supported on the Web. The file uses lossy compression, a type of compression in which color and grayscale continuous-tone images are compressed and some data is lost to eliminate redundant or unnecessary information. These images support 16 million colors and are best suited for photographs and complex graphics.</td>
</tr>
<tr>
<td>.mif file</td>
<td>A management information format file used to describe a hardware or software component.</td>
</tr>
<tr>
<td>.msi file</td>
<td>The Windows Installer installation package in its finished state. It includes installation resource files and can have compressed within it all of the application’s data files. The .msi file is the one that is distributed to the end users and will interact with the Windows Installer service to install your application on their machines.</td>
</tr>
<tr>
<td>.msm file</td>
<td>The database file of a merge module. This type of file contains all of the installation properties and installation logic for the module. See also merge module.</td>
</tr>
<tr>
<td>.msp file</td>
<td>A Windows Installer patch file. This type of file consists of a summary information stream, transform substorages, and cabinet files. An .msp file contains at least one database transform that adds patching information to the database of its target installation package. The installer uses this patching information to apply the patch files that are stored in the cabinet files.</td>
</tr>
<tr>
<td>.mst file</td>
<td>A transform package. This type of file is a simplified Windows Installer database that contains the differences between two .msi databases. Transforms enable administrators to apply modified settings to a database when they are deploying an installation package. See also transform.</td>
</tr>
<tr>
<td>.NET</td>
<td>An operating system platform that Microsoft created for connecting information, people, systems, and devices. The .NET environment enables developers to build, create, and deploy their applications and Web services using whatever languages they prefer via the common language run time.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>.NET Compact Framework</td>
<td>A scaled-down version of the .NET Framework designed to run on resource-constrained devices, such as mobile devices. The .NET Compact Framework is currently available only for Pocket PC and Windows CE .NET devices, with support for more devices forthcoming.</td>
</tr>
<tr>
<td>.NET Framework</td>
<td>A programming infrastructure that Microsoft created for building, deploying, and running applications and services that use .NET technologies such as Web services. The .NET Framework consists of three main parts: the common language run time, a hierarchical set of unified class libraries, and a componentized version of Active Server Pages called ASP.NET.</td>
</tr>
<tr>
<td>.ocx file</td>
<td>An object linking and embedding (OLE) custom control file. This type of file is a cross-platform COM file that is called by an application to perform a function, such as the ability to resize windows.</td>
</tr>
<tr>
<td>.p12 file</td>
<td>A certificate file that conforms to public-key cryptography standard (PKCS) number 12, which specifies a portable format for securely storing or transporting a user's private keys, certificates, miscellaneous secrets, and other information.</td>
</tr>
<tr>
<td>.pcp file</td>
<td>A Windows Installer patch creation properties file.</td>
</tr>
<tr>
<td>.prq file</td>
<td>A prerequisite file that contains information about a base application or component that must be installed on the target machine before the main application can be installed. Including setup prerequisites in installation projects enables developers to chain multiple installer files together into a single executable file.</td>
</tr>
<tr>
<td>.reg file</td>
<td>See registry file.</td>
</tr>
<tr>
<td>.scm file</td>
<td>A ScreenCam movie file.</td>
</tr>
<tr>
<td>.wmf file</td>
<td>A Windows metafile format file. This type of graphics file is used to exchange graphics information between Microsoft Windows-based applications.</td>
</tr>
<tr>
<td>absolute path</td>
<td>An absolute path includes all of the information necessary to locate a file by starting at the root directory of a specified drive. For example, C:\Program Files\InstallShield is the absolute path to the InstallShield folder when it is installed on drive C.</td>
</tr>
<tr>
<td>accessibility</td>
<td>The capacity or tendency to be available to all people, including those with disabilities.</td>
</tr>
<tr>
<td>acquisition phase</td>
<td>The phase of the installation process during which the installer queries the database for instructions. The acquisition phase is followed by the execution phase.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>action</td>
<td>A command that performs an operation at a particular point during the execution of an installation or uninstallation wizard. Developers of installation packages can use built-in standard actions and create their own custom actions. Actions may display progress to the end user or allow the end user to cancel the operation.</td>
</tr>
<tr>
<td>active directory</td>
<td>A structure supported by Microsoft Windows 2000 that enables administrators to track and locate any object on a network. Active Directory is the directory service used in Windows 2000 Server for distributed computing environments.</td>
</tr>
<tr>
<td>active template library (ATL)</td>
<td>A set of classes for writing COM controls, resulting in smaller binaries than, for example, MFC.</td>
</tr>
<tr>
<td>ActiveX</td>
<td>A set of object-oriented programming technologies and tools. ActiveX enables developers to write applications so that other applications and the operating system can call them. ActiveX technology makes it possible to create interactive Web pages that look and behave like applications, rather than static pages.</td>
</tr>
<tr>
<td>administration</td>
<td>The act or process of managing something.</td>
</tr>
<tr>
<td>administration sequence</td>
<td>The list of actions that are executed when a user launches your installation with the /a command-line option. This is useful for network administrators who want to provide a common installation point on the network and prepare different installation criteria for multiple users. Each Administration sequence consists of a User Interface sequence and an Execute sequence.</td>
</tr>
<tr>
<td>administrative installation</td>
<td>Copies and uncompresses your data files to a directory specified by the user, but does not create shortcuts, register COM servers, or create an uninstallation log.</td>
</tr>
<tr>
<td>administrative privileges</td>
<td>The highest level of permission that can be granted to a computer user. Levels of permissions are necessary in networked environments to ensure system security and prevent damage to computer hardware and software. A user with administrative privileges can perform tasks such as install and uninstall software and change a computer's configurations. Administrative privileges usually pertain to Windows NT 4.0, 2000, or XP machines as opposed to Windows 95, 98, or ME machines.</td>
</tr>
<tr>
<td>advertised shortcut</td>
<td>A shortcut to a product or feature that is not installed until the first time that the end user launches the shortcut. At run time of an installation, if the end user selects the “This feature will be installed when required“ option for the product or the feature containing the shortcut, the shortcut is created but the component’s files are not installed until the end user launches the shortcut. The first time the shortcut is launched, the Windows Installer service installs the component’s files and other data and then the shortcut launches the target file. Every time the shortcut is used from then on, it behaves like a normal shortcut.</td>
</tr>
</tbody>
</table>
### Table 1 • InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>advertisement</td>
<td>A type of “just-in-time” installation in which features are not installed immediately during the installation process. Instead, they are installed on the fly when they are requested. When you enable feature advertisement, the feature is advertised, regardless of the mode in which the installation is running, as long as no other factors prevent it from being advertised. If you launch <code>MsiExec.exe</code> from the command line with the <code>/jm</code> option, the feature is advertised to the end user’s machine. If you use the <code>/ju</code> function, the feature is advertised to the current end user. In the Custom Setup dialog, the end user can control which features are immediately installed and which are available later. The two types of advertising are assigning and publishing. See also assigning; publishing.</td>
</tr>
<tr>
<td>advertisement sequence</td>
<td>The advertisement sequence contains the list of actions that are executed when a user launches your installation with the <code>/j</code> command-line option. Validation rule ICE78 requires the advertisement user interface sequence to be empty.</td>
</tr>
<tr>
<td>advertising</td>
<td>The process of presenting to end users features that are not installed immediately during the installation process. Instead, these features are installed on the fly when they are requested. See also advertisement.</td>
</tr>
<tr>
<td>AlwaysInstallElevated</td>
<td>A user policy that can be configured for Windows platforms under the following registry keys: HKEY_LOCAL_MACHINE\Software\Polices\Microsoft\Windows\installer and HKEY_CURRENT_USER\Software\Polices\Microsoft\Windows\Installer. To install a package with elevated (system) privileges, set the <code>AlwaysInstallElevated</code> value under both of these registry keys to 1.</td>
</tr>
<tr>
<td>American Standard Code for Information Interchange (ASCII)</td>
<td>The code that represents letters, numbers, punctuation marks, and other characters such as numbers, with each character assigned a value between 0 to 127. This code enables different types of computers and computer applications to exchange data.</td>
</tr>
<tr>
<td>animation</td>
<td>Multiple graphic images that are alternately changed and displayed at a specified number of frames per second to produce the illusion of movement.</td>
</tr>
<tr>
<td>API</td>
<td>See application programming interface.</td>
</tr>
<tr>
<td>app paths</td>
<td>The registry key that Windows uses to find your application and its <code>.dll</code> files if their locations are not already in the system’s path. App paths entries can be set through the component’s advanced settings.</td>
</tr>
<tr>
<td>application programming interface (API)</td>
<td>A set of routines that an application uses to communicate with the computer’s operating system and that the operating system uses to make services available to the application.</td>
</tr>
<tr>
<td>ASCII</td>
<td>See American Standard Code for Information Interchange.</td>
</tr>
</tbody>
</table>
**Table 1 • InstallShield Glossary**

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>assigning</td>
<td>A type of advertisement. If an administrator assigns an application to a machine, the installation program automatically runs the next time that the machine starts or restarts. If the administrator assigns an application to a user, the installation program places a shortcut on the Start menu of the user’s machine. When the user selects the shortcut or launches a document associated with the assigned application, the application is installed.</td>
</tr>
<tr>
<td>asynchronous</td>
<td>A custom action that independently continues with the execution of its thread while the installer executes the main installation.</td>
</tr>
<tr>
<td>execution</td>
<td></td>
</tr>
<tr>
<td>ATL</td>
<td>See active template library.</td>
</tr>
<tr>
<td>autonomic computing</td>
<td>A self-managed computing model named after, and patterned on, the human body’s autonomic nervous system. An autonomic computing system would control the functioning of computer applications and systems without input from users, similar to the way that the human body’s autonomic nervous system regulates and protects the body.</td>
</tr>
<tr>
<td>auto-repair</td>
<td>The automatic restoring of an application to its original state by the installer. A partial or complete application reinstallaation might be required if any files associated with any feature are missing or corrupted.</td>
</tr>
<tr>
<td>basic UI</td>
<td>One level of the installer’s internal user interface (UI) capabilities. Typically, installation packages that are built with the basic UI level display built-in modeless dialog that show progress messages and disc prompt messages. They do not display any authored dialogs.</td>
</tr>
<tr>
<td>billboards</td>
<td>Images, such as marketing messages, that can be displayed during installation.</td>
</tr>
<tr>
<td>Binary table</td>
<td>A table that holds the binary data for items such as bitmaps and icons. It also contains data for custom actions.</td>
</tr>
<tr>
<td>bitmap</td>
<td>A representation of an image presented as an array of bits. In bitmap graphics, an image is displayed on the screen as a collection of tiny squares called pixels, which together form a pattern. Each pixel in the image corresponds with one or more bits.</td>
</tr>
<tr>
<td>cabinet file</td>
<td>A single file that holds a number of compressed files. During installation of an application, the compressed files are decompressed and copied to your computer. Cabinet files are efficient because they save space and time when distributing software. A cabinet file usually has the file extension .cab. Missing or corrupt files may prevent installations from completing. It may be necessary to replace missing or corrupt operating system files or InstallShield files by extracting them from a cabinet file.</td>
</tr>
</tbody>
</table>
A cache (pronounced *cash*) is a temporary storage area for frequently accessed data. The purpose of caching is to store frequently used information in a location that is easy to access, resulting in a faster-running computer. There are two types of cache: memory cache and disc cache. Memory cache stores the data and the address of where the data is stored in main memory. Memory caching is useful because most applications access the same data repeatedly. Disc caching uses the main memory. It is used to hold information that has recently been requested from the hard disc or has previously been written to the hard disc. In general, installations usually use the disc cache. When data is read from or written to main memory, a copy is also saved in the memory cache. When data is called for, the computer first checks the memory cache, then the disc cache, and finally main memory.

<tr>
<td>caption</td>
<td>A text heading in a window. The windows caption is what users click and drag to position the active window on the screen.</td>
</tr>
<tr>
<td>CBT</td>
<td>See computer-based training.</td>
</tr>
<tr>
<td>CD</td>
<td>See compact disc.</td>
</tr>
<tr>
<td>CD browser</td>
<td>A graphical user interface that is launched when a CD is inserted in the drive. It is used to launch one or more applications on the CD.</td>
</tr>
<tr>
<td>CD-ROM</td>
<td>See compact disc read–only memory.</td>
</tr>
<tr>
<td>checksum</td>
<td>A calculated figure that is applied to data to test for possible corruption. The checksum is derived by sequentially combining bytes of data in the file in a systematic manner. After transmission or storage compression, the checksum calculation is performed again and the result is compared with the previous outcome. If the numbers do not match, this indicates that there is likely an error in the stored or transmitted data.</td>
</tr>
<tr>
<td>column</td>
<td>A vertical set of information.</td>
</tr>
<tr>
<td>COM</td>
<td>See component object model.</td>
</tr>
<tr>
<td>COM file</td>
<td>Binary software components containing reusable code that can be shared across products. A popular example of a COM file is a Microsoft Excel spreadsheet when it is embedded in a Word document. In this example, Excel acts as the COM server and Word acts as the client.</td>
</tr>
<tr>
<td>COM server</td>
<td>An executable file that exposes objects to other applications according to the Component Object Model (COM) specification. The types of objects exposed by a COM server may include ActiveX controls, ActiveX documents, Automation objects, or MTS components.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>COM+ file</td>
<td>An extended COM file. With regard to installations, COM+ adds greater support for building distributed components. For example, you can create appID keys and values in the registry and thereby configure various COM components to run remotely or with special privileges.</td>
</tr>
<tr>
<td>command</td>
<td>(1) An instruction given to a computer. (2) An instruction that the operating system executes from the command line or a Command Prompt window to perform a specific task. If errors occur during installation, you may, for example, need to execute commands to run utilities, search your computer’s directories, or delete files.</td>
</tr>
<tr>
<td>command line</td>
<td>The area of the Command Prompt window in which commands are typed. A command line is used to pass commands to executable files (for example, .exe, .bin).</td>
</tr>
<tr>
<td>command prompt window</td>
<td>The Command Prompt window is the interface to MS-DOS. To access the Command Prompt window, click Run on the Start menu, and then type command.com in Windows 95, 98, and ME or cmd.exe in Windows NT, 2000, or XP. If errors occur during installation, you may need to open the Command Prompt window to enter commands to run utilities or search your computer’s directories, for example.</td>
</tr>
<tr>
<td>command-line option</td>
<td>A command-line option is an argument to a command that changes how the command is executed. See also command.</td>
</tr>
<tr>
<td>commit execution</td>
<td>Execution of a Windows Installer action upon completion of the InstallFinalize action, which occurs when the installation has completed transferring files, registering COM servers, and creating shortcuts and registry entries.</td>
</tr>
<tr>
<td>committing databases</td>
<td>Accumulated changes made in a Windows Installer database. The changes are not reflected in the actual database until the database is committed, that is, until MsiDatabaseCommit is called.</td>
</tr>
<tr>
<td>compact disc (CD)</td>
<td>A disc used for electronically recording, storing, and playing back audio, video, and other information in digital form.</td>
</tr>
<tr>
<td>compact disc read-only memory (CD-ROM)</td>
<td>A type of compact disc that is only readable.</td>
</tr>
<tr>
<td>component</td>
<td>Elements of the application from the installation developer’s perspective. Components are not visible to the end user. When the end user selects a feature for installation, the installer determines which components are associated with that feature, and then those components are installed. Components of an application would contain, for example, the executable binary files, data files, shortcuts, help system files, and registry entries.</td>
</tr>
</tbody>
</table>
### Table 1 • InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>component object model (COM)</strong></td>
<td>A Microsoft-developed software architecture that enables the creation of component-based applications. Component-based applications allow other components and other applications to use their features, adding functionality to these programs.</td>
</tr>
<tr>
<td><strong>compress</strong></td>
<td>Take one or more files and create a new file whose size is less than the total size of the original file(s) and from which the original file(s) can be re-created.</td>
</tr>
<tr>
<td><strong>computer-based training (CBT)</strong></td>
<td>Any instruction delivered by computer. CBTs often use graphics, sound, animation, and interaction to train people.</td>
</tr>
<tr>
<td><strong>condition</strong></td>
<td>A statement of logic that compares the value of a property to a fixed value or determines whether the property is defined. The condition must evaluate to true if the object, feature, component, action, or other item associated with the condition is to be installed or performed.</td>
</tr>
<tr>
<td><strong>conditional installation</strong></td>
<td>Installation of certain items only if certain conditions are met. For example, if an operating system condition is associated with the installation of an application, the application is installed on a target machine only if that target machine is running the specified operating system.</td>
</tr>
<tr>
<td><strong>consume</strong></td>
<td>What an installation does to a redistributable package such as a merge module or InstallShield object.</td>
</tr>
<tr>
<td><strong>context menu</strong></td>
<td>A context menu, also known as a right-click menu or a pop-up menu, opens when a user right-clicks an item on the desktop, in Windows Explorer, or in an application.</td>
</tr>
<tr>
<td><strong>converted project</strong></td>
<td>(1) A file that has been transformed from one type of file to another. (2) The Open MSI/MSM Wizard in InstallShield is a tool that converts .msi files and merge module (.msm) files to InstallShield installation projects (.ism files) that you can modify and build in InstallShield.</td>
</tr>
<tr>
<td><strong>costing</strong></td>
<td>File costing is the process that InstallShield uses to determine the total disc space that a current installation requires.</td>
</tr>
<tr>
<td><strong>custom action</strong></td>
<td>An action that is created by an installation author as opposed to a standard action that is built into a Windows installer. The action encapsulates a function performed during the installation, uninstallation, or maintenance of an application.</td>
</tr>
<tr>
<td><strong>database</strong></td>
<td>A discrete collection of data in a database management system (DBMS).</td>
</tr>
<tr>
<td><strong>database function</strong></td>
<td>A function that operates on a database.</td>
</tr>
<tr>
<td><strong>database handle</strong></td>
<td>A quantity that specifies a database when a database function is called.</td>
</tr>
</tbody>
</table>
### Table 1 • InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>database management system (DBMS)</td>
<td>A set of applications that control the organization, storage, and retrieval of data for many users.</td>
</tr>
<tr>
<td>DBMS</td>
<td>See database management system.</td>
</tr>
<tr>
<td>DCOM</td>
<td>See distributed component object model.</td>
</tr>
<tr>
<td>DCOM file</td>
<td>Software components that are able to communicate across a network. DCOM, previously called network OLE, allows the components for a single application to be distributed across multiple networked computers.</td>
</tr>
<tr>
<td>decompress</td>
<td>The reverse process of compression, which minimizes the size of a file by removing its space characters. This process returns the file to its original state.</td>
</tr>
<tr>
<td>deferred execution</td>
<td>Execution of an installer action upon execution of the installation script.</td>
</tr>
<tr>
<td>dependency</td>
<td>A software object that is required by another software object.</td>
</tr>
<tr>
<td>dialog</td>
<td>Windows of information that display to the end user during installation and uninstallation. They enable the end user to interact with the operation by reading or specifying information. See also wizard.</td>
</tr>
<tr>
<td>dialog box</td>
<td>A window that displays within an application interface that enables users to enter information or specify commands.</td>
</tr>
<tr>
<td>differential release</td>
<td>A release that contains only those files that were absent from one or more of a specified set of existing releases. A differential release is used to update the versions of your product that were installed by those existing releases.</td>
</tr>
<tr>
<td>digital signing</td>
<td>To assure end users that the code within your application has not been tampered with or altered since publication, you can digitally sign your application. When you do so, end users are presented with a digital certificate when they download your product.</td>
</tr>
<tr>
<td>distributed component object model (DCOM)</td>
<td>An extension of the component object model (COM), a Microsoft-developed software architecture that enables the creation of component-based applications.</td>
</tr>
<tr>
<td>distribution media</td>
<td>A CD-ROM or other format of media deployed to users.</td>
</tr>
<tr>
<td>DLL</td>
<td>See dynamic link library.</td>
</tr>
<tr>
<td>drag</td>
<td>The act of selecting an item and moving it to another location.</td>
</tr>
<tr>
<td>dynamic link library (DLL)</td>
<td>A shared, code-base file containing functions that can be called from other applications.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>edit field object</strong></td>
<td>An interactive object that lets the user enter text into a field.</td>
</tr>
<tr>
<td><strong>elevated privileges</strong></td>
<td>Privileges that are higher than standard privileges, and are usually temporarily. Privileges are permissions to perform certain actions on a system.</td>
</tr>
<tr>
<td><strong>end user</strong></td>
<td>The person who installs or uninstalls your product.</td>
</tr>
<tr>
<td><strong>end user machine</strong></td>
<td>The machine onto which an end user installs or from which uninstalls your product.</td>
</tr>
<tr>
<td><strong>engine</strong></td>
<td>A program that performs essential functions and coordinates the overall operation of other programs. Engines work behind the scenes. InstallShield uses the InstallScript engine (ISScript.msi) and the Windows Installer engine to drive installations. InstallShield also has its own proprietary engine called ikernel.</td>
</tr>
<tr>
<td><strong>environment variable</strong></td>
<td>A variable that can be accessed by multiple programs on the target system.</td>
</tr>
<tr>
<td><strong>EXE media type</strong></td>
<td>All of the installation and uninstallation files that are contained in a single, self-extracting file.</td>
</tr>
<tr>
<td><strong>executable (.bin) file</strong></td>
<td>A file that contains a program that can run on UNIX platforms.</td>
</tr>
<tr>
<td><strong>executable (.exe) file</strong></td>
<td>A file that contains a program that can run on Windows platforms.</td>
</tr>
<tr>
<td><strong>execution phase</strong></td>
<td>The phase during which an installer’s actions are executed.</td>
</tr>
<tr>
<td><strong>execution script</strong></td>
<td>Installer actions for a Windows Installer installation. The execution script is generated during the acquisition phase of installation and executed during the execution phase.</td>
</tr>
<tr>
<td><strong>expand</strong></td>
<td>(1) To restore a compressed file to its original size. A compressed file is a single file that contains one or more other files, for example, a cabinet file. Compressed files are reduced in size, thus, saving space. (2) A DOS command used to restore compressed files. During an installation, missing or corrupted operating system files or InstallShield files may need to be expanded from a compressed file to enable the installation to complete.</td>
</tr>
<tr>
<td><strong>extensible markup language (XML)</strong></td>
<td>(1) A programming language that is essentially a simplified version of standard generalized markup language (SGML). It enables developers to create customized tags to organize and deliver content efficiently. (2) The format of the output of MultiPlatform projects. (3) Windows-based projects created in InstallShield can be converted to XML so that they can be saved in source code control software.</td>
</tr>
<tr>
<td><strong>extensible stylesheet language (XSL)</strong></td>
<td>A language used to describe how XML information should be presented.</td>
</tr>
</tbody>
</table>
**Table 1 • InstallShield Glossary**

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>external user interface</td>
<td>The user interface developed by the author of an installation package. It does not use the internal user interface capabilities that are available with the installer.</td>
</tr>
<tr>
<td>extract</td>
<td>To remove, or decompress, a file from a compressed file, such as a cabinet file. A compressed file is a single file that contains one or more other files. Compressed files are reduced in size, thus, saving space. To use a file that has been compressed, it must first be “pulled out” of the compressed file. A command-line utility called Extract.exe can be used to extract files. During installation, missing or corrupted operating system files or InstallShield files may need to be extracted from a compressed file to enable the installation to complete.</td>
</tr>
<tr>
<td>false positive</td>
<td>A false positive is something that gives the appearance of being true by a test, but in reality is not. Most cases of false positives are found in anti-virus software. For example, anti-virus software may claim that it has found a virus in an InstallShield file, but in fact, this is not the case; their virus definitions need to be updated.</td>
</tr>
<tr>
<td>feature</td>
<td>Logical representations of the functionality of the product. For example, an installation could consist of a database, the main application files, and the help system files. Database, Application, and Help System would all be features of the product. Although features are visible to the end user, the actual files that comprise the features are within the components of the features. See also component.</td>
</tr>
<tr>
<td>file</td>
<td>An element of data storage in a file system.</td>
</tr>
<tr>
<td>file extension</td>
<td>The portion of a file name, following the final point, that indicates the kind of data stored in the file.</td>
</tr>
<tr>
<td>InstallShield scripting run time</td>
<td>See iDriver.exe.</td>
</tr>
<tr>
<td>formatted</td>
<td>When data has been divided or arranged for storage or display.</td>
</tr>
<tr>
<td>full update</td>
<td>An installation that installs an updated version of your product over an earlier version.</td>
</tr>
<tr>
<td>full user interface (UI)</td>
<td>One level of the installer’s internal user interface (UI) capabilities. Installation packages that are built with the full UI level can display both the modal and modeless dialogs that have been included in the internal UI.</td>
</tr>
<tr>
<td>gallery</td>
<td>A collection of available resources that can be shared.</td>
</tr>
<tr>
<td>globally unique identifier (GUID)</td>
<td>A long string of numbers created by InstallShield to uniquely identify your product from others. Enter string GUIDs throughout InstallShield in the following format: (XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXXX).</td>

<td>The InstallShield engine. See also engine.</td>
</tr>
<tr>
<td>immediate execution</td>
<td>Installation phase terminology that generally refers to custom actions that are immediately executed when the installer builds the script in an InstallScript project.</td>
</tr>
<tr>
<td>import address table</td>
<td>The table used to import .dll files or executable files.</td>
</tr>
<tr>
<td>(IAT)</td>
<td></td>
</tr>
<tr>
<td>indirect build</td>
<td>A full build that creates references to the payload files only. This means that at installation time, the payload must be in the same place where it was at build time. For example, if your payload is on a network server, then the installation looks for the payload on that same network server.</td>
</tr>
</tbody>
</table>
### Glossary

**install level**
A feature’s install level partly determines whether it is selected by default for installation. That value is compared to the Windows Installer property INSTALLLEVEL to determine which features are selected for installation: if a feature’s install level property is less than or equal to the value of the INSTALLLEVEL, the feature will be installed.

**installation**
The transfer of a program and its constituent files, features, and components from source media to a target system. See also installation process.

**installation package**
one or more files that are used together to install or uninstall an application.

**installation process**
The entire process of installing the contents of a package or application onto a target computer. The installation process consists of the acquisition phase, the execution phase, and, if the installation attempt is not successful, rollback.

**installation project**
The entire collection of source files, dialogs, actions, and conditions that make up your installation and uninstallation while it is under construction.

**installation sequence**
The sequence in which an application’s files are installed, actions are executed, and dialogs display at run time. The installation sequence runs by default when the installation is launched, for example, by double-clicking the installation launcher.

**installation type**
A predefined group of features from which the end user can select to install or uninstall.

**installation-on-demand**
A Windows Installer capability that makes it possible to offer functionality to users and applications in the absence of the files themselves.

**INSTALLDIR**
A system variable that specifies the root destination directory for an installation.

**installer**
An installation and configuration service on a computer.

**installer database**
A database that contains all the necessary information for the installation of an application. It consists of many interrelated tables that together comprise a relational database of information necessary to install a group of applications.

**installer function**
The application programming interface called by an application to obtain installer services.

**installer package authoring tool**
A third-party tool that lets users create installation packages.

**installer properties**
Variables that are used during the installation.

**INSTALLLEVEL**
Initial level at which features are selected “ON” for installation by default.

</thead>
<tbody>
<tr>
<td>JVM</td>
<td>See Java Virtual Machine.</td>
</tr>
<tr>
<td>KB</td>
<td>See knowledge base.</td>
</tr>
<tr>
<td>key file</td>
<td>A unique file for each component that Windows Installer uses to detect the component’s presence. In order to create advanced component settings or shortcuts, a key file must be specified.</td>
</tr>
<tr>
<td>key path</td>
<td>A unique registry value for each component that Windows Installer uses to detect the component’s presence. A component can have either a key file or a key path, but not both.</td>
</tr>
<tr>
<td>knowledge base (KB)</td>
<td>A collection of technical information, instructions, and articles that are beyond the scope of the software’s help information. The Knowledge Base features tips, tricks, and techniques, answers to Frequently Asked Questions, and articles on both technical and design issues. Revenera posts periodic updates to the Knowledge Base Articles on its Web site (<a href="http://www.installshield.com">http://www.installshield.com</a>).</td>
</tr>
<tr>
<td>left-click</td>
<td>The act of selecting the left button on a mouse.</td>
</tr>
<tr>
<td>library</td>
<td>A collection of similar objects that are stored for occasional use, such as programs in source code or object code form, data files, scripts, and templates. A program library is a collection of (usually) precompiled, reusable programming routines that a programmer can “call” when writing code.</td>
</tr>
<tr>
<td>load-ordering group</td>
<td>One service may require another service to already be running before it starts. For this reason, services need to be grouped and set to load in a specific order. Service load-ordering groups are listed under HKEY_LOCAL_MACHINE\System\CurrentControl Set\Control\ServiceGroupOrder. The service’s Start Type property determines when it loads within its group.</td>
</tr>
<tr>
<td>localization</td>
<td>The process of adapting a product or service to a particular language and culture.</td>
</tr>
<tr>
<td>log database (LogDB)</td>
<td>A database that is on the target machine and contains a log of everything that was configured to be logged during installation and uninstallation.</td>
</tr>
<tr>
<td>log file</td>
<td>File containing a record of the activity that occurred during a software process (such as an installation, a build, a download) on a computer workstation or Web server. For example, Web servers maintain log files listing every request made to the server, summarizing files that were copied; bytes that were transferred; or which pages, images, and files are requested. A build log file lists all features, setup types, merge modules, dynamic links, and files included in the build.</td>
</tr>

<tbody>
<tr>
<td>logging</td>
<td>The process of recording the activity of a software process (such as an installation, a build, or a download) in a log file.</td>
</tr>
<tr>
<td>macro</td>
<td>An instruction that represents a sequence of instructions.</td>
</tr>
<tr>
<td>maintenance mode</td>
<td>When a user runs an installation program a second (or later) time for a product already installed on their system, the installation runs in maintenance mode. Maintenance mode enables the user to modify feature selections from the first-time installation, repair the features already installed, or remove the entire program.</td>
</tr>
<tr>
<td>major upgrade</td>
<td>A comprehensive update of the product that warrants a change in the ProductCode property. A new product code is required if you want to have two versions of a product installed on the same machine.</td>
</tr>
<tr>
<td>managed application</td>
<td>An application is called a “managed application” if elevated (system) privileges are used to install the application.</td>
</tr>
<tr>
<td>MD</td>
<td>See media descriptor.</td>
</tr>
<tr>
<td>media descriptor (MD)</td>
<td>The semantics of an installable unit (IU). It provides a mapping of the elements in the deployment descriptor (DD) to some physical source for the data, which is usually files.</td>
</tr>
<tr>
<td>merge module (MM)</td>
<td>A package containing all of the logic and files needed to install distinct pieces of functionality such as run-time .dll files and virtual machines. Merge modules are built once and can be added to any installation project.</td>
</tr>
<tr>
<td>metafile</td>
<td>An image saved using the standard Windows metafile format. A metafile is a set of drawing instructions. Windows metafiles have a .wmf file extension.</td>
</tr>
<tr>
<td>MFC</td>
<td>See Microsoft Foundation Classes.</td>
</tr>
<tr>
<td>Microsoft Data Engine (MSDE)</td>
<td>A fully SQL Server–compatible data engine for building desktop and shared solutions. It provides an easy migration path to SQL Server 7.0. Solutions built with MSDE can be migrated to full SQL Server 7.0 without requiring a change in a single line of code.</td>
</tr>
<tr>
<td>Microsoft Developer Network (MSDN)</td>
<td>A set of online and offline services designed to help developers write applications using Microsoft products and technologies.</td>
</tr>
<tr>
<td>Microsoft disc operating system (MS-DOS)</td>
<td>The first operating system created by Microsoft. MS-DOS is the underlying operating system of Windows 95, 98, and ME. Windows NT, 2000, and XP operating systems support existing DOS applications.</td>
</tr>
<tr>
<td>Microsoft Foundation Classes (MFC)</td>
<td>A huge set of C++ classes that developers can use to write Win32 applications. To run an application that uses MFC, the MFC engine has to be installed on a target system.</td>
</tr>
<tr>
<td>MIDI</td>
<td>See musical instrument digital interface.</td>
</tr>
</tbody>
</table>
## Glossary

**migrating**
The process of moving from the use of one operating environment to another that is, in most cases, thought to be a better one. For example, moving from Windows NT Server to Windows 2000 Server would be considered a migration because it involves ensuring that new features are exploited and that old settings do not require changing; it also involves taking steps to ensure that current applications continue to work in the new environment. Migration could also mean moving from Windows NT to a UNIX-based operating system (or the reverse). You can also migrate data from one kind of database to another kind of database. This usually requires converting the data into some common format that can be output from the old database and input into the new database. Migration is also used to refer simply to the process of moving data from one storage device to another.

<table>

### Glossary

**Table 1 • InstallShield Glossary**

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>MST</td>
<td>See .mst file.</td>
</tr>
<tr>
<td>multimedia</td>
<td>A collection of various media such as sound, video, graphics, and animation used together to convey a message.</td>
</tr>
<tr>
<td>multipurpose Internet mail extensions (MIME)</td>
<td>The standard used by Web servers to identify the files that they are sending to Web clients. The MIME standard is a way of specifying both the type of file being sent and the method that should be used to turn it back into its original form.</td>
</tr>
<tr>
<td>musical instrument digital interface (MIDI)</td>
<td>A protocol designed for recording and playing back music on digital synthesizers. Unlike .wav files, which are digital recordings of actual sound (voice or music), MIDI files simply define the instruments and notes that are to be played, and how they should be played. A synthesizer (generally part of a MIDI-capable sound board) on the end-user's system reads the MIDI instructions and plays the music. Since MIDI files contain only instructions and not the actual music, they are many times smaller than digital audio files of the same duration. MIDI files also use less processor power to play.</td>
</tr>
<tr>
<td>named instance</td>
<td>An instance is a complete and independent installation of SQL Server on a given server. One default instance and any number (up to 16) of named instances can be installed on a single server. Apart from the management tools and client connectivity components that are shared between instances, each instance is effectively standalone. Each instance has its own security, can be started and stopped independently, and can even be service packed independently of other instances on the same server.</td>
</tr>
<tr>
<td>nested installation</td>
<td>A type of custom action that installs or removes another installation package (sometimes called the child product) from within a running installation (called the parent product).</td>
</tr>
<tr>
<td>network</td>
<td>A network is two or more computers connected together to share hardware, software, and information. During installation, it may be necessary to move installation files that are on a network to your computer's hard drive to install the software properly.</td>
</tr>
<tr>
<td>NT service</td>
<td>An application that is installed on Windows NT to run as a service, meaning that once it is installed, execution is automatic and transparent to any user, and a user does not have to log in for the service to start. NT manages services that are defined and described in the registry.</td>
</tr>
<tr>
<td>object</td>
<td>A package containing all of the logic and files needed to install distinct pieces of functionality.</td>
</tr>
<tr>
<td>One Really Cool Application (ORCA)</td>
<td>An external tool for editing Windows Installer files.</td>
</tr>
</tbody>
</table>
Table 1 • InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>One-Click Install</td>
<td>With a One-Click Install installation, the end user can download an application with minimal effort and can begin using the application immediately. The installation is automatically downloaded, uncompressed, and then executed automatically, with minimal user input. End users are not asked to specify a download location, and they are not required to manually launch the installation.</td>
</tr>
<tr>
<td>operating system (OS)</td>
<td>The software that controls the operation of a computer and directs the processing of programs by assigning storage space in memory and controlling input and output functions.</td>
</tr>
<tr>
<td>ORCA</td>
<td>See One Really Cool Application.</td>
</tr>
<tr>
<td>OS</td>
<td>See operating system.</td>
</tr>
<tr>
<td>package</td>
<td>All of the files needed to run an installation, including the installation database file, your application’s files (separate from the installation database file or compressed into it), and an executable file (which may have all of the above files compressed inside it).</td>
</tr>
<tr>
<td>package code</td>
<td>The globally unique identifier for an installation package. See also globally unique identifier (GUID).</td>
</tr>
<tr>
<td>panel</td>
<td>A window within a wizard that contains one or more related settings that an end user can configure. See also wizard.</td>
</tr>
<tr>
<td>parent/child installation</td>
<td>See nested installation.</td>
</tr>
<tr>
<td>patch</td>
<td>A special type of installation package that contains just the bits and portions of the application that is necessary to either update the application’s files and installation to a specific version or to fix a bug in an earlier version.</td>
</tr>
<tr>
<td>patch file</td>
<td>A patch package used for patching. A patch package (.msp) file contains the transforms and instructions necessary for upgrading one or more installed versions of a product. Windows Installer uses a patch package to patch local or administrative installations. A patch package does not include a database like a regular installation package. Instead it contains at minimum one database transform that adds patching information to the database of its target installation package. The installer uses this information to apply the patch files that are stored in the cabinet file stream of the patch package.</td>
</tr>
<tr>
<td>patching</td>
<td>The method of updating an installation that replaces only the bits being changed rather than the entire application. This means that end users can download a patch for a product that is much smaller than the entire product.</td>
</tr>
</tbody>
</table>
Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>In a computer operating system, a path is the route through a file system to a particular file. A path name is the specification of that path. Each operating system has its own format for specifying a path name. The DOS, Windows, and OS/2 operating systems use the following format: driveletter:directorynamesubdirectorynamefilename.suffix. UNIX-based systems use the following format: /directory/subdirectory/filename.</td>
</tr>
<tr>
<td>path variable</td>
<td>A variable that represents a location that can be defined once in a central location so that it is not necessary to change every source file’s path each time that the project is moved or the folder structure is changed. You can instead use path variables to define commonly used paths once, and they are used during the development of your installation project. These paths do not apply to the target machines where the application is being installed. Rather, they are used to link to source files that need to be included in your installation project. When the project is built, those links are evaluated and the files they point to are built into the installation package.</td>
</tr>
<tr>
<td>PKCS</td>
<td>See public-key cryptography standards.</td>
</tr>
<tr>
<td>platform</td>
<td>The operating system for which the installation program is intended. An installation technology may be limited to creating installations for a specific platform(s).</td>
</tr>
<tr>
<td>preview mode</td>
<td>Mode for viewing the design of the user interface, or the current appearance of dialog and billboards. <em>Preview mode</em> is a term used in Windows Installer.</td>
</tr>
<tr>
<td>product</td>
<td>The actual application to be installed or uninstalled.</td>
</tr>
<tr>
<td>product code</td>
<td>A string that uniquely identifies a product.</td>
</tr>
<tr>
<td>progress bar</td>
<td>The visual indication of the progress of an executable file.</td>
</tr>
<tr>
<td>property</td>
<td>A value that has been placed on an object within an installation project that is used during installation or uninstallation by the installer or uninstaller.</td>
</tr>
<tr>
<td>public property</td>
<td>A global variable whose value is set by the end user or system administrator. A public property can be set or changed during installation through interaction with the user interface as well as by setting the property on the command line, by applying a transform, or by using a standard or custom action. Unlike private property values, the values of public properties can be changed. Public property names cannot contain lowercase letters.</td>
</tr>
<tr>
<td>public-key cryptography standards (PKCS)</td>
<td>Developed by RSA Security, Inc., these specifications standardize aspects of public-key cryptography that are not covered by existing standards bodies.</td>
</tr>
</tbody>
</table>
### Glossary

#### Term | Definition
--- | ---
**publishing** | A type of advertising ("just-in-time" installation) in which no user-interface elements are created for the component during installation, but the component can still be installed through Add and Remove Programs of the Control Panel or when an installed component requests the published component from the installer.

**qualified component** | A method of single-level indirection that is similar to a pointer. Qualified components are primarily used to group components with parallel functionality into categories.

**QuickPatch** | A special type of patch package that contains just the bits and portions of the database necessary to update your application's files and installation to a specific version. You can create a QuickPatch in InstallShield by using the QuickPatch type of project.

**readme file** | A text file that is included with the distribution of an application that contains important information. This information often pertains to the installation, uninstallation, or functionality that may not have been included in other product documentation.

**red green blue (RGB)** | The three colors of light that can be mixed to produce any other color. Colored images are often stored as a sequence of RGB triplets or as separate red, green, and blue overlays, though these are not the only possible representations. These three colors correspond to the three “guns” in a color cathode ray tube (CRT) and to the color receptors in the human eye.

**redistributable** | A merge module, object, or other file that may be legally distributed with an installation or application.

**reduced user interface (UI)** | The reduced UI level displays authored modeless dialogs, built-in modal error messages, and disc-prompt messages during installation. This UI level does not display any authored modal dialogs. This UI level uses the installer's internal user interface capabilities. See also modal, modeless, and internal user interface.

**reference count** | A tally that is incremented each time a shared file is installed. It is maintained under HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\SharedDLLs.

**refresh build** | This type of build only recompiles custom code. It can also perform single file replacement, meaning it can only rebuild and add or modify a single changed file without rebuilding the entire installation. This type of build is available for InstallScript projects only.
**Regedt32.exe, Regedit.exe**
The two versions of the Windows Registry Editor. The Registry Editor enables you to edit the entries in the registry. Regedt32 provides more functionality for editing the registry. If errors occur during installation, you may need to edit the registry to complete installation. Regedt32.exe and Regedit.exe have been merged in Windows XP computers, thus these two applications perform the same functionality in the new operating systems.

**registry**
A central database used by the Windows operating system to track the personal settings and the software and hardware installed on a computer. During installation, installation choices are written to the registry.

**registry file**
A text file of a predefined format that contains keys and values that can be merged into a registry.

**reinstallation**
When a product has been installed on a machine and its installation is run again, the installation reinstalls the product by overwriting its existing files, shortcuts, and registry entries.

**relative path**
A path that includes all of the information necessary to locate a file by starting at the current folder on the current drive, for example, InstallShield\Support. That folder can be located along that relative path only if it exists in the current directory.

**release build**
A full rebuild fit for releasing.

**release notes**
A file that is included with the distribution of an application. This file contains important information about the installation and uninstallation of the application. It can also contain information that may not have been included in other product documentation.

**remote procedure call (RPC) stub**
A small routine placed in a program that is used to request a service on another computer. RPC is a protocol, or agreed-upon format for transmitting data, that allows a program to request a service from a program located in another computer. The stub accepts the request from the program and forwards it to the remote procedure. When the procedure is complete, the stub receives the result and passes it back to the program that made the request.

**repair mode**
In repair mode, the installation checks for any type of corruption, such as missing or damaged files, incorrect registry entries, and self-registering files. If the installation detects any corruption, it attempts to repair the problem. See also maintenance mode.

**resiliency**
The ability for the application to reinstall components as necessary. If a component is accidentally deleted or corrupted, Windows Installer technology enables the application to essentially repair itself.

### Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>restricted public property</td>
<td>A global variable for which the installation author can limit the ability to set or change it. Usually, only system administrators can manipulate restricted public properties. Restrictions are used to maintain a secure environment.</td>
</tr>
<tr>
<td>result set</td>
<td>The set of rows created by executing a SELECT statement.</td>
</tr>
<tr>
<td>RGB</td>
<td>See red green blue.</td>
</tr>
<tr>
<td>rich text format (RTF)</td>
<td>A Microsoft file format that contains special commands to indicate formatting information such as fonts and margins. RTF lets you exchange files between different word processors and operating systems.</td>
</tr>
<tr>
<td>rollback</td>
<td>The installation keeps track of all changes that are made during the installation process so that, if an error occurs and the installation is aborted, the changes will be “rolled back,” that is, the machine will be restored to its original state.</td>
</tr>
<tr>
<td>row</td>
<td>A set of related columns that describe a specific entity, also known as a record.</td>
</tr>
<tr>
<td>RPC stub</td>
<td>See remote procedure call stub.</td>
</tr>
<tr>
<td>RTF</td>
<td>See rich text format.</td>
</tr>
<tr>
<td>run time</td>
<td>The time during which the installation interacts with the installer to install or uninstall your application on the target machine.</td>
</tr>
<tr>
<td>safe mode</td>
<td>Safe mode is a troubleshooting mode available in Windows 95, 98, ME, and 2000. When you start your computer in safe mode, only the operating system and mouse, keyboard, and display drivers are loaded. You may be able to start your computer in safe mode when it otherwise would not start at all. Safe mode lets you troubleshoot the operating system to determine what is not functioning properly.</td>
</tr>
<tr>
<td>schema</td>
<td>A description of the current structure of tables and views in a data source. The schema describes what columns are in each table, the data type of each column, and the relationships between tables.</td>
</tr>
<tr>
<td>SCM</td>
<td>See Service Control Manager.</td>
</tr>
<tr>

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Section 508</td>
<td>A United States law that amended the Rehabilitation Act to require federal agencies to make their electronic and information technology accessible to people with disabilities. Section 508 was enacted to eliminate barriers in information technology, to make available new opportunities for people with disabilities, and to encourage development of technologies that will help achieve these goals. The law applies to all federal agencies when they develop, procure, maintain, or use electronic and information technology. Under Section 508, agencies must give disabled employees and members of the public access to information that is comparable to the access available to others.</td>
</tr>
<tr>
<td>security tool</td>
<td>A privacy tool that detects and eliminates destructive pests, such as Trojans, spyware, addware, and hacker tools on your computer. It complements anti-virus and firewall software, extending protection against non-viral malicious software that can evade the end user's existing security and invade privacy.</td>
</tr>
<tr>
<td>self-healing</td>
<td>See auto-repair.</td>
</tr>
<tr>
<td>self-registering file</td>
<td>A file that can enter information about itself in the Windows registry and remove that information upon uninstallation. Other types of files can be used without entering information into the registry. The installation of a self-registering file consists of installing the file to its desired location and then registering the file on your computer.</td>
</tr>
<tr>
<td>sequence</td>
<td>A collection of actions and dialogs that is executed sequentially in an installation project.</td>
</tr>
<tr>
<td>sequence tables</td>
<td>Tables that list the actions that control the installation process and specify their order of execution.</td>
</tr>
<tr>
<td>service</td>
<td>For Windows Installer–based or InstallScript-based projects, this is a program that runs in the background whenever a computer is running. Services perform tasks that do not require user interaction, such as software installation, process monitoring, file transfer, task scheduling, network management, and many more. In Win32, services are managed by the Service Control Manager.</td>
</tr>
<tr>
<td>Service Control Manager (SCM)</td>
<td>Maintains the system's database of services and exposes an interface for controlling these services.</td>
</tr>
<tr>
<td>service pack (SP)</td>
<td>An update to a software product that fixes existing problems and may provide product enhancements. The next version of a product incorporates all service packs previously released.</td>
</tr>
<tr>
<td>setup</td>
<td>See installation.</td>
</tr>
<tr>
<td>setup project</td>
<td>See installation project.</td>
</tr>
<tr>
<td>Setup.inx</td>
<td>The compiled script file. It is the object code that the installer engine executes.</td>
</tr>
</tbody>

### Table 1 • InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>shortcut</td>
<td>A file that points to an application. Clicking the shortcut is a fast way to open the application. Shortcuts are usually placed on the desktop or on the Start menu. See also advertised shortcut.</td>
</tr>
<tr>
<td>silent installation</td>
<td>An installation that is run without a user interface or any end user intervention.</td>
</tr>
<tr>
<td>small update</td>
<td>A patch that upgrades a package where both the installed package and the most recent one have the same version number.</td>
</tr>
<tr>
<td>software development kit (SDK)</td>
<td>The documentation, samples, command-line compilers, debugging aids, utilities, and tools designed to enable developers to create applications and libraries that target a specific operating system. SDKs are usually provided by the manufacturer of the operating system.</td>
</tr>
<tr>
<td>source list</td>
<td>A list that specifies the locations where the installer searches for installation files. The entries in the source list can be network locations, URLs, or compact disks.</td>
</tr>
<tr>
<td>SP</td>
<td>See service pack.</td>
</tr>
<tr>
<td>splash screen</td>
<td>An image that is displayed to end users during the startup of a product installation. You can specify the image to be displayed, the length of time that it should display, and whether it contains localized images.</td>
</tr>
<tr>
<td>spyware</td>
<td>Any technology that aids in gathering information about a person or organization without their knowledge. On the Internet, spyware is programming that is put on someone’s computer to secretly gather information about the user and relay it to advertisers or other interested parties. Spyware can be loaded on a computer as a software virus or as the result of installing a new program. Data collecting programs that are installed with the user's knowledge are not, properly speaking, spyware, if the user fully understands what data is being collected and with whom it is being shared.</td>
</tr>
<tr>
<td>SQL</td>
<td>See Structured Query Language.</td>
</tr>
<tr>
<td>SQL statement</td>
<td>A complete phrase in SQL that begins with a keyword and completely describes an action to be taken. For example, SELECT * FROM Orders.</td>
</tr>
<tr>
<td>standard action</td>
<td>An action that is built into an installation development software product. InstallShield products also support the creation and use of custom actions. See also action, custom action.</td>
</tr>
<tr>
<td>string table</td>
<td>A database that maintains the string IDs, values, and comments for all supported languages. These strings are used in dialogs and message boxes displayed to the end user at run time.</td>
</tr>
</tbody>
</table>
### Table 1 • InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Structured Query Language (SQL)</td>
<td>A language used to work with databases.</td>
</tr>
<tr>
<td>summary information stream</td>
<td>The properties such as title, author, package code, templates, summary, and schema that are defined for a Windows Installer package and are used by the installer to install the application.</td>
</tr>
<tr>
<td>synchronous execution</td>
<td>The opposite of asynchronous execution, where control of the process is not released until the entire process has completed.</td>
</tr>
<tr>
<td>system policy</td>
<td>The rules and regulations by which a system must abide.</td>
</tr>
<tr>
<td>system privileges</td>
<td>The system, programs, and functions available to each user.</td>
</tr>
<tr>
<td>table</td>
<td>A collection of rows of data.</td>
</tr>
<tr>
<td>TARGETDIR</td>
<td>In a Windows Installer–based installation, the TARGETDIR property specifies the root destination directory for the installation. In an InstallScript installation, the TARGETDIR system variable, by default, specifies the root destination directory for the installation.</td>
</tr>
<tr>
<td>Task Manager</td>
<td>A tool available on Windows platforms that provides information about the applications and processes running on your computer as well as your computer’s performance. Prior to installation, you may need to use the Task Manager to end running applications and processes to prevent conflicts.</td>
</tr>
<tr>
<td>temp directory</td>
<td>A folder on your hard drive where the operating system or applications can temporarily store files while they are in use. When the application exits, the temporary files are deleted. It may be necessary to manually clean, or delete files from, the temp directory.</td>
</tr>
<tr>
<td>template</td>
<td>Something that establishes or serves as a pattern.</td>
</tr>
<tr>
<td>transform</td>
<td>A transform (.mst) file represents the differences between two installation databases. For example, network administrators may want to distribute different configurations of a product to the various departments in the company. As a result, you can create a transform for every configuration of the product, then apply the appropriate transform as needed.</td>
</tr>
<tr>
<td>transform error condition flags</td>
<td>A set of properties that are used to set the error conditions in a transform.</td>
</tr>
<tr>
<td>transform validation flags</td>
<td>The set of properties used to verify that a transform can be applied to the Windows Installer package.</td>
</tr>
<tr>
<td>tree node</td>
<td>A data structure that contains zero or more “child” nodes. Nodes are tree “roots”. Tree nodes that do not have “children” are typically referred to as “leaves”.</td>
</tr>
</tbody>
</table>
**Table 1 • InstallShield Glossary**

<table>
<thead>
<tr>
<th>Term</th>

<tr>
<td>UI</td>
<td>See user interface.</td>
</tr>
<tr>
<td>uncompressed</td>
<td>See decompress.</td>
</tr>
<tr>
<td>uniform/universal resource locator (URL)</td>
<td>Represents the location of a Web site or page.</td>
</tr>
<tr>
<td>uninstallation</td>
<td>The undoing of an installation. Uninstallation is the installation maintenance option that enables the end user to remove the product files and reverse any changes that were made to the machine made during installation.</td>
</tr>
<tr>
<td>uninstallation log file</td>
<td>A record of all uninstallation-related events that occurred during an installation. The log file is initialized at the beginning of the installation. If this log file becomes corrupted, it may result in an error during uninstallation.</td>
</tr>
<tr>
<td>uninstallShield</td>
<td>A component included in the Setup Wizard that uninstalls the product from the end user’s PC.</td>
</tr>
<tr>
<td>unspanned CD/DVD media type</td>
<td>The payload is laid out in a CD/DVD archive, but no spanning across multiple media is used.</td>
</tr>
<tr>
<td>Update Manager (Windows or Java)</td>
<td>An optional Win32 or Java-based client application that can be used by end users to set their own update schedules, or to silence the update queries performed by the agent.</td>
</tr>
<tr>
<td>upgrade</td>
<td>A move from a lesser version of an application to a newer, usually improved version of an application.</td>
</tr>
<tr>
<td>upgrade code</td>
<td>The code required to install a newer version of existing software.</td>
</tr>
<tr>
<td>upgrading</td>
<td>The process of installing a newer version of existing software.</td>
</tr>
<tr>
<td>URL</td>
<td>See uniform/universal resource locator.</td>
</tr>
<tr>
<td>user interface (UI)</td>
<td>The user’s access to the software.</td>
</tr>
<tr>
<td>user profile</td>
<td>Record of an individual end user’s settings, such as shortcuts, favorites, and settings for application, display, and hardware. User profiles enable multiple users to share a single computer while maintaining their own preferences.</td>
</tr>
<tr>
<td>validation</td>
<td>The process of validating, that is, to confirm the true form of data.</td>
</tr>
<tr>
<td>value pack (VP)</td>
<td>An installation that upgrades the features and functions of an installed application.</td>

</tbody>
</table>
Table 1 • InstallShield Glossary

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable</td>
<td>A value stored in the computer. Its value can be composed of any printable characters, numeric or text. Unlike a constant, whose value never changes, a variable’s value can be changed at any time.</td>
</tr>
<tr>
<td>volume</td>
<td>The total amount of space, in blocks, on one piece of media.</td>
</tr>
<tr>
<td>VP</td>
<td>See value pack.</td>
</tr>
<tr>
<td>Web installation</td>
<td>An installation that end users can access and run from a Web site.</td>
</tr>
<tr>
<td>WinDir</td>
<td>Stores the path to the executable file for Win16 on Win32 (WOW).</td>
</tr>
<tr>
<td>window</td>
<td>The area in which an open application appears on a screen.</td>
</tr>
<tr>
<td>Windows API</td>
<td>The Windows application programming interface (API), which provides the building blocks that are used by applications written for the Windows platform. Each API is a specific method prescribed by a computer operating system or by an application program. A programmer writing an application can make requests of the operating system or another application with the use of a Windows API. Each API has different system requirements to run properly.</td>
</tr>
<tr>
<td>Windows installation CD</td>
<td>The compact disc that contains the Windows operating system. If your computer manufacturer installed the operating system on your computer, the installation CD should have been included with your computer documentation. If you installed the Windows operating system on your computer, you used the installation CD to do so.</td>
</tr>
</tbody>
</table>
| Windows Installer service   | (1) An installation and configuration service. It is based on a data-driven model and provides all installation data and instructions in a single, complete package. In the data-driven installation model, a primary set of installation tables is created where every application resource (files, registry keys, and so on) is clearly tied to the component or feature it supports. The user selects the objects to install and where to install them, and the Windows Installer manages the procedural instructions.  
(2) Refers to the service, properties, and tables of an .msi package.                                                                 |
| Windows Installer service   | An operating system component that centrally manages application installation configuration and application uninstallation.                      |
| Windows NT service          | See Windows service.                                                                                                                         |
| Windows service             | Long-running executable applications that run in their own Windows sessions. For example, writing messages to an event log.                    |
